Evidence of this admixture remains to-day, the Huambisa as well as the Jivaro and several other tribes of the region being fair-skinned and bearded. They are implacably hostile, both to the whites and to the neighboring Indians, whom they are gradually driving from the region of the Upper Marañón.

HUAMEL. A bad spelling for guemal (q.v.).

HUANACO, hwà-ná'kò. See GUANACO.

HUANCAVELICA, wán'ká-vá-lé'ká. A department of Peru, bounded by the departments of Lima and Junin on the north, Ayacucho on the east, Ica on the south, and Lima on the west (Map: Peru, B 6). Area, 9251 square miles. It belongs entirely to the region of the Cordilleras, and contains only a very small portion of land fit for agriculture. The mountains are rich in minerals, but little mining is carried on, since the roads are so poor that transportation is rendered extremely difficult. Population, in 1896, 223,796. The capital, Huancavelica, is situated in the northern part of the department at an altitude of over 12,000 feet, and has a population of about 3000.

HUANCAYO, wán-ki'ò. A town in the Peruvian Department of Junin, situated on the river Mantaro, at an altitude of over 10,000 feet (Map: Peru, C 6). The Constitution promulgated by a congress which assembled here in 1839 remained in force till 1860. Population, about 5000.

HUÁNUCO, wá'nu-kò. A department of Peru, bounded by the Department of Loreto on the north and east, Junin on the south, and Ancachs on the west. Area, 14,024 square miles (Map: Peru, B 5). It is exceedingly mountainous in the western part, with a general eastern slope toward the Ucayali River. It is watered by several streams, among which are the headwaters of the Amazon, and is covered to a large extent with thick forests. The climate is hot and moist in the east, and cold in the mountainous regions of the west. The mountains are supposed to contain rich deposits of gold, silver, and quicksilver, but the lack of good roads prevents their exploitation. The population was estimated, in 1896, at 145,309. Capital, Huánuco (q.v.).

HUÁNUCO. The capital of the Peruvian department of the same name, situated at an altitude of nearly 6000 feet, near the river Huallaga, 170 miles northeast of Lima (Map: Peru, B 5). It is the seat of a bishopric, and was, until 1855, the capital of the Department of Junin. It was founded about 1543. About 35 miles west lies the town Huánuco Viejo, an Inca town settled by the Spaniards in 1535, and now almost abandoned. Population of Huánuco, about 7500.

HUARAZ, or **HUARAS,** wá'rás. Capital of the Peruvian Department of Ancachs, situated on the Huaraz River, and connected by rail with the coast (Map: Peru, B 5). It has a cool and uniform climate; its streets are narrow and its houses plain; and the only buildings noteworthy are the Government building, a hospital, a school, and two churches. Set in the wall of its cemetery is a very interesting collection of stones sculptured by the ancient Peruvians, and collected from the surrounding country. Population, about 17,000.

HUARTE, wár'tá, JUAN DE DIOS (c.1520-c.1600). A Spanish physician and philosopher, born in Navarre. He wrote a curious book on phrenology, *Exámen de ingenios para las ciencias* (1578). This volume was extremely popular, and was translated into several European languages—into English as *A Trial of Wits*. Some of his theories on education are very enlightened for the time, while others are fantastic in the extreme.

HUASCAR, wás'kär (c.1495-1533). A Peruvian Inca, born in Cuzco. He was the legitimate heir of Huayna Capac, but his father allowed him to inherit only half the kingdom, leaving the other half to a younger brother, Atahualpa, of a more fierce and warlike character, who coveted the whole. A battle between the rival claimants took place near Mount Chimborazo (1532), and Huascar was defeated, falling afterwards into the hands of his half-brother, who compelled him to look on while the women of the royal household were tortured to death. The landing of the Spaniards in the same year was the beginning of the end for Atahualpa, whose dread that they might reinstate his brother caused him to condemn Huascar to be secretly drowned in the river of Andamarca.

HUASTECS, wás'téks. A detached tribe of Mayan stock (q.v.), on the shores of the Gulf of Mexico along the Pánuco in the States of Vera Cruz and San Luis Potosí. The language contains more archaic forms than any other of the stock, bearing out the traditional and other evidences that the Huastecs are a tribe left behind in the southward migration of the Maya people.

HUAYNA CAPAC, wá-é'ná ká'pák (?-1523). A Peruvian Inca, born in Cuzco. His reign began in 1483, and being by that time an experienced soldier, he waged war against his neighbors till he had conquered the country as far north as Quito, including Puná Island, Ecuador, and as far south as Atacama, Chile. A ferocious warrior, he cultivated also the peaceful art of road-making (notably the highway between Tumbes, Pachacamac, and Cuzco), while it was the magnificence of the palaces he had built which so impressed the first Spanish invaders. Huayna Capac had a harem of more than 600 members, and it was his decree that his legitimate heir should share with a younger brother the huge kingdom he was to inherit which led to its partition and the internal dissensions that made it fall an easy prey to Francisco Pizarro.

HU'BALD. See HUCBALD.

HUBAY, hoo'bò-i, JENÖ (1858—). An Hungarian violinist, born at Budapest. He studied the violin with Joachim in Berlin, and in 1876 began to give concerts in Hungary, and later in Paris. He was chief violin professor at the Brussels Conservatory (1882), and at the Budapest Conservatory (1886), succeeding his father, Charles Hubay, who was also a well-known violinist. As a composer he ranks high, his operas *Der Geigenmacher von Cremona* (1893), *Alienor* (1892), and the Hungarian *A fulu rózsá* (1896) being especially noteworthy.

HUBBARD, ELBERT (1850—). An American writer, and maker of fine books, born in Bloomington, Ill. He made himself widely known as

the originator and proprietor of the Roycroft Shop, in East Aurora, N. Y., founded for the avowed purpose of reviving the old handicrafts, particularly that of artistic book-making. He also originated the *Philistine*, a periodical devoted to expressing a curious jumble of shrewd but generally kindly philosophy which is sometimes marred by vulgarity and personal vilification. His other literary work includes a series of biographical sketches published under the caption, *Little Journeys*; several pamphlets, such as *A Message to Garcia* (1898), which is a vigorous arraignment of the careless employee and of which about half a million copies were circulated, and *Time and Chance* (1901), a graphic sketch of John Brown's career.

HUBBARD, JOSEPH STILLMAN (1823-63). An American astronomer, born in New Haven, Conn. He graduated at Yale College in 1843, and the next year went to Philadelphia, where he acted as assistant to Sears Cook Walker, who some years before had built the observatory of the Philadelphia High School. A few months later he accepted a position offered him by General Frémont, then a lieutenant, as computer of the observations for latitude and longitude made during the explorer's journey across the continent. On May 7, 1845, he was appointed to fill a vacancy in the corps of professors of mathematics in the Navy, and was assigned to duty at the Washington Observatory, where he remained during the rest of his life. He contributed frequently to the *Astronomical Journal* and twice, for long periods, was its editor. During his connection with the Washington Observatory he made a number of cometary investigations and important computations. He was a member of the National Academy of Sciences and of various other scientific societies.

HUBBARD, LUCIUS FREDERICK (1836—). An American soldier, Senator, and railway manager. He was born in Troy, N. Y., went to school in Granville, N. Y., learned the trade of a tinsmith, and followed it for three years in Chicago. In 1857 he started a newspaper in Red Wing, Minn., and afterwards served in the Civil War, conducting himself gallantly and becoming brigadier-general. Afterwards he engaged in railroad building and milling. He was a State Senator (1872-76), Governor of Minnesota (1882-87), and in the Spanish-American War commanded a volunteer brigade.

HUBBARD, OLIVER PAYSON (1809—). An American chemist, born at Pomfret, Conn. He was educated at Hamilton College, where he studied in 1825-26, and at Yale, where he graduated in 1828, was assistant at Yale to Benjamin Silliman, and from 1836 to 1866 occupied the chair of chemistry, pharmacy, mineralogy, and geology at Dartmouth College. From 1866 to 1871 he was a general lecturer on those subjects, and from 1871 until his retirement as professor emeritus in 1883 was again connected with the faculty of Dartmouth, holding the professorship of chemistry and pharmacy. In 1832 he made investigations in the Eastern United States in connection with the examination conducted by Silliman for the Secretary of the Treasury in regard to the cultivation of the sugar-cane. He was a member of the New Hampshire State Legislature in 1863-64, and a secretary of the American Association of Geologists and Natural-

ists in 1844. His publications include a *Lecture Introductory to the Eighty-third Course of the New Hampshire Medical Institute at Dartmouth College* (1879), and a *History of Dartmouth Medical College* (1880), besides contributions to the *American Journal of Science* on "Observations Made During an Excursion to the White Mountains" (1838), "Geological Surveys of New York, Ohio, Indiana, and Michigan" (1840-41), "Condition of Trap Dikes in New Hampshire" (1850), and other subjects.

HUBBARD, RICHARD WILLIAM (1817—). An American painter, born at Middletown, Conn. He studied under Daniel Huntington, and in France. His landscapes include: "Meadows Near Utica" (1869); "Vermont Hills" (1874); "Autumn, Lake George"; "Connecticut Pastoral" (1880); "Lake in the Adirondacks" (1883); and "Down in the Meadows" (1885).

HUBBARD, WILLIAM (1621-1704). An American clergyman and historian, born in England. As a child he was brought by his parents to New England, graduated at Harvard (1642), was ordained, and became assistant and afterwards pastor of the Congregational church at Ipswich, Mass., a post which he resigned but a year before his death. He wrote, at the order of the Colonial Government, which paid him fifty pounds for it, a *History of New England*, mainly compilation, which barely escaped destruction by fire when Gov. Thomas Hutchinson's house was mobbed in 1765. The Massachusetts Historical Society printed it in 1815. He wrote also *A Narrative of Troubles with the Indians* (1677), which was for years popular in New England, and was even reprinted at the beginning of the nineteenth century at Worcester, Mass., 1801, and Roxbury, Mass., 1805. It is full of errors, but valuable especially as illustrating what was regarded by the writer's contemporaries as an elegant prose style. Minor works are a volume of sermons (1684), and *Testimony of the Order of the Gospel in Churches* (1701).

HUBBARDTON. A town in Rutland County, Vt., 18 miles northwest of Rutland (Map: Vermont, A 7). It was the scene of a sharp conflict on July 7, 1777, between the rear-guard of General Saint Clair's army, retreating from Ticonderoga, and a British and Hessian force under Generals Fraser and Riedesel. The Americans under Colonels Warner and Francis were defeated, with a total loss in killed, wounded, and prisoners of 324 men, nearly one-third their number, while the British loss was only 183. A monument commemorates the battle. Population, in 1890, 506; in 1900, 488.

HUBE, hū'be, ROMUALD (1803-90). A Polish jurist, born at Warsaw, and educated there, at Cracow, and in Berlin. From 1826 to 1832 he was professor of criminal law at Warsaw, then became head of a committee on revision of the laws of Poland, and was for a time professor at Saint Petersburg. In 1846, and again in 1867, he went with Count Bludoff on diplomatic missions to Rome. He died at Warsaw after thirteen years' service in the Russian Council of State. His works include: treatises on penal law (1828); on Polish criminalists (1830); *Antiquissima Constitutiones Summales Provinciae Gnesnensis* (1856); *Loi Salique* (1867); *Histoire de la formation de la loi Bourguignonne* (1867); *Droit romain et gréco-byzantin chez les peuples*

slaves (1880); and on Polish law in the thirteenth (1874) and fourteenth (1881) centuries.

HUBER, u'bar', FRANÇOIS (1750-1831). A Swiss naturalist. He was born in Geneva, inherited a love of nature, as well as keen powers of observation from his father, studied physics under Saussure and chemistry with a relative. At fifteen he began to lose his sight. Before he became totally blind he married a Mlle. Lullin. Her devotion, his father's wealth, and the keen eyes of his man servant, Burnens, made it possible for him to carry out his pioneer researches of the life and habits of bees. In 1792 he published at Geneva, under the title *Nouvelles observations sur les abeilles*, letters to Bonnet. In later works, especially on the origin of wax and the construction of cells, Huber was assisted by his son. Among his more important discoveries were the aerial impregnation of the queen bee (see BEES); the killing of the male by the workers; the rivalry of the queens; the use of the antennæ; the origin of the propolis; and the ventilation of the hives which supplies fresh oxygen.

HUBER, hoo'bër, HANS (1852-). A Swiss dramatic composer, born at Schönewerd, near Olten. He studied at the Leipzig Conservatory, and became well known as a music-teacher, being appointed in 1896 director of the music school at Basel. His operas *Weltfrühling* (1894) and *Gudrun* (1896) were successfully produced at Basel, and his instrumental pieces are universally popular. Of especial excellence are his violin and piano concertos.

HUBER, JOHANNES (1830-79). A German theologian and philosopher, leader of the Old Catholics. He was born in Munich; was educated there, and became professor of philosophy in the university in 1859, and a fearless opponent of the Ultramontanes. His work *Die Philosophie der Kirchenväter* (1859) was put on the Index Expurgatorius. He actively opposed the dogma of infallibility, and played a conspicuous part at the first general congress of the Old Catholics at Munich, in September, 1871. With Döllinger he wrote the famous *Der Papst und das Konzil von Janus* (1869). Among his other works are: *Johannes Scotus Erigena* (1861); *Die Freiheiten der französischen Kirche* (1870); *Das Papsttum und der Slaat* (1870); *Der Jesuitenorden* (1873); and *Der Pessimismus* (1876). Consult Zirngiebl, *Johannes Huber* (Gotha, 1881).

HUBER, VICTOR AIMÉ (1800-69). A German critic and social reformer, born at Stuttgart. He studied medicine and modern languages at Würzburg and Göttingen; taught at Bremen, was appointed professor of the history of literature and of modern history at Rostock in 1833, of the languages of Western Europe at Marburg in 1836, and in 1843 at Berlin. From 1851 to 1869 he lived in retirement in the Harz Mountains. His writings on Spanish, French, and English literature include: *Die Geschichte des Cid* (1829); *Crónica del Cid* (1844); *De Primitiva Cantilenarum Popularium Epicarum (vulgo Romances) apud Hispanos Forma* (1844); *Skizzen aus Spanien* (1828 sq.); *Die neuromantische Poesie in Frankreich* (1833); and *Die englischen Universitäten* (1839-40). He was for a time a Conservative in politics, and founded the journal *Janus*; but later became a Socialist. Consult: Elvers, *Victor Aimé Huber* (Bremen, 1872-74);

Jäger, *Victor Aimé Huber, ein Vorkämpfer der sozialen Reform* (Berlin, 1879).

HUBERT, hü'bért. The custodian of Arthur, in Shakespeare's *King John*. The character is taken from that of Sir Hubert de Burgh, who died in 1243.

HUBERT, u'bar', SAINT (?-728). A French bishop, founder of Liège. There are numerous legends concerning him, but there seems no doubt that he was of noble birth and was married to a lady of rank. It is related that the apparition of a crucifix upon the head of a stag which he was chasing one day turned him to the religious life. He became Bishop of Maestricht, and made so many converts in the district that he was called the Apostle of the Ardennes. He is the patron saint of the hunter, and his anniversary is made the occasion of curious ceremonies in French rural districts. Saint Hubert received from heaven a wonderful stole that is said to have retained its miraculous healing properties until the present day.

HUBERT DE BURGH (?-1243). An English statesman. He held office under Richard the Lion-Hearted, and about 1202 was made, by King John, castellan of Falaise and guardian of Arthur of Brittany, the young son of John's elder brother, Geoffrey. The story of his refusal to obey the King's orders to blind the young prince, incorporated by Shakespeare in his *King John*, is unauthentic. In the struggle between John and the barons he sided with the King, but is mentioned as one of those by whose advice Magna Charta was granted. In the same year he was made justiciar of England. He held Dover Castle against the Dauphin Louis in 1216, and on August 24th of the following year gained a notable naval victory over a French fleet which was bringing in reinforcements to Louis. After 1219, Hubert, with Stephen Langton, Archbishop of Canterbury, carried on the government for the young Henry III. He was a bitter opponent of the foreign party headed by Peter des Roches, Bishop of Winchester, and attempted to put an end to the system by which the wealth of the English clergy was being taxed for the benefit of the Papal Court. His policy in general was dictated by a twofold desire to strengthen the power of the Crown and to further his own fortunes. During his terms of office he amassed vast riches through prudent marriages, as well as by arrogating to himself lucrative offices and the guardianship of wealthy heirs. Members of his family were advanced to high positions in the Church. His ill success against the Welsh about the year 1228 afforded his enemies an opportunity for undermining his influence with the King. He was dismissed from office in 1232, and charged with malfeasance, murder, and treason. Though restored to the King's favor for a short period, he never again exercised any influence in the Government. He died in London, May 12, 1243. Consult Stubbs, *Constitutional History of England*, vol. ii. (4th ed., Oxford, 1896).

HUBERTI, u'barté', LÉON GUSTAVE (1843-). A Belgian composer, born at Brussels. He won the Prix de Rome (1865) at the Brussels Conservatory, and from 1874 to 1878 was director of the Mons Conservatory. He was inspector of singing in the Antwerp schools (1880-89), becoming later a professor at the Brussels Conservatory, and director of the music school of St.

Josse-ten-Noode-Schaerbeek. His compositions, which are of sterling merit, comprise: The oratorios, *Een laatste Zonnestraal*, *Bloemardinne*, and *Willem van Oranjes dood*; the dramatic poem *Verlichting*, for organ, orchestra, soli, and chorus; a *Symphonie funèbre*, a romantic suite, many songs, piano pieces, and instrumental numbers.

HUBERTUSBURG, hu-bér'tus-bōōrk, or **HUBERTSBURG** (Ger., Hubert's castle). A royal hunting-seat, not far from Leipzig, built in 1721 by Augustus the Strong (Frederick Augustus I.) of Saxony. Here, on February 15, 1763, was signed the treaty of peace between Austria, Prussia, and Saxony, marking the conclusion of the Seven Years' War (q.v.).

HUBLI, or **HOOBLY**, hōō'blī. A town and railway junction in the Dharwar District, Bombay, British India, 90 miles southwest of Karwar on the Malabar coast (Map: India, C 5). It is one of the principal cotton marts in that section of India, and has manufactures of copper ware, silks, etc. The chief objects of interest in the town and vicinity are numerous ancient Jain temples. Population, in 1891, 52,600; in 1901, 58,150.

HÜBNER, hūb'nēr, ALEXANDER, Count (1811-92). An Austrian author and diplomat, born in Vienna. He held various minor diplomatic positions in Paris, Lisbon, and Leipzig, and was then sent to Paris as Minister Plenipotentiary (1849). He held this post under the Republic, and under Napoleon III. until 1859. After this he was Minister of Police in his own country, but did not keep that portfolio long. From 1865 to 1867 he was Ambassador to Rome, and then made a tour of the world, described in *Ein Spaziergang um die Welt* (1875). His best-known work is *Sixtus V.* (1870).

HÜBNER, EMIL (1834-1901). A distinguished German classical philologist, born at Düsseldorf. He was professor at the University of Berlin from 1870 until his death. His contributions to classical learning, above all in the field of Latin epigraphy, were very numerous. To his influence was due an awakening of interest in classical studies in general, and especially in epigraphy in Spain, which he made a favorite field of study. Among his publications the most important are: *De Senatus Populique Romani Actis* (1859); *Epigraphische Reiseberichte aus Spanien und Portugal* (1861); *Die antiken Bildwerke in Madrid* (1862); *Inscriptiones Hispaniæ Latine* (1869, supplementary volume 1892); *Inscriptiones Hispaniæ Christianæ* (1871, supplementary volume 1900); *Inscriptiones Britannæ Latine* (1873); *Inscriptiones Britannæ Christianæ* (1876); *Exempla Scripturæ Epigraphicæ Latine* (1885); *Monumenta Linguae Ibericæ* (1893); *Ueber mechanische Copien von Inschriften* (1881); *Grundriss zu Vorlesungen über die römische Literaturgeschichte* (4th ed. 1878); *Grundriss zu Vorlesungen über lateinische Grammatik* (2d ed. 1880); *Bibliographie der klassischen Altertumswissenschaft* (2d ed. 1889); *La arqueología de España* (1888); *Römische Herrschaft in Westeuropa* (1890). Hübner was also co-editor of *Hermes*, 1866-81, and of the *Archäologische Zeitung* (1868-73).

HÜBNER, JULIUS (1806-82). A German historical painter of the Düsseldorf school. He

was born at Oels, in Silesia, studied at the Academy School in Berlin and under Schadow, there and at Düsseldorf. He first attracted attention by his picture of "Ruth and Boaz" (1825). He traveled in Italy, and resided for the most part at Düsseldorf until 1839. In that year he settled at Dresden, becoming a professor in the Academy of Arts in 1841, and director of the Gallery of Paintings in 1871. He obtained the great gold medal at Brussels in 1851. Among the works of his first period are "The Fisherman" (1828), after Goethe's ballad; "Ruth and Naomi" (1833), in the National Gallery, Berlin; "Christ and the Evangelists" (1835); "Job and His Friends" (1838), in the Gallery of Frankfurt; "Consider the Lilies" (1839); and the portrait of Frederick III., in the Kaiserhalle, Frankfurt. To his second or Dresden period belong the "Golden Age" and "Dispute Between Luther and Dr. Eck" (1866), in the Dresden Gallery; "Charles V. at San Yuste," "Last Days of Frederick the Great," "Cupid in Winter," and others. He was also known as a poet.

HÜBNER, KARL (1814-79). A German genre painter, born at Königsberg. He was a pupil of the Düsseldorf Academy. His works were especially popular in Holland and in America, where he went in 1874, and was received with enthusiasm. His genre subjects include: "The Silesian Weavers" (1844); "The Sleeping Wood-Thief" (1845); "The Abandoned" (1846); "The Seizure for Debt" (1848, Königsberg Museum); "The Sinner at the Church Door" (1874, National Gallery, Berlin); "Consolation in Prayer" (1875, Düsseldorf Gallery); and "The Recovery," in the Pennsylvania Academy of Fine Arts.

HUB OF THE UNIVERSE. A name jestingly given by Oliver Wendell Holmes in one of his essays to the State House in Boston as the centre of a self-satisfied community. The term is frequently applied to the city itself, which is popularly supposed to boast of its superior wisdom and culture.

HÜBSCHMANN, hupsh'mán, JOHANN HEINRICH (1848—). A German philologist, born at Erfurt. He studied Oriental philosophy at Jena, Tübingen, Leipzig, and Munich; in 1876 became professor of Iranian languages at Leipzig, and in 1877 professor of comparative linguistics at Strassburg. His principal works are: *Zur Casuslehre* (1875); *Armenische Studien* (1883); *Das indo-germanische Vokalsystem* (1885); *Etymologie und Lautlehre der ossetischen Sprache* (1887); *Persische Studien* (1895); and *Armenische Grammatik* (1895 sq.).

HUC, uk, ÉVARISTE RÉGIS (1813-60). A French Roman Catholic missionary and traveler. He was born in Toulouse; joined the Lazarist fathers in 1839, and at once went to China. After spending a few years in missionary labor in Northern China, in 1844 he set out for Tibet. With his two companions he spent several months in a Tatar monastery, learning the Tibetan language, and then made his way over the desert and glaciers to Lhasa, arriving in January, 1846. Within a few weeks, however, he was compelled to return, the Chinese ambassador having successfully used his influence to that end. Such was the strain on Father Huc's health that he was forced to come back to France in 1849. He published: *Souvenirs d'un voyage dans la Tartarie, le Thibet et la Chine pendant les années 1844-46* (2

vols., 1850); *L'empire chinois* (1855); and *Le christianisme en Chine, en Tartarie et au Thibet* (1857-58). All of these works have been translated into English. The strangeness of the things described caused them to be received with incredulity, but later travelers have established their truth. Father Huc's health was never fully restored, and he died at the age of forty-six.

HUC'BALD, or **HUBAL'DUS** (c.840-c.930). A Benedictine monk, author, and musician. He was noted for his piety and learning. He lived most of his life in the Monastery of Saint-Amand, near Tournay. His writings include some lives of the saints, but he is best known by his treatises on music. The authorship of these is disputed, excepting *Harmonica Institutio*, a criticism of a work by Reginon de Prum. The most celebrated of them is *Musica Enchiriadis*, now believed to be by an unknown writer of the end of the tenth century. It illustrates rules by practical examples, and is a valuable aid to the understanding of certain early systems of notation. Other works attributed to him are *Alia Musica* and *Commemoratio Brevis de Tonis et Psalmis Modulandis*.

HUCHO, hū'kō. A Western salmon. See TROUT.

HUCKABACK (probably from LGer. *hukkebak*, pickaback, from *huken*, to crouch + *bak*, back). A coarse kind of linen or cotton cloth, figured somewhat like damask; it is usually employed for toweling.

HUCKLEBERRY (probably a corruption of *hurtleberry*, *whurtleberry*, *whortleberry*, probably from AS. *wyrtil*, OHG. *wurzala*, Ger. *Wurzel*, root + *berry*; apparently confused with AS. *heortberge*, *heorotberge*, hartberry, from *heort*, *heorot*, stag, hart + *berge*, berry). A term now

HUCKLEBERRY.

applied indiscriminately to various small, hardy shrubs of the genus *Vaccinium* (order Vacciniaceæ). The flowers of these plants have a four or five toothed calyx, four or five cleft bell-shaped corolla, with the limb bent back, and eight to ten stamens with two-horned anthers. The fruit is a four to five celled, many-sided berry. The numerous representatives of the genus, mostly confined to the Northern Hemisphere, are common in the north of Great Britain,

Europe, and throughout North America. In nature the huckleberry is represented by numerous species, and as each of these show marked variations in size of fruits and productiveness, the wonder is that so attractive a native plant should have existed so long apparently unheeded. The plants range in size from six inches in *Vaccinium Pennsylvanicum*, to five to ten feet high in *Vaccinium corymbosum*, and bear fruits from one-eighth inch up to five-eighths inch in diameter. In color they are equally variable, showing all shades from waxen black, blue, and white, to red in one species, *Vaccinium Vitas-Idææ*, which is often called cranberry because of the likeness of its acid fruit to that of the cranberry.

While the huckleberry has been successfully transplanted to gardens, grown from seeds and grafted, it has nowhere been cultivated in a commercial way. In certain portions of the United States wild plants are protected and cared for in order that the fruit may be secured for the canneries or markets. The "blueberry barrens" of Maine, an area of some 150,000 acres in extent, is a notable example of the preservation of a native product from which is derived a large annual income. The annual pack from this region alone is about 30,000 cases of 24 cans each, valued at \$57,000. Besides forming a valuable commercial product when canned, the huckleberry is extensively gathered and marketed for dessert purposes. Although naturally a dry, rather seedy fruit, the larger specimens are juicy, and possess a most agreeable flavor. The huckleberry is also used for preserves and jellies, as well as for making wine and distilled liquors. In America, however, its chief value is as a dessert fruit, both in a fresh state and when canned.

HUCKNALL TORKARD, hūk'nal tōr'kērd. A town in Nottinghamshire, England, five miles north of Nottingham (Map: England, E 3). It has coal-mining industries. Lord Byron is buried in the old parish church. Population, in 1891, 11,000; in 1901, 15,250.

HUDE, hūd'de, **ANDREAS** (c.1600-63). A Dutch commander in New Netherland after 1629. As one of the four councilors of Wouter van Twiller, director-general in America for the Dutch West India Company (1633), Hudde obtained a large grant of land upon Long Island, and in 1642 he was surveyor of Manhattan. Four years later, when trouble had arisen between the Dutch and Swedish settlers on the South, or Delaware River, he was sent to guard the Dutch West India Company's interests there, and at once entered into strife with the governor of the Swedes, who tried to stir up the Indians against him. But Hudde held his own until 1655, when the Dutch authorities sent ships to help him, and he conquered the Swedish rulers. He continued to enjoy the company's confidence, and was made commander of Forts Altona and New Gottenburg (1657), as well as colonial surveyor and parish clerk. That he was a well-educated man is evidenced by the quality of his literary remains in the Albany archives.

HUD'DERSFIELD. A manufacturing and market town in the West Riding of Yorkshire, England, on the Colne, 16 miles southwest of Leeds. It has excellent facilities for inter-communication by railway and canal with all important commercial centres, and is the chief seat of the English cloth and woolen manufac-

ture (Map: England, E 3). Coal-mining and stone-quarrying are also profitable industries. The town is well built, with spacious thoroughfares, and fine ecclesiastical, public, and commercial buildings. The town hall and market hall are noteworthy. It has a proprietary college affiliated to the London University, a collegiate school, and other educational institutions. Its municipal government is of a high order and the corporation has been a pioneer in several economic features. Artisans' dwellings were established in 1853 for married couples, and for single women as well as for bachelors. Huddersfield was the first to own and work its tramways; it owns its gas, water, and electric works, and several beautiful parks; maintains free public libraries, an art gallery, public baths and wash-houses, slaughter-house, markets, technical schools, fire brigade, a hospital, cemeteries, and a modern system of refuse and sewage disposal. It was the first town to adopt an eight-hour labor day. It is the seat of a United States consulate. Although a town mentioned in the Domesday Book, its importance dates only from the establishment of the woolen manufacture in the eighteenth century. Population, in 1891, 95,400; in 1901, 95,000.

HU'DIBRAS. See BUTLER, SAMUEL.

HUDIBRAS, SIR. A foolhardy and pessimistic character, the suitor of Perissa, in Spenser's *Faerie Queene*, probably meant to represent Puritanism.

HUD'SON. A town in Middlesex County, Mass., 28 miles west of Boston; on Assabet River, and on the Fitchburg and the Boston and Maine railroads (Map: Massachusetts, D 3). It has a public library. There are manufactures of leather, leather and rubber shoes, rubber gossamer clothing, rubber goring and webbing, and wooden and paper boxes. The government is administered by town meetings. The water-works and electric-light plant are owned and operated by the town. Population, in 1890, 4670; in 1900, 5454.

HUDSON. A city and the county-seat of Columbia County, N. Y., 28 miles south of Albany; on the east bank of the Hudson River, and on the New York Central and Hudson River, the Boston and Albany, and other railroads (Map: New York, G 3). It is finely situated on the slope of Prospect Hill, and has a number of noteworthy buildings, the State House of Refuge for Women, State Volunteer Firemen's Home, Hudson Orphan Asylum, State Armory, and the court-house, city hall, and city hospital. Public Square and Franklin Square parks, and Promenade and Reservoir hills are also of interest. There are extensive manufactures of knit goods, car-wheels, ale, lumber, tobacco, iron, machinery, stoves, furnaces, etc. Under a charter of 1895, the government is administered by a mayor, elected biennially, and a city council. The water-works are owned and operated by the municipality. Population, in 1890, 9970; in 1900, 9528. Hudson was settled as Claverack Landing by New Englanders in 1783; its present name was adopted in 1784, and a city charter was received in 1785. For some years the city carried on an extensive foreign trade, and was an important whaling port, but its shipping was almost completely destroyed in the War of 1812.

HUDSON. A city and the county-seat of Saint Croix County, Wis., 19 miles east of Saint Paul, Minn.; on Lake Saint Croix, an expansion of the Saint Croix River, and on the Chicago, Saint Paul, Minneapolis and Omaha Railroad (Map: Wisconsin, A 4). It has saw and flour mills, box, furniture, and broom factories, breweries, railroad car and machine shops, and also a large cold-storage plant, the city being the centre of a region that is interested in raising vegetables, small fruits, poultry, etc., for shipment. There is a well-equipped sanatorium. The water-works and electric-light plant for street lighting are owned by the municipality. Population, in 1890, 2885; in 1900, 3259.

HUDSON, CHARLES (1795-1881). An American clergyman, politician, and author, born in Lexington, Mass. He was educated for the Church, which he entered as a Universalist in 1819, and he presided over a congregation in Westminster, Mass., until 1839. Beginning his political career in the House of Representatives in his own State, he afterwards went to Congress (1841-49), and then was made naval officer at the port of Boston, a position he retained four years, and then exchanged it for others in the public service. Besides editing a Boston daily newspaper, he wrote much upon historical and political topics for the periodical press. His books include: *Letters to Rev. Hosea Ballou* (1827); *History of Westminster* (1832); and a *History of Lexington* (1868), with a genealogical register of its families.

HUDSON, ERASMUS DARWIN (1843-87). An American physician, born in Massachusetts. He graduated at the College of the City of New York in 1864, and at the College of Physicians and Surgeons, New York City, in 1867. During 1867-68 he was house surgeon at Bellevue Hospital. In 1869-70 he was health inspector of New York City; in 1870 was attending physician to the class for diseases of the eye in the out-door department of Bellevue Hospital; was attending physician at Northwestern Dispensary in 1870-72, and attending physician to Trinity Chapel parish and Trinity Home in 1870-75. He was appointed professor of principles and practice of medicine at the Woman's Medical College of the New York Infirmary in 1872, and held that position for ten years; and from 1882 until his death was professor of general medicine and diseases of the chest in the New York Polyclinic. He was the author of the following professional works: "Report of Pulse and Respiration of Infants," in *Eliot's Obstetric Clinic* (1872); *Doctors, Hygiene and Therapeutics* (1877); *Methods of Examining Weak Chests* (1885); *Limitations of the Diagnosis of Malaria* (1885); *Home Treatment of Consumptives* (1886); and *Physical Diagnosis of Thoracic Diseases* (2d ed. 1887).

HUDSON, FREDERIC (1819-75). An American journalist, born in Quincy, Mass. After a common-school education he went to New York City in 1836, and became attached to the *New York Herald*, of which he soon became managing editor, which position he held until 1866. His long experience and diligence in collecting gave him abundant material for his *Record of Journalism in the United States from 1690 to 1872*, published in 1873, which is perhaps the most accurate and interesting history yet published of

the rise and development of the American newspaper.

HUDSON, GEORGE (1800-71). An English speculator, known as the 'railway king.' He acquired a fortune as a linen-draper, and at the age of twenty-seven inherited £30,000. Investing in railways, he soon carried out large schemes of annexation and extension, crushing roads and buying up embarrassed lines. He was three times elected Lord Mayor of York, and was sent to Parliament. In 1847 the value of railway property fell rapidly, and it was found on investigation that Hudson was paying dividends out of capital, and appropriating large sums to his personal use. He spent his last twenty years in contesting lawsuits.

HUDSON, HENRY (?-1611). An English navigator. He is first mentioned as the commander of the ship *Hopeful*, sent in May, 1607, by the Muscovy Company in quest of a northeast passage to the Spice Islands. After a voyage of four and a half months, during which he touched the coasts of Greenland and Spitzbergen, and sailed as far north as 80° 23', he returned to England. The next year he sailed again under the auspices of the Muscovy Company, and reached Nova Zembla, attempting in vain to force a passage through the Vaigatch or Kara Strait, in the expectation of finding himself within easy reach of the Pacific. This voyage proved as unsuccessful as the first. His next undertaking was made in behalf of the Dutch East India Company. In their employ he sailed from Amsterdam on March 25, 1609, with two ships, the *Good Hope* and the *Half Moon*. He made Nova Zembla, intending to try again the passage of the Vaigatch, but his crew rebelled, and the *Good Hope* returned to Holland. Hudson, in the *Half Moon*, crossed the Atlantic, and sighted land in the latitude of Nova Scotia. He then sailed south as far as latitude 35°, and again turning north, carefully examined the coast up to Sandy Hook, which he reached on September 12th. A month was spent in exploring the Hudson River, which the *Half Moon* ascended to the present site of Albany. He reached England on November 7th, having satisfied himself that the story of a great strait leading through the continent somewhere in the latitude of 40° was false. In 1610 he set out once more, this time to search for a northwest passage under the patronage of an association of English gentlemen. He left England in April, and by June 10th had reached the strait which now bears his name. Passing into the bay beyond (Hudson Bay), he spent three months in exploring its coasts and islands. Early in November his vessel was frozen in. The winter seems to have been one of great suffering. Provisions were scarce, and dissensions arose among the sailors. Late in June, 1611, a part of the crew mutinied, seized and bound Hudson, his son, and seven others of the ship's company, and putting them into the small boat, set them adrift. They were never seen again. A few wretched survivors from among those on board the ship reached England. For an account of Hudson, consult the introduction to Asher, *Henry Hudson, the Navigator*, edited for the Hakluyt Society (London, 1860). The volume includes reprints of the earliest accounts of his voyages, both English and Dutch.

HUDSON, HENRY NORMAN (1814-86). An American Shakespearean scholar and editor, born at Cornwall, Addison Co., Vt. In early life he worked as a baker and a wheelwright. He graduated from Middlebury College, Vermont, in 1840, and then taught school in Kentucky and Alabama. He presently became an authority of considerable note on Shakespeare, lectured widely on his works, and was appointed a professor in Boston University. Among his works in this field are: *Lectures on Shakespeare* (2 vols., 1848); a valuable annotated edition (11 vols., 1851-56); and *Shakespeare: His Life, Art, and Characters* (2 vols., 1872). Having entered the priesthood of the Protestant Episcopal Church, he was for some years editor of the *Churchman*; was rector at Litchfield, Conn., 1859-60, and served as chaplain in the Union Army during the Civil War. On his return he published *A Chaplain's Campaign with General Butler* (1865). He was author also of *Sermons* (1874); *Studies in Wordsworth* (1884); *Essays in Education* (1884); and other works.

HUDSON, WILLIAM (c.1730-93). An English botanist, born at Kendal. He became an apothecary, but devoted much time to botany, entomology, and other natural sciences. He is chiefly noted for his adaptation of the Linnæan system of plant classification to the flora of Britain, which he published under the title, *Flora Anglicæ* (1762). A second and greatly enlarged edition appeared in 1778. The genus *Hudsonia* was named by Linnæus in his honor.

HUDSON, WILLIAM HENRY (1863-). An English author and professor of English literature, born in London, and educated by private tutors. He was private secretary to Herbert Spencer, librarian of Sion College, London (1885-86), and later of the London City Liberal Club (1889-90), and of Cornell University (1891-92). From 1892 to 1901 he was professor of English literature at Leland Stanford, Jr., University. His principal works, besides contributions to magazines, are: *The Church and the Stage* (1886); *An Introduction to the Study of Herbert Spencer* (1893); *Studies in Interpretation* (1896); *Idle Hours in a Library* (1897); *The Study of English Literature* (1898); *Sir Walter Scott* (1900); *The Sphinx, and Other Poems* (1900); *The Satan of Theology* (1901); and editions of Goldsmith's *Vicar of Wakefield* (1898) and of the *Roger de Coverley Papers* (1899).

HUDSON BAY. A spacious landlocked gulf in the northeastern section of Canada, which may be regarded as an arm at once of the Arctic and the Atlantic oceans (Map: North America, K 3). It communicates with the Atlantic by means of Hudson Strait, and with the Arctic by Fox Channel and various passages to the north and west, which, notwithstanding the comparative lowness of their latitude, have proved less practicable for navigation than the Arctic Ocean itself. Hudson Bay extends from about latitude 51° to about 64° N., a distance of about 900 miles. Its area is about 400,000 square miles. Its depth is about 70 fathoms; on the west coast there is an average rise and fall of 11 to 12 feet at spring tides. The southern prolongation of Hudson Bay bears the name of James Bay. Hudson Bay contains several islands, in addition to the large Southampton Island at its north end, but no rocks or shoals, and the region is

THE HUDSON RIVER
LOOKING NORTH FROM WEST POINT

singularly free from storm or fogs. Neither the bay nor Hudson Strait is ever entirely frozen over, but both are beset by detached floes and bergs of ice, which render navigation difficult for sailing vessels. Steamships can make the voyage up the bay and reach land from about the middle of June to the end of October. The west shore lies low, but the east shore is bold and rocky. Thirty rivers of considerable magnitude flow into the bay, the Nelson River being the most important. The Churchill and the Severn come next, the former having a deep though comparatively narrow mouth, which can be entered with ease by the largest ships at all tides. Though the land lying south and west of James Bay is suitable for dairy farming, and though ironstone, manganiferous iron ore, galena, and plumbago are found in other portions of the surrounding territory, neither the soil, timber, nor minerals have been to any extent drawn upon. Whale, walrus, seal, and salmon abound in the waters of Hudson Bay, and steam whalers visit it during the summer; but the only business which has been developed lucratively is the fur trade by the Hudson's Bay Company. This may be accounted for by the severity of the long winter on the shores of the bay. The few summer months are marked by a genial and bracing climate. The bay was discovered in 1610 by Henry Hudson (q.v.).

HUDSONIAN CURLEW, **GODWIT**, etc. See **CURLEW**, **GODWIT**, etc.

HUDSON RIVER, or **NORTH RIVER**. The principal river of New York State, and the most important waterway in the Eastern United States (Map: New York, G 3). It rises in the Adirondack Mountains in the northern part of the State, receiving the waters of most of the lakes in the southeastern half of the Adirondack region, and having its ultimate source in a small lake near the outlet of Long Lake in the northeastern part of Hamilton County. After passing through these mountains in a number of windings, it flows almost due south until it empties into the Atlantic Ocean through New York Bay at New York City. Throughout its course it receives only three considerable tributaries, the Sacondaga, Mohawk, and Wallkill, all from the west. The scenery along the Hudson is of remarkable beauty and grandeur, and with the number of places on its shores celebrated in history and literature, the river justly merits the title of the 'Rhine of America.' Like the other Atlantic rivers, it breaks transversely through the Appalachian ridges instead of following what would now be the natural course along the great longitudinal valleys. (See **APPALACHIANS**, especially under the sub-head *Drainage Development*.) Accordingly, its valley is in places very narrow, and its banks lined with high and steep hills or mountains, notable among which are the Highlands, 1500 feet in elevation, through which the river winds in a highly picturesque gorge, narrowed at one point to about 1600 feet. Farther down, near the mouth, its western shore, for about 18 miles, is formed by a great dike of trap rock, the famous Palisades (q.v.), rising perpendicularly from the water's edge to a height of 300 to 500 feet. The Catskill Mountains, west of the Hudson, about 100 miles from the sea, approach to within 8 miles of the river.

The Hudson differs from the other Atlantic rivers in the fact that, owing to the consider-

able sinking or depression of the land which has been going on in this region, its valley has been drowned and tide-water admitted nearly 100 miles beyond the gorge of the Highlands as far as Albany. Below this point the so-called river is really an estuary or fiord, its volume being far out of proportion to its drainage area, though, owing to the narrowness of its valley, it still retains the aspect of a river, except for a stretch of about 20 miles between the Highlands and the Palisades, where it expands into Haverstraw Bay and Tappan Sea, the latter over 3 miles wide. Above Albany and Troy the river is really a small stream, obstructed by falls and rapids. It is this drowning of the Hudson Valley which is one of the principal causes of the commercial supremacy of New York City, as it has made this river the only deep-water passage cutting entirely through the Appalachian system. The connection of the Atlantic with the North Central States is completed by the Erie Canal (see **CANAL**), which extends from Troy to Buffalo on Lake Erie. The Hudson Fiord, as it may be called, is a majestic waterway, from one-half to nearly one and one-half miles wide, with the exceptions noted above. It is navigated by a large number of vessels of all kinds, and elegant passenger steamers ply upon its waters. The principal places on the river are Glens Falls, Cohoes, Troy, Albany, Hudson, Catskill, Kingston, Poughkeepsie (where is the only bridge between Albany and the sea), Newburgh, West Point (seat of the United States Military Academy), Peekskill, Haverstraw, Ossining (Sing Sing), Nyack, Tarrytown, Yonkers, and at the mouth of the river, New York, Hoboken, and Jersey City. The sailing craft, however, whose numbers formerly added so much to the picturesqueness of the river, have to a great extent disappeared. The enormous traffic is further facilitated by the New York Central and Hudson River and the West Shore railroads, which run along either shore of the Hudson and the Mohawk. The navigable length of the Hudson from New York to Troy is 150 miles, and the entire length of the river is about 300 miles. It was discovered by Verrazzani in 1524, but first explored by Henry Hudson in 1609. It was called North River to distinguish it from the Delaware, or South River, but the English named it in honor of its explorer. Its Indian name was Shatemuc. The Hudson figured prominently in the Revolutionary War (see **STONY POINT**; **WEST POINT**), and it was on this river that steam navigation was first successfully introduced by Robert Fulton in 1807.

HUDSON RIVER SCHOOL OF PAINTING.

So called from the work produced by a number of American artists who found their subjects largely in the neighborhood of the Hudson River. Some of them lived on its banks, and the father of this group of painters was probably Cole (q.v.), who lived at Catskill. The Hudson certainly furnished charming subjects for the landscape painter's brush; but as it was exploited in art rather early in the art development of our country, it seemed to have been regarded by artists of the day as offering pictorial opportunities, rather than any grand and dramatic expressions of nature. This latter, however, it does at times present, but these phases have not been made much of by the 'school,' those painting along its shores prefer-

ring rather the gentle and idyllic charms where haze and sunshine and autumnal coloring have softened its landscape to an almost cloying sweetness. For this reason, a later and more robust set of painters have been disposed to use the term as one of gentle reproach, and indicating that scant justice has as yet been done this noble river. Among those who have invested this class of subject with considerable charm may be mentioned J. F. Kensett, Sanford R. Gifford, J. B. Bristol, Worthington Whitredge, J. R. Brevoort, and J. F. Cropsey. The influence of the school has not been lasting.

HUDSON RIVER SERIES. See **ORDOVICIAN SYSTEM.**

HUDSON'S BAY COMPANY. An English chartered company. It was incorporated in 1670, by Charles II., who granted to a number of 'adventurers,' with Prince Rupert at their head, the sole right to trade with the native tribes on the shores of Hudson Bay. The company had power to establish laws and impose penalties, to erect forts, maintain ships of war, and "make peace and war with any prince or people not Christian." It started with a capital of about £110,000, and for a long time it maintained its monopoly intact. The progress made was not rapid, and by the middle of the eighteenth century the company had no more than 120 people in its employ; but nevertheless three or four ships were sent out annually with a cargo of coarse English goods, which were sold to natives for furs and skins at rates which brought the proprietors a handsome profit. Conflicts soon arose with the French, who laid claim to the territory on the ground of an expedition made in 1656 by Jean Bourdon, who, according to Charlevoix, *Histoire de la Nouvelle France*, vol. i. (Paris, 1744), traveled from Quebec to Hudson Bay and took formal possession of the country inclosing James Bay. There is no doubt, however, that the Hudson basin had been visited by English navigators long before 1656. In 1682 a trading post on the coast was surprised by the French, and in 1686 four more of the company's forts were taken. During the war of 1689-97 the same forts changed hands more than once, and by the terms of the Peace of Ryswick some of them were given to the French. It was not until the Treaty of Utrecht, in 1713, that the latter finally resigned all claims to the Hudson Bay territory. From 1713 to 1763 the company enjoyed a peaceful and prosperous, but far from dazzling, career. It imported annually into England about 30,000 skins, and its dividends were 8 to 10 per cent. The conquest of New France was the turning-point in the company's history. When Canada became English, the vast territory of the Hudson's Bay Company became accessible from the south as well as from the sea. Trade increased tremendously, and in the next French war (1778-83), when its factories were surprised by a French squadron under Laprouse, the company was strong enough to bear a loss of £500,000.

So profitable a monopoly could not be long enjoyed. Not only private trappers, but rival companies, entered the field, on the principle of free and open trade guaranteed to all British subjects in the Declaration of Rights. Such a competitor was the famous Northwest Company, which, after years of strife amounting at times to actual war, was merged (1821) with its op-

ponent under the name 'Adventurers of England Trading into Hudson's Bay,' for a period of twenty-one years. The territories of the company had been gradually extended until they reached to the Arctic on the north and the Pacific on the west. In 1859 the trade monopoly was abolished, but the claims of vested interests and property rights remained unsettled until 1869, when, in return for an indemnity of £300,000, together with a land grant of 7,000,000 acres made by the Dominion Government, the company gave up all its ancient privileges, and took its place on a footing with other business corporations, retaining, however, its forts or trading stations. The company's influence with the Indians has always been very great, and it has been served by a corps of well-trained agents who still in large measure administer justice and preserve order among the native tribes. Information regarding the Hudson's Bay Company may be found in Cawston and Keane, *Early Chartered Companies* (London, 1896). Consult also: Bryce, *History of the Hudson Bay Company* (London, 1900); Willson, *The Great Company* (London, 1900); Bradley, *Fight with France for North America* (New York, 1901). An account of the Northwest Company is given in Washington Irving's *Astoria*.

HUDSON STRAIT. See **HUDSON BAY.**

HUÉ, hoo-á'. Capital of the Kingdom of Annam, situated on the left bank of the Truong River, about 10 miles above its entrance into the sea, about latitude 16° 29' N., and longitude 107° 38' E. (Map: French Indo-China, E 3). It is a walled city, fortified in the beginning of the nineteenth century by French engineers after the style of Vauban. Hué consists of two parts, the city proper and the suburbs, the former being in the middle of a square island separated from the suburbs on three sides by the river and on one side by a canal. The walls, which have a circumference of about 8000 yards, are of brick and very high, and the citadel has eight gates. The royal palace has yellow tiles on the roof; those of the nobles have red tiles. The wall inclosing the royal palaces has three gates, the centre one being in the form of a pagoda, elaborately carved and gilded; but most of the public buildings and nearly all the houses are comparatively mean and in bad repair. Population about 100,000, of whom 800 are Chinese and 350 Europeans, the latter consisting for the most part of the French Resident, his staff and military guards. The forts at the river mouth were taken by the French in 1883.

HUE, u, GEORGES ADOLPHE (1858—). A French dramatic composer. He was born at Versailles, and gave early evidence of his musical gift. When twenty-one years of age he won the Grand Prix de Rome, and two years later the Prix Cressent. During his period of study at the Paris Conservatory he was the pupil of Reber and Paladilhe. His compositions include the following operas: *Les Pantins* (1881); *La belle au bois dormant* (1894); *Vazanta*; and *Le roi de Paris*. Among his orchestral works are the symphonic legend, in three parts, *Rübezahl*, and a dramatic sacred episode, *Resurrection*. He also wrote much chamber music, and numerous pieces for individual instruments. He was one of the most successful teachers in Paris.

HUE AND CRY. A phrase, derived from the old process of pursuit with horn and voice, used in English law to describe the pursuit of felons. Whoever arrested the person pursued was so far protected that he required no warrant to justify the arrest; and even if the party turned out to be no felon, no action could be brought if the arrest was bona fide. But it was not only a ground of action, but an offense subject to fine and imprisonment, maliciously and wantonly to raise the hue and cry against a person. It was the duty of all persons to join in a hue and cry, and if a person who had been robbed, or knew of a robbery, failed to raise the hue and cry, he was liable to fine or imprisonment, or, according to some authors, to indictment. Hue and cry is now regulated in England by the Sheriffs Act, 1887 (50 and 51 Vict., c. 55). Consult: the *Commentaries of Blackstone*; Pollock and Maitland, *History of English Law* (2d ed., London and Boston, 1899).

HUEFFER, huff'ër, FRANCIS (1843-89). An English musical writer and librettist, born in Münster, Germany. He studied in England and on the Continent, and afterwards settled in London, and became musical critic of the *Times* in 1878. He furnished the libretto for the operas *Columbia* and *The Troubadour* of Mackenzie, and *The Sleeping Beauty* of Cowen. His works include an edition of the works of the troubadour Guillem de Cabestant (1868); *Richard Wagner and the Music of the Future* (1874); *The Troubadours: A History of Provençal Life and Literature in the Middle Ages* (1878); *Musical Studies* (1880), a collection of articles originally written for the *Times* and other newspapers, translated into Italian by Visetti (1883); and a translation into English of the correspondence of Wagner and Liszt. He was one of the first to advocate the cause of national English opera.

HUELEN, wá'lán (c.1540-1603). A Chilean patriot, native of Angol. In 1599 he was at the head of the forces of Araucania, mustered to repel the Spaniards, and by copying their methods and teaching his followers to ride the horses the invaders had brought to South America, was enabled to wage successful warfare against them, though no longer a young man. He was victorious at Valdivia (1599), near Concepción (1601), near Bio-Bio (1602), against the enemy with firearms and coats of mail; but his siege of Osorno failed, and he died of old wounds and new before he had succeeded in capturing the fort.

HUELVA, wá'vá. The capital of the Spanish province of the same name, situated on the deep and navigable estuary of the Odiel River, 10 miles from its mouth in the Gulf of Cadiz (Map: Spain, B 4). It is a well-developed town, with a good harbor, and is a railroad centre. Among its buildings is a fine hotel built in 1883 by an English company. There are also several notable churches, that of San Pedro having formerly been a Moorish mosque. The Roman aqueduct has been restored, and after centuries of disuse, again supplies the city with water. The industries and commerce of the city have become very important, through the exploitation on a large scale of the copper-mines of the province. The mining companies have built two large iron piers at the harbor, one of them costing \$780,000. The city has also large machine-

shops and shipyards, as well as various other industries. The United States is represented by a consular agent. Population, in 1900, 20,927.

HUENE, hu'ne, KARL, Baron von Hoiningen (1837-1900). A German politician, born in Cologne, and educated in Berlin. He entered the army, and after serving in the wars of 1864, 1866, and 1870-71, became a member of the Prussian House of Deputies (1877). In 1884 he was elected to the Reichstag, where he rose to prominence as a leader of the Centre, and author (1885) of the *Lex Huene*, rescinded in 1893, by the terms of which all taxes on cereals and cattle, save 15,000,000 marks, were divided among the various parochial governments of Prussia. In 1893 he lost his leadership of the Clericals by his compromise with the Administration on the military budget, and failed of reelection in that year, and again in 1895. But until his death he remained a member of the Prussian Council of State, to which he had been appointed in 1890.

HUEPPE, hup'pe, FERDINAND (1852—). A German bacteriologist, born at Heddesdorf, and educated in Berlin. In 1890 he was appointed professor of hygiene in the German University at Prague. He established the fact that subterranean water is free from germs, and contended that the source of infection from bacteria is the decayed organism on which the bacillus feeds. Hueppe did much to simplify disinfection and to promote inoculation with 'benign' bacteria. He first advanced the theory that the power of 'nitrifying' microbes to absorb carbonic oxide, even in the dark, is due to the oxidation accompanying the ammoniacal preparation of saltpetre. He wrote: *Die Formen der Bakterien* (1886); *Ueber die Beziehungen der Fäulnis zu den Infektionskrankheiten* (1887); *Ueber den Kampf gegen die Infektionskrankheiten* (1889); *Die Methoden der Bakterienforschung* (5th ed. 1891); *Die Choleraepidemie in Hamburg, 1892* (1893); *Ueber die Ursachen der Gärungen und Infektionskrankheiten* (1893); *Naturwissenschaftliche Einführung in die Bakteriologie* (1896); *Zur Rassen- und Socialhygiene der Griechen* (1897); and *Handbuch der Hygiene* (1899).

HUÉRCAL-OVERA, wár'kál ó-vá'rá. A town of Southeastern Spain, in the Province of Almería, situated in a broad and fertile valley surrounded by mountains, 16 miles from the Mediterranean coast (Map: Spain, D 4). It has straight and wide streets and several plazas, on one of which stands a handsome church. The town is connected by rail with Murcia, and between it and the coast are the silver and copper mines of the Sierra de Almagrera. Population, in 1900, 15,774.

HUERTA, wár'tá, VICENTE GARCÍA DE LA (1734-87). A Spanish poet and critic. He was born at Zafrá, in Estremadura, and spent the greater part of his life in Madrid, where he held the office of principal librarian of the Royal Library, and where he died. He early distinguished himself by his poetic talent. His tragedy *Raquel*, founded upon the story of the love of King Alfonso VIII. for the Jewish Rachel, was received with great enthusiasm when first produced in 1778, and is still considered a work of some merit. Huerta was a most zealous, but not always a wise or skillful, defender of the ancient Spanish national taste against the Gal-

licism which then prevailed. His shafts were directed especially against the French school of dramatists and lyric poets inaugurated as a result of Luzan's crusade. As a lyric and dramatic poet he shows great command of language and versification. His poems were published in two volumes, *Obras poéticas* (1778-79); they are accessible in the *Biblioteca de autores españoles*, vol. lxi. (Madrid, 1869). Huerta edited the *Teatro español* (17 vols., Madrid, 1784-85), a collection of the best works of the older Spanish dramatists.

HUESCA, wá'skä (Lat. *Osca*). The capital of the Spanish province of the same name, situated in a fertile plain on the River Isuela, 45 miles northeast by rail from Saragossa (Map: Spain, E 1). It is an old town, retaining its mediæval aspect, surrounded by the ruins of its double line of ancient walls. It has a celebrated Gothic cathedral dating from the fifteenth century, in which is a magnificent alabaster tablet, representing the Passion; and an old Romanesque church dating from the twelfth century. There are also several old monasteries in the neighborhood, that of Monte Aragón containing in its crypt the tomb of Alfonso I. The institute for secondary education occupies the building of the old university, founded in 1354, and removed to Saragossa in 1845. In one of the vaults of this building the famous 'Bell of Huesca' is said to have been constructed from the sixteen heads, including one as the clapper, of as many insurgent nobles, who were executed by command of King Ramiro II. Population, in 1887, 13,041; in 1900, 11,976. Under the Romans *Osca* was a place of considerable importance, having a number of Greek and Latin schools and a college founded by Sertorius, who here met his death at the hands of Perpenna in B.C. 72. The Moors strongly fortified Huesca; after being taken by Pedro I. in 1096 it became the capital of Aragón, but was superseded by Saragossa in 1118.

HUÉSCAR, wá'skár. A city in the Province of Granada, Spain, situated 75 miles northeast of the city of that name (Map: Spain, D 4). It has manufactures of flour, paper, linen, and woolen goods. Population, in 1900, 7917.

HUET, u'á', PAUL (1804-69). A French landscape painter, born in Paris. He was a pupil of the Ecole des Beaux-Arts (1820-24), and of Gros and Guérin, and was himself the founder of the new school of romantic painting (1831), which opened the way for Dupré and Rousseau. Many of his pictures are owned by the French museums—the Luxembourg possesses two of them, "Une matinée dans la forêt" (1835) and "La vallée de la Touque." His other works include: "Le Château d'Arques" (1840); "Le coup de vent;" "Vue de Naples;" "Les ruines du château de Pierrefonds;" and "Vue de Rouen" (1833). His landscapes are treated in the romantic manner, with stormy sombre skies, and intense coloring. Consult Burty, *Paul Huet* (Paris, 1869).

HUET, PIERRE DANIEL (1630-1721). A French Roman Catholic scholar. He was born at Caen, February 8, 1630, and was educated in the Jesuit School there. He was a zealous follower of Descartes and a pupil of Bochart, and accompanied the latter on his visit to Stockholm in 1652. On his return to Caen he gave

himself up entirely to study; and as a preliminary to his translation of the text of Origen, he published his *De Interpretatione* (1661), but it was only at the end of fifteen years' study that he published his edition of Origen's *Commentaria in Sacram Scripturam* (1668). In 1670 he was summoned to Paris to take part with Bossuet in the education of the dauphin. In 1679 he published his *Demonstratio Evangelica*. He had an active part, moreover, in the Delphin edition of the classics. In 1674 he was elected a member of the French Academy. In 1676 he entered into holy orders; and in 1678 was named abbot of the Cistercian abbey of Aulnay, from which place is named his work, *Aletana Questiones de Concordia Rationis et Fidei* (1690). In 1691 he published in Latin a work on *The Situation of Paradise* (Eng. trans. 1694); another in 1693 *On the Voyages of Solomon*, which were followed later by his work in classical geography, *History of the Commerce and Navigation of the Ancients*, in French (1716; Eng. trans. 1717). In 1685 he was named Bishop of Soissons, a dignity, however, on which he never entered, being transferred to the See of Avranches in 1692. Huet died in Paris January 26, 1721. His works were published in a collected form in 1712, and a volume of *Huetiana* appeared in 1722. For his life, consult Trochon (Paris, 1877), and his autobiography (trans., London, 1820).

HUFELAND, hō'fe-lánt, CHRISTOPH WILHELM (1762-1836). A German physician, born at Langensalza in Thuringia. He studied medicine at Jena and Göttingen, was professor of medicine at Jena from 1793 to 1798, was physician in ordinary at the Court of Weimar, and resided at Berlin from 1798, where he was professor of therapeutics and pathology from the foundation of the university in 1810. He had a very high reputation for learning and skill as a physician, and he was equally esteemed for his intellectual abilities, and his noble and benevolent character. His published works are numerous, chiefly on medical and physiological subjects. His *Makrobiotik*, or the *Art of Prolonging Life* (1796), was translated into almost all the languages of Europe. Among his most important works are: *Ueber die Ursachen, Erkenntnis und Heilart der Skrofelkrankheit* (1795); *Guter Rath an Mütter über die wichtigsten Punkte der physischen Erziehung der Kinder* (1799); and *Enchiridion Medicum* (1836).

HÜFFER, huff'fer, HERMANN (1830—). A German historian and jurist, born at Münster, and educated at Bonn and Berlin. He was appointed professor of jurisprudence at Bonn in 1860, and in 1884 was made Privy Councilor. From 1867 to 1870 he was a member of the North German Reichstag. Besides his main work, *Diplomatische Verhandlungen aus der französischen Revolution* (1868-79), the following may be mentioned: *Quellen zur Geschichte des Zeitalters der französischen Revolution* (part i., dealing with the years 1799-1800, 1900-91); *Rheinisch-westfälische Zustände zur Zeit der französischen Revolution* (1873); *Der Rastater Gesandtenmord* (1896); and the literary writings: *Aus dem Leben Heinrich Heines* (1878); *Zu Goethes Campaigne in Frankreich* (1883); *Annette von Droste-Hülshoff und ihre Werke* (1887-90); and *A. L. Mencken, der Grossvater des Fürsten von Bismarck* (1800).

HUG, hōōg, JOHANN LEONHARD (1765-1846). A Roman Catholic scholar. He was born at Constance, June 1, 1765, studied at Freiburg, and in 1789 entered into priest's orders. In 1791 he was appointed professor of Oriental languages and of the Old Testament at Freiburg, and in 1792 of the New Testament also. The most important fruit of his biblical researches was his *Introduction to the New Testament* (1808; 4th ed. 1847; Eng. trans., London, 1827, New York, 1830). His great eminence as a biblical scholar led to his being called on to take part in the arrangement of the newly organized studies of several German universities, as at Breslau, in 1811; at Bonn, in 1816; at Tübingen, in 1817; and again at Bonn, 1818, and 1831. He died March 11, 1846. Among his untranslated works are *De Antiquitate Codicis Vaticanae Commentatio* (1810); *Das hohe Lied* (1813); *De Pentateuchi Versione Alexandrina Commentatio* (1818); *Gutachten über das Leben Jesu, kritisch bearbeitet von D. Fr. Strauss* (1835); and several on subjects of classical criticism, especially an interesting work on the ancient mythologies (1812). Consult A. Maier, *Gedächtnissrede auf Hug* (Freiburg, 1847).

HÜGEL, hu'gel, KARL ALEXANDER ANSELM, Freiherr von (1796-1870). An Austrian soldier, traveler, and naturalist, born at Regensburg. He visited Greece, Crete, and Cyprus, examined the ruins of Palmyra and Baalbek, made numerous journeys through Syria and Palestine, and arrived at Bombay in 1832. Thereupon he traversed the greater part of the Deccan, ascended the Nil-Gherria range, undertook thorough geographical researches in Ceylon, and in 1833 shipped from Madras to Australia (then New Holland). He returned to India (Calcutta) by way of the Philippines, penetrated through Bengal to the Tibetan frontier, and reached Vienna early in 1837. He contributed papers regarding his expedition to Austrian scientific publications and to the *Journal of the Royal Geographical Society of London*, and wrote also: *Kaschmir und das Reich der Sikk* (4 vols., 1840-42); *Das Kabulbecken* (2 vols., 1850-52); and *Der Stille Ocean und die spanischen Besitzungen im ostindischen Archipel* (1860). Other scholars, among them Endlicher, Heckel, Fenzl, and Schott, also prepared the results of his scientific collections. He obtained a European reputation as a horticulturist, and founded and became president of the Austrian Horticultural Society.

HUGER, ū-jē', BENJAMIN (1805-77). An American soldier, prominent on the Confederate side in the Civil War. He was born in Charleston, S. C.; graduated at West Point in 1825; and served in topographical and ordnance duty until the Mexican War, in which he was chief of ordnance in General Scott's army. For his services he was brevetted successively major, lieutenant-colonel, and colonel. From 1848 until 1860 he commanded various arsenals. Soon after the outbreak of the Civil War he entered the Confederate service as a brigadier-general, and was soon promoted to be a major-general, in which capacity he commanded a division in the Seven Days' Battles against McClellan, but was relieved from his command for his failure to intercept the Federal army after the battle of Malvern Hill. He subsequently served in the ordnance department in the Trans-Mississippi district.

HUGER, ISAAC (1742-97). An American soldier in the Revolution, born on Limerick Plantation, S. C., of French Huguenot ancestry. He was sent to France to be educated, and on his return to America served in 1760 as a lieutenant of a volunteer militia company, in a campaign against the Cherokees. With his four brothers, he entered enthusiastically into the revolutionary movement. He served first as colonel in the South Carolina militia organization, and in January, 1779, was commissioned brigadier-general in the Continental Army. He took part in all the campaigns in the South, was especially relied upon by General Greene, to whom he was second in command in his North Carolina campaign against Cornwallis in the early months of 1781, and was wounded at the battle of Guilford Court House.

HUGGINS, Sir WILLIAM (1824-). An English astronomer, born in London. He devoted himself to the study of astronomy, and in 1856 built an observatory at his residence in Upper Tulse Hill, London, in which he mounted a telescope of eight-inch aperture, and made careful drawings of Mars, Jupiter, and Saturn. His attention was first engaged in observations on double stars, but afterwards he took up spectrum analysis. His first discovery in this line was presented to the Royal Society in a paper on the "Lines of Some of the Fixed Stars." He found also that some of the nebulae gave a spectrum of a few bright lines only, which showed that the light had emanated from heated matter in the state of gas; and, further, that one of the principal constituents of the gaseous nebulae is hydrogen. He concluded, therefore, that the nebulae are not simply clusters of stars too distant to be separately distinguished, but relics of the mass of glowing gas from which the solar system is supposed to have been formed by condensation. (See NEBULAE.) He has also examined the spectra of comets, and has found that part of the light of these objects is different from the solar light. He also proved the existence of carbon in comets. Huggins was the first to apply Doppler's principle (q.v.) to the measurement of stellar velocities toward the solar system or away from it. This important kind of observation has since been carried on by many astronomers, and promises to throw entirely new light on the constitution of the sidereal universe.

He also made innovations along other lines. He introduced photography into astronomy, which, however, was of limited use till about 1875, when the invention of the gelatin dry plate enabled the astronomer by long exposure to accumulate sufficient amount of light to obtain good pictures of celestial objects, too faint to be seen even with the most powerful telescope. Huggins also invented a spectroscopic method for studying the red prominences of the sun, and proved, through a laboratory experiment, the existence of calcium in the solar prominences and chromosphere. In all his various researches Huggins has been ably assisted by his wife. In recognition of his services to science, a number of honors were bestowed upon Huggins by various scientific bodies. He was president of the Royal Astronomical Society from 1876 to 1878, of the British Association for the Advancement of Science in 1891. He was chosen president of the Royal Society in 1900, and has at different

times received the Royal, the Copley, and the Rumford medals. Besides a number of original papers, he published, jointly with Lady Huggins, *An Atlas of Representative Stellar Spectra* (1900), which received the Actonian Prize of the Royal Institution.

HUGH, hū (?-947). King of Provence and Italy. He was the son of Lothair, Count of Arles, and after the death of Louis the Blind (923) became ruler of Provence. In 926 he was crowned King of Italy at Paris, by the subjects of Rudolph, who were in revolt. His attempts to make himself Emperor involved him in constant war. Lombardy was invaded by the Hungarians, and Berengar finally drove him into Provence, where he died.

HUGH, SAINT (c.1135-1200). Bishop of Lincoln. He was born at Avalon, near Pontcharra, Burgundy, on the border of Savoy, about 1135. His father was Lord of Avalon, but renounced the world when Hugh was eight years old and took his son with him into a monastery near Grenoble. In 1160 Hugh became a Carthusian monk at the Grand Chartreuse, and won such high repute that he was called in 1175 by Henry II. of England to put in order a monastery of the Order at Witham, Somerset. His great success led to his election as Bishop of Lincoln in 1186. Every year he spent a little time in retreat in Witham Monastery, but the rest of his time he lived the life of a busy and most efficient bishop. His moral courage made him fearless in resisting unjust demands from King or peasant, and a charity which was boundless endeared him to the people. So while he lived he was held in universal esteem, and when he died in London, November 16, 1200, he was not forgotten, and his tomb in Lincoln Cathedral became a place of pilgrimage. Consult his life in Latin edited by Dimock (London, 1864); in English by Perry (ib., 1879); Thurston (ib., 1898); Bramley (1901), in connection with memorial sermons on the 700th anniversary of his death (Lincoln, 1901); and by Charles Marson (London, 1901).

HUGH CAPET, hū kā'pēt, Fr. **HUGUES CAPET**, ug kā'pā' (939-96). King of France from 987 to 996. He was a son of Hugh the Great, Count of Paris, and Hedwig, a sister of Otho the Great of Germany. Hugh Capet succeeded his father as Count of Paris in 956, and became thereby the real ruler of the country, though the title of King still belonged to the Carolingians. When, in 987, Louis V., the last Carolingian King of France, died without heirs, Charles, Duke of Lorraine, claimed the throne by descent, but at a meeting of the nobles and prelates of the realm at Senlis it was declared that the crown was elective, and thereupon Hugh was chosen, and became the founder of the Capetian dynasty (q.v.). Charles of Lorraine was easily defeated in the contest which ensued. The rest of Hugh's life was passed in a kind of border warfare against the great feudatories whose territories surrounded the royal domain. In 988 he had his son Robert elected and crowned as his successor.

HUGHENDEN, hū'en-den (*Hitchendon*). A parish of Buckinghamshire, England, among the Chiltern Hills, north of High Wycombe (Map: England, F 5). It is noted for Hughenden Manor, long the residence of Benjamin Disraeli, Earl of Beaconsfield. Earl and Lady Beacons-

field are buried in the parish church, which contains a monument erected by Queen Victoria to the statesman's memory. Population, 1800.

HUGHES, hūz, BALL (1806-68). An American sculptor. He was born in London, studied seven years with Edward H. Bailey, and won several important prizes at the Royal Academy. He also executed a bust and a statuette of George IV. In 1829 he came to New York and made a marble statue of Alexander Hamilton for the Merchants' Exchange. It was destroyed in the fire of 1835. He also made the high relief of Bishop Hobart, now in Trinity Church, New York City. Among his later works are a bronze statue of Dr. Nathaniel Bowditch, in Mount Auburn Cemetery, near Boston, a statuette of Gen. Joseph Warren, a bust of Washington Irving, and a model for an equestrian statue of Washington.

HUGHES, DAVID EDWARD (1831-1900). An English-American inventor. He was born in London, but was early brought by his parents to the United States, where he subsequently received his education at Bardstown College, Kentucky. In 1850 he was made professor of music, and later of natural philosophy at that college. In 1855 he took out a patent for his first important invention—the printing telegraph, which bears his name. After his telegraph was adopted in the United States, he went to Europe (1857), where the instrument was successively adopted by France, Italy, England, Russia, Germany, Austria, Turkey, Holland, Belgium, Switzerland, and Spain. Among his other inventions and discoveries may be mentioned the microphone (1878) and the induction balance (1879). In recognition of the great value of his services to commerce and the arts, medals and numerous titles of honor were bestowed upon him by various scientific bodies, and by the governments of nearly all the European States. His publications comprise a number of papers on electricity and magnetism, presented to the Royal Society (of which he was a fellow), and to other societies.

HUGHES, HUGH PRICE (1847-1902). A British minister of the Wesleyan Church. He was born at Carmarthen, South Wales, and was educated at University College, London, and the theological school in Richmond, Surrey. Obligated by the laws of his Church to move every three years, he left the charge he had taken at Dover in 1869 for Brighton, and was afterwards at Oxford, and in three different London churches before he became stationary in the metropolis as superintendent of the West London Mission and editor of the *Methodist Times* (1885). He refused to accept from the mission a salary greater than \$1500, and during the last year of his life, having received a small legacy, served gratuitously. His publications include: *Social Christianity* (1889); *The Atheist Shoemaker* (1889); *The Philanthropy of God* (1890); and *Ethical Christianity* (1892). Consult *Hugh Price Hughes as We Knew Him* (London, 1902).

HUGHES, JOHN (1797-1864). An American prelate, first Archbishop of New York; born in Annalohan, County Tyrone, Ireland. Brought up in the northern or Protestant section of his native land, where Orange societies were rife, he early became imbued with the combative spirit which ever afterwards characterized him. His parents were poor, and could give him little

schooling, but he educated himself, and at the age of twenty emigrated to the United States, where he worked as a day laborer in Maryland and Pennsylvania for three years, until he gained admission to the Roman Catholic College of Mount Saint Mary, Emmittsburg, Md. There he earned distinction as a debater and also as a collector of funds for the rebuilding of the college after it was burned down. He was ordained a priest in 1826, and the same year the first of his controversial pamphlets was published, *An Answer to Nine Objections Made by an Anonymous Writer Against the Catholic Religion*. After being assistant at the Church of Saint Augustine, Philadelphia, he went to Bedford, Pa., thence returned to Philadelphia (1827), to take charge of Saint Joseph's Church, afterwards took charge of Saint Mary's, and was the founder of Saint John's Orphan Asylum (1829). From 1833 to 1835 he published in the *Catholic Herald* his replies to his Presbyterian antagonist, Dr. Breckenridge. In 1838 he was appointed coadjutor of the Bishop of New York, four years afterwards became a bishop himself, and continued his controversies upon educational, political, and religious affairs, in which his oratorical powers exerted a potent influence. One of Bishop Hughes's first undertakings was the establishment of a short-lived theological seminary at Lafargeville, Jefferson County, which was reopened at Fordham under the name of Saint John's College in 1841. In 1850 he was made an archbishop, and in 1861 was sent on a special embassy to gain the friendship of France for the North in the Civil War, extending his influence in the same cause both to Ireland and Italy. Two volumes of his writings, edited by Lawrence Kehoe, were published in 1865 after his death. Consult: Hassard, *Life of John Hughes* (New York, 1866); and Brann, *John Hughes* (New York, 1892), in the "Makers of America Series."

HUGHES, THOMAS (1823-96). An English author and politician, second son of John Hughes, of Donington Priory, Newbury, Berkshire, born at Uffington, Berks. He was educated at Rugby under the celebrated Dr. Arnold; graduated B.A. from Oriel College, Oxford, in 1845; was called to the bar at Lincoln's Inn in 1848, and became a member of the chancery bar. In 1856 he gave to the world *Tom Brown's School Days*—a picture of life at a public school, evidently written from the author's own personal experience, and recording the vivid and enduring impressions he brought with him from Rugby. It was followed, in 1858, by *The Scouring of the White Horse*; in 1861, by *Tom Brown at Oxford*, in which the mental history of his hero is continued, with sketches of college life and incidents; and in 1869, by *Alfred the Great*. Hughes pursued meanwhile the study and practice of the law; and was appointed Queen's Counsel in 1869. He gained the confidence and good-will of the working classes by endeavoring to promote a better understanding between masters and men, and by teaching the latter the value of coöperation as a means of social elevation. At the general election for Lambeth in 1865, he was placed at the head of the poll, the workmen being especially enthusiastic in securing his return. In 1868 he was returned for Frome, which he continued to represent till 1874, and always took a prominent part in debates relating to the combinations

of trades-unions, and the amendment of the law of master and servant. In 1880 he took a leading part in the socialistic settlement at Rugby, Tenn. Hughes also wrote: *Memoir of a Brother* (1873); *Vacation Rambles* (1895); and several other works.

HUGH OF LINCOLN, lin'kon. A boy who is the hero of a mediæval legend. The story is told variously in the chronicles and ballads. According to one version, twenty-four boys were playing ball. Sir Hugh of Lincoln, who kicked the ball through the window of a Jew, was enticed into the castle by the Jew's daughter, murdered, and thrown into a well, from which he addressed his mother miraculously, and thus disclosed the crime. The story, based upon the belief that the Jews murdered Christian children, is found throughout the popular literature of mediæval Europe. It received the highest artistic treatment in Chaucer's *Prioress's Tale*. Consult Child, *English and Scottish Popular Ballads*, part v. (Boston, 1838).

HUGH OF LUSIGNAN, lu'zè'nyän'. The name of several counts of La Marche, of whom the best known is Hugh X. (1208-49). During his father's life King John of England had robbed him of his bride, Isabella of Angoulême. After John's death he married Isabella, who styled herself countess-queen. He participated in the crusade against Damietta (1219). During the minority of Louis IX. he was one of the leading nobles who revolted against the regent, Blanche of Castile, but was compelled to submit. In 1241 he insulted his overlord, the brother of Saint Louis. The latter subdued him, but pardoned him.

HUGH THE GREAT (?-956). Count of Paris (called also **THE WHITE**). On the death in 923 of his father, Robert I., who had been elected King of France in opposition to Charles the Simple, he could have taken the title of King, but instead permitted it to go to his brother-in-law, Rudolph of Burgundy. He took the same course after the death, in 936, of Rudolph, who was succeeded by Louis d'Outre Mer, a young son of Charles the Simple. Meanwhile Hugh had amassed large estates, and as Louis proved anything but a docile King, Hugh was forced to seek the assistance of his brother-in-law, Otho the Great of Germany, in the war that ensued. The King was captured and released, after giving up to his conqueror the city of Laon. Louis immediately renewed the struggle, and this time was victorious. Peace was proclaimed in 950. Four years afterwards Hugh again had the opportunity to make himself King, on Louis's death (954), but he favored the election of Lothair, and in reward for his services was invested with the duchies of Aquitaine and Burgundy. It was his son, Hugh Capet, who ascended the throne thirty years later.

HUGH THE GREAT (1057-1101). Count of Vermandois, the third son of Henry I. of France. He joined the First Crusade (1096), and was taken prisoner. Rescued by Godfrey de Bouillon, he continued to fight in the Holy Land, and died there from the effects of a wound received near Nicæa. There seems to have been no reason for his being called 'The Great,' except that that was the customary sobriquet among the Capetians.

HUGLI, or **HOOGLY**, hōōg'li. The westernmost and principal deltaic channel of the Ganges, British India, formed by the junction of three offsets of the Ganges, the Bhagirathi, the Jalangi, and the Churni, known as the Nadiya rivers (Map: India, E 4). It is 125 miles long, the estuary, as far as Saugor Roads, measuring 35 miles more. It is the most available for navigation of all the channels by which the Ganges reaches the sea. In the dry season the tide is felt as high as Chandernagar, 17 miles above Calcutta. During the southwest monsoon the Hugli is subject to a bore seven feet high, often ascending at the rate of 22 miles an hour. Ships drawing 26 feet of water can ascend to the port of Calcutta. The entrance of the river is much incumbered with shoals, and dredgers are constantly employed in maintaining a clear channel.

HUGLI, or **HOOGLY**. A city and river port of Bengal, British India, capital of a district of the same name, on the right or western bank of the river Hugli, 27 miles north of Calcutta, in latitude 22° 54' N., and longitude 88° 22' E., on the Calcutta and Allahabad Railway (Map: India, E 4). The city was founded by the Portuguese in 1547. Chinsura (q.v.), which now forms a part of it, was founded by the Dutch. It contains several important educational institutions, including the Hugli College, and is also the seat of an extensive military cantonment. Population, in 1891, 33,060; in 1901, 29,383.

HUGO, hōōg'gō, GUSTAV VON (1764-1844). A German jurist, born at Lörrach, Baden, and educated at Göttingen. After acting as tutor to the Prince of Anhalt-Dessau (1786), he became professor of law at Göttingen (1788). In 1819 he was made Privy Councillor. He made important investigations of the sources of Roman law. He was, together with Savigny and Haubold, one of the founders of the historical method in jurisprudence. He edited: *Ulpiani Fragmenta* (1788); translated Gibbon's chapter on Roman law as *Ueberischt des römischen Rechts* (1789); *Pauli Sententiæ Receptæ* (1796); and *Jus Civile Ante-Justinianum* (1815). But his most important labor was his own book, *Lehrbuch eines civilistischen Kursus* (1792), and his *Civilistisches Magazin* (1814-37), with its supplement, *Beiträge zur civilistischen Bücherkenntnis der letzten vierzig Jahre* (1828-45). Consult Eysenhardt, *Zur Erinnerung an Gustav Hugo* (Berlin, 1845).

HUGO, u'gō', VICTOR MARIE (1802-85). The greatest French poet of his century, a distinguished dramatist, novelist, essayist, and politician. His first volume appeared in 1822. For nearly two-thirds of the century he was a leader in French literature, for the greater part of that time preëminently the leader. He represents the supreme reach of an individualistic and romantic movement. Besançon, his birthplace, had once been a Spanish city—a significant fact, for his work often shows Spanish influence. His father was a distinguished officer of the Republic and Empire, his mother the daughter of a sea captain of Nantes, of royalist and Catholic sympathies. With her the child lived in Paris till 1811, when General Hugo summoned his family to join him in Madrid, whence he was constrained to send them back in 1812, as King Joseph's cause was growing desperate. The impressions of this year left deep marks on many of Victor's works, notably *Bug Jargal*

(1826), *Hernani*, *Ruy Blas*, and *Torquemada*. Then, till the fall of the Empire, he was once more with his mother in Paris in the abandoned Convent of Les Feuillantines, which appears prominently in *Les Misérables*. Set at technological studies by his father, he aspired at fourteen 'to be Chateaubriand or nothing,' wrote a Miltonic *Deluge*, and planned dramas, epics, and operas. At fifteen he competed for an Academic prize, winning honorable mention and some minor literary patronage. Two years later (1819) he won three prizes at the poetic competition (*Jeux Floraux*) of Toulouse. He also wrote at this time, though he did not publish it in this form till his old age, a novel, *Bug Jargal*, a story of Haiti, of great promise and weird power. An extended revision of this was printed in 1825. In 1819 he founded a fortnightly literary journal, *Le Conservateur Littéraire*, the failure of which, with the withdrawal of his allowance from his father, reduced him to a poverty that gave materials for the Marius episodes in *Les Misérables*. His brother, Abel, generously helped him to print *Odes et poésies diverses* (1822), which paid him 700 francs, and caused King Louis XVIII. to grant him a pension of 1500 francs, increased later to 3000. On the strength of this he married (October, 1822), and thereafter enjoyed a happy domestic life. These verses, in their brilliant rhetoric and richness of rhythmic melody, had been approached in that generation only by Lamartine's *Méditations*. They show an ardent royalism, a perfunctory and sonorous religiosity, and an intense political passion, on which Napoleon was already beginning to exercise a fascination that declared itself openly in the superb *Ode on the Vendôme Column* (1827).

The next few years were occupied with an extravagantly romantic novel, *Han d'Islande* (1823), and with literary journalism. In 1826 appeared *Nouvelles odes et ballades*, whose preface was a sort of literary manifesto of Romanticism, and of the first *Cénacle* (q.v.). Versification and rhythm here begin to show an aggressive individuality, and several poems indicate that sympathetic study of the mediæval mind which is associated with French Romanticism. Hugo was recognized as the Romantic leader, and asserted and confirmed that position by *Cromwell* (1827). As early as 1826 the Odéon Theatre had offered hospitality to an English company, in which were Charles Kemble and Miss Smithson. This company played *Othello*, *Romeo and Juliet*, and *Hamlet*, all of which were enthusiastically greeted by the new French school. Indeed, Kemble and his companions did not leave the Odéon till July, 1828. *Cromwell* begins with an elaborate preface full of dramaturgic observations, more opportune than new; but they now become the rallying-point of a school who thought "the drama the only complete poetry of our time, the only poetry with a national character." This school demanded for the drama an unconventional vocabulary and a mingling of tragic and comic, to show more fully the irony of destiny, thus unconsciously following Diderot (q.v.), while attempting to follow nature. In all Hugo's dramas the lyric element tends to delay the dramatic effect. *Hernani* and *Ruy Blas* alone are still played in France.

Cromwell was followed by a drama taken from

VICTOR HUGO
FROM A PHOTOGRAPH

Scott's *Kenilworth*—*Amy Robsart* (1829), a failure—and *Marion Delorme*, which the censorship forbade the stage till 1831. In 1829 Hugo published *Les Orientales*, a collection of poems containing some of the most striking pieces of metrical art in the world. They were followed by the long-contested triumph of *Hernani* and of Romanticism on the French stage (1830), after Hugo had vainly tried to bring about the performance of *Marion Delorme*. For nearly a hundred days, from February 26th to June 5th, the battle raged nightly at the Théâtre Français, but no further organized effort was made to resist the retrograde evolution of the Romantic drama till it collapsed with Hugo's *Les Burgraves* in 1843. The situation in *Hernani* is strained and dramatically unreal, the sentiment is mawkish, the oratory grandiloquent; but a throbbing life and intensely expressed emotion maintain the interest, though this is a lyric rather than a dramatic one. The same qualities and the same defects, with more strained antithesis of grotesque and sublime, tragic and comic, foul and fair, characterize *Marion Delorme* (1830). They characterize also *Le roi s'amuse* (1832); the prose dramas, *Lucrèce Borgia* (1833); *Marie Tudor* (1833); *Angelo, tyran de Pedoue* (1835). They reach their height in *Ruy Blas* (1838), and become most conspicuous in *Les Burgraves* (1843). Hugo's conceptions were too grandiose to be reconcilable with the limitations of the drama. He gave up the effort and turned to politics. But these sixteen mainly dramatic years had produced work of great value in other fields, the novel *Notre-Dame de Paris* (1831), with its Gothic intensity of pathos and its marvelous reproduction of the Paris of Louis XI.; the Quixotic but eloquent *Claude Gueux* (1834), a plea against capital punishment; the *Feuilles d'automne* (1831); *Chants du crépuscule* (1835); *Voix intérieures* (1837); *Les rayons et les ombres* (1840); four collections of poems that show growing democratic sympathies and satiric power, a deepening communion with nature, and a generous warmth of universal sympathy, a little shallow in its breadth, that was to give the keynote to his political activity of the next decade.

The ten years from 1843 to 1853, from *Les Burgraves* to *Les châtimens*, count no literary work of import, but they mark a vital change in the mind of Hugo that affects all the work to follow. Till 1843 drama had taken the first place. From 1853 fiction becomes more prominent, poetry intermittent, with occasional political writings. Hugo sees that his power is essentially lyric, and gives this a dominant place even in prose fiction. Through all there is a new earnestness, born in part of the death of his daughter, Leopoldine, and her young husband (1843), in part of a vague yet intense enthusiasm for the socialistic ideas of Fourier and Proudhon which drew him into a political whirlpool and made him a revolutionary member of the Constituent Assembly of 1848. As a practical politician, then and always, Hugo was a failure. He favored the ambition of Louis Napoleon, till Louis ceased to favor his own advancement; he was an advocate of several hopelessly unpractical schemes, and an unconscious convert to the caressing flattery of Emile de Girardin. Napoleon's coup d'état of 1851 saved Hugo from himself. It made a martyr and hero out of a visionary who was distrusted as a turncoat. In his eloquent *Histoire*

d'un crime (finished in 1852 and published in 1877), he shows unconsciously how his efforts to organize resistance to the usurper were distrusted by his fellow Republicans. He fled to Brussels, whence he was urgently requested to move on to England, and resided first in Jersey, then in Guernsey, as near France as possible, consistently scorning every offer of amnesty till the collapse of the Second Empire brought him back to share the darkest days of the Terrible Year (1870-71).

These years of exile steeled his mind, and his genius was fired by what seemed his country's shame. In 1852 appeared the fierce and scurrilous *Napoléon le Petit*, a foretaste of the *Les châtimens* (1853) in which the satiric unites with the lyric genius to produce a classic that will survive for generations the Empire that fired Hugo to a white heat. To calmer hours we owe *Les contemplations* (1856), a collection of lyrics closing in a noble strain, and the first of four volumes of *La légende des siècles* (1859, 1877, 1883), the high-water mark of his achievement in lyrical epic. In 1862 the long-heralded *Les Misérables* appeared on the same day in ten languages—an event till then unparalleled in the annals of letters. The ten volumes of this vast romance reveal Hugo, no longer as in *Notre-Dame*, an evoker of the past, but with eyes on the present and heart in the future. It lacks continuity and proportion. It is a chaos of eloquent special pleading, political reminiscences, socialistic prophecies, bad psychology, grotesque situations, false pathos, and descriptions wonderfully vivid and absorbing. In the hurly-burly of this lyric-epic novel we find most of the virtues and all the intellectual vices of Hugo. Its value lies not in its thought, but in its emotion, its lyric cry, and its epic power of description. On the development of fiction it had no influence, for it belonged to a type already outworn. The same may be said of *Les travailleurs de la mer* (1866), in which the descriptions are superb, and the subject petty. *L'homme qui rit* (1869), an historical phantasmagoria of the English Court of Elizabeth and an unmitigated failure, closes the fiction of the exile. Meanwhile Hugo's poetic muse had had her Indian summer in *Chansons des rues et des bois* (1865). But as the Empire tottered to its fall, his inauspicious interest in politics became once more dominant. He wrote much for *Le Rappel*, a radical journal, founded by his sons and son-in-law, but revealed once more, in 1870, the hopelessly unpractical nature of his political ideas, alike as a prophet of the people and as a member of the National Assembly at Bordeaux in 1871. He resigned his seat in March and went to Brussels, where he barely escaped being mobbed, owing to his defense of the Paris Commune. He was expelled from Belgium, and soon after returned to Paris. Here he failed signally in the elections of 1872, though he was elected life Senator in 1876. But if he might not be a tribune, he was already the poet laureate of the Third Republic. Of the *Les châtimens* 100,000 copies were sold within a year, several plays, notably *Ruy Blas*, were revived with success, and he rose to the new occasion in *L'année terrible* (1872), a noble volume of patriotic verse that made a French critic exclaim, with just pride, that Germany had no such poet to sing her victory as France to glorify even her disaster.

Hugo was now past seventy, but it is too early to speak of his decline. He could pose as old, indeed, in the poems of *L'art d'être grandpère* (1877); but *Quatre-vingt-treize* (1874) is the most virile of his novels, with more intensity of action and a truer tragic catastrophe than *Notre-Dame* or *Les Misérables*, though by no means without their faults and its own. The second part of *La légende des siècles*, if inferior to the first, is still grand; there are passages of primary quality in *Les quatre vents de l'esprit* (1881), *La pitié suprême*, and even in the *Philosophic Poems* (*Le pape, Religions et religion, L'âne*, 1878-80); the drama *Torquemada* (1882) is vigorous at least by starts, and in the posthumous volumes (*La théâtre en liberté, La fin de Satan, Toute la lyre*) one comes constantly on verses that bear his unmistakable mint-stamp.

He died in Paris, May 22, 1885. His great age, reaching out into a new generation from an epoch that had passed away, and was indeed more foreign to that day than to our own, could not but impress popular imagination, the more so as his talent, his manner, and his personal physique had something of the monumental and grandiose. Thus his death stirred an unparalleled wave of popular feeling. His body lay in state beneath the Arc de Triomphe. His funeral became a pageant that royalty might envy, and could not equal. The relics of Saint Geneviève, the patron saint of Paris, were removed from the Pantheon that it might receive the popular hero.

Despite his own belief, Victor Hugo had no new or deep theories of life. He was the confidant of his century, "the sonorous echo in the middle of things." Personally he was vain, and rather ignorant, if we compare his knowledge with his pretensions. But he is Olympian in his defects—Zeus, Apollo, and Haphæstion turned into one. His convictions are not important. He thinks to proclaim an oracle and reiterates a commonplace. But he is perhaps the greatest compeller and gatherer of words, the greatest master of language that we know; a great writer, rather than a great author, and therefore the more sure of an enduring democratic fame. He has formed the rhetorical and poetic taste of three generations of French youth. All schools of French verse that have arisen in the last half-century have united to call him their father.

HUGO OF FLAVIGNY, flâ've'nyé' (1064-?). A Franco-German monk and scholar, born in Verdunois. He was educated in the Monastery of Saint Vannes, and afterwards went to Dijon, where, about 1090, he began his *Chronicle*. In 1095 he went to England, and a year afterwards became Abbot of Flavigny. He was obliged to leave his abbey in 1099, and though reinstated in 1100, was again forced to leave it by the hostility of Norgaud, Bishop of Autun, and retired to Dijon. His *Chronicle* is of value for its account of the last years of the eleventh century, and extends from the birth of Christ to 1102. The original manuscript was in the possession of the late Sir Thomas Phillipps, the antiquary, and was one of the great Meerman collection, before he bought it. It was published by P. Labbe in *Bibliotheca Manuscriptorum Nova*, and in the *Monumenta Germaniæ Historica*.

HUGO OF SAINT VICTOR (c.1097-1141). A French monk and theologian, born probably in Lorraine. He was educated in the Monastery of Hamersleben in Saxony, and became monk in the Abbey of Saint Victor, near Paris. Until the middle of the thirteenth century his works were very popular. In his treatment of most of the general questions of theology he kept to the beaten path, but his views on psychological questions were original. There has been much discussion as to the authenticity of certain writings attributed to him. In *Les œuvres de Hugues de Saint Victor* (1886) M. Hauréau gives a list of those about which there seems little doubt, and disregards many theretofore considered his. Hugo's most famous book is *De Sacramentis Christianæ Fidei*. An excellent edition of his works was published at Venice in 1588.

HUGUENOTS, hū'gè-nōts, *Fr. pron.* ug'nô' (derivation unknown, possibly corrupted through *Ignots, Iguenots*, from Ger. *Eidgenossen*, confederates; according to others, a diminutive of *Hugo, Hugues, Hugh*). The name borne by the Protestants of France from about the year 1560 till their extinction as a political party in the seventeenth century; in a more general sense, the adherents of the Reformed religion before the French Revolution. Lutheran Protestantism invaded France as early, probably, as 1520, and its principles were warmly embraced by large numbers of the learned classes and the nobility. The followers of the new religion enjoyed the special protection of Margaret of Angoulême, Queen of Navarre and sister of Francis I. The work of John Calvin (q.v.), himself a Frenchman, gave energy and cohesion to French Protestantism; but its strength always remained in the nobility and the middle classes, and it never appealed to the masses of the people as in Northern Germany.

Toward the end of his reign Francis I. opposed the Huguenots with great severity, and caused many to be burned. During the reign of Henry II. the persecution assumed a still severer character, the *Chambre Ardente* (q.v.) being erected in 1547 for the trial of heretics. Nevertheless the Protestants increased in numbers, and strengthened their organization. The first national synod on May 23, 1559, adopted a Calvinistic code of eighty articles which became the constitution of French Protestantism. The influence of the Guise family, who began to come into power in the reign of Francis I., now showed itself in bitter warfare upon the Huguenots, whose cause was supported by the powerful Bourbon family, the great rivals of the Guises. In 1560 the extremists among the Huguenots, headed by La Rénaudie, a nobleman of Périgord, conceived the plan of seizing the person of the young King, Francis II., and placing him under the guardianship of the Bourbon princes. The plot, however, known as the conspiracy of Amboise, was betrayed, the King was made secure in the castle of Amboise, and the Duke of Guise was appointed Governor-General. Numerous executions and reprisals followed, and Condé was imprisoned. The Edict of Romorantin, in May, 1560, took the prosecution of heretics out of the hands of the Parliaments and put it into those of the bishops. By the Assembly of Notables in August, it was resolved that the whole matter of religion should rest until the next assembly of the States-General. Francis II. died on December 5, 1560, and Charles IX., a boy of ten, ascended the throne. The Queen-mother, Catharine de' Medici (q.v.), being determined to take the power into her own hands, was compelled to seek Huguenot support against the Guises. In July, 1561, appeared an edict which freed dissenters from the penalty of death. For the complete termination of strife, the Court caused a religious conference to be held at Poissy in September, 1561, between the representatives of the two religious parties. The chief disputants were the Cardinal of Lorraine on the one side, and Theodore Beza (q.v.) on the other. The effect of the discussion was merely to widen the breach between the Catholics and the adherents of the new confession, but it served to unite and embolden the Huguenots, with whom the machinations of the Guises forced Catharine into closer alliance. On January 17, 1562, appeared an edict, giving noblemen the right of the free exercise of their religion on their own estates. This was followed by the recourse to arms on the part of the Guise faction.

Violence and reprisals were perpetrated on both sides. On March 1, 1562, a company of Protestants meeting in a barn at Vassy for religious exercises, was attacked, and many of them were massacred by the followers of the Duke of Guise. Condé raised the Protestant standard at Orleans, while the Guises seized the person of the King and proclaimed the Huguenots rebels. This was the beginning of the First Civil War. The Huguenots were at first successful, overran the southwestern part of the country, and were joined by 4000 soldiers from Germany. At Dreux, however, December 19, 1562, the Protestants were defeated. The Duke of Guise was assassinated before Orleans in February, 1563, and on March 19th the Queen-

mother concluded the Peace of Amboise, which granted a large measure of religious freedom to the nobles, but set aside one town only in every bailiwick as a place of worship for the Huguenots. The terms of the treaty were disadvantageous when compared with the provisions of the edict of January, 1562, and were accepted by Condé against the vehement remonstrances of Coligny (q.v.). Catharine hated the new faith, and formed a close alliance with the Spaniards for the extirpation of heresy, retraced the privileges of the Protestants, and made attempts upon the liberty and life of Condé and of Admiral Coligny. These leaders then determined to take possession of the King's person in September, 1567. The Court took refuge in Paris, which Condé invested; on November 10, 1567, an indecisive battle was fought at Saint-Denis between Condé and a much superior force under the Constable Montmorency (q.v.), and soon after Condé fell back into Lorraine, where he effected a junction with an auxiliary force of 10,000 men from Germany, and again threatened Paris; upon which Catharine determined to conclude peace, and the Second Civil War was terminated by the Treaty of Longjumeau on March 23, 1568, which confirmed the terms of the Treaty of Amboise. Catharine, however, had consented to the treaty only to gain time, and had no intention of acting up to its terms. Plots were formed against the lives of Condé and Coligny, who fled to La Rochelle, where they were joined by Jeanne d'Albret, Queen of Navarre, and her young son Henry. With reinforcements from Germany and England, the Huguenots began the Third Civil War, but at Jarnac, March 13, 1569, they were defeated by the royal troops under the nominal command of the Duke of Anjou, afterwards Henry III., and Condé was slain after he had rendered himself prisoner. These misfortunes greatly dispirited the Protestants. Jeanne d'Albret endeavored to reanimate them in an assembly at Cognac, and set up her son, then but fifteen years of age, as the head of the Protestant cause. Coligny became their military leader, and having received a further accession of troops from Germany, laid siege to Poitiers, but was again defeated by the Duke of Anjou at Moncontour, October 3d. Fresh reinforcements from England, Switzerland, and Germany enabled Coligny to take Nîmes in 1569, and to relieve La Rochelle, while La Noue obtained a victory over the royal troops at Luçon. Catharine and her son now sought for peace, to which the Protestants, weary of the hard contest, consented. The treaty, concluded at Saint-Germain-en-Laye on August 8, 1570, gave to the Protestants the free exercise of their religion everywhere except in Paris, and the possession of a number of strongholds.

Catharine, having failed to overthrow the Protestant cause in the open field, sought to accomplish her object by treachery. She entered into friendly relations with the Huguenots, partly, it is true, out of fear of the Guise family. After September, 1571, Admiral Coligny exercised great influence at Court, and was received with much show of affection by the young King and the queen-mother. The marriage of Henry of Navarre, who had just succeeded his mother in his little kingdom, to Margaret of Valois, sister of Charles IX., seemed to promise an end to the period of civil strife. Then came the mas-

sacre of Saint Bartholomew's Day, August 24, 1572, when two thousand Huguenots, among them Coligny, perished. So far from effecting its intended purpose, this detestable deed only roused the Huguenots to take up arms again. The Duke of Anjou lost his army before La Rochelle, and on June 24, 1573, concluded a peace at that place by which the Protestants obtained complete freedom in the exercise of their religion in the three towns of Montauban, Nîmes, and La Rochelle, which were exempted also from the obligation of receiving a royal garrison. Everywhere else the Huguenots were promised freedom from molestation on condition that they should not hold assemblies of more than three persons at a time. A section of the Roman Catholic nobility, at whose head was the Duke of Alençon, the youngest son of Catharine, from purely political motives, united with the Huguenots, and their cause was strengthened by the support of the Politiques (q.v.), the party of compromise and peace. The accession of Henry III., in 1574, was followed by the outbreak of the Fifth Civil War. Henry of Navarre, who, since Saint Bartholomew's Day, had remained a virtual prisoner at the French Court, succeeded in making his escape in February, 1576, and, placing himself at the head of the Huguenot forces in the south, achieved a number of successes in Guienne. This led to the conclusion of the Treaty of Beaulieu, May 6, 1576, by which the Huguenots were granted an increased number of places of security and partial representation in the Provincial Parliaments. This was regarded by the Catholics as a surrender to heretics and traitors who had not hesitated to call in foreign aid against their sovereign. The Duke of Alençon was won back to the support of the Court, and under the auspices of Henry, Duke of Guise, the Catholic League was organized for the defense of the Church, the extirpation of heresy, and the maintenance of the honor and authority of the King. Although there were certain ulterior motives which made the League dangerous to the House of Valois, Henry III. for the time put himself at the head of the movement, and at the close of 1576 assembled the States General at Blois. The severe measures enacted by this body against the Huguenots kindled the Sixth Civil War (1577), which was marked by no important engagement. Peace was concluded at Bergerac on September 17, 1577, and confirmed by the Edict of Poitiers, which guaranteed the preservation of the *status quo*. The Seventh Civil War (the *Guerre des Amoureux*) broke out in November, 1579, with little cause, and was terminated by the Peace of Fleix in November, 1580, with little result.

There was now a comparatively long interval of repose till 1584, when, by the death of the Duke of Anjou (formerly Alençon), Henry of Navarre became heir to the throne of France. Hereupon, Henry, Duke of Guise, exerted himself for the revival of the League, entered into an alliance with Spain and the Pope for the extirpation of heresy, declared the Cardinal of Bourbon heir to the throne, and began hostilities against the Huguenots. The results of twenty-five years of warfare were destroyed by the Edict of Nemours (July 7, 1585), which annulled all previous edicts of toleration. This was followed by the outbreak of the Eighth Civil War, known as the War of the Three Henrys (Henry III. of

France, Henry of Navarre, Henry of Guise). The Catholic League and the King put no less than seven armies into the field, while the Huguenots received large reinforcements from Germany. At Coutras, October 20, 1587, Henry of Navarre defeated the Catholic Army, but this was offset by the victory of Guise over the German auxiliaries at Vimory and Auneau. So contemptible had Henry III. become in the eyes of the people of Paris, that the entrance of the victorious Duke of Guise into the city on May 9, 1588, was followed by an insurrection in his favor. While the Duke was negotiating with the Queen-mother, Henry III. fled from Paris, but at Rouen in July, 1588, acceded to all the demands made by Guise, the extermination of heresy in the kingdom, the convocation of the States-General, and the appointment of Guise to the post of lieutenant-general of France. At Blois, on December 23, 1588, Henry III. caused the Duke of Guise to be murdered, and summoned to his aid Henry of Navarre. In less than a year the King himself was assassinated by Jacques Clément, and Henry of Navarre succeeded to the throne. The League, however, now under the leadership of the Duke of Mayenne, the brother of Henry of Guise, set up the Cardinal of Bourbon as a rival King, and, with the aid of Spanish troops, held its own in Paris. On July 25, 1593, Henry of Navarre formally embraced Catholicism, and in the following year gained possession of the capital. The civil wars in France were brought to an end by the Peace of Vervins between Henry and the Spanish King, May 2, 1598. On April 13th of the same year, the King, in the Edict of Nantes, guaranteed the Huguenots full liberty of conscience and the preservation of their religious and civil condition. See HENRY IV.

Though Henry IV., convinced that the French were a Catholic people and would never accept a Protestant sovereign, abjured his faith on political grounds, his reign was one of broad toleration, and his great Minister, Sully, was a Huguenot. But when, during the minority of Louis XIII., Maria de' Medici, the Queen of Henry IV., assumed the reins of government, the many privileges enjoyed by the Huguenots were found to have created a strong party that stood in the way of absolutism. The King took an oath in 1614 to maintain the Edict of Nantes, but the marriage treaties with the Spanish Court excited the apprehensions of the Huguenots to such a degree that, in November, 1615, they made common cause with the Prince of Condé, who had set up the standard of rebellion. This was contrary to the advice of the most sagacious of their own party. Although by the Treaty of Loudun, May 4, 1616, they obtained a new confirmation of their freedom of worship, the Court now only waited for an opportunity of breaking at least their political power. In June, 1617, a royal edict commanded the entire suppression at once of the Protestant Church and of political privileges, in the Province of Béarn; but the Provincial Court at Pau refused to register the edict, and the matter lay over until 1620, when, urged by his adviser that the time was opportune to strike decisively, the King carried the edict into full effect by force of arms. The Protestants throughout all France took alarm, and hostilities again broke out in May, 1621. At the head of the Protestants were the two brothers,

the Duke of Rohan and the Prince of Soubise. Their cause, however, was feebly maintained; almost all the Protestant towns fell into the hands of the King, force, stratagem, and bribery being equally employed. By the Treaty of Montpellier, October 19, 1622, the Huguenots lost a number of their strongholds and the right of assembly without permission of the King. The Court, however, paid little attention to the stipulations of the treaty, and when the Government was involved in difficulties in Italy, the Protestants took the opportunity again to rise in arms (1625). Soubise, with a fleet furnished by the town of La Rochelle, more than once defeated the weak royal navy. Cardinal Richelieu, who had assumed control of the affairs of State in 1624, was a believer in absolutism. He sought to overthrow the Huguenots as a political force, and pursued this end relentlessly. He took charge himself of the siege of La Rochelle, the Huguenot stronghold, which was taken after an heroic resistance, October 28, 1628. The fall of La Rochelle was speedily followed by that of Nîmes, Montauban, and all the other Protestant strongholds. The Peace of Alais, June 27, 1629, put an end once for all to the Huguenots as a political party. Richelieu was a great statesman and politician, and when the political power of the Huguenots was broken, he endeavored by conciliation to attach to the State these people, of whom some were the best and most useful in France. This policy was not changed under Mazarin, and Colbert during his years of power restrained Louis XIV. from persecution. After Colbert's death, the King entered upon a rigorous policy of repression, under the influence of Madame de Maintenon. Political motives, however, may have served to determine the policy of Louis XIV.; for the presence of a powerful element in the country differing in belief and to some extent in political theory from the generally accepted doctrines, must have clashed with the Grand Monarch's ideal of a nation dwelling in peaceful uniformity under the wing of a benevolent autocracy. The Huguenots were deprived of civil rights, and in the southern provinces, where Protestantism was strong, recourse was had to severer measures. To force them into the bosom of the Church, the people were handed over to the mercies of a licentious soldiery. Detachments of troops were quartered on the inhabitants, while bodies of cavalry patrolled the country, demolishing the places of worship, and in some cases putting the Huguenot preachers to death. (See DRAGONADE.) Hundreds of thousands of Protestants fled to Switzerland, the Netherlands, England, Germany, and the West Indies, as well as to South Carolina, New York, Massachusetts, and other North American Colonies. The climax of this persecution was the revocation, October 22, 1685, of the Edict of Nantes, which deprived the Huguenots of their last defense, and gave a new impulse to the emigration which took the best blood of France to strengthen her rivals. Thousands betook themselves to the mountains of the Cévennes, and continued the exercise of their religion in secret. Among these and the mountaineers of the Cévennes, a remarkable fanatical enthusiasm displayed itself, and under the name of Camisards (q.v.) they maintained for a number of years a wonderfully successful opposition to the forces of the great monarchy. The War of the Cévennes, or Camisard War, be-

gan in 1702 and was not terminated until 1705, sporadic outbursts continuing until 1709 or 1710. The suppression of the local rebellion was attended with circumstances of great cruelty. France, after the Edict of Nantes, lost more than 50,000 of her population, among them many of wealth and position, besides a number of the middle classes engaged in mechanical pursuits, the total emigration being variously estimated from two hundred thousand to a million; while, notwithstanding the many persecutions, about one million remained.

The partial repose which the Protestants enjoyed for more than ten years was attended by a revival of their worship, especially in Provence and Dauphiné. In 1724, therefore, Louis XV., at the instigation of the Jesuits, issued a severe edict against them. The spirit of the age, however, now began to be opposed to persecution. An edict in 1752 declared marriages and baptisms by Huguenot ministers to be null, and required the repetition of them by the Roman Catholic clergy. But when, upon this, many began again to flee from their country, the disgust of the Roman Catholics themselves was so much excited that the Court recalled the edict. Montesquieu and Voltaire successfully advocated the cause of toleration.

FRENCH PROTESTANTISM IN THE NINETEENTH CENTURY. The first movement toward toleration of Protestantism after the revocation of the Edict of Nantes was the edict of Louis XVI., in 1787, legalizing Protestant marriages. By the concordat concluded between Napoleon and Pope Pius VII., in 1801, Protestantism (Calvinist and Lutheran) and Judaism became, with Catholicism, established religions, with equal protection and a proportional measure of State support, but subject at the same time to the strictest Government control. By the concordat religion became a part of government, and religious liberty was lost. No Church was permitted to make converts from any other, though this law soon became a dead letter with regard to the Roman Catholic Church. The Protestant General Synod was put down; particular synods could be convened only by Government; undue ecclesiastical power was given to consistories (elected presbyterial committees), tending to the disintegration of the Church and opening the way for later divisions. The parishes were few in number, most of them very extensive, and more than half of them (100 out of 171) without pastors. Under these circumstances religion became a mere form, or simply the expression of a political idea. The confirmation of the young, irrespective of religious experience, was a measure of self-preservation. Brilliant exponents of Protestantism at this time were Madame de Staël and Benjamin Constant.

A revival of French Protestantism from its depleted condition after the Revolutionary period and the subsequent political turmoil, during which it suffered greatly, took place under the Scottish Haldanes (see HALDANE, JAMES, ALEXANDER, and ROBERT) and the English Methodist Cook (see COOK, CHARLES) in the early twenties. To the revival the formation of the Bible Society in 1819 contributed. During this period Samuel Vincent introduced German Protestant theology into France, and created a liberal movement against the narrow orthodoxy of the revival. Aggressive working being forbidden by law, there

was much suffering for conscience' sake. In 1826 the Catholic Prince de Salm was exiled for having embraced Protestantism. Debarred thus from normal activity, the awakened Church turned to benevolent work, and the second third of the century saw the rise of a great number of strong benevolent and religious societies. The Evangelical Society was founded in 1833, the Central Society in 1847, for the building of churches. Orphanages, refuges for the blind, the deaf, for neglected, criminal, and crippled children sprang up in great profusion. Educational interests took a prominent place. In 1829 the Society for the Encouragement of Primary Instruction among Protestants was founded. In 1833 the Protestant Guizot secured the passage of the common-school law. In 1840 there were 677 Protestant schools, from primary to normal. There are two theological faculties—at Montauban, and, since Strassburg was lost, in Paris.

From this period dates also the foreign-mission work of the Protestant Church, a history of almost unparalleled zeal and self-sacrifice. The Society of Evangelical Missions was founded in 1822; the first missionaries went to South Africa in 1829. The mission-fields are now seven in number, in Africa, the Society Islands, and Madagascar. In 1901 the expenditures of the society were over 2,000,000 francs.

Protestant journalism also dates from the revival. *Le Semeur*, founded in 1831, enjoyed the collaboration of Vinet. *Le Lien* was founded in 1840 by the elder Athanase Coquerel (q.v.), to counteract the growing tendency to disintegration—a vain effort, as it proved. The narrow if profound evangelicalism of the revival produced a reaction, fostered by the liberal teachings of the theological school at Strassburg, which ended in the scission of 1842 between the orthodox and liberal wings of the Reformed Church, still held together by their relation to the State. The question of the relations between the Church and the State became a capital one; Vinet wrote a book advocating separation, and would have headed such a movement but for the powerful opposition of Guizot. The learned of that day strongly advocated it; in 1847 Lamartine declared that separation would not be too dearly purchased by a revolution. The next year (1848) the Count de Gasparin (see GASPARIN, AGENOR ETIENNE) and Frédéric Monod headed the Free Church movement. In 1849 the Union of Free Evangelical Churches of France was formed, based quite as much upon individual religious experience, in opposition to the formalism of the Reformed Church, as upon the separation of Church and State. This movement, never numerically important, barely reaching the number of fifty churches in all France, has yet been notable for the ability of its leaders—Pressensé, Bersier, Hollard, the Monods—and for its support to the orthodox, as against the liberal, wing of the Reformed Church.

The year 1852 saw a new impulse in the Church. The Sunday-School Union and the French Protestant Historical Society date from this year, and celebrated their jubilees in the summer of 1902. From this year dates also the movement toward the restoration of the synodal organization of the Reformation days, which appears now (1903) to have almost reached fruition. In 1859 the celebration of the tercentenary of the first synod of the Reformed

Churches showed the deep attachment of the people to the traditions of the past.

During all this time the liberal ferment was working in the Church, a spirit not so much of *unorthodoxy* as of *freedom*. The attempt of the elder Coquerel to draw the two wings together proved sadly abortive when, in 1864, after a conflict of several years, the younger Athanase Coquerel was tried for heresy, under the leadership of Guizot, for having hailed Renan's *Life of Jesus* as a sign of revived interest in religious studies, while combating his views as to the person of Christ. Coquerel defended himself nobly, but was condemned, by 12 voices to 3, in the Consistory of Paris, and in spite of the protest of 8000 church members of that city he was deposed from the ministry, the State not interfering, as he was suffragant, not titular, pastor. He continued to preach, however, being supported by the Protestant Liberal Union (founded in 1860). Guizot's victory in this case nearly cost him his seat in the consistory. At the next election he was returned only by a majority of 8 in a vote of 2600.

In the Franco-Prussian War many Protestant pastors rendered distinguished service. At its close the Reformed Church took up the question of reorganization, the Lutheran that of the inroads caused by the loss of Alsace, which robbed it of 38 consistories and 191 parishes, while the Reformed Churches had lost 5 consistories and 26 parishes.

The twenty-ninth General Synod of the Reformed Churches had been held in 1659. Six synods held in 'the Desert' during the century of persecution had not been of national extent. The thirtieth synod was convoked by President Thiers in 1872, at the instance of Guizot. The synod memorialized President Thiers in favor of disestablishment, but in vain. A strong but vain effort was made to bring together the two wings of the Church. Since that time, no official synod of the whole Church being possible, the orthodox wing has met triennially in 'official' synod, the liberal wing in fraternal assembly, both bodies electing representatives to the Permanent Committee, which alone is recognized by Government.

Of late years, in view of the anti-Protestant movement of the ultramontane party in the Catholic Church, and of the rapid spread of atheistic socialism, both wings of the Church have recognized the importance of union, and have earnestly sought a common doctrinal basis. Failing in this effort, in 1899 delegates from both bodies met in Lyons and formed a practical union for work in the League for the Moral and Social Improvement of the Country. This league was immediately joined by the Free and Lutheran churches, and by the Methodist and Baptist missionary churches. At the officious synod at Anduze, in May, 1902, the serious effort to find a basis of doctrinal agreement again failed, but was prophetic of union in the near future. At this synod the unanimous adoption of a resolution asking for disestablishment placed the Reformed Church in line with the advocates of Church disestablishment in France.

The establishment of the Third Republic had been the signal for a forward evangelistic movement, to which the founding of the *Mission Populaire Evangélique* in 1871 by the Rev. Robert McAll, of England, contributed much. (See Mc-

ALL MISSION.) The law of 1878, giving full religious liberty, opened the door to an active home-mission work, already initiated in 1872 by the Interior Mission. Social questions have largely occupied the attention of Protestants. E. de Pressensé, pastor, historian, Senator, led the movement for the purification of the press, a movement which in 1902 took on new life under the energetic action of Pastor Wilfred Monod, of Rouen. Charles Robert introduced and advocated profit-sharing. Jules Siegfried headed the movement for improved workingmen's dwellings; Gide and Boyer that for business coöperation; Léon Say that for Sunday rest; Richard Waddington that for labor unions. Dr. Legrain has been prominent in the temperance movement; Pastor Robin in that for prison reform and 'assistance by work'; Pastor Arbourg in that for benefit associations; Pastor Fallot in that for public morality. Protestant pastors have a league for the study of social questions. A large proportion of the younger pastors, led by Elie Gounelle, of Roubaix, and Wilfred Monod, with many of the younger laymen, are actively promoting the movement for social Christianity, which seems better adapted than any other movement to make a stand against the rapidly growing anti-religious socialism. Among the activities of these Social Christians is the founding of 'solidarities'—social settlements distinguished not only by their evangelistic character, but by the prominence given to 'mutuality,' to works of economic betterment, and 'get-together' methods of bringing class into normal relations with class.

The latest figures for French Protestantism (census of 1893) put the number at 700,000, a gain of 176,000 over the census of 1806. Of these about 560,000 are in the Reformed (Calvinistic) Church, 80,000 in the Lutheran, 70,000 in the Free churches, and 4000 each in the Methodist and Baptist churches. The number of pastors in the Reformed Church has increased from 72 to about 1200.

The great service of Protestantism to France has been in maintaining the inviolable principle of religious liberty. Though a very small minority, it has always been resolute in defending its rights. By its loyalty to the cause of education it has been able to serve the country in public office to a degree far beyond its numerical proportion. In education, law, finance, reform, Protestants have been prominent, and many great public works—the founding of savings banks, the abolition of the slave trade, the revival of various industries—are due to Protestant initiative.

BIBLIOGRAPHY. The standard history in English is the series of volumes by H. M. Baird, which are an admirable product of American scholarship: *History of the Rise of the Huguenots of France* (New York, 1879); *The Huguenots and Henry of Navarre* (ib., 1886); *The Huguenots and the Revocation of the Edict of Nantes* (ib., 1895). Consult, also: C. W. Baird, *History of the Huguenot Emigration to America* (New York, 1885); Smiles, *The Huguenots in England* (American ed., with an appendix relating to the Huguenots in America, New York, 1868); Willert, *Henry of Navarre and the Huguenots in France* (ib., 1893), a convenient little volume, popular in treatment; Blackburn, *Admiral Coligny and the Rise of the Huguenots* (Philadelphia, 1869); Puaux, *Histoire de la réformation française* (Paris, 1859-

64); Meaux, *Les luttes religieuses en France au XVIème siècle* (Paris, 1876); Kervyn de Lettenhove, *Les Huguenots et les Gueux, 1560-85* (Bruges, 1883-85); Durand, *Histoire du Protestantisme française pendant la Révolution et l'Empire* (Paris, 1902); Félice, *Les Protestants d'autrefois; Vie intérieure des églises, mœurs et usages* (4 vols., Paris, 1897-1902).

HUGUENOTS, u'g'-nó', LES. An opera in five acts by Meyerbeer, with words by Scribe, first produced in Paris in 1836. It is the first of the historical, as distinguished from the purely romantic operas. The plot deals with the persecutions of the French Huguenots in the seventeenth century.

HUGUENOT SOCIETY OF AMERICA, THE. An hereditary patriotic society, organized in New York City on April 12, 1883, and incorporated on June 12, 1885. Its objects are to perpetuate the memory and to foster and promote the principles and virtues of the Huguenots; to publicly commemorate at stated times the principal events in the history of the Huguenots; and to collect and preserve all existing documents, monuments, etc., relating to the genealogy or history of the Huguenots of America. Membership is extended to descendants of Huguenot families which emigrated to America or to other countries prior to the promulgation of the Edict of Toleration, November 28, 1787, as well as to writers who have made the history of the Huguenots a special subject of study. The insignia of the society consists of a badge, pendant from a gold dove with spreading wings surmounted by a rising sun, and worn on a watered-silk ribbon of white, bordered with red, white, and blue. The badge itself is of gold, surrounded by a wavy, ornamental border, and bearing on the obverse the device of Marguerite de Valois, a marigold turning toward the sun, and a ribbon with the motto, "Non Inferiora Secutus," while on the reverse is the name of the society, as well as the name of the member and number of the insignia. This society has its headquarters in New York City, where a valuable library, consisting of Huguenot books, manuscripts, etc., has been collected. There are branch societies in several States and cities, notably in Virginia, Pennsylvania, South Carolina, and New Jersey. Its publications are known as *Collections of the Huguenot Society of America*. In 1898 it celebrated the tercentenary anniversary of the promulgation of the Edict of Nantes, at which delegates from societies abroad were present, and a memorial volume containing a full account of the exercises was published in 1900.

HUGUENOT SOCIETY OF LONDON, THE. An organization established in 1885, by descendants of the Huguenot refugees. Its objects are the collection and publishing of knowledge relating to the history of the Huguenots. The society consists of an unlimited number of fellows and twenty honorary fellows, and meets four times a year, with a summer conference at some place of historic interest. The society issues annual volumes of "Proceedings," and has also published fifteen volumes of church registers, lists of aliens, and letters and dispatches.

HUGUES, ug, DOMINIQUE JEAN BAPTISTE (1849—). A French sculptor, born at Marseilles. He studied under Dumont and Bonnassieux at the Ecole des Beaux-Arts, and made his first suc-

cess with a bas-relief of Homer, in 1875. His works have frequently appeared in the Salon, such as "Le baptême du Christ" (1878); "Œdipe à Colone" (1882); and "Jeune Romaine" (1889); and he contributed "L'Asie" (1886) to the decoration of the Paris Hôtel de Ville.

HUHNE, hu'ne, BERNHARD (1547-1611). A German navigator in the service of Spain. He was born in Heidelberg, and by 1599 was head pilot of the Spanish colonies of North America, whence he embarked on the Pacific with Juan Fernandez (1600), to discover an outlet into Bering Sea, as California was then considered an island. The first voyage resulted merely in strife with the aborigines, but the following year Hühne set out alone, and though he did not find the mythical wealthy city of Anlan, which Philip III. had bidden him seek, he explored the Gulf of California, and made charts of it most useful to later navigators.

HUIA (hōō'yá) BIRD (Maori name). A remarkable bird of New Zealand (*Heterolocha Gouldi*), now considered one of the starling family, and approaching extinction, because it is

HEADS OF HUIA.
a, female; b, male.

confined to the limited forests of certain mountain ranges, and is constantly pursued as a cage-bird or as a curiosity, and also by the natives, who regard its tail-feathers as a proper badge of mourning. It is about the size of an American thrush, and both sexes are glossy green-black, excepting a white terminal band upon the tail and the large rounded wattles at the gape, which are orange-red. Their ivory-white bills, however, differ to a degree unknown elsewhere among birds. That of the female is long, slender, curved, and hoopoe-like; that of the male only half as long and much straighter and shorter. Sir William Buller has described the species very fully (*Birds of New Zealand*, London, 2d ed. 1888). He says its favorite food is the grub of a large, timber-boring beetle. The male bird, with his short, stout bill attacks the more decayed portions of the wood and chisels out his prey, while the female, with her long, slender bill, probes the holes in the sounder part, the hardness of which resists the male's weapon; and elsewhere she obtains for him grubs beyond his reach. It is not surprising to learn, in view of this coöperative work, that the pairs are devoted companions, and when one has been captured the other is easily taken. These birds nest in hollow trees.

HUICHOL, wê-chôl' (a corruption of the native name, signifying prophet, doctor). A wild tribe of the remote Nahuatlan stock, occupy-

ing six villages in the rough mountain region of northwestern Jalisco, Mexico. Despite former missionary efforts and long continued contact with Spanish civilization, they are said to be living in the same state of barbarism as when Cortez first put foot on the Mexican soil. Their culture is that of the well-known Pueblo type, displaying a number of ceremonial rites, especially in connection with the Peyote (q.v.), which they call Hikuli. They number 4000. Consult Lumholtz, *Symbolism of the Huichol Indians* (New York).

HUI-SHEN, hwê'shên'. A Buddhist monk and traveler, of the fifth century. See HWEI-SANG.

HUISMAN, hois'mán, ROELOF. See AGRICOLA, RODOLPHUS.

HUITFELDT, hut'fêlt, ARILD (1546-1609). A Danish historian and statesman. After studying in Germany and France he entered the diplomatic service, and finally became Chancellor of the Kingdom. He published a long series of volumes on the history of the Kings of Denmark to the death of Christian III. These were afterwards issued under the title, *Denmarks Riges Kronike* (1650-52). The work is slovenly in style and uncritical in its judgments, but preserves many valuable documents.

HULAKU KHAN, hōō-lá'kōō kán. See MONGOL DYNASTIES.

HUL'DA. In the mythology of Northern Germany, a spiritual being corresponding to the Berchta of Southern Germany and Switzerland, and the Frigga of Scandinavian mythology. As goddess of death, she goes at the head of the troops of ghosts. To her the souls of dying children betake themselves. She flies through the air with her attendants, bringing fortune to the good and misfortune to the evil. She sometimes has witches among her followers. See BERCHTA; FREYJA AND FRIGGA.

HULEH. See MEROM.

HULL. The capital of Ottawa County, Quebec, Can., on the Ottawa River, opposite the city of Ottawa, with which it is connected by a suspension bridge (Map: Ontario, H 2). Lumber industries and large pulp and paper mills occupy the inhabitants, who are mostly French Canadians. Iron is mined in the neighborhood. The town was almost totally destroyed by fire in 1900, which also wrought considerable destruction in Ottawa, 3000 buildings in all being burned. It has been rebuilt. Population in 1891, 11,264; in 1901, 13,988.

HULL, also known as KINGSTON-UPON-HULL. A seaport, Parliamentary and municipal borough, and civic county in the East Riding of Yorkshire, England, at the confluence of the Hull with the estuary of the Humber, 20 miles from the North Sea, and 41½ miles east-southeast of York by rail (Map: England, F 3). The town stands on a level plain amid uninteresting surroundings. The modern portion has spacious, regular, and well-paved streets, while the old quarter, which serves as the business section, has narrow crooked lanes, and is very crowded, forming an irregular peninsula. Among noteworthy public buildings are Trinity Church, founded 1412, a decorated and perpendicular building, one of the finest parish churches in England; the town hall, the new exchange, corn exchange, and

market hall; there are statues of William III., erected 1734, and of Bishop Wilberforce, who was born at Hull. The chief educational establishments are the grammar school, founded in 1486; the Trinity House nautical school, 1716; Cogan's charity school for girls, 1763; the Hull and East Riding College, the Royal Institution, the literary and philosophical institute, mechanics' institute, technical school, and school of art. There are numerous charitable endowments. The municipality possesses property worth \$5,000,000, which exceeds the ratable value of the town. It owns the markets, tramways, electric lighting, a profitable water-supply from springs, and maintains parks, free libraries, public baths and wash-houses, fire brigade, crematorium, sanitarium, cemeteries, refuse destructor, and disinfecter.

Hull is the third port of importance in the kingdom, and has an extensive coasting, fishing, and foreign trade. It has regular communication with Germany, Russia, Holland, Belgium, Scandinavia, Denmark, the United States, India, and Australia, and is the seat of a United States consul. It exports the woolen and cotton goods of the midland counties, coal, oil, machinery, and mill work, and imports cattle, grain, timber, wool, flax, hemp, tallow, pitch, etc. It has capacious docks covering 200 acres; its shipping comprises 235 sailing and 632 steam vessels, with a total of over 228,400 tons, and a fishing fleet of 500 boats. An average of 6000 vessels enter, and clear a gross tonnage of 6,160,000 annually. The average annual value of its exports during the five years ending in 1900 was \$100,000,000, and of its imports, \$150,000,000. Oil-mills, iron ship-building yards, engineering-works, foundries, rope and sail making, tanneries, breweries, chemical and color works, and the many industries of a large seaport, afford employment to thousands of workmen.

The town is governed by a mayor, 14 aldermen, 42 councilmen, a recorder, and a sheriff. It sends three members to Parliament. Originally consisting of Myton and Wyke, two villages, as Myton-Wyke, it developed into an important port shortly after the Conquest. In 1298, struck with its advantages as a port, Edward I. purchased it, renamed it Kingston-upon-Hull, and gave it the charter of a free borough. Its fisheries and trade prospered under the enterprise of its merchant princes, the De la Poles, and in 1339 it supplied Edward III. with 16 ships and 466 seamen for his armament against France. In 1588 it furnished Elizabeth with £600 and 800 men against the Spanish Armada. It adhered to the Parliamentary cause during the Civil Wars, and the Governor, refusing to admit King Charles, precipitated hostilities; it successfully resisted two long sieges by the Royalists. In 1534 it was made the seat of a suffragan bishop, and again in 1891. After the fifteenth century its commercial importance increased with its imports of fish from Iceland; it was one of the first ports to engage in, and until late in the nineteenth century was the headquarters of the whale fishery. Population, in 1801, 29,500; in 1851, 84,700; in 1891, 200,500; in 1901, 240,600. The annual death-rate averages 19.6 per 1000. Consult: Symons, *Hullinia, or Selections from Local History* (Hull, 1872); Sheahan, *History of Hull* (Beverley, 1864); Freeman, *English Towns* (London, 1883).

HULL, CHARLES HENRY (1864—). An American scholar, born at Ithaca, N. Y. He graduated at Cornell University in 1886, and then studied at the universities of Göttingen, Halle, and Berlin. He was appointed assistant professor of political economy at Cornell, and in 1901 professor of American history. He edited *The Economic Writings of Sir William Petty*, which were brought out by the University Press at Cambridge, England.

HULL, ISAAC (1773-1843). An American naval officer. He was born at Derby, Conn., became a cabin boy on a merchant vessel at the age of fourteen, soon showed great aptitude for the handling of a ship, and before he was twenty-one was placed in command of a merchantman. In 1798 he entered the United States Navy as lieutenant, serving for several years on the *Constitution*, and becoming first lieutenant in 1801; and, after distinguishing himself against the French at Port Plate, Haiti, participated, as commander of the *Argus*, in the war with Tripoli. He became captain in 1806, and at the opening of the War of 1812 was in command of the *Constitution*. While on his way from Annapolis to New York in July, 1812, he escaped by masterly seamanship from a British squadron of five strong men-of-war, which pursued him for three days. On August 19th he fought his celebrated engagement with the *Guerrière*, a slightly weaker British frigate, which after a brief conflict was forced to surrender. (See CONSTITUTION, THE.) In this battle his seamanship is pronounced by naval critics to have been almost perfect. The victory was the first obtained by the Americans over the British in this war, and aroused the greatest enthusiasm throughout the United States. Subsequently he was a member of the Naval Board, was at the head of the Boston and New York navy yards, and as commodore, was in command for a time of squadrons in the Pacific and the Mediterranean. He is regarded by naval critics as the ablest single-ship commander on either side during the War of 1812.

HULL, WILLIAM (1753-1825). An American soldier. He was born in Derby, Conn., graduated at Yale in 1772, studied law at Litchfield, Conn., and was admitted to the bar in 1775. In July, 1775, soon after the outbreak of the Revolutionary War, he entered the American Army as a captain, and served thereafter until the close of the war, taking part in the battles of Trenton, Princeton, Saratoga, and Monmouth, leading a column in the assault on Stony Point, and rising (August, 1779) to the rank of lieutenant-colonel. After the war he removed to Newton, Mass., became major-general of Massachusetts militia, and was elected to the State Senate. In 1805 he was appointed, by President Jefferson, to the Governorship of the Territory of Michigan, which position he held until 1812, when he was raised to the rank of brigadier-general and placed in command of the Northwestern Army. He joined his troops at Dayton on May 25th, and led them through the wilderness to Detroit, where he arrived on July 5th, having heard three days before of the declaration of war against England. On the 12th he took the offensive and crossed over to Sandwich, Canada, but wasted time in issuing futile proclamations, and, soon becoming alarmed, recrossed to Detroit. On August 16, 1812, intimidated by the aggressive movements of the British

General Brock, he surrendered without making any real attempt at resistance. A general outcry was raised against Hull, and finally, on March 26, 1814, a court-martial, assembled at Albany, N. Y., sentenced him to be shot. This sentence was approved by President Madison, who, however, remitted the punishment. There has since been much controversy over Hull's case, but it is now pretty generally agreed by historians that though he surrendered with unsoldierly alacrity, and might possibly have preserved Detroit and his army altogether, the blame for his surrender must rest fully as much with the Administration as with himself. Consult: Hull, *Defense of Brigadier-General Hull, with an Address to the People of the United States* (Boston, 1814); Forbes, *Report of the Trial of Brigadier-General Hull* (New York, 1814); and the somewhat biased *Revolutionary Services and Civil Life of Gen. William Hull, Together with the History of the Campaign of 1812*, by James Freeman Clarke (New York, 1848), by Maria Campbell, Hull's daughter.

HULLAH, JOHN PYKE (1812-84). An English musical composer, teacher, conductor, and lecturer. He studied the organ and piano under W. Horsley, and singing under Crivelli at the Royal Academy of Music. He was one of the most important factors in modern English musical life, and accomplished more for the cause of music among the masses than any other English musician of the century. In 1840, while pursuing his studies in Paris, he was much impressed with the French system of tuition, and upon his return to London in 1841 prevailed upon the national education committee to permit him to use a modification of it in his singing school for schoolmasters, which he inaugurated at Exeter Hall. His ideas and reforms met with determined opposition from the very beginning, but notwithstanding it is recorded that in the twenty years from 1840 to 1860 over 25,000 people availed themselves of the advantage of his classes. In 1847 his pupils and friends built and presented to him a building known as Saint Martin's Hall, in which his pupils could give their public performances. He held appointments as professor of singing at Kings, Queens, and Bedford colleges, and succeeded Horsley, in 1858, as organist of Charter House. From 1870 to 1873 he led the Royal Academy concerts, and for several years conducted the annual concert of the metropolitan school-children, held at the Crystal Palace. In 1872 he was appointed Government inspector of training schools. Besides three operas, which have but a local significance, he was the composer of many successful and widely known part-songs, motets, anthems, and songs. His published writings cover every phase of musical art and aesthetics, and include: *A Grammar of Vocal Music* (1843); *A Grammar of Musical Harmony* (1852); *A Grammar of Counterpoint* (1864); *The History of Modern Music* (1862); *The Third or Transition Period of Musical History* (1865); *The Cultivation of the Speaking Voice* (1870); *Music in the House* (1877). He received the degree of LL.D. from Edinburgh University; was elected member of the Cecilia Society of Rome, and member of the Academy of Music in Florence. He died in London.

HULL HOUSE. A social settlement, situated at 335 South Halsted Street, Chicago. It has been a leader in the social settlement move-

ment in the United States. The old residence of Charles J. Hull, used as a junk-shop and tenement-house in the midst of a foreign and poverty-stricken population, was repaired, beautified, and opened as a settlement in 1889 by Miss Jane Addams (q.v.) and Miss Ellen Starr. All the usual features of a settlement are maintained; new buildings have been added, including a coffee-house, a children's building, and a gymnasium. The distinctive features are its attractive buildings, its close connection with the life of the Nineteenth Ward and with social work in Chicago, its large constituency, and the broad interests of its residents, who have held State or city offices such as factory inspectors or street inspectors, or who have been students conducting special investigations. See SOCIAL SETTLEMENTS.

HULLIN, u'lân', PIERRE AUGUSTIN, Count (1758-1841). A French general of the First Empire, born in Paris. He was one of the leaders in the attack on the Bastille, and tried to rescue Delaunay. He took part in all the great days of the early Revolution; but was too moderate for some of his fellows, and was imprisoned during the Terror. On his release he entered the Italian Army, and in 1796 became Bonaparte's adjutant-general. He was appointed president of the military court which sentenced the Duke d'Enghien (1804), and he wrote, in the attempt to shift the blame on Talleyrand, *Explications offertes aux hommes impartiaux*, etc. (1823). He was made count in 1809, commanded a division under Napoleon, was one of his most trusted servants, and in 1812 was Governor of Paris. When the Emperor was sent to Elba, Hullin tried to ingratiate himself with the new régime, but failed. In 1815, during the Hundred Days, he was again Governor of Paris, but afterwards was banished to Brussels and lived for a time at Hamburg. He was pardoned in 1819, and returned to France.

HÜLLMANN, hul'mân, KARL DIETRICH (1765-1846). A German historian, born at Erdborn, and educated at Halle. He became in 1797 professor of history at Frankfort-an-der-Oder, and in 1808 at Königsberg. Ten years afterwards he was made the first rector of Bonn, and began his important service to that university. His principal works are: *Deutsche Finanzgeschichte des Mittelalters* (1805); *Geschichte des Ursprungs der Regalien in Deutschland* (1806); *Geschichte des Ursprungs der Stände in Deutschland* (2d ed. 1830); *Geschichte des byzantinischen Handels* (1808); *Staatsrecht des Altertums* (1820); *Das Städtewesen des Mittelalters* (1825-29), his most valuable work; *Römische Grundverfassung* (1832); *Staatsverfassung der Israeliten* (1834); *Handelsgeschichte der Griechen* (1839); *Griechische Denkwürdigkeiten* (1840); and *Geschichte des Ursprungs der deutschen Fürstenwürde* (1842).

HUL/SEAN LECTURES. A course of lectures given annually at Cambridge, founded by the Rev. John Hulse, of Elworth, in the County of Chester. He was educated at Saint John's College, Cambridge, and at his death, December 14, 1790, bequeathed the bulk of his property to his university. His will provided for the founding of two divinity scholarships in Saint John's College, the Hulsean prize, the office of Christian advocate, and that of Hulsean lecturer or Christian preacher. By a statute confirmed by the Queen in council in 1860, the office of Christian

advocate was changed into the Hulsean professorship of divinity. The office of Hulsean lecturer, or preacher, is an annual one; and the duty of the lecturer is to preach not fewer than four, nor more than six sermons before the university in the course of the year. The list of Hulsean lectures, from their beginning in 1820 down to 1893, is given in Hurst, *Literature of Theology*, pp. 32-34. To which add 1894-95: A. Barry, *The Ecclesiastical Expansion of England* (1895); 1896-97, S. Cheetham, *The Mysteries, Pagan and Christian* (1897); 1898-99, J. M. Wilson, *The Gospel of the Atonement* (1899); 1900-01, F. H. Chase, *Credibility of the Book of the Acts of the Apostles* (1902).

HULTSCH, FRIEDRICH (1833—). A German philologist, born in Dresden. He was educated at Leipzig, where he taught in the Nikolaischule, and after several years at Zwickau became professor in the Kreuzschule of Dresden, of which he was rector from 1868 to his retirement, in 1889. Hultsch's especial study was ancient mathematics. He edited the *Scriptores Metrologici* (1864-66); *Heronis Geometrica et Stereometrica* (1864); *Polybii Historie* (1867-72); *Pappus* (1876-78); for a large part of the text an editio princeps), and *Autolycei de Sphæra quæ Movetur Liber* (1885); and wrote the very valuable *Griechische und römische Metrologie* (1862, 2d ed. 1882); *Die Elemente der ägyptischen Teilungsrechnung* (1895), and *Die Gewichte des Altertums* (1898).

HUMAITÁ, ʰō-mā'ê-tü'. A town and fort of Paraguay, situated at the southwestern end of the country, on the river Paraguay, near its confluence with the Paraná (Map: Paraguay, F 9). During the War of the Triple Alliance it was besieged for over a year by the forces of Argentina and Brazil, and finally surrendered in 1868. The fortifications were razed at the end of the war (1868-70). The surrounding region yields rich crops of cotton, tobacco, coffee, and sugar. Population, about 4000.

HUMANE ASSOCIATION, AMERICAN. A federation of societies of the United States for the prevention of cruelty to animals and children, formed at Cleveland, Ohio, in 1877, at a meeting held to consider the maltreatment of animals in transit between the East and West. It became a national organization, whose purpose was at first to deal with interstate traffic. It sent representatives to influence legislation at Washington, and its agents investigated the abuses which prevailed on lines of railways transporting cattle. It offered a prize of \$5000 for the best model of a cattle-car that would make possible the feeding, watering, and resting of cattle in transit, as the result of which many improved cars were brought into use. In 1884 it won a suit in Massachusetts against two leading railroads for violation of the law, thus establishing an important precedent. For many years its purpose has been that of a federation of all local humane societies. It carries on considerable work of an educational nature. It has instituted inquiries in the United States and abroad on the subject of vivisection in the schools and colleges. Prizes were offered, in 1900, to college and medical students, for essays on vivisection, its abuses and their remedy. Its most recent undertaking is the raising of money to organize humane societies in States where they do not now exist. The secretary is

Francis H. Rowley, Brookline, Mass. See CRUELTY TO CHILDREN, and CRUELTY TO ANIMALS, PREVENTION OF.

HUMANE SOCIETY, ROYAL. An organization for the recovery of persons apparently drowned, founded in England in 1774. It maintains receiving houses in appropriate places along the Thames, and near canal banks, and in various parts of London. The chief station is on Serpentine River in Hyde Park, on ground given by George III., and was erected in 1794. The seal of the Society bears the unique motto, *Lateat Scintilla Forsan* ('a small spark may perhaps lie hid').

HUMANISM (from *human*, OF., Fr. *humain*, from Lat. *humanus*, relating to man, from *homo*, OLat. *hemo*, man; connected with AS. *guma*, man, Gk. *χθών*, *chthōn*, Skt. *kṣam*, earth). A name applied to the literary movement at the close of the Middle Ages, whose object was the revival of the pagan learning of classical antiquity. The humanists from the beginning divided into two divergent schools, one of which sought to engraft the classical learning on the tree of Christianity, while the other endeavored to revive not merely the literature of classical antiquity but, through this, the pagan spirit of the ancient heathen cults. The first humanistic movement began in the fourteenth century in Italy, where the political and social developments were preparing the way for a departure from mediæval traditions. The numerous small Italian States, despotic and republican alike, favored the development of individuality at a time when feudalism (q.v.), still in existence in other parts of Europe, gave less opportunity for the exercise of individual activities. The ferment of Italian politics gave the individual freer play, and the sense of personal independence was rapidly tending to looser social and political ideals. Paganism in Italy, though overpowered, had never been completely exterminated. It had lived on in popular legend and retrospective pride of race, and in countless associations connected with the Roman Forum, the Coliseum, and other historic monuments. But these survivals from ancient Rome were an insignificant moment in mediæval Italian culture; the pagan past did not seriously influence men's minds till new social and political conditions had prepared the way for the revival of classical ideals. (See RENAISSANCE.) The exile of the Papal See from Rome for nearly three-quarters of a century (see AVIGNON) must also have acted as a removal of the great check against the recrudescence of paganism. In the fourteenth century all Italy was astir with the new life. Dante, as is shown in his homage to Vergil, felt the new impulse. Petrarch, who may be regarded as the first Christian humanist, threw himself into the van of the new movement. His passion for antiquity and his intolerance of certain forms of mediævalism were boundless. He devoted great energy to the discovery and rescue of Latin manuscripts, to the collection of old Roman coins and other antiquities, and to seathing denunciation of scholastic philosophy, jurisprudence, and medicine. But while the mediævalist had looked forward to an immortality beyond the grave, the pagan humanist would be satisfied with nothing less than an earthly immortality, achieved by poetry like Vergil's and prose like Cicero's. And

as the literary style of the Augustan age (q.v.) became the sole model for the writer, so the spirit of antiquity, with its sensuous attitude toward life and nature, its unqualified secularity, its abandonment to the charm of things seen and temporal, controlled the humanists' thought and conduct.

A second humanistic movement—more properly called humanitarianism—came to its culmination in Comte's (q.v.) worship of humanity. It finds in man the highest and worthiest object of esteem and reverence, and is hostile to any theory which places the divine outside of the human. It is differentiated from the pagan Renaissance attitude most markedly by its placing the golden age of man's development not in the past, but in the future.

Consult: Burckhardt, *Die Cultur der Renaissance in Italien* (Basel, 1860; 3d ed. 1877-78), English translation by Middlemore (London, 1878 and 1891); Voigt, *Die Wiederbelebung des klassischen Altertums oder das erste Jahrhundert des Humanismus* (Berlin, 1859; 2d ed. 1880-81); Symond's (q.v.) works on the Renaissance, epitomized by Pearson in *A Short History of the Renaissance in Italy* (New York, 1893); Owen, *Skeptics of the Italian Renaissance* (New York, 1893); Jebb, *Humanism in Education*, Romanes Lecture (London and New York, 1899); Pastor, *History of the Popes* (London, 1891); Einstein, *The Italian Renaissance in England* (New York, 1902); Gasquet, *The Eve of the Reformation* (London, 1898).

HUMANITARIANS (from Lat. *humanitas*, humanity, from *humanus*, human). The name assigned to the several classes of anti-Trinitarians, who regard Christ as a mere man, and refuse to ascribe to Him any supernatural character, whether of origin or of nature. Theodotus of Byzantium, called the Tanner, a Monarchian (q.v.), is said to have been excluded from the Church by Victor, Roman Pontiff (189-198), because, having denied Christ in time of persecution, he afterwards defended himself by declaring that in so doing "he had denied not God, but man." A contemporary and probably an associate of Theodotus, Artemas, taught in like manner that Christ was a mere man. Theodotus and Artemas probably represent a school or sect at Rome, and were the first to formulate the doctrine, so far as known. (See SOCINUS, FAUSTUS; UNITARIANS.) The name humanitarian is also sometimes applied to the disciples of Saint-Simon (q.v.), and in general to those who look to the perfectibility of human nature as their great moral and social dogma, and ignore altogether the dependence of man upon supernatural aid, believing in the all-sufficiency of his own innate powers.

HUMANITIES. A term now employed primarily to designate the study of the classical literatures of Greece and Rome, and the various sciences which deal with them, such as grammar, classical philology, etc.; but sometimes secondarily it includes all 'culture studies' in contrast to professional studies. Cicero, Aulus Gellius, and other Latin writers used *humanitas* in the sense of culture becoming to a man and gained by the study of the great masterpieces, mostly of Greek literature, but not exclusive of Roman. The scholastics adopted the term especially in the form of *literæ humani-*

ores (the more humane letters), but gave it a different emphasis by placing it in contrast and in subordination to *divinitas* (divinity or theology). This contrast gave to humanity an enlarged meaning, including all forms of secular learning. The humanistic movement (see HUMANISM) restored the word to its Ciceronian significance. But when the narrowness of humanism in regarding the study of the ancient classics as the means *par excellence* of gaining humane culture came to be appreciated, and when other sciences of liberal character arose, the term humanities began gradually to take on a larger meaning, and it is now used by some authorities to include all philological study, together with history, philosophy, political science, economics, and all other sciences which concern themselves with human civilization. In the Scotch universities, however, the singular, 'humanity,' is used to designate the study of the Latin language and literature.

HUMANN, hōō'mān, KARL (1839-96). A German engineer and archaeologist, born at Steele. In 1861 he gave up his studies, as he was ordered south because of his health. In Samos he made successful excavations of the famous Temple of Hera. In 1862 he built Sir Henry Bulwer, English Ambassador at Constantinople, an island palace; two years later was employed by the Turkish Government to survey Palestine for a railroad from Jaffa to Jerusalem; and, after a trip to Egypt, mapped out the Eastern Balkans, after surveys ordered by Fuad Pasha. But besides the name he made for himself by these maps, and by engineering in Northern Asia, he got fame for his excavations at Pergamus (1878-86); was made honorary doctor by the University of Greifswald, director of the Museum of Berlin, and Privy Councilor (1894). His later excavations were at Senjirli, in Northern Syria, at Tralles, and Magnesia. With Conze, Bohn, and others, he published *Die Ergebnisse der Ausgrabungen zu Pergamon* (1880-88), and with Puchstein, *Reisen in Kleinasien und Nordsyrien* (1890).

HUMAYUN, hōō'mā-yōon'. A Great Mogul of India, son of Baber and father of Akbar. He came to the throne in 1530, but after ten years of successful warfare was defeated by the Afghan Sher Khan and driven from India. He took refuge at the Court of Persia, and with a Persian army returned in 1555, and recovered control of Delhi and Agra. He died at Delhi, where a great mausoleum was built for him.

HUM'BER. The continuation and estuary of the rivers Ouse and Trent, between the English counties of York and Lincoln (Map: England, G 3). It is 38 miles long and from 1 to 7 miles broad, with Hull on its north shore and Great Grimsby on the south. It was the entrance for the Norse invasions of the ninth and tenth centuries.

HUMBERT I. (Ital. UMBERTO) (1844-1900). King of Italy from 1878 to 1900. He was the eldest son of Victor Emmanuel II. and Adelaide, Archduchess of Austria, and was born at Turin, March 14, 1844. At an early age he obtained an insight into political and military life under the guidance of his father, during the war of 1859, although he was then too young to take an active part in the struggle. He was more closely connected with the process of the unification of Italy which followed. In July,

1862, he visited Naples and Palermo, where he shared the popularity of Garibaldi. When the war between Prussia and Austria was imminent, Humbert was dispatched to Paris to ascertain the sentiments of the French Government in reference to the alliance between Italy and Prussia. On the outbreak of hostilities he hastened to take the field; obtained the command of a division of General Cialdini's army, with the rank of lieutenant-general; and took a gallant part in the battle of Custoza, June 24, 1866, covering the retreat of the Italians by brave and skillful tactics. In 1868 he married his cousin, the Princess Marguerite of Savoy. He succeeded to the throne on the death of his father, January 9, 1878. He showed great bravery during the cholera epidemic in 1884, and gained in popular esteem by his visit to Naples at that time. In 1887 the foreign policy of the Government resulted in the Triple Alliance between Italy, Austria-Hungary, and Germany. The colonial policy of the country was not so successful, however, as the Italian troops met with great reverses in Abyssinia in 1887, and again in 1895. In 1898 a commercial treaty was concluded with France, but throughout Humbert's reign the country suffered under financial depression and heavy taxation. Toward the end of his reign King Humbert lost some of his former popularity. An Anarchist attempted to assassinate him before the gates of Rome in 1897, but failed. Three years later, however (July 29, 1900), Humbert was shot at and mortally wounded by another Italian Anarchist, Bresci, who had come from the United States intent on this act. The King died almost immediately. Humbert was succeeded by his only son, Victor Emmanuel III. See ITALY.

HUMBERT, ɛn'bar', FERDINAND (1842—). A French painter, born in Paris. He studied with Picot, Cabanel, and Eugène Fromentin. His first appearance in the Salon was in 1865, with "La fuite de Néron." Besides portraits, he painted numerous canvases upon religious or historical subjects, such as "Le Christ à la Colonne" (1875), which is now in the Orléans Museum, and "Pro Patria," a decoration for the Panthéon (1886). He was awarded several medals, and was made an officer of the Legion of Honor.

HUMBERT, GUSTAVE AMÉDÉE (1822-94). A French jurist and politician, born at Metz. He studied law in Paris, and gave private lessons both before and after he was under-prefect of Thionville (1848-51). He was professor of Roman law at Toulouse, and thence entered politics in 1871 on his election to the Chamber of Deputies. Humbert took a prominent part in debates on legal questions, became a leader of the Republican Left in 1875, was transferred to the Senate, and in Freyinet's Cabinet (1882) was Minister of Justice. In 1890 Humbert left his post as vice-president of the Senate, and became president of the chief court of accounts. He wrote: *Essai sur les finances et la compatibilité publique chez les Romains* (1887), and *Organisation de l'empire romain* (1892). His connection with the great Humbert swindle, carried through by his son, Frédéric, and his daughter-in-law, Frédéric's wife, is problematic.

HUMBLEBEE. See BUMBLEBEE.

HUMBOLDT, hūm'bōlt, *Ger. pron.* hūm'bōlt, ALEXANDER, Baron von (1769-1859). A German naturalist and traveler. He was born in Berlin, September 14, 1769. His father, who died in 1779, was a chamberlain to the King of Prussia; his mother was of Burgundian descent, and his youthful life was spent in the old Castle of Tegel, near Potsdam. He studied, in company with his brother Wilhelm (q.v.), first under private tutors, then at the universities of Frankfort-on-the-Oder, Berlin, and Göttingen. His preference for scientific studies was strongly manifested in his early years, and highly developed by the influence of Blumenbach and other university instructors. During his residence at Göttingen (1788 and 1789) he made geological examinations in the Harz Mountains and Rhine Valley, which resulted in his first important publication, *Ueber die Basalte am Rhein, nebst Untersuchungen über Syenit und Basanit der Alten* (1790). In 1790 Humboldt made a tour through France, the Netherlands, and England, in company with Georg Forster, already eminent as a scientific traveler, whose influence was strong in shaping the younger man's career; and in 1791 he entered the Academy of Mining at Freiberg, Saxony, where Werner was then professor of geology. His eight months' residence at Freiberg gave him materials for several technical papers in chemistry and physics, and for some more elaborate essays, especially those upon the cryptogamous plants of the mines (*Flora Subterranea Freibergensis*, etc.). In consequence he was soon (1792) appointed superintendent of mines in the principalities of Bayreuth and Anspach, and resided for the next three years at Bayreuth. The breadth of his interest and researches at this period is exemplified by his work and speculations on the nature of muscular and nervous force, entitled *Versuche über die gereizte Muskel- und Nervenfasern, nebst Vermutungen über den chemischen Prozess des Lebens in der Tier- und Pflanzenwelt* (1797).

The desire for larger freedom, and especially for exploratory travel, led Humboldt to resign his office in 1797. He had already in 1795 wandered about the Alps, studying geology, but further intended journeys to Sicily and up the Nile were prevented by political obstacles. The next three months were spent at Jena, in intimate association with Goethe, Schiller, and the men at the university, who then made an extraordinary circle of intellects; and here he began to plan for the great journey to Spanish America with which his fame is now most closely associated. In Paris he made the acquaintance of a talented young French botanist, Aimé Bonpland, who joined in his plans and was destined to be his principal collaborer. Meanwhile Humboldt was incessantly at work, and the years 1797-99 witnessed the publication of many notable contributions to science, among which those pertaining to the composition of the atmosphere were particularly notable. Many of these were brought together in his book *Versuche über die chemische Zerlegung des Luftkreises* (1799). At length, after spending some time in Spain and getting letters from the Government, Humboldt and Bonpland sailed in a Spanish frigate from Coruña, in June, 1799. They visited Teneriffe, ascended the peak, and made valuable observations there, as well as at sea during the voyage, which terminated at Cumana, in Venezuela.

The travelers explored the region for upward of a year, crossing over to the upper waters of the Orinoco, and establishing the connection between that stream and the Upper Amazon. The year 1801 was spent in explorations in Cuba, the basin of the Magdalena River, and in the Andes of Quito, the famous ascent of Chimborazo, to an altitude of about 19,000 feet, being accomplished in June, 1802. The explorations were then extended to Peru, where Humboldt devoted himself largely to the electrical and astronomical studies favored by the climate, but also acquired a valuable knowledge of the cinchona (quinine) plant and its culture. From Peru the two savants took ship for Mexico, landing at Acapulco in February, 1803. There they traveled for a year, Humboldt paying special attention to the determination of positions on the map and to volcanic phenomena, and then returned to Europe by way of Cuba and the United States (where several weeks were spent), reaching Bordeaux in August, 1804.

Humboldt now went to Paris, and occupied himself with Bonpland in the arrangement of their manuscripts and collections, a large part of which, however, had been lost by a shipwreck; at the same time he pursued continuous experiments in physical chemistry. Having visited his brother, then Prussian Ambassador at Rome, and returned to Berlin, he accompanied Prince Wilhelm of Prussia, in 1807, on a political mission to France, and obtained leave from the Government of his own country to remain thenceforth in Paris for the publication of the account of his travels. He enlisted the coöperation of Gay-Lussac, Cuvier, and many others of the most eminent French specialists of the day in the elaboration of his materials, and began in 1807 to publish the results in magnificent volumes (20 in folio and 10 in quarto, illustrated by 1425 copperplates). The title was *Voyage aux régions équinoxiales du Nouveau Continent fait en 1799-1804 par Alexandre de Humboldt et Aimé Bonpland*. The first 14 volumes were devoted to botany, and were actually prepared mainly by C. S. Kunth; vols. xv. and xvi. were an 'atlas pittoresque;' vols. xvii., xviii., xix., xxi., and xxii. were devoted to physical geography, geognosy, and astronomy; vol. xx. contained a 'geography of plants;' vols. xxiii. and xxiv. were zoological; vols. xxv. and xxvi. were devoted to a sociological account of the countries of Spanish America; and vols. xxviii., xxix., and xxx. contained Humboldt's narrative of his journey, which was left unfinished. The original of this work contains the *Essai politique sur le royaume de la Nouvelle Espagne*, the *Essai politique sur l'île de Cuba*, and the *Vues des Cordillères*. Among the minor works of the great master, the *Ansichten der Natur* (first edition, 1808) had an immediate and widespread welcome. It was translated into almost every European language, and issued in English in both London and Philadelphia. The publication of the great *Voyage* continued at irregular intervals until 1827, and the volumes or groups of volumes appeared under individual titles, by which they are more usually known. The bibliography of Bruhns's biography of Humboldt disentangles the confusion of titles and editions which resulted, and to that the curious reader is referred. After Humboldt's death an octavo

edition of his principal works was published in Paris (1864-66).

The favor of Frederick William III. of Prussia, who had settled upon Humboldt a pension of 2500 thalers, and later of 5000, required him to make frequent journeys with that monarch, and at last he was summoned to reside at the Court. In 1827, then, he took up his permanent residence in Berlin, and with much discontent endeavored to carry on his investigations amid uncongenial surroundings. One of the best results of his work at this period was his success in establishing for the first time international co-operation in furtherance of scientific observations. In 1827-28 he gave a series of remarkable lectures on physiography at Berlin, which formed the basis of his subsequent *Kosmos*. In 1829, under the patronage of the Russian Government, and accompanied by Ehrenberg and Gustav Rose, he made a rapid journey as far east as the Yenisei, one of the most striking results of which was the discovery of diamonds and other precious stones in the Ural Mountains, as Humboldt had predicted would be the case from his knowledge of their geology. Many geographical positions were astronomically determined, and erroneous views as to the physical geography of the northern interior of Russia were corrected. The record of this journey was first written by Humboldt as *Fragments de géologie et de climatologie asiatique* (1831), and afterwards enlarged into *Asie centrale, recherches sur les chaînes de montagnes et la climatologie comparée* (1843).

The subsequent years were spent in occasional diplomatic journeys and in the preparation of what he deemed the crowning monument of his intellectual life, his *Kosmos*, an encyclopædic account and explanation of the physical universe. Four volumes were written and published in Berlin, in 1845, 1847, 1850, and 1858. They were translated as fast as issued into many languages, and created a profound impression.

He kept health and vitality, and continued at work until the winter of 1858-59, when his strength declined. He died May 6, 1859, and was buried with royal honors at Tegel. After his death new editions of many of his works were issued, and several collections of his letters appeared.

Humboldt's influence upon scientific thought has been vast and far-reaching. "With him," says Agassiz, "ends a great period in the history of science; a period to which Cuvier, Laplace, Arago, Gay-Lussac, De Candolle, and Robert Brown belonged." His grasp of the universe as a whole was no less remarkable than his faculty of observing and explaining single phenomena. His scenic descriptions are strikingly picturesque. Humboldt has contributed to nearly every branch of science, either by direct investigation or by the accumulation of valuable material. He may be regarded as the founder of the modern science of physical geography, and he placed meteorology upon a firm basis. We can only allude to his observations on the cultivation of the soil in different climates, and its effect upon civilization; his study of the languages, the architecture, and the customs of the ancient peoples of South and Central America; his discovery of the decrease in intensity of the earth's magnetic force from the poles to the equator; his fruitful labors in chemistry with Gay-Lussac; his experiments concerning the respiration of fishes; and his con-

ALEXANDER VON HUMBOLDT

FROM AN ENGRAVING BY P. HABELMANN, AFTER A PAINTING BY EMMA RICHARDS

tributions to the science of geology (especially in the departments of petrography, vulcanology, and seismology).

Humboldt's published correspondence with some of the most distinguished men of his time, such as Goethe, Varnhagen, Pictet, Bunsen, Gauss, and Raumer, as well as with his brother Wilhelm, attests the almost unparalleled breadth of his intellectual interests.

The most complete and painstaking *Life of Humboldt* is Bruhns's (Leipzig, 1872); an English translation exists, less the very full bibliography. Klencke's shorter biography, also translated into English, is accurate but dull; and another is by R. H. Stoddard (New York, 1860), with additions by Bayard Taylor, which is far more satisfactory.

HUMBOLDT, KARL WILHELM, Baron von (1767-1835). An eminent German scholar, author, and statesman, elder brother of the preceding, born at Potsdam, Prussia, June 22, 1767. He was educated at the universities of Frankfurt-on-the-Oder and Göttingen, where he was especially trained in jurisprudence, but also studied æsthetics, antiquities, and the Kantian philosophy, then newly propounded. After Continental travel, he spent some time in 1789-90 at Erfurt and at Weimar, where he met Schiller, then professor extraordinarius at Jena. In 1790 he became referendary in the Supreme Court of Judicature at Berlin, with the title of Prussian Councilor of Legation, but in 1791 resigned his appointment, and in 1794-97 was at Jena, active in scientific and literary study, and one of the Schiller circle. His interesting correspondence with Schiller, extending from 1792 to 1805, was published by him in 1830 with a "Vorerinerung" (2d ed., by Vollmer, 1876; in the *Cotta'sche Bibliothek*, ed. by Muncker, 1893). From 1801 to 1806 he was Prussian Resident Minister at the Papal Court, and in 1806-08 Minister Plenipotentiary. At Rome he was a most liberal patron of artists, including Rauch and Thorwaldsen, made philosophical, æsthetic, philological and archæological researches, and wrote the elegy *Rom* (1806), his most ambitious poem. In 1809 he was appointed Privy Councilor of State, in charge of public worship and education. After a successful administration, which introduced many reforms, and organized and obtained endowment for the Berlin University (decreed 1807, opened 1810), he resigned the post in 1810, to accept that of Envoy Extraordinary and Minister Plenipotentiary at Vienna, with rank of Minister of State. In the political affairs of the time he took a prominent part. He was present at the Peace Congress of Prague in 1813, in 1814 was at the Congress of Châtillon and signed, with Hardenberg, the first Paris Treaty, and in 1814-15 attended the Vienna Congress as Prussia's Second Plenipotentiary. Humboldt likewise took part in the negotiations attending the conclusion of the second Paris Treaty, and was a member of the Territorial Commission at Frankfurt-on-the-Main in 1816-17. As a State Councilor he strongly disagreed with Chancellor Hardenberg on certain matters of tax reform, and in consequence he was ordered to London as Ambassador. He returned in 1818 to attend the Congress of Aix-la-Chapelle, and in 1819 was appointed to the Ministry of the Interior (then divided into two branches) with the department of communal and municipal af-

fairs. His liberal opinions soon involved him in difficulties with the Government. He demanded a new Prussian constitution which should combine the autonomy of provinces and governmental districts with a Parliament chosen by direct election; and he attacked the Carlsbad decrees, which, among various provisions, established a censorship of the press and contained measures hostile to the universities and schools. Dismissed in 1819, he was not recalled to the Council of State until 1830. In the last years of his life Humboldt devoted much attention to art matters and to the organization of the Berlin Museum. He died April 8, 1835, at Tegel.

As a statesman Wilhelm von Humboldt was enlightened and industrious, but perhaps hardly constructive. As a critical essayist he was of transient influence. Of his poetical works, besides the *Rom* above mentioned, only the translation of the *Agamemnon* is now much read (1816, 2d ed. 1857; in the *Universalbibliothek* of Reclam). But as a philologist he marks an epoch. It was he who first called the attention of scholars to the phenomenon of the Basque language, particularly in the volume *Prüfung der Untersuchungen über die Urbewohner Hispaniens vermittelt der baskischen Sprache* (1821). His chief publication, *Ueber die Kawisprache auf der Insel Java* (3 vols., 1836-40), with its noted introduction, "Ueber die Verschiedenheit des menschlichen Sprachbaues" (separately printed 1835, 3d ed. of Pott's revision, 1880), was the first on the subject. Important dissertations read before the Berlin Academy include those on the comparative study of language, the province of the historian, and the origin of grammatical forms. Humboldt was in these and other writings the first to associate the science of comparative philology with philosophy, history, and other collateral studies, and to give it a universal significance. His *Ideen zu einem Versuch, die Grenzen der Wirksamkeit des Staates zu bestimmen* (edited by Cauer 1851, in Reclam's *Universalbibliothek*), which Schiller vainly tried to get published, limits the authority of the State to the inferior task of protecting the life and property of its citizens. The collected works appeared at Berlin (7 vols.) in 1841-52. Consult also the study by Haym (Berlin, 1856); Adler, *Wilhelm von Humboldt's Linguistical Studies* (New York, 1866); Gebhardt, *Wilhelm von Humboldt als Staatsmann* (Stuttgart, 2 vols., 1896-99); and Kittel, *Wilhelm von Humboldt's geschichtliche Welt anschauung* (Leipzig, 1901).

HUMBOLDT RIVER. The longest river of Nevada. It rises in Elko County, in the northeast corner of the State, and flows 350 miles in a generally southwest direction, emptying into Humboldt Lake in Churchill County, 80 miles northeast of Carson City (Map: Nevada, E 1). The lake has no outlet, the water sometimes evaporating faster than the river can supply it; at times of high water it formerly overflowed into Carson Sink, but this is now prevented by a dam. The river is only a few yards wide, growing smaller by evaporation toward its mouth. Its water is saline, and it flows through an arid and barren region covered with sage-brush, with the exception of a few fertile alluvial plains and clumps of willows. The valley of the Humboldt is the only east and west pass through the mountains of Nevada, and it is followed throughout its course by the Central Pacific Railroad.

HUME, DAVID (1711-76). An English philosopher and historian. He was born at Edinburgh on April 26 (O. S.), 1711. His father was the laird of Ninewells in Berwickshire, but David, being the youngest son, had to make his fortune with no other assistance than an education and the influence of his family. He appears to have studied in the University of Edinburgh when twelve years of age, but his education for the most part consisted in home reading. His family designed the law to be his profession, and he submitted to the initial steps of the proper practical training, but it was not a pursuit to his liking. Deserting it, he experimented in a mercantile house in Bristol, but commerce was not more congenial to him than jurisprudence, and he gave it a very short trial. To use his own words, "I now went over to France with a view of prosecuting my studies in a country retreat, and there I laid the plan of life which I have steadily and successfully pursued. I resolved to make a very rigid frugality supply my deficiency of fortune, to maintain unimpaired my independence, and to regard every object as contemptible except the improvement of my talent in literature." He spent much of the next three years at La Flèche, in intercourse with the Jesuits, and then he wrote his *Treatise of Human Nature*, which, however, he did not publish till 1739-40. It consists of three books, "Of the Understanding," "Of the Passions," and "Of Morals." Now one of the three or four most famous philosophical productions of England, at the time of its appearance "it fell deadborn from the press without reaching such a distinction as even to excite a murmur among the zealots," as Hume himself acknowledged, much to his mortification. He now turned to political theory, and published anonymously in 1741-42 two volumes of *Essays Moral and Political*. In 1744 he was a candidate for the chair of 'ethics and pneumatic philosophy' in the University of Edinburgh, but his *Treatise* had given him a reputation for 'heresy, deism, skepticism, atheism, etc.,' and the university would have none of him. In 1746 he obtained a 'very genteel' appointment as secretary to General Saint Clair on "10 shillings a day, perquisites, and no expenses." An expedition had been planned to Canada, but an unsuccessful attack on L'Orient, in France, led to a recall of the general. Two years after Hume accompanied General Saint Clair to the Court of Turin, as secretary and aide-de-camp, and took notes of his impressions of Holland, Germany, and Italy.

In 1748, during his absence on the Continent, he published his *Enquiry Concerning Human Understanding*. The following year he returned to England; in 1751 he gave to the public the *Enquiry Concerning the Principles of Morals*, and in 1752 the *Political Discourses*, said to have been the 'cradle of political economy.' At the same time he also composed *Dialogues on Natural Religion*, which, however, were not published till after his death. By this time he had put by enough money to gain him an income of £50 a year. Besides he had "a hundred pounds' worth of books, great stores of linens and fine clothes, and near £100 in his pocket, along with order, frugality, a strong spirit of independency, good health, a contented humor, and an unabated love of study," as he himself relates. In 1751 he had removed to Edinburgh, and a year later he

was elected librarian to the Faculty of Advocates at a salary of £40. In 1754 he published the first volume of the *History of Great Britain, Containing the Reign of James I., and Charles I.*; the second volume appeared two years afterwards. Then he took up the Tudors, and, working backward, finished his *History of England* in 1762. In 1757 he had published *Four Dissertations: the Natural History of Religion; of the Passions; of Tragedy; of the Standard of Taste*. In 1763 he was a member of the embassy to France under Lord Hertford, and there found himself famous. He was lionized by the frivolous society ladies, fêted by the nobles, and taken by the men of letters into their friendship. After his return he was made Under-Secretary of State (1767-69), and by 1769 had an income of £1000 a year. In 1770 he retired from public life and built a home in Edinburgh on a new street, which was jocularly called 'Saint David's Street,' after him. Here he wrote *My Own Life*, and here he died, August 25, 1776. His *History of England* became a classic as soon as it appeared; his economic writings were a fitting prelude to those of his friend Adam Smith (q.v.), while his philosophical works roused Kant "from his dogmatic slumber," gave rise by reaction to Scottish philosophy, and are the immortal text-books of skepticism and agnosticism. His philosophy was but the consistent development of Berkeley's idealism. (See BERKELEY.) Berkeley had denied the reality of matter, and had accounted for what passed for matter by making it a complex of sensations and ideas, but he still held to the reality of mind as the subject of sensations and ideas. Hume dropped out mind as Berkeley had dropped out matter, and thus left nothing to be known except 'perception' (impressions and ideas), together with certain fictions of the imagination, of which he gives no satisfactory account that can be made consistent with his general position. "All the perceptions of the human mind resolve themselves into two distinct kinds which I shall call impressions and ideas." These differ not by reason of any differences in the manner in which they are produced, but merely in priority and liveliness. Ideas are simply those perceptions which, appearing later than similar perceptions, are less forceful and vivid. Ideas are of two sorts, ideas of the memory and ideas of the imagination. Of these the former are the more lively, and retain, in great measure, the order and sequence of these original impressions, whereas ideas of the imagination are fainter and are "not restrained to the same order and form with the original impressions." Ideas are associated in accordance with certain principles, viz., "Resemblance, contiguity in time or place, and cause and effect." There are no general ideas. Ideas of space are complexes of *minima visibilia*, or colored points, disposed in a certain manner. These points are indivisible. Ideas of time are derived from the succession of our perceptions, and as these perceptions are in the last instance indivisible, time is not infinitely divisible. No perception has any proper external, objective reference. A cause is an object precedent and contiguous to another, and so united with it in the imagination that the idea of the one determines the mind to form the idea of the other, and the impression of the one to form a more lively idea of the other. "There is no substance, hence no mind except the bundle of per-

ceptions. A true skeptic will be diffident of his philosophical doubts, as well as of his philosophical convictions." In ethics, Hume was a utilitarian. (See UTILITARIANISM.) Self-love cannot be the sole basis of reasonable action. 'Crucial experiments' render such a view impossible. Sympathy is a real principle in human nature, and reflections on public interest and utility are the sole sources of the moral approbation paid to fidelity, justice, veracity, integrity. Sympathy does the work it does because it is our pleasure in other persons' pleasures and our displeasure in their pains. Thus our own pleasure and pain are the springs of action, but they are not the ends of action.

A complete edition of Hume's philosophical works was published by Green and Grose (4 vols., London, 1874-75); his *Treatise* and two *Enquiries* in two volumes by Selby-Bigge (Oxford, 1889-94); his *History* has appeared in almost innumerable editions; his autobiography was edited by Adam Smith (London, 1777). Consult also: Burton, *Life and Correspondence of David Hume* (Edinburgh, 1846); and Huxley, *David Hume* (London, 1879), containing a popular account of Hume's philosophical views. For treatment of Hume's philosophy, consult: Jodl, *David Hume's Lehre von der Erkenntnis* (Halle, 1871); Pfeiderer, *Empirismus und Skepsis in David Hume's Philosophie* (Berlin, 1874); Meinong, *Hume-Studien* (Vienna, 1877-82); Gizycki, *Die Ethik David Hume's* (Berlin, 1878); T. H. Green, *Introduction to Hume*, in Green and Grose's edition of Hume's works; also published as part of vol. ii. of Green's *Works* (London, 1885); Knight, *Hume* (London, 1886); and the various histories of modern philosophy by Ueberweg-Heinze, Falckenburg, Höffding, and Windelband.

HUME, HAMILTON (1797-1863). An Australian explorer, born in Paramatta in New South Wales. He is best known as leader with Howell of the cross-country expedition of 1824, on which, when question arose as to the part he had taken in it, he wrote: *A Brief Statement of Facts in Connexion with an Overland Expedition from Lake George to Fort Phillip, in the Year 1824* (3d ed. 1874), and, with Howell, *Journey of Discovery to Fort Phillip* (1837). He accompanied Sturt (q.v.) in his first exploration. A county in New South Wales, a mountain range in Victoria, and a river, one of the largest tributaries of the Murray, bear the name of Hume.

HUME, JOHN. See HOME, JOHN.

HUME, JOSEPH (1777-1855). A British political reformer, born January 22, 1777, at Montrose, Scotland. He was educated in the local schools of Montrose, and at the age of thirteen was apprenticed to an apothecary. He studied medicine, was admitted in 1796 a member of the College of Surgeons, Edinburgh, and became assistant surgeon in the marine service of the East India Company. He applied himself to the native languages, and during the Mahratta War, from 1802 to 1807, filled the office of Persian interpreter to the army. He also discharged duties connected with the prize agencies and the commissariat, and arrived in England in 1808, with a fortune of £30,000 or £40,000. He spent some years in travel and study, and published a blank-verse translation of Dante's *Inferno* in 1812. By purchase he entered the House of Com-

mons in 1812 as Tory member of Parliament for the Borough of Weymouth and Melcombe Regis. In 1818 he was elected for the Aberdeen district of burghs, comprehending his native town of Montrose. In 1830 he had gained such distinction as a radical reformer that he was returned unopposed as one of the members for Middlesex, which he represented until 1837. In 1842 he was again chosen for his native burgh, Montrose, and remained until his death in the service of his fellow-townsmen. As leader of the Radical Party in the House of Commons, he usually found himself in active conflict with both Whig and Tory governments, and at first was treated with contemptuous tolerance. He discovered the widespread conspiracy of the Orange lodges to make the Duke of Cumberland King at William IV.'s death, and a tardy but sincere homage was paid to his integrity and public services by Sir Robert Peel and other political opponents. He held various public offices, was a prominent member and leader of several notable societies, and was twice elected lord rector of Aberdeen University. He died February 20, 1855.

HUME, MARTIN ANDREW SHARP (1847-). An English soldier and historian, long a resident of Spain. He was born in London, but was educated at Madrid, was made Knight of the Spanish Order of Isabella the Catholic, in 1868, and editor of the Spanish State Papers in the Public Record Office, London. He had active service with the Turks in 1878-79, and traveled widely in Africa and South America. Besides his *Chronicles of Henry VIII.* (1889), *Courtships of Queen Elizabeth* (1896), and other works on her period, he wrote *Spain, Its Greatness and Decay* (1898); *Modern Spain* (1899); and *A History of the Spanish People* (1901).

HUME, or HOME, SIR PATRICK (1641-1724). A Scottish statesman. Born at Polwarth, Berwickshire, he was brought up a strict Presbyterian, and after a term of law study at Paris, he represented his native county in Parliament, where he at once took a foremost place as defender of the Covenanters. He went so far as to bring imprisonment upon himself, and on being freed was suspected of complication in the Rye House Plot, so that he was forced to remain in hiding until he could escape in disguise to the Continent. There he joined the Duke of Argyll, and embarked with him on the unsuccessful expedition to Scotland (1685). Hume became a refugee with a price set upon his head, but he once more escaped abroad, lived at Utrecht under an assumed name, and returned with William of Orange at the Revolution of 1688. With estates restored, he was now a Scottish peer, Lord Polwarth; was made Lord Chancellor in 1696, and Earl of Marchmont in 1697. He strenuously opposed in Parliament the claims of the Old Pretender to the crown, and voted for the union of Scotland with England, though he was not above the suspicion of having received a reward for so doing. Too dogmatic to be popular, he did not hold office in the United Kingdom till the reign of George I., when he was given some minor charges, but shortly retired.

HUMERAL VEIL (Lat. *humeralē*, covering for the shoulders, from *humerus*, *umerus*, shoulder; connected with Gk. *ἄμος*, *amos*, Goth. *amsa*, Skt. *amsa*, shoulder). An oblong veil of silk, either white or of the color prescribed for the

day, which is worn over the shoulders by the deacon in the mass, when he holds the paten from the offertory to the *Pater noster*, and by the priest in giving benediction or carrying the Blessed Sacrament in procession.

HUMERUS (Lat., shoulder). The largest and longest bone of the upper extremity; the bone of the arm proper, extending from the shoulder to the elbow. It is divided anatomically into a shaft and two extremities. The upper extremity is rather the larger, and has a semi-globular head which is partially received into the shallow glenoid cavity of the scapula or shoulder-blade, forming a ball-and-socket joint. Two processes or projections of the shoulder-blade assist the glenoid cavity in completing the cavity or seat of the head of the humerus. There are three ligaments which hold the humerus to the scapula—the capsular, the coraco-humeral, and the glenoid, the relations being somewhat similar to those of the hip-joint (q.v.). The shaft of the humerus is nearly cylindrical in its upper part, but triangularly prismatic below, becoming flattened and broad at the lower extremity, where are placed the two condyles, with their articular surfaces, and the trochlea between them, which form, with the two bones of the forearm, the elbow-joint. (See ARM; SKELETON.) The broad, flat lower extremity has two depressions on the anterior aspect of the bone; one slight one on the outer side called the radial depression, which is for the reception of the anterior border of the head of the radius, when the arm is strongly flexed; the other, called the coronoid depression, for the reception of the coronoid process of the ulna during flexion of the arm. Opposite the latter depression, on the posterior surface of the bone, is a deep triangular depression, called the olecranon fossa, for the reception of the olecranon process of the ulna when the forearm is extended. The humerus forms with the scapula, as above mentioned, a ball-and-socket joint, the shoulder-joint (q.v.). The elbow-joint is a hinge joint, and, to a certain extent, in its relation to the head of the radius, a ball-and-socket joint.

HUMFREY, HUMPHREY, or **HUMPHRYS, PELHAM** (1647-74). A famous English musician, and one of the founders of modern English music. He was born in London. He was one of the children of the Chapel Royal, and while yet a boy composed considerable Church music, and in a book of *Divine Services and Anthems*, published by Clifford in 1664, there are five anthems ascribed to him. Upon the breaking of his voice he was sent by Charles II. to France for instruction under Lully. The King was so impressed with the genius of the boy Humfrey that he caused him to be supplied with £200 from the secret-service money, to pay the expense of his journey, and in the two years following (1665-66) sent him £100 and £150, respectively. Upon his return in 1667, he was appointed to the Chapel Royal, where the music he had brought back with him was greatly admired. He had become very skillful in the art of scoring, which, added to his own genius, enabled him to compose anthems which have remained ever since models of beauty in expression, and strikingly apt in the artistic blending of words and music. He was appointed Gentleman of the Chapel Royal (1666) during his absence in France; became Master of the Children in 1672, Composer in

Ordinary for the Violins to His Majesty in 1673, and wrote many pieces for the King's band, an organization modeled after "Les Petits Violons" of Louis XIV. His compositions are still in use (many of them still in manuscript) in all the cathedrals and churches of England and America. They are remarkable for their expression and depth of sentiment, as well as for discoveries and departures in harmony; for instance: the sharp fifth, as a passing note, the major third and minor sixth on a bass note, a sequence of imperfect fifth and the augmented or extreme sharp sixth, and the flat third and sharp fourth, combinations new to church music, were utilized by him for the first time. It is supposed from the fact that he frequently indulged in extreme keys, such as C minor and F minor, that his violinists did not use fretted finger-boards, but tempered their scales at will. He died at Windsor and was buried in the cloisters of Westminster Abbey near the southeast door.

HUMIDITY (from Lat. *humiditas*, moisture, from *humidus*, *umidus*, moist, from *humere*, *umere*, to be moist; connected ultimately with Gk. *ὕψος*, *hygros*, Icel. *vökr*, moist), **ATMOSPHERIC**. The moisture or aqueous vapor in the atmosphere. This vapor is really an invisible gas, and is the most important component of the atmosphere as to quantity next after nitrogen and oxygen. When this invisible vapor becomes visible it is called dew, fog, mist, haze, cloud, rain, hail, snow, frostwork, or frost, according to the size of the drops of water or the method in which the vapor condenses. Water and ice are not included under the term 'atmospheric humidity,' that term being strictly confined to the invisible vapor.

The aqueous vapor in the air is perpetually falling to the earth as rain or snow, and is renewed by evaporation from the ocean, the lakes and rivers, and the soil itself. The quantity of aqueous vapor in a cubic foot of air varies greatly with temperature and locality on the earth's surface. Thus in the air of Arizona and New Mexico there is oftentimes only from 3 to 10 per cent. of the amount that could be held in case the air was saturated. The quantity that can be held in a saturated space varies greatly with the temperature, but does not depend upon the barometric pressure, and is also quite independent of the presence of air in that same space, since the aqueous vapor and the dry air co-exist side by side. The elastic pressure of the dry air and the elastic pressure of the aqueous vapor added together produce what is ordinarily called barometric or atmospheric pressure. The weight of the moisture and the weight of the dry air added together determine the density of a cubic foot of atmosphere at any time. When a cubic foot of space contains as much aqueous vapor as it can possibly hold at any given temperature, it is said to be saturated with moisture. The following table shows that there may be as much in an extreme case as twenty grains of invisible aqueous vapor in a cubic foot if the space is saturated at the temperature of 100° F., and this vapor will exert an elastic pressure of about one pound to the square inch, such as would be counterbalanced by a column of mercury of about 1.9 inches of the barometer. If, now, dry air is added to this cubic foot of space until a pressure of thirty inches is exerted in all directions, then the weight of the

dry air at a temperature of 100° F. will be 465 grains per cubic foot, and the combined weight of the vapor and the air, or the so-called saturated air, will be 485 grains. The following table gives these relations for saturation at a pressure of thirty inches and for temperatures between zero and a hundred, computed according to the data adopted in the Psychrometric Tables of Prof. C. F. Marvin (United States Weather Bureau, 1900) :

air cools at the rate of one degree Fahrenheit for 183 feet of ascent. In this way air that is forced over a mountain may be cooled below the dew-point and form cloud or rain. The moisture in ordinary dry air is easily absorbed by many substances, such as sugar, flour, salt, and in very moist weather objects may become so damp that fungus germs floating in the air and settling on them take root and cover them with mold, or set up fermentation within them.

PRESSURE AND WEIGHT OF VAPOR AND AIR IN A CUBIC FOOT OF ATMOSPHERE AT A PRESSURE OF 30 INCHES WHEN SATURATED AT THE RESPECTIVE TEMPERATURES

TEMPERATURE	Vapor pressure	Dry air pressure	Vapor weight	Dry air weight	Total weight saturated air
DEGREES FAHR.	Inches	Inches	Grs. per cu. ft.	Grs. per cu. ft.	Grs. per cu. ft.
0.....	0.038	29.962	0.48	605.32	605.80
10.....	0.063	29.937	0.78	591.93	592.71
20.....	0.103	29.897	1.24	578.79	580.03
30.....	0.164	29.836	1.94	565.79	567.73
40.....	0.247	29.753	2.85	552.89	555.74
50.....	0.360	29.640	4.08	539.93	544.01
60.....	0.517	29.483	5.74	526.75	532.49
70.....	0.732	29.268	7.98	513.00	520.98

90.....	1.408	28.592	14.79	482.65	497.64
100.....	1.916	28.084	19.77	465.77	485.54

This table shows that the capacity of the unit volume of space or air for aqueous vapor increases very rapidly with rising temperature. When the space is not saturated, the atmosphere is said to have a relative humidity expressed as a given percentage of complete saturation. Thus if the air has a temperature of 100 degrees and contains only 10 grains of vapor per cubic foot, it contains only 50 per cent. of the maximum amount possible at that temperature.

The humidity of the atmosphere is usually determined by either the dew-point apparatus or the psychrometric apparatus. In the former the air is cooled down without altering the quantity of moisture that it contains, and the temperature at which that moisture saturates the air is determined. This dew-point temperature is always lower than the temperature of the free air. In the psychrometric method the temperature of a thin layer of water that is evaporating under standard conditions in the open atmosphere is determined. From this temperature of evaporation the psychrometric formula gives us the vapor-tension, the temperature of the dew-point, and the quantity of moisture in the air. In general the temperature of the dew-point is about as far below the temperature of evaporation as the latter is below the temperature of the air.

The rate of evaporation from a moist surface diminishes with increasing humidity of the air, so that the total evaporation under a given wind in any given unit of time indicates the average dryness of the air during that time.

Nearly all animal and vegetable substances, by reason of their cellular structure, absorb moisture from moist air, but give it up to very dry air. They are, therefore, perpetually expanding and contracting, curling and uncurling, and their changes may be utilized in the construction of hygrometers. When moist air cools by radiation at night to temperatures below the dew-point, the vapor is precipitated, forming cloud, mist, fog, or dew. On the other hand, when air rises, thereby coming under less pressure, it expands, does work, and is cooled dynamically by reason of the work done. Ordinary

The humidity of the atmosphere, although invisible, has a special and strong influence in absorbing radiant energy, whether from the sun or from the earth. It therefore converts the dry air into a powerful obstructor to the passage of radiant heat, and by this means the humid atmosphere is made to act as a blanket, keeping the earth and the lower air much warmer than it would otherwise be. See HYGROMETER.

HUMIL'IA'TI (Lat. nom. pl., humbled). A monastic Order, which originated in the eleventh or twelfth century, and was confirmed by Innocent III. in 1201. In the sixteenth century it had 94 houses, with about 170 monks, in Italy, but as it was corrupt, Carlo Borromeo (q.v.) tried to reform it. This attempt led to a murderous assault on him, so Pius V. in 1571 suppressed the Order. Several of their houses were turned over to the Barnabites.—A female Order of Benedictines, known as humiliate nuns, or nuns of Blasoni, from their founder, Clara Blasoni of Milan, served as nurses, etc. The Order still exists in Italy, with four houses.

HUMMEL, hum'mel, JOHANN NEPOMUK (1778-1837). A distinguished Austrian pianist and composer, born at Pressburg and educated primarily by his father, who was a music-teacher. When but eight years of age he accompanied his father to Vienna on the appointment of the latter as kapellmeister of Schikaneder's Theatre. Here he came under the notice of Mozart, who became so interested in the boy that he admitted him to his own family and instructed him for two years. His debut in 1787 was also under the auspices of Mozart. Next followed a number of very successful tours through Germany, Denmark, England, and Holland. Probably no other musician in the entire history of music had so distinguished a number of teachers and patrons as Hummel. Beginning with Mozart, his next teacher was Clementi, with whom he studied in London during 1791, followed by a course of study in composition under Albrechtsberger in Vienna (1793), while at the same time he was studying with Salieri in dramatic writing, and receiving much indirect, but nevertheless profit-

able, advice and instruction from the great Haydn. His entire career was marked by success and the appreciation of the public; so much so that at one time he was considered to rival Beethoven. His principal appointments were as follows: From 1804 to 1811, deputy kapellmeister under Haydn in the service of Prince Eszterházy; 1811-16, a successful teacher of composition in Vienna; kapellmeister to the Court of Stuttgart 1816-19, when he resigned to take a similar position at Weimar. None of these appointments interfered with his concert activities, for during his many leaves of absence he appeared in Saint Petersburg (1822), in Paris (1825), Belgium and Holland (1826), Vienna (1827), Warsaw (1828), and made a return visit to France in 1829. He appeared in London, and was for a season the musical director of German opera at the King's Theatre. From this time on his health gradually failed, and after much suffering he died at Weimar. He was a Chevalier of the Legion of Honor, and during his lifetime received many tokens of princely favor. As a pianist he ranked with the most famous of his generation, and as a composer was of scarcely less excellence. His compositions number over a hundred, and include operas, cantatas, ballets, and considerable chamber music. For the Church, he wrote three masses arranged for four voices with orchestral and organ accompaniment, which are still held in high esteem. His *Graduale* and *Offertorium* are in use to-day throughout Austria and Hungary. At least six of his concertos and a few of his sonatas remain standard works, and are in constant demand. He is of importance in the history of music, if only because of his efforts to introduce the present method of fingering in pianoforte study.

HUMMEL, KARL (1821—). A German landscape painter and engraver, son of the composer, Johann Nepomuk Hummel. He was born at Weimar, studied engraving under Schwerdgeburth and painting under Preller, with whom he traveled through Europe. From an earlier and idealized manner, after the fashion of Preller or of Claude Lorraine, Hummel gradually approached a more natural treatment, and turned in this second period from Italian scenery to landscapes nearer home. Among his pictures, of which many belong to the Grand Duke of Weimar, are: "The Gardens of Armida," which is his most important work (1858); "View of Brienz Lake" (1858), and "View in Lauterbrunn Valley" (1859), both in the Leipzig Museum; "Civita Castellana" (1879); "Monte Coracte"; "Keller Lake in Holstein" (1884); and a "Wooded Landscape Near Michaelstein" (1888). His engravings of landscapes are also well known. Hummel became professor in the Weimar Academy of Art in 1859.

HUMMELER (from *hummel*, variant of *humble*, *hamble*, to mutilate, from AS. *hamelian*, OHG. *hamalōn*, to maim, Ger. *hummeln*, *häm-meln*, to geld, from OHG. *hamal*, *ham*, mutilated; possibly connected with Skt. *śam*, to injure). A hand implement or machine used especially in Scotland, for removing the awn from the grain of barley after it has been thrashed. A common kind of hummeler is a set of blunt knives fixed in a frame, with a handle, by means of which the machine is operated. Another form consists of blunt knives set on a roller. Hummelers of various construction are sometimes at-

tached to threshing-machines, in all of which blunt knives are made to pass frequently through the grain.

HUMMING-BIRD (so called from the sound of its whirring wings). One of the diminutive birds of the picarian family Trochilidæ, closely related to the swifts. More than 400 species are known, exclusively American, and mainly confined to the tropics, though a few species are summer visitors to colder latitudes, as far even as 61° N. A few, also, of the tropical species inhabit elevated mountainous tracts, even to the confines of perpetual snow. In the United States eighteen species of humming-birds are known, but only one of these is found east of the Mississippi and north of Florida. All of the others belong to the Southwestern States and the Pacific Coast (see below).

CHARACTERISTICS. The brilliancy of humming-birds, the rapidity with which they dart through the air, their hovering above the flowers from which they obtain their food, with a humming sound of wings which move so quickly as to be indistinctly visible, or 'like a mist,' have attracted universal admiration. The diminutive size of almost all of them—some are the smallest of birds, and when stripped of their feathers not larger than a bumblebee—has still further contributed to render them objects of interest. Like the bumblebees, too, they perform a service in the cross-fertilization of flowers. Consult Belt, *Naturalist in Nicaragua* (London, 1888).

The largest known species is *Patagona gigas* of the Andes, which reaches a length of 8½ inches, but this is really gigantic, few species exceeding 6 inches. The smallest known species is *Calypte Helena*, which is only 2¼ inches long; it is a native of Cuba.

The plumage of the different species exhibits an almost endless variety of form as well as of color, in crests, neck-tufts, leg-tufts, and many an extraordinary development of tail. The plumage of the males is usually far more varied and glittering than that of the females, and this tribe furnishes an extensive and forcible example in support of the doctrine of sexual selection (q.v.). The metallic brilliancy of the plumage, which in the gorgets and elsewhere often exhibits a gem-like coruscation and iridescence, is due to the interference of light by the minute scales upon the surface of each feather, and not to pigments. The young resemble their mothers until they reach maturity.

Food, ETC. Humming-birds have slender bills, which are also generally long, and in some extremely so, the form of the bill exhibiting adaptation to the kind of flowers from which the bird obtains its food—straight in some, curved in others. The bill of the 'swordbill' (*Docimastes ensiferus*) is 5 inches long, much longer than the head, body, and tail of the bird together, while in *Rhamphomicron microrhynchum* the bill is only ¼ of an inch long. In the sickle-billed humming-birds (*Eutoxeres*) (see **HERMIT**) the bill is notably curved so as to form almost one-third of a circle, while in *Avocettula* it is sharply and abruptly recurved at the tip. Humming-birds do not, as was long supposed, feed on honey alone, but to a considerable extent, and some of them perhaps chiefly, on insects, not excepting spiders, while they often snatch away the insects which have become entangled in spiders' webs. The lower mandible fits into the

 2. SPANGLED COQUETTE (*Lophornis reginae*).
 3. RACKET-TAIL (*Steganura Underwoodi*).
 4. CALLOPE HUMMER (*Stellula callope*).

5. TUFTED COQUETTE (*Lophornis ornatus*).
 6. SWORD-BILL (*Docimastes Ensiferens*).
 7. RUFUS HUMMER (*Selasphorus rufus*).
 8. FLORESIS HUMMER (*Selasphorus floresii*).
 9. NEST OF RED-THROATED SAPHIRE (*Hylocharis sapphirina*).

upper, and the bill is thus adapted as a tube for sucking, in which, as well as in seizing small insects within the recesses of flowers, the tongue is also a very efficient organ. The tongue is very long, capable of being darted out to a considerable length; the bone of the tongue is much elongated, and its branches pass round the back of the skull to the forehead, where they meet in a point before the line of the eyes. The tongue itself consists of two filaments, joined together for the greater part of their length, and separated at the tip. The wings of humming-birds are very long and powerful, the first quill-feather the longest, and the rest shorter in succession.

NESTS, ETC. These diminutive birds construct exquisite nests of shreds of bark, soft grass, or cottony substances. They are placed in a great variety of situations, from a mere saddling upon a branch to an attachment to the tip of a pendent and swaying leaf or tendril; and often the exterior is made almost invisible by having a coating of lichens or something else allying it closely to its background. The eggs are invariably two in number, and they are always plain white. The tiny owners are very bold in defense of their nests and young, and are said to strike fearlessly with their needle-like bills at the eyes of birds of prey, which they far surpass in agility and rapidity of flight. They are very easily, however, imbued with confidence in a person with whom they are familiar, and have been known to return again in spring, after a winter migration to a warmer climate, to the window from which they had been allowed to escape. Attempts to keep them in confinement have generally failed, and few have ever been carried alive across the Atlantic. Most of the hummers have no song, their only notes being querulous squeaks of wrath or fear. A few of the tropical forms, nevertheless, are said to be slightly musical. The skins of humming-birds were employed for ornamental purposes by the more civilized American races before the discovery of America by Europeans, and were used by the Mexicans for making the pictures which excited the admiration of their Spanish conquerors.

EXAMPLES. Within the present space limits it will not be possible to give any adequate description of the various species of humming-birds, and this article must be confined to mention of the forms illustrated herewith, and to a brief account of the better-known species of the United States. The helmet-crests (*Oxygogon*) are Andean, and owe their name to their high-pointed head ornaments. The coquettes (*Lophornis*) are small, much ornamented hummers of the Amazon region, and are easily recognized by their fan-like crests, and by the spangled frills on each side of the neck. They are numerous and well scattered in South America, where one of the most beautiful is the 'tufted' coquette of the island of Trinidad and the adjacent mainland. The racket-tailed hummer (*Steganura*), whose home is a limited region near the head of the Amazon, is among the smallest and most extraordinary of these birds; and is described as crossing, recrossing, and 'snapping' in a marvelous way its long tail-feathers in the air, as it darts about, especially when a rival male is near. The long-tailed species of the genus *Aithurus* are West Indian; the one figured is a denizen of Jamaica.

RUBYTHROAT, ETC. Of the several humming-birds of the United States, the ruby-throated (*Trochilus colubris*), is most widespread and familiar. It extends far to the north in summer, and may be found breeding from Florida to Hudson Bay. In winter it retires to subtropical regions, and is found from southern Florida to Central America. It is less than 4 inches long, and the principal color is bright shining green. The throat of the male is a beautiful metallic ruby-red. This exquisite bird arrives in the Northern United States early in May, with the opening of the cherry-blossoms, and goes south late in August or early in September. In the Rocky Mountain region of the United States the rubythroat is replaced by the broad-tailed hummer (*Selasphorus platycercus*), a somewhat larger bronze-green bird with rose-purple throat. On the Pacific Coast the common hummer is the Nootka Sound or rufous humming-bird (*Selasphorus rufus*), about the size of the rubythroat, but deep rufous above, with the throat brilliant scarlet. It is notable for its occurrence as far north as Nootka Sound, Alaska, but it winters in Mexico. The commonest species in California, where it is resident through the year, is Anna's humming-bird (*Calypte Anna*), a trifle smaller than the rubythroat, and of more exquisite coloration. The male is bronze-green above, with the whole head and throat brilliant purplish or rose-red.

BIBLIOGRAPHY. The literature devoted to humming-birds is very extensive, including several hundred titles, but the most important works are: Gould, *Monograph of the Trochilidæ* (London, 1861), and Elliot, *Synopsis and Classification of the Trochilidæ* (Washington, 1879), while to the American reader, Ridgway, "The Humming Birds" (*Annual Report of the Smithsonian Institution for 1890*, Washington, 1892), is by far the best popular work. See **HELMET-CREST**; **HERMIT**; **HILL-STAR**; **SUN-BIRD**.

HUMORESKE, hu'mô-rês'ke (Ger., Dan., from *humor*, Lat. *humor*, humor, disposition, from *humere*, to be moist). Originally a short, humorous tale or sketch, but applied by Schumann to short compositions for the pianoforte in a rather free form, and distinguished by originality in harmonic and rhythmic combinations.

HUMORS. See **HIPPOCRATES**; **MEDICINE**.

HUMPBACK. A rorqual (family Balænopteriidæ) or whalebone whale of the genus *Megaptera*, in which the dorsal fin forms a lump upon the back. It is found in all seas, often reaches a length of 50 feet, and sometimes much more; is thick and ungainly, and yields fifty or more barrels of oil. The baleen is short and of poor quality. This whale (*Megaptera longimana*) is recognizable at a long distance by its lolling, irregular manner of swimming, and at the mating season pairs indulge in antics highly amusing because of their size and uncouthness. They strike each other with their long flippers, and these love-pat caresses may be heard miles away. It is believed that in these performances originated the stories current about the attack of the whale by the thresher shark, which, as a matter of fact, could not injure such an opponent. See **RORQUAL**; **WHALE**.

HUMPBACKED SALMON. One of the smallest and poorest of the Pacific salmon (*Oncorhynchus gorbuscha*). It weighs only

three to six pounds, and is distinguishable by the small size of the scales and by the oblong coarse markings on the tail. It is occasionally seen in California and in the Columbia River, but is common from Puget Sound northward, where it is the 'dog-salmon' or 'gorbuscha' of Alaska; also called 'haddo' and 'hay-ko' by the Indians, who smoke-dry it, and use it as winter food. See SALMON; and Plate of SALMON.

The term humpbacked is applied to other fishes, having an elevated dorsal outline, especially an Alaskan whitefish (*Coregonus Nelsoni*).

HUMPED CATTLE, or ZEBU. The common domestic cattle of India and the East, known in books as 'zebu' or 'zubr,' but not so called anywhere in the Orient. It seems to be a distinct species (*Bos Indicus*), of which no wild examples remain. Certain bands of these cattle running wild have, however, ranged the forests of Eastern India for hundreds of years, and are large, long-horned, and shy. In addition to the enormous hump on the fore shoulders, these cattle show some convexity of the forehead, concavity of the upper border of the short horns, large drooping ears, and a very large dewlap. In size and color they vary considerably. The most common colors are ashy gray or creamy buff, but red, brown, black, and even white ones are seen. A certain number of white bulls are held sacred by the Hindus, whence the name 'Brahminy,' often given to the entire race; and these wander about, devastating crops and feeding upon the vegetables exposed for sale in the bazaars without serious interference. The humped cattle are diffused over India, China, the Asiatic islands, Madagascar, and the east coast of Africa. There are many breeds, differing much in size; the largest are greater than any oxen of Europe, while the smallest are not much bigger than a large mastiff. The hump of the largest breeds is said to be sometimes 50 pounds in weight. English residents in India esteem the hump as delicious for the table. There are hornless breeds, and a breed with two fatty humps, one behind the other, is common in the vicinity of Surat. The voice resembles the grunting of the yak, almost as nearly as the lowing of the ox. The zebu is used in India both as a beast of draught and of burden, is yoked in the plow, is occasionally used for riding, and can travel from twenty to thirty miles a day, and is very gentle and docile. In recent years they have been introduced into Jamaica in considerable numbers, and are used on the large banana estates.

GALLA OX, or SUNGA. A breed of humped cattle domesticated in East Africa, and most common in Abyssinia, remarkable for its massive horns, which sometimes form the figure of an upright lyre above its head. A sunga's horn may be 46 inches long, and 15 inches around the base. This variety was known in ancient Egypt, and has been regarded as the parent stock of the Indian breeds of humped cattle; while Blyth finds in it an affinity to the bangeng. Consult *Proceedings of the Zoological Society of London* (London, 1898).

HUMPERDINCK, hum'për-dînk, ENGELBERT (1854—). A German composer, critic, and teacher, born in Siegburg, near Bonn. He was studying to become an architect at Cologne, when he came under the influence of Hiller (q.v.), and was persuaded to devote himself to music. Few of his native contemporaries have been more for-

tunate or successful in securing recognition for their work and talents. At the age of twenty-six he was an intimate friend of the Wagner family at Bayreuth, and for the two or three years immediately preceding the great master's death was his especial protégé; besides which he was the instructor of Siegfried Wagner, and was selected because of his intimate knowledge of the composer's ideas, to write the pianoforte arrangements of Wagner's music dramas, and to assist in the preparation of *Parsifal* for the public stage. He is better known throughout Europe generally, and America in particular, for his opera *Hänsel und Gretel* (1893)), which gained for him a world-wide reputation. In 1902 an English dramatic version of *Die Königskinder* (1896) was given in England and America under the title of *The Children of the King*, in which was retained the incidental music of the original German version. Humperdinck was educated largely at the Cologne Conservatory. He won the Mendelssohn prize in 1878, and the Meyerbeer prize in 1880. His principal teaching appointments were at the Barcelona (Spain) Conservatory (1885-86); Cologne (1887-88); Frankfurt, in which city he won the Mozart scholarship and also acted as concertmaster at the opera (1890-96). Other important compositions in addition to those already mentioned are: *Dornröschen* (1895); *Die sieben Geiseln*, a children's fairy story (1896); *Symphony in C* (1896); and incidental music to *Der Richter von Zalamea* (1896). During his stay in Frankfurt he served as musical critic on the staff of the *Frankfurter Zeitung*, from which he retired in 1896, when he took up his residence at Boppart. His manner is somewhat Wagnerian, but his music is nevertheless strikingly original and pure. He is particularly happy in his musical treatment of folk-lore and fairy tales. In 1900 he was called to Berlin as member of the Academy of Fine Arts and teacher of composition.

HUMPHREY, HEMAN (1779-1861). An American Congregational clergyman and educator. He was born in Connecticut; graduated at Yale in 1805, and was pastor of the Congregational church in Fairfield, Conn., from 1807 to 1817, and of that in Pittsfield, Mass., from 1817 to 1823. He was president of Amherst College from 1823 to 1845, during the infancy of that institution. He was an early advocate of temperance, and a report of his on the subject made in 1813 is said to have been the first temperance tract. Among his publications there are, besides biographies, *The Sabbath* (1830); *Tour in France, Great Britain, and Belgium* (1838); and *Domestic Education* (1840). Consult: Z. M. Humphrey and Neill, *Memorial Sketches of Heman and Sophia Humphrey*; and Tyler, *History of Amherst College* (Springfield, 1873).

HUMPHREY, THE GOOD DUKE (1391-1447). Duke of Gloucester and youngest son of Henry IV. He was Regent of England under Henry V. and Protector previous to the coronation of Henry VI. He married Jacqueline, heiress of Holland and Hainault, and in 1424 overran Hainault, which was recovered by the Duke of Brabant. Later he married Eleanor Cobham, who was imprisoned for life for treason, and at the time of his death Humphrey himself was under similar charge.

HUMPHREY CLINKER, THE EXPEDITION OF. A novel in the form of letters, by Tobias

Smollett. It narrates the fortunes of the title character, a postillion, after he enters the service of the Brambles. He proves to be his master's natural son, and marries his mistress's maid, Winifred. The work was published in 1771, and founded partly on Anstey's *New Bath Guide*, and partly on the author's own life. Tabitha and Winifred are obviously the literary ancestors of Sheridan's Mrs. Malaprop; while Scott admits copying the pedantic Lismahago in his Sir Dugald Dalgetty.

HUMPHREYS, ALEXANDER CROMBIE (1851—). An American gas-engineer and educator, born in Edinburgh, Scotland. Having come to the United States in 1859, from 1866 to 1872 he was a member of the staff of a New York insurance company; in 1872 was appointed secretary of a Greenville (N. J.) gas-light company, and shortly afterwards its superintendent. In 1877-81 he studied at the Stevens Institute of Technology (Hoboken, N. J.); from 1881 to 1885 was chief engineer of a lighting company of New York, and in 1885 was appointed superintendent of construction of a gas improvement company, of which he became general superintendent, and ultimately commercial manager, with headquarters at Philadelphia, Pa. He entered a London gas company in 1892, and in 1894 established a branch of the company in New York. During his connection with these various enterprises he greatly furthered the manufacture of water-gas. In 1902 he was elected president of Stevens Institute to succeed Henry Morton, deceased.

HUMPHREYS, ANDREW ATKINSON (1810-83). An American soldier. He was born in Philadelphia; graduated at West Point in 1831, and was assigned to the artillery. He resigned in September, 1836, and for the next two years was a civil engineer employed on Government work under Major Hartman Bache. In July, 1838, he reentered the army as first lieutenant, and was assigned to the corps of topographical engineers. From 1842 to 1849 he was assistant in charge of the Coast Survey office. Later he was engaged in the surveys of the delta of the Mississippi, and in those for various railroads. Soon after the outbreak of the Civil War he became a member of the staff of General McClellan, with the rank of major, and in the Peninsula campaign was chief topographical engineer of the Army of the Potomac. In April, 1862, he was promoted to be brigadier-general of volunteers, and he was afterwards in command of a division in the Fifth Corps of the Army of the Potomac, participating in the battles of Fredericksburg and Chancellorsville. In the battle of Gettysburg he commanded the Second Division of the Third Corps, and as such had an active share in the second day's fighting, earning promotion to a major-generalship in the volunteer service. From July 8, 1863, to November, 1864, he was chief of staff to General Meade, and subsequently commanded the Second Corps of the Army of the Potomac in Grant's final campaign against Lee. He was brevetted major-general in the Regular Army for services at Sailor's Creek, commanded the District of Pennsylvania for a time, and after being mustered out of the volunteer service was placed in command of the engineer corps with the regular rank of brigadier-general. He was retired from active service in 1879. He published: *The Virginia Campaigns of 1864 and 1865* (1882); *From Get-*

tsburg to the Rapidan (1882); and, with H. L. Abbott, a *Report on the Physics and Hydraulics of the Mississippi River* (1861).

HUMPHREYS, DAVID (1752-1818). An American soldier, diplomat, and poet, born in Derby, Conn., and educated at Yale College. At the outbreak of the Revolutionary War he entered the army as captain, became major of a brigade under General Parsons in 1777, was made aide to General Putnam in 1778, and in 1780 became Washington's aide and military secretary. After the battle of Yorktown he was put in charge of the colors and standards captured from the British troops, and for his services received from General Knox, in 1786, a sword voted by Congress five years before. In 1784 he acted as secretary of the commission, consisting of Adams, Jefferson, Franklin, and others, that went to Paris to arrange commercial treaties between foreign powers and the United States. He served in the Connecticut Legislature in 1786, participated in the suppression of Shays's Rebellion in 1787, and from 1788 to 1790 lived with Washington's family at Mount Vernon, where he wrote *An Essay Upon the Life of Gen. Israel Putnam*. From 1791 to 1797 he served as United States Minister in Lisbon, being the first diplomatic representative of the United States ever sent to Portugal; and was then made Minister Plenipotentiary to Spain. In 1802 he returned, bringing with him the first merino sheep introduced into the United States. During the War of 1812 he commanded the Connecticut militia. He was a fellow of the Royal Society of London, and a prominent member of the literary coterie known as the 'Hartford Wits,' with whom he wrote the *Anarchiad*. His other writings include: *The Widow of Malabar*, a translation of the French tragedy; *An Address to the Armies of the United States* (1782); *The Happiness of America*; *The Future Glory of the United States*; and many political papers and orations.

HUMPHREYS, HENRY VOEL (1810-79). An English author, illustrator, and naturalist, born in Birmingham. Much of his early life was spent in Italy. He provided the illustrations for Westwood's *British Butterflies* (1841), and for Loudon's *British Wild Flowers* (1856). He was the author of some numismatic handbooks, such as: *The Coins of England* (1846); *Ancient Coins and Medals* (1850); two volumes of illustrations for *Froissart's Chronicles* (1844); *Illuminated Books of the Middle Ages* (1844-49, with Owen Jones); and other works and illustrations.

HUMPHREYS, JOSHUA (1751-1838). An American shipbuilder of Revolutionary time. Welsh by descent, but a native of Haverford, Pa., he learned his trade in Philadelphia, and when it became necessary for the English colonies to have ships of their own with which to fight the mother country, Humphreys was their first builder. From that fact he was called 'the father of the American Navy.' He built such ships as the *Constitution*, *Chesapeake*, *Congress*, *Constellation*, *President*, and *United States*.

HUMPHREYS, MILTON WYLIE (1844—). An American educator, born in West Virginia. He was educated at Washington and Lee University, and at Leipzig and Berlin, and from 1869 to 1875 was adjunct professor of the ancient lan-

guages at Leipzig. Having held the chair of Greek at Vanderbilt University from 1875 to 1883, he was professor of ancient languages at the University of Texas from 1883 to 1887, and in the latter year became professor of Greek at the University of Virginia. In 1882 he was president of the American Philological Association, and for a number of years he was American editor of the *Revue des Revues*. His publications include excellent editions of *The Clouds* of Aristophanes (1885), and the *Antigone* of Sophocles (1891).

HUMUS (Lat., ground). A generic term for the decomposed organic matter contained in soil. During decomposition of vegetable matter the carbon, nitrogen, oxygen, and hydrogen pass off in the form of water, carbon dioxide, ammonia, etc., or are carried down into the earth in solution, while the remainder of the constituents form compounds less easily removed, to which the name humus is properly applied. These compounds have been investigated chemically, but little is known as to their nature and relations; special names have been given to a few of them, as erenic acid, apocrenic acid, ulmic acid, and ulmin. They are of importance in relation to the fertility of the soil, increasing its power of absorbing and retaining water, lessening its tenacity, and causing more rapid absorption of heat from the sun's rays. They may also indirectly afford nutrition to plant life. See SOIL; COMPOST.

HUMUS PLANTS. Plants which grow naturally in humus soil. Ordinarily in nature, where large amounts of humus are found, there is a rich development of forest trees. Associated very intimately with the humus, however, are a number of plants which depend not only upon the rich organic food found in the humus and in the shade furnished by the trees, but also upon the presence of fungi which permeate the humus. The significance of these fungi is discussed under the head MYCORHIZA. Until recently, the plants dependent upon humus have been called saprophytes, but inasmuch as more close investigation has shown that the dependence is very rarely directly upon the humus, but rather upon the fungi spoken of above, such plants are now referred to as symbiotic saprophytes. Among these are found not only plants destitute of chlorophyll, like the Indian pipe, but also a large number of green plants, even forest trees, such as beech and pine. See FOREST; SAPROPHYTE.

HU-NAN, hū'nān' (Chin., south of the lake, i.e. the Tung-ting Lake). An inland province of China, bounded on the east by the mountains of Kiang-si, on the south and southwest by the Nan-ling Mountains, which separate it from the provinces of Kwang-tung and Kwang-si, on the west by Kwei-chow and Sze-chuen, and on the north by Hu-peh (Map: China, D 6). Area, about 75,000 square miles. It is made up of the basins of four rivers, which discharge into the Tung-ting Lake and through it into the Yang-tse. The chief of these rivers are the Siang, which rises in the Nan-ling and flows north, receiving many tributary waters in its course; the Tsze; and the Yuen, which has its origin in the southeast of Kwei-chow, the latter furnishing the shortest and most satisfactory route to Kwei-chow, Yun-nan, and Burma, being navigable by native boats as far as Ch'en-yuan-fu

on the Kwei-chow frontier. The general slope of the province is toward the lake. Hills attaining in some places the height of mountains are found in the south, southeast, and along the Kwei-chow border on the west. The soil is fertile, and in many parts two crops a year are produced. The chief agricultural products are tea, rice, hemp, and tobacco. Hu-nan is one of the principal tea-producing regions of China, and immense quantities are shipped every year to foreign countries from Hankow. The coarser varieties are prepared in brick form and sent overland via Hankow to Siberia and Russia. Both bituminous and anthracite coal is found and mined. The anthracite is of good quality and is exported. Iron, copper, and tin are also found. Capital, Ch'ang-sha-fu. The population of Hu-nan is estimated at about 22,000,000. The inhabitants are noted for their lawlessness and their hostility to foreigners.

HUNCAMUNCA, hūn'ká-mūn'ká. The ingenious daughter of King Arthur and Queen Dollalolla in Fielding's burlesque *Tom Thumb the Great*.

HUNCHBACK, THE. The most successful comedy of J. Sheridan Knowles, produced in 1832. At Covent Garden, under Kemble's direction, Fanny Kemble played Julia, and the part of Master Walter was taken by the author himself.

HUNDRED (AS. *hundred*, Ger. *hundert*, from AS., Goth. *hund*, OHG. *hunt*, Ger. *hund*, OIr. *cēt*, Lith. *szimtas*, Lett. *simts*, OChurch Slav. *sūto*, Lat. *centum*, Gk. *ékarón*, *hekatón*, Skt. *śata*, hundred + AS. *-red*; connected with OHG. *radia*, Ger. *Rede*, account, speech, Goth. *raþjō*, Lat. *ratio*, reckoning, *veri*, to think). An ancient territorial unit in England, less than a shire or county, and usually greater than a parish or town. The origin of the name is involved in obscurity, but it is supposed to be derived from a convenient grouping of one hundred families for purposes of defense, or for local administration. Hundreds varied greatly in size in different parts of England, from two square miles in the southern counties, to three hundred square miles in Lancashire, but they maintained considerable uniformity within the limits of a given county. But they were not mere subdivisions of the county, being both historically and for various administrative purposes independent of the greater territorial division within which they were included. See WAPENTAKE; WARD.

Each hundred had a court of ancient and forgotten origin, which was known as the *Hundred Court*. This was held at frequent intervals and appears to have been of equal authority with the county courts, though its jurisdiction seems to have been more restricted, being apparently confined to civil causes, such as actions of debt and trespass. Like the other customary courts of the feudal period, such as the county courts, courts baron, and the like, the hundred courts were composed of the freeholders of the hundred, who were liable to do service as 'suits,' i.e. triers of suits, as one of the obligations of their freehold tenure. Most of these courts have been abolished and their jurisdiction transferred to the county courts, but a few, which were courts of record, have been permitted to survive.

But the hundred was more than a political

and administrative unit; it was also a communal unit. It was liable in damages for a false judgment given by the hundred court. As early as the reign of Edgar it was provided that the hundred should be responsible for the administration of justice and liable to punishment by fine or otherwise if thieves and other criminals were not brought to justice. The statute of Winchester in 1285 (13 Edw. I., c. 2) made the hundred liable to respond in damages for robberies committed within its limits if the offender was allowed to escape punishment. At a still earlier period it was subject to the famous murder fine, imposed by the laws of Canute upon any hundred in which any one not an Englishman was found slain. (See ENGLISHERY.) As lately as 1886 the hundred continued to be legally liable for damages resulting from rioting. Consult: Pollock and Maitland, *History of English Law* (2d ed., London and Boston, 1899); Stubbs, *Constitutional History of England* (Oxford, 1880).

HUNDRED DAYS, THE (Fr. *les cent jours*). The term of Napoleon's second reign as French Emperor. The period extended from March 20, 1815, the date of his entry into Paris, to June 28th, when Louis XVIII. once more assumed power. At Elba Napoleon had been kept informed of the dissension prevailing among the Allies at the Congress of Vienna, and of the extreme unpopularity of the restored Bourbons in France. Seizing the opportunity, he left Elba, February 26th, landed with 900 men near Cannes, and called upon the country to rise in his favor, March 1st. The apathy of the Bourbons at Paris allowed Napoleon time to recruit his strength. When Louis at last bestirred himself it was too late. The Napoleonic fever had spread, the soldiers of the Empire rallied around their old leader, and the troops sent out against him joined his standard. The final blow to the monarchy came when Ney, after great hesitation, went over to Napoleon, who entered Paris in triumph March 20th, Louis having fled northward to Ghent. Napoleon immediately organized a government, issued writs for the election of an extraordinary assembly to draft a new constitution, abolished the existing Legislature, and began to raise troops. Meanwhile the Allies at Vienna, on hearing of his landing, pledged themselves to hunt down the 'bandit' and to put it out of his power, once for all, to disturb the peace of Europe. Eight hundred thousand men were sent out against him. At Paris there was a foreboding that this sudden restoration could not last; but though men had lost much of the fear and respect Napoleon had been wont to inspire, the work of organization nevertheless went on actively. On June 1st, in the Champs de Mars, Napoleon solemnly swore to this new Constitution, which was very liberal in character, and then set out with his army, for he had succeeded in raising 287,000 men, for the north. (See LIGNY; QUATRE-BRAS; WATERLOO.) Four days after Waterloo, June 22d, he abdicated in favor of his son, attempted to escape to America, failed, and gave himself up to the English. See FRANCE.

HUNDRED YEARS' WAR, THE. The name of the long series of contests waged by the English kings, between 1337 and 1453, to gain the French crown and French territory. It was by

no means an uninterrupted war, but rather a succession of battles, truces, and peaces. The first great period of the war extends from 1337 to 1380. Philip VI. (1328-50), of the House of Valois, had succeeded Charles IV., the last of the direct descendants of Hugh Capet, since, in accordance with the Salic law (q.v.), the crown of France could be transmitted through the male line only, though Edward III. of England was a nearer relation to the late King, his mother, Isabella, being a sister of Charles. Edward's claim, however, was weak in this, that if females could transmit claims to the crown, then there were others who had even better claims than the English King. On June 6, 1330, and May 30, 1331, Edward by letters patent recognized Philip's claims, and had the latter been a more capable man, war might not have resulted. The French King interfered in the affairs of the Flemish cities, with which England had intimate commercial relations. Moreover, Edward was influenced by the exiled Robert of Artois, who had been unable to obtain his inheritance from Philip VI. Edward declared war in 1337, and gradually made alliances with the Emperor Louis IV. and John of Brittany, who was opposed by Charles of Blois, cousin of Philip VI., in his attempts to secure his inheritance. It is this war in Brittany which the great chronicler Froissart (q.v.) has especially described. On the other hand, Philip established that close alliance of France and Scotland which was to endure for centuries. There were many small skirmishes during the first years of the war, but neither side gained decisive victories, and on January 9, 1343, a truce was concluded for three years, each side retaining its possessions. Hostilities, however, were resumed in 1345. At this juncture the alliance of the Flemish cities was lost to England by the death of Jakob van Artevelde (q.v.), the leader of the Flemings, who perished in a popular tumult. On August 26, 1346, the English, under the leadership of Edward himself, won their first great victory at Crécy (q.v.), which showed that the French knights could not stand against the well-disciplined yeoman archers of England. The victors took possession of Calais.

Meanwhile France was already experiencing the evils of war; the distress of the peasants was great; financial troubles set in, made worse by the tampering with the coin and the ever-increasing taxes. The second great defeat of the French took place at Poitiers (q.v.) in 1356, where the famous Black Prince led the English, and where King John, the successor of Philip VI., was taken prisoner. The States-General now for a time had control of the Administration. Their leaders were Etienne Mareel, provost of the Merchants (q.v.), Robert le Coq, Bishop of Laon, and Charles the Bad of Navarre; but the revolt of the peasants (see JACQUERIE) in 1358 caused the more conservative classes to rally to the aid of the Dauphin Charles, who had been appointed regent by the States-General during King John's captivity. A brief breathing-spell was brought about in 1360 by the Peace of Breigny (q.v.). John died in 1364, and his son Charles V. (q.v.), who was to be known as the 'Wise,' succeeded him. Himself an unwarlike man, he had the help of a great soldier in Du Gueselin (q.v.). His object was to regain the lands his father had lost, and by interfering with

the possessions of the English in France, and attacking them in Spain, he forced a new war in 1369. Du Guesclin did not attempt to meet the English in the open, but harassed them, and cut off their supplies, and the English experienced a succession of misfortunes. Moreover, in 1376 the Black Prince died, and there was no one capable of taking his place; a year later Edward III. also died, and was succeeded by Richard II., a minor. When, in 1380, Charles VI. (q.v.) succeeded his father, few possessions remained to the English in France. In 1396 a truce for twenty-eight years was signed, which ended the first period of the war.

In France meanwhile Charles VI. had become insane, civil war broke out between the factions of the Armagnacs (q.v.) and the Burgundians, and Paris itself was distressed by the rising of the Cabochiens (q.v.) in 1413. In England Richard II. was overthrown by Henry IV. in 1399, and the latter was succeeded in 1413 by his son Henry V. But the House of Lancaster did not feel secure on the throne, and nothing would turn the attention of the people away from internal affairs as completely as a foreign war. So, in 1415 the war began again with the invasion of France by Henry V. France disunited offered an easy prey to the English, and soon the country was almost entirely in their possession, especially as they were aided by Philip, Duke of Burgundy (q.v.), who was eager to revenge the murder of his father, John the Fearless (q.v.). To the first year of this period belongs the battle of Agincourt (q.v.), the last of the three great English victories. On May 20, 1420, the Treaty of Troyes was signed, by which Henry V. was recognized as Regent of France and the heir of Charles VI., while the Dauphin was disowned by his own mother. The English held practically the whole of France.

In 1422 both Henry V. and Charles VI. died, and the former was succeeded by his son, Henry VI., a child of ten months, who was crowned Henry of France at Paris, his uncle Bedford being Regent. Charles VII., the successor of Charles VI., gave no signs of ability, and it seemed as if Henry VI. would really hold France permanently. But when affairs looked darkest France was saved by Joan of Arc (q.v.), who came forward and raised the siege of Orléans in 1429, thus turning the tide of war. From that time on the English slowly but surely lost ground, and when, in 1453, their last great captain, Talbot, fell at Castillon, the war ceased. Of all the extensive English conquests in France, nothing remained except the city of Calais and a small adjoining district. This France did not regain until 1558. (Oxford, 1873); Hardy, *La Guerre de cent ans* (Paris, 1877); Dognon, *Les Armagnacs et les Bourguignons* (Toulouse, 1890); Wallon, *Jeanne d'Arc* (Paris, 1875); Longman, *Edward III.* (London, 1869). See FRANCE; ENGLAND; and BURGUNDY.

HUNKEK, JAMES GIBBONS (1860—). An American musical writer and critic, born in Philadelphia, Pa. He was a pupil of Alfredo Barili, and of Ritter and Doutréau for theory, in Paris. On the completion of his studies in the latter city he returned to New York, where he took up his permanent residence (1885). He was musical editor, and in 1902 became dra-

matic editor, of the New York *Sun*. His numerous contributions to the leading magazines and reviews contain vigorous and consistent presentations of his musical ideals. His works include: *Mezzotints in Modern Music* (1899); *Chopin, as Man and Musician* (1900), probably the most sympathetic life of Chopin for either musician or layman; and *Melomaniacs* (1902), a volume of stories on musical subjects, characteristically clever and imaginative.

HUNFALVY, HUN'FÖL-VÉ, JÁNOS (1820-88). An Hungarian geographer. He was born in the County of Zips, Hungary; became professor of statistics in the Academy of Kesmark; took part in the political agitation preceding the revolution of 1848; and was professor of history in the polytechnic school at Buda (1866-70), and of geography in the University of Pest after 1870. He was elected a member of the Hungarian Academy in 1865, and died in Budapest. Hunfalvy wrote a *Universal History* (1850-51), and a *Universal Geography*; of the latter, only two volumes appeared during the author's lifetime; the third was published in Budapest in 1890. An excellent descriptive work on Hungary, entitled *A magyar birodalom természeti viszonyainak leírása*, appeared in 1863-66. He issued in German his *Ungarn und Siebenbürgen in Originalansichten* (1856), and in both German and Magyar his work on the *Travels of Ladislas Magyar* (1859).

HUNFALVY, PÁL (1810-91). An Hungarian philologist and ethnographer, brother of the preceding. He was born in the County of Zips, studied law at Pest, and from 1842 to 1848 was professor of law at Kesmark. Then he was elected to the Hungarian Diet, in which he sat until it was dissolved, when he went to Pest, and in 1856 founded the philological review *Magyar Nyelvészet*. Having been elected to the Hungarian Academy in 1859, he was for many years its librarian. He wrote: *Chrestomathia Fennica* (1861); *Utazás a Balt-tenger vidékein*, travels in the Baltic country (1871); treatises on the dialects of the Voguls (1872) and the Ostiaks (1875); a Magyar ethnography (1876; German by Schwicker, 1877); in Prochaska's series on the peoples of Austria-Hungary, a volume entitled *Die Ungarn oder Magyaren* (1881); and *Die Rumänen und ihre Ansprüche* (1883).

HUNGARIAN CONFESSION, THE. A confession of faith prepared by the Synod of Czenger, and adopted by the Reformed Church of Hungary, 1558. Its chief points were its emphatic rejection of the anti-Trinitarian views which had spread widely through Hungary of the Roman Catholic and Lutheran doctrines of the Eucharist, and of Anabaptism. Upon the point of reprobation it is silent. The Confession was superseded in 1567 by the Hungarian Synod's acceptance of the Second Helvetic Confession (1566). Consult Schaff, *Creeds of Christendom* (London, 1884). See CREEDS AND CONFESSIONS.

HUNGARIAN GRASS. See FOXTAIL GRASS.

HUNGARIAN LANGUAGE. Called by those who speak it, Magyar; one of the Ural-Altaic group of languages, and both politically and literarily the most important representative of the group. With the exception of the closely allied Finnish (including the various Finnic dialects spoken in Russia, as well as the Lapp) and

Turkish, and the problematic Basque in the Pyrenees, it is to-day the only European language that does not belong to the Indo-Germanic group. The Ural-Altaic languages are divided into: (1) The Finno-Ugric and (2) Samoyedic, forming the Ural branch; and (3) Turkic, (4) Mongolic, and (5) Tungusic, forming the Altaic branch. The linguistic position of Hungarian was for many years the subject of a heated controversy, one school led by Vámbéry claiming its close affiliation with Turkish, while the other, under Hunfalvy, placed it where it is now recognized to belong, in the Finno-Ugric division.

Hungarian, like other Ural-Altaic tongues, is agglutinative in structure. It is built upon a basis of monosyllabic roots, through the addition of successive suffixes, which entail no inner change or structural modification in the original stem, but are merely set up in a row, one after another, like a row of bricks. The suffixes themselves, however, are modified in obedience to a law of so-called vowel harmony, which forms the most distinctive feature of this group of languages. The vowel sounds in Hungarian are divided into three classes: Open vowels, a, á, o, ó, u, ú; close vowels, e, ö, ő, ü, u; middle or neutral vowels, é, í, i. These neutrals may be used indifferently in words containing vowels of either of the other classes; but suffixes containing open or close vowels may stand only after a root containing a vowel of the same class; e.g. *házban*, 'in the house'; *keriben*, 'in the garden'; *váratandának*, 'they will be expected'; *kéretendének*, 'they will be entreated.' Hungarian has no inflectional endings, in the strictest sense of the term. It has no grammatical gender, or even suffixes indicative of sex; ő means 'he' or 'she,' neki, 'to him' or 'to her,' and so on. In expressing case relations, the bare stem is used regularly for the nominative, and to some extent for the possessive; the other cases are represented by means of the various postpositive particles which in Hungarian take the place of prepositions: e.g. *ház*, 'house'; *házban*, 'in the house'; *házból*, 'out of the house'; *házelőtt*, 'in front of the house'; *házhoz*, 'toward the house'; *háznál*, 'with the house'; *házat*, 'house' (accusative); *házalatt*, 'under the house'; *házfelet*, 'above the house'; etc. A noteworthy peculiarity is the system of possessive suffixes employed with substantives, closely analogous to the personal endings of the verbs: e.g. *házam*, 'my house'; *házad*, 'thy house'; *háza*, 'his (her) house'; *házunk*, 'our house'; *házotok*, 'your house'; *házok*, 'their house.' In the absence of the auxiliary verb 'to have,' these possessive endings are used with the verb 'to be,' to denote ownership; *nekünk van házunk*, 'to us is house ours,' i.e. 'we have a house.' The verbal system in Hungarian is highly developed, giving the language a remarkable flexibility and a wide range of expression, though it offers to foreigners the chief difficulty in acquiring the language. There are two distinct forms of the verb, a definite and an indefinite form, differing throughout in their terminations. Their respective uses are exceedingly idiomatic, but in general the distinction between them depends upon whether or not the object of the verb is a definite person or thing: *látok*, 'I see'; *a kutyát látom*, 'I see the dog.' Hungarian is especially rich in derivative verbs. Not only are there suffixes which, added to the simple verbal

stem, form causative, frequentative, inceptive, intensive, diminutive, reciprocal, potential, and desiderative stems, but with the characteristic facility of agglutinative languages, two or more of these suffixes may be used in combination, resulting in such linguistic anomalies as reflexive-frequentative-potential, intransitive-diminutive-potential, and transitive-frequentative-causative-potential verbs. The following examples will give some idea of the formation of derivative verbs: *látni*, 'to see'; *látogatni*, 'to visit'; *beszélnek*, 'they talk'; *beszélgetnek*, 'they chatter'; *beszélkednek*, 'they talk with each other'; *ver*, 'he beats'; *verinthet*, 'he can beat gently.' Among the peculiarities of the language are: the two-person suffix, *lak*, used in place of the regular ending of the first person, when the subject of the verb is 'I,' and the object 'thee' or 'you'; the use of the singular number with ordinal numerals, e.g. *tíz ház*, 'ten house' (not 'houses'); and the inverted order of name and surname, e.g. Arany János = John Arany; Petőfi Sándor = Alexander Petőfi. The requirements of emphasis often allow the words in a short Hungarian sentence to be put in an order the reverse of that in English: e.g. *Pénzemet elvett szolgálom*, 'money-my away-took servant-my' ('my servant took (away) my money'). The extent to which agglutination may be carried in the Hungarian language will be illustrated by the fact that it is possible to perform the following operation of word-building: *Magyar*, 'Hungarian'; *Magyarázni*, 'to render into Hungarian,' hence 'to make clear,' 'to translate'; *megmagyarázni*, 'to translate,' with the added notion of the accomplishment of the action, the syllable *meg* having the force of the German *be* and *er*; *megmagyarázhat*, 'he may translate'; *megmagyarázhatatlan*, 'that cannot be translated,' 'untranslatable'; *megmagyarázhatatlanabb*, 'more untranslatable'; *legmegmagyarázhatatlanabb*, 'most untranslatable'; plural subs. *legmegmagyarázhatatlanabbak*, 'the most untranslatable'; *a legmegmagyarázhatatlanabbakal*, 'with the most untranslatable.' A large number of names of common things in the Hungarian language are borrowed from the Slavic and German. Consult Hunfalvy, *Die Ungarn oder Magyarern* (Vienna, 1881); id., *Ethnographic von Ungarn* (German trans. with additions by Schwicker, Budapest, 1877); id., *Vámbéry's Ursprung der Magyarern* (Vienna, 1883, refuting Vámbéry's theory of a Turkish relation); Riedl, *Magyarische Grammatik* (Vienna, 1858); Topler, *Grammar*, in German (Budapest, 1882); Singer, *Grammar*, in English (London, 1882); Ballagi, *German-Magyar and Magyar-German Dictionary* (3d ed., Budapest, 1874); Bizonfy, *English-Hungarian Dictionary* (ib., 1878); the *Dictionary of the Hungarian Academy of Sciences* (ib., 1862-74). See HUNGARY.

HUNGARIAN LITERATURE. Until modern times, literature in the vernacular did not flourish to any very great extent in Hungary. Latin was the general medium of cultured expression during the Middle Ages, and even recently it has sometimes sought to supplant the popular tongue in official and literary use. There are, however, documents in Hungarian or Magyar that belong to the mediæval period, most of them being translations of legends and of books of the Bible. The earliest continuous monument of Magyar is a funeral ceremonial dating from

about the beginning of the thirteenth century. From the middle of the fifteenth century until the second half of the sixteenth century there was some activity in the way of translating into Hungarian the lives and legends of the saints and the individual books of the Bible.

With the religious revolution ordinarily termed the Reformation there was inaugurated a more important era of literary production. Poetry was cultivated by Valkai, Tinódi, Rimai, Balassa; but no very great degree of originality marked the ensuing period, for from then until the closing years of the eighteenth century Magyar literature was chiefly one of imitation. Considerable attention, however, was shown to some of the more striking forms of literary art. Thus, during the sixteenth and seventeenth centuries lyric verse was cultivated; the drama was started by Karádi (1569); and much prominence was given in the seventeenth century to epic verse, by the poems of Zrínyi, Gyöngyösi, Liszti, and others. Before the commencement of the eighteenth century there also appeared many works of a polemical, legal, and philological nature.

During the eighteenth century an endeavor was made by the central authorities to subordinate Hungarian life and patriotic feelings to Germanic ideals. The attempt failed, but it resulted temporarily in an undue production of books in Latin and German, to the detriment of composition in Magyar.

Near the close of the century, and with the advent of the French Revolution, there was a reaction, and societies for the cultivation of the Magyar tongue were formed, and various periodicals (the first newspaper in Hungarian was started by Ráth at Pressburg in the eighth decade of the eighteenth century) founded in the same interest. The new movement, which coincided with the great national awakening in Hungary, bore rich fruit; and within the first quarter of the nineteenth century all foreign elements gave way before it. The credit of this is largely due to Francis Kazinczy, the great linguistic reformer, and the poets Csokonai, Dayka, Verseghy, Alexander Kisfaludy, and Virág. The golden age of Hungarian literature was the thirty years preceding the revolution of 1848-49. Charles Kisfaludy, brother of Alexander, created the Hungarian drama by his tragedies and comedies, and his contemporary Katona won great fame as a writer of tragedy. Kölesey, by his poems, ballads, prose writings, and orations, exerted a potent influence upon the patriotism of the nation. Fay's fables and Czuczor's and Vörösmarty's popular epics also did much to evoke and foster a true national feeling. In the lyrics of Alexander Petöfi, one of the greatest and most original of modern poets, whose "Up Magyars!" became the war-hymn of the Revolution, and in the epic verses and ballads of Arany, Hungarian literature reached its culmination in the middle of the nineteenth century. Their contemporary, Bajza, was not only an eminent lyrical poet, but an historical writer and æsthetic critic. Jósika (a disciple of Scott's) and Eötvös, eminent in the field of fiction, exercised a large influence. In the domain of political literature and journalism Széchenyi, Kossuth, Eötvös, and Csengeri hold high rank. In the field of history Horváth, Jászay, and Szalay deserve mention. In 1848 the powerful national awakening culminating in revolution supplied a new inspiration. Na-

tional consciousness prompted Tompa's *Folk-tales and Folk-Sagas* (1846), and Erdélyi's *Hungarian Folk-Songs and Tales* (1846-48), with literary and æsthetic essays. Erdélyi's *Poems* (1844), lyric in the main, exercised a powerful influence over the famous trio, Petöfi, Arany, and Tompa. Arany (1817-82), the greatest ballad writer, surpassed him in formal perfection, and his greatest work also was a national epic, *Toldi*, in twelve cantos, celebrating the exploits of Toldi, the Hungarian Samson. Tompa (1819-68), unexcelled for sombre melancholy, struck the popular fancy with his *Poems* (1847). In drama, Szigligeti (1814-78), with a wonderful mastery of dramatic development and situation, mostly based on intrigue, created a new genre with *The Deserter* (1843), which still holds the boards. His masterpiece, *Mamma* (1857), and other successful plays called forth a host of successors, with the results that the Viennese farces and vaudevilles were banished from the Hungarian stage.

However, the Revolution of 1848-49 doomed many gifted writers to the dungeon, the scaffold, or exile. Lyric poetry was under the ban; the activity aroused sought new channels. Arany translated Shakespeare, Tasso, Goethe; Szász followed suit with masterly versions of Molière, Hugo, Dante, Shakespeare, Tennyson, Goethe, Schiller, and Heine. At this time the novel, with its opportunities for covert allusions, and the drama gained ascendancy. Jokai (1825—), novelist, poet, publicist, historian, and political champion, won his reputation, and Szász (1829—) proved his genius equally prominent in lyric poetry, fiction, and journalism. In 1860 the Austrian restraint was modified, and this gave a new impetus to literature. Tolnay's (1837—) *Ballads* (1861) were justly classed with Arany's; his *Lyric Poems* (1865) are strikingly original and tinged with melancholy, while the same brooding over life's problems characterizes his novels. Madach (1826-64) grappled with philosophical questions in *Man's Tragedy*, his best work. Rákosi (1842—) produced in *Esope* (1866) a comedy remarkable for poetic language and deft character-drawing, while his keen drama, *Magdalen*, and the æsthetic study of tragedy are among the best contributions to Hungarian drama.

The constitution of 1867 marked a new epoch: the fight for nationalism being over, the Hungarians could look more soberly upon themselves, the wider horizons of cosmopolitanism having opened new vistas. In short stories, novels, and especially in his comedies, *The Good Patriots* (1872) and *New Men* (1873), Toldy (1844-79) gave splendid satires of contemporary life. Csaky (1842—), the most fertile playwright, elicited applause with his *Proletarians*. Hungarian literature has its realistic writers, its psychological fiction, the short stories of Gyulai (1826—), who fosters the highest literary ideals in his *Poems* (1882), his critical studies and university lectures. Abrány (1849—), in the character-play, *The Infallible Man* and the novels, *Who Is Stronger?* and *The Philosophy of the Husband*, devoted himself to a study of the problems of marriage. Mikszáth (1849—), probably the most popular novelist of the day, champions the peasants in North Hungarian village stories, matchless in their style, language, and sympathetic tone. Finally Bródy, a wonderful complex

of unusual powers and nonchalance in workmanship, represents symbolism hand in hand with the most uncompromising realism.

Consult: Toldy, *A magyar nemzeti irodalom története* (*A Description of the National Literature of Hungary*) (Budapest, 1851); the first volume, which deals with the mediæval period, was translated into German (ib., 1865); Dux, *Aus Ungarn* (Leipzig, 1880); Schavieker, *Geschichte der ungarischen Litteratur* (Leipzig, 1889); Neményi, *Das moderne Ungarn* (Berlin, 1883). Professor Beöthy, of the University of Budapest, is now preparing a history of Hungarian literature which is to be published in Gosse's English series of *Literatures of the World*.

HUNGARIAN VERSION. See BIBLE.

HUNGARY, or, officially, **THE LANDS OF THE HUNGARIAN CROWN.** A kingdom of Central Europe, constituting one of the units in the dual monarchy of Austria-Hungary. It occupies a compact area of 125,039 square miles, comprising Hungary proper, with Transylvania and the crownlands of Croatia and Slavonia and Fiume, which are united to Hungary, but have more or less independent administrations. The lands of the Hungarian Crown are often designated as Transleithania, or the country beyond the Leitha, the Austrian half of the monarchy being called Cisleithania, or the country on this side of the Leitha, the Leitha being a small river which forms a part of the boundary between the two divisions. The Hungarian name of the country is Magyarország (pronounced möd'yör-ör'säg), the 'land of the Magyars' (Hungarians); the German name is Ungarn. The Kingdom of Hungary, exclusive of Croatia and Slavonia, has the form of an oval with its longest axis lying east and west along the parallel of 46° N. It is encompassed for two-thirds of its perimeter by the broad curve of the Carpathian Mountains, which, beginning at the Danube a short distance below the Austro-Hungarian capital, Vienna, extend northeast, then east, then southeast and south, and finally west, forming a great wall on the side of Moravia, Galicia, Bukowina, and Rumania. On the west Hungary proper borders on Lower Austria and Styria, and on the south, for a distance of about 100 miles, on Servia, from which it is separated by the Danube. Southwest of Hungary proper, and separated from it by the Drave and the Danube, is the dependent Kingdom of Croatia and Slavonia, a great part of whose southern boundary is formed by the Save, separating it from Bosnia and Servia. Croatia has a coast-line on the Adriatic, and on an arm of this sea is Hungary's busy port of Fiume.

TOPOGRAPHY. The two great orographic features of Hungary are the Carpathians and the vast plains which they inclose in their broad sweep of about 800 miles. Croatia and Slavonia are traversed by the eastern offshoots of the Alps. The Carpathians spread out laterally in minor ranges, and a large portion of Transylvania, in the extreme east of the Kingdom, is covered by them. The loftiest portions of the Carpathians are the High Tatra range in the north and the

Transylvanian Alps in the southeast, which rise in peaks over 8000 feet above the sea. The culminating point of the High Tatra is the Gerlsdorferspitze, 8737 feet. The Carpathians, rising above their densely wooded lower slopes, present an imposing aspect, with their naked granite peaks, on whose summits but little snow rests through the winter. The great stretch of monotonously level land in the central and southern parts of Hungary proper is divided into the Little Hungarian and the Great Hungarian plains. The Little Hungarian Plain (Kis-Alföld) in the northwest comprises an area of about 5000 square miles, with a mean elevation of 450 feet. A portion of its surface is swampy, but for the most part it is exceedingly fertile. The Great Hungarian Plain (Alföld), which is the basis of Hungary's agricultural wealth, and the principal seat of the Magyar nationality, lies in the centre of the country between the Danube and the northeastern highlands. It covers an area of nearly 40,000 square miles, and lies at an average elevation of 325 feet above the sea. Its surface has a very gradual slope from north to south. Low hills of loess and sand, with deep, swampy hollows, lend the only appearance of relief. The surface is to a great extent treeless. The soil, especially in the broad alluvial lands, is exceedingly fertile. In spite of its monotony, the Alföld, with its interminable expanse, its boundless fields and wide-spreading villages, its great herds of cattle and droves of horses, and its picturesque types of peasants, herdsmen, and fishermen, is a region replete with interest for the traveler, and with poetical charm for its inhabitants.

HYDROGRAPHY. The Danube receives the drainage of the entire country, except a small area in the north, which is drained into the Vistula. The course of the Danube from Pressburg to Orsova measures nearly 600 miles, and the river is navigable throughout. The principal tributary from the north is the Theiss (Tisza), which traverses the Great Hungarian Plain, and the principal affluent of which is the Maros; from the west and south the Danube receives the Drave and the Save. There are two large lakes in Hungary, the Balaton (Platten See), with an area of over 400 square miles (including submerged marshes), and the Neusiedler See or Fertö, 110 square miles, both lying in the western part, south of the Danube. In the Carpathians there are many beautiful little lakes of great depth, to which the Hungarians apply the name tengerszem, or 'eye of the sea.'

CLIMATE. Hungary may be divided into two main climatic belts, the highland belt forming the northern, eastern, and southeastern portions, and the lowlands occupying the great central and southwestern parts. The winter, however, is severe throughout the country, and in the highland region the temperature sometimes falls as low as -18° F., while in the lowlands it seldom falls below 5°. The summers are oppressively hot in the central lowlands, the Alföld, where the mercury rises to 95° or even 105°. The rainfall differs considerably between the highlands and the lowlands, the annual precipitation in the former being 47 inches, and in the latter only half as much. The Alföld suffers frequently from prolonged droughts, but may at other times receive even excessive rains.

GEOLOGY AND MINERAL RESOURCES. Hungary

stands in marked contrast to Austria, in that by far the greater part of its surface consists of geologically recent formations. The Great Plain, watered by the Danube and the Theiss, presents an almost unbroken surface of Quaternary and recent alluvial deposits, while the great northern and eastern mountain systems show a preponderance of Tertiary rocks on their surface. The Croatian and Slavonian highlands are of Jurassic and Triassic formation, and here also are the chief outcroppings of the coal-measures. Archaean diabases and granites occur in western Transylvania, and along the entire southern slope of the Carpathian Mountains runs an extensive belt of volcanic rocks. The nuclear mass of the Carpathians is largely constructed of granite. Hungary possesses a very considerable mineral wealth. There are great deposits of coal, iron, and salt; lead, copper, silver, and gold are found in various localities, the last mentioned chiefly along the rivers of Transylvania. Antimony, cobalt, nickel, mercury, and zinc also occur, and among the non-metallic minerals there are precious stones, kalin, marble, and porphyry. The Hungarian opal is particularly worthy of mention. It is only within recent times that the wealth of coal and iron has begun to be exploited on a large scale. The deposits of salt in the county of Mármaros, in the Eastern Carpathians, which are worked by the State, are practically inexhaustible. (See table, under AUSTRIA-HUNGARY.) There are hundreds of mineral springs scattered throughout Hungary. Among the most celebrated are those at Tatra-Füred (Schmek), in the Northern Carpathians, Mehádia (Baths of Hercules), near Orsova, and the Iron Gate of the Danube, and Füred, on Lake Balaton, and Harkány, near Fünfkirchen (Pées).

AGRICULTURE, LIVE STOCK, FORESTS, ETC. Hungary is preëminently an agricultural country, about three-fourths of the total population being included in the agricultural class. The country made marked progress, both in the extent of the industry and in respect to agricultural methods, during the last two decades of the nineteenth century. Indeed, the development recently made in this and in other phases of its economic life has won for the country the appellation of the 'European Japan.' In respect, therefore, to its agricultural system, it belongs to Western Europe, and contrasts sharply with the adjoining regions to the east and south. A large majority of the cultivators of the soil are independent land-owners. In 1895 48.5 per cent. of the total area (excluding properties consisting only of woods or pastures) was included in holdings which ranged in size from 5 to 100 acres. There are, however, a great many large estates belonging to the State and to members of the nobility, upon which the prevailing system of agriculture is very similar to that in vogue upon the large English estates. The improvement in agriculture is largely indebted to the activity of agricultural societies. The natural conditions are generally favorable to the industry, the great fertility of the soil being especially a marked feature of the Hungarian plain. In some respects this plain is comparable to the Western prairies of the United States, but, like that region, it is subject to an uncertain rainfall, and it contains considerable stretches of sandy, arid land as well as marshy tracts, which have never been

brought under cultivation. While the products of the country are characterized by their great variety, Hungary is best known for its production of wheat, live stock (including horses), and wine, the first two entering the European markets in competition with American products. The area devoted to wheat increased from a little less than 6,500,000 acres (on an average) during the period 1881 to 1885 to 8,142,000 acres in 1900, and has become greater than the combined acreage of rye, barley, and oats, which are about on a level with each other in importance. The increase in the area devoted to wheat was principally in the sandy and previously uncultivated tracts of Central and Southern Hungary. Increased attention is also being given to corn, 5,469,000 acres having been devoted to its cultivation in 1900. A large variety of root crops are grown, of which the potato leads in importance, followed by beets, much less than half of the latter crop being sugar-beets. The yield of the principal agricultural staples will be found in the table under AUSTRIA-HUNGARY. Vine culture is extensively carried on in the hilly districts, the Hungarian wines being the most superior known to the market. The most famous Hungarian wines are those that bear the name of Tokay. During the latter part of the nineteenth century the phylloxera devastated the Hungarian vineyards, and their area greatly decreased. From an average of 367,360 hectares (907,747 acres) in the period 1881 to 1885 it decreased to 202,865 hectares (501,279 acres) in 1895, but had increased again in 1900 to 221,838 hectares (548,162 acres). Hungary has an extraordinary wealth of temperate-zone fruits. The grapes are unsurpassed in flavor, and the plums and watermelons are of an excellent quality. Apples, pears, cherries, etc., are very extensively raised, and some semi-tropical fruits are cultivated in the south. Nuts are found in great variety. There is a considerable production of tobacco, but this is under the monopoly of the Crown.

The Hungarian horse, though not large, is in great demand in the European market, because of its endurance and swiftness. The superiority of the breed is due to the care of the Government, which selects and owns most of the stallions kept in the country. The fondness of the Hungarian for horses is well expressed in the saying, "The Magyar was created on a horse." The number of horses in 1895 was 1,972,930. In the same year there were 5,829,483 head of cattle, 7,526,783 sheep, 6,446,134 hogs, and 286,392 goats. As compared with the figures of the 1884 census, there was a decided increase in all varieties of live stock, excepting sheep, the latter having suffered a large decrease. In some sections buffaloes are used in considerable numbers in tillage. The Hungarian oxen are characterized by the extraordinary spread of their horns. The principal forest area is in the Carpathian Mountains, and consists of forests of beech, oak, and pine. The numerous rivers of the country are rich in fish, and thus contribute an important item to the food-supply of the people.

MANUFACTURES. Since no duties can be collected upon the imports from Austria, the Hungarian manufacturing industries must compete with the long-established and highly developed Austrian industries; but in spite of this, much progress has been recently made. The Govern-

VIENNA and Vicinity.

SCALE OF MILES

10 12 14 16 Longitude East E

AUSTRIA-HUNGARY.

Austria-Hungary consists of the Austrian Empire and the Hungarian Kingdom. The provinces of Austria are: Lower Austria, Upper Austria, Salzburg, Styria, Carinthia, Carniola, Kustenland, Tyrol and Vorarlberg, Bohemia, Moravia, Silesia, Galicia, Bukowina and Dalmatia. Capital, Vienna. Liechtenstein forms a part of the Austrian Customs Union. The Hungarian dominions include Hungary, Town of Fiume, Croatia, and Slavonia. Capital, Budapest. Bosnia and Herzegovina are administered by the Austro-Hungarian Government. Novibazar is under Austrian military occupation, though administered civilly by Turkey.

Railroads:

ment has sought to encourage industries by favorable legislation, such as exemption from taxation. Most of the industries are being thoroughly modernized—concentrated under large plants, with highly improved machinery. The leading industries are those which draw their supplies from the abundant agricultural products of the country—flour-milling, brewing and distilling, sugar and tobacco manufactures, etc. Iron products, clothing, and many less important items are also included among the manufactures. Many of the large establishments are centred in Budapest.

TRANSPORTATION AND COMMERCE. In respect to railway mileage, Hungary will compare favorably with other European countries. Including Croatia and Slavonia, there were in 1899 10,500 miles of railway lines, about four-fifths of which were owned by the State, while the greater part of the remainder was operated by the State. Hungary has the distinction of having first applied the 'zone-tariff' system to its railroads. The Danube and its tributaries afford extensive facilities for water transportation. The navigation of some of the rivers, notably the Theiss, has been greatly improved through the shortening of the course by means of numerous cuts. The limited coast-line tends to restrict the country's participation in the sea-going trade. The principal port, however, Fiume, is rapidly growing in importance, and a subvention is granted to Hungarian vessels registering in this port, the number of which is rapidly increasing. Over three-fourths of the imports are from Austria, which takes a not much smaller proportion of the exports. This arises from the fact that the two countries are mutually complementary in respect to their products, and that trade between them is free, whereas there is a tariff barrier to the trade with other countries. Grain, cattle, and other farm products pass from Hungary to Austria in return for manufactured products, principally textiles. Germany occupies a second place in the trade with Hungary.

GOVERNMENT. The Emperor of Austria is King of Hungary. The foreign and military and naval affairs of the Austro-Hungarian Monarchy are conducted jointly by Austria (Cisleithania) and Hungary (Transleithania) through the medium of common ministries (including a ministry for the common finances) and the so-called Delegations representing the separate halves of the Monarchy. The crownland of Croatia-Slavonia enjoys autonomy in local affairs, having its own Diet and its own Ban or Governor. It is, however, also represented in the Hungarian Diet. Since 1867 Transylvania has been an integral part of Hungary. In the national Hungarian Parliament the Magyar interests are predominant, and the Magyar language is official throughout Hungary proper, being obligatory in schools, etc. Croatia and Slavonia are allowed the official use of their native language. A full exposition of the government and the educational system, and a statement of finances, will be found in the article AUSTRIA-HUNGARY.

POPULATION. The population of the Lands of the Hungarian Crown in 1900 was 19,254,559, or 153 per square mile. This was somewhat more than two-fifths of the population of the Austro-Hungarian Monarchy, exclusive of Bosnia and Herzegovina. There are a large number of racial elements represented in Hungary, and the

bitterness of racial feeling is the occasion of much political and social friction. The Magyar-speaking population numbers about 9,000,000, but this figure includes a large number of persons not of Magyar blood. The Rumans (Wallachs), mostly in Transylvania, number about 3,000,000, and the Southern Slavs (Croats and Serbs) are nearly as numerous. The Northern Slavs number about 2,500,000, about four-fifths of them being Slovaks, and the remainder mainly Ruthenians. Hungary has a German-speaking population of over 2,000,000. The Germans constitute an important element in many of the cities, and in Transylvania there is a German-speaking district known as the 'Saxon Land.' There are over 850,000 inhabitants of Jewish blood, most of whom are included in the Magyar-speaking population. Next to Rumania, Hungary contains a larger number of gypsies than any European country. They form a picturesque element in the population, and their music is quite a feature in the charms of rural life in Hungary. There are a number of Armenians and Bulgarians in the Kingdom. The population of Transylvania consists mostly of Rumans, and the Magyar element is but feebly represented in Croatia and Slavonia. The Magyars are, as a rule, the land-owners of the country. Hungary is unique among progressive European countries in the extent to which the different races still retain their own peculiar and long-established costumes. The costume of an Hungarian peasant is made of a linen shirt with long sleeves, reaching to the knee; a bodice ornamented with metal buttons or cords; wide linen trousers or tight-fitting ones, made of black or blue cloth, and stuck into leather boots ornamented with cords; a black round hat with feathers, or a black fur cap for head-dress, and a cloak made of close, coarse cloth and trimmed with fur, cords, etc., or a wide sleeveless sheep-skin coat, worn also to some extent in summer. The costume of the Hungarian peasant woman is also very picturesque, and is made usually of lighter materials. The population is very largely centred in villages, some of which contain several thousand inhabitants, but there are a few large towns. Budapest in 1901 had a population of 732,322, or more than twice its population in 1881. Szegedin, with a population in 1901 of 102,991, is the only other town containing over 100,000 inhabitants. Cities having between this and 50,000 inhabitants in the order of size, are: Szabadka (Maria-Theresiopel), Debreczin, Pressburg (Pozsony), Hódmező-Vásárhely, Agram (Zágráb), the capital of Croatia and Slavonia, Keeskenét, Arad, Temesvár, and Grosswardein (Nagy-Varád). Other well-known towns are: Klausenburg, Kronstadt, and Hermannstadt, the three principal places of Transylvania; Fiume, Kasehau, Oedenburg, Stuhlweissenburg, Raab, Eszék, and Gran (Esztergom), the seat of the Catholic Primate of Hungary. The population of the Kingdom of Hungary, in 1900, according to religions, was as follows: Roman Catholics, 9,920,000; Orthodox Greeks, 2,816,000; Calvinists, 2,441,000; Lutherans, 1,289,000; United Greeks and Catholic Armenians, 1,854,000; Israelites, 851,000; Unitarians, 68,500.

HISTORY. The Hungarians, or, as they call themselves, the Magyars, have been settled in their present abode just 1000 years. They constitute a branch of the Finno-Ugrian race (Uralo-

Altaic family), their nearest kin being the Finns. (See HUNGARIAN LANGUAGE.) They figure in the old writers as Ugri, Wengri, Ungri, Ungari, Hungari. Hungary, south and west of the Danube, was included in the Roman Province of Pannonia. The southeastern portion formed part of the Roman Province of Dacia. At the time of the great migration of nations which overwhelmed the Roman Empire of the West and in the succeeding period, the middle basin of the Danube was overrun by Germanic peoples (Ostrogoths, Gepidæ, and Longobards), by non-Aryan peoples (Huns and Avars), and by the Slavs. The Avars, who had established a realm in Pannonia, were conquered by Charles the Great, King of the Franks, at the close of the eighth century. A century later the Magyars (Hungarians) left their abodes on the plains to the east of the Carpathians (whither they are supposed to have come from the original home of the Finno-Ugrian race in Western Siberia), and moving westward under the lead of Arpád, who is sung as a great national leader by the Hungarians, they descended about 896 into the region which was to take its name from them. The invaders were a barbarous horde, who for more than half a century were the terror of the nations to the west and the south. They broke up the Moravian realm, made incursions into Germany and Italy, everywhere pillaging, burning, and slaughtering, and awakening superstitious terrors in the minds of the inhabitants, and carrying their devastations almost to the Straits of Dover. At last the German kings succeeded in putting an end to their onslaughts. They were defeated in 933 by Henry the Fowler on the Unstrut, and Otho the Great vanquished them on the Lech in 955. Forced to accommodate themselves to a settled existence, and in possession of a fruitful domain, the Hungarians showed themselves amenable to the civilizing influences emanating from without, and among other things they developed a capacity for the adoption of political institutions based upon Western models. Shortly before the close of the tenth century their ruler, Gejza, embraced Christianity, which began to take root in the nation. His son Stephen, the first King of Hungary, known as the Saint, was crowned in the year 1000 (some years after he began his rule), with a crown sent him by Pope Sylvester III., who at the same time bestowed on him the title of 'Apostolic Majesty.' With Saint Stephen, whose reign of over forty years terminated in 1038, a new era began for Hungary; Christianity took the place of heathen superstitions; the royal authority was firmly established; new laws were made, and the people advanced rapidly in civilization. After Stephen's death there was a reaction, and his immediate successors had to contend against a pagan revival and a general tendency to disintegration. Ladislas I., the Saint (1077-95), renowned for his wise legislation and for great personal valor, proved a worthy successor of Stephen; and under his rule Hungary again became a strong kingdom, with its boundaries increased by the acquisition of part of Croatia. Coloman (Kálmán) (1095-1114), known as the 'Learned,' was far in advance of his age, as many of his laws show. He gained possession of Dalmatia. Under King Gejza (1141-61), German colonists settled in Northern Hungary and in Transylvania, in consequence of which mining and several branches of industry

made rapid progress. Andrew II. (1205-35) is known in connection with the Crusades. The Golden Bull, the Hungarian Magna Charta, was extorted from him by his nobles in 1222. Béla I. (1235-70) showed great qualities in subduing the pride of the nobles and in healing the wounds of his people after the terrible invasion of the Mongols in 1241. Andrew III. was the last male scion in the Arpád line—dying without issue in 1301. The crown of Hungary now became elective.

The succeeding period of Hungarian history, terminating with the battle of Mohács in 1526, witnessed the culmination and decline of the independent monarchy. Louis I., called the Great (1342-82), was the second King of the House of Anjou, which obtained the throne in 1307, being by his great-grandmother connected with the Arpád dynasty. Louis extended the power of the Hungarian kings over Moldavia and Wallachia, Bosnia, Servia, and parts of Bulgaria. In 1370 he was elected King of Poland. At home he reestablished the authority of law, which under his predecessors had been openly violated by the powerful nobles. He promoted science, industry, and commerce. Sigismund (1386-1437), the son-in-law of Louis, succeeded him as King, but he is better known as Holy Roman Emperor. In the person of Sigismund's son-in-law, Albert V. of Austria (1438-39), the Hapsburgs first came into possession of the Hungarian throne. After his death the country was for a few years under the rule of King Ladislas of Poland, who was overwhelmed and slain by the Turks at Varna in 1444. He was succeeded by Ladislas the Posthumous, the son of Albert of Hapsburg, under whom the government was administered by John Hunyadi, an heroic figure in the wars between Christendom and the Turks. Hunyadi's son, Matthias I., ascended the throne in 1458. Matthias I.—better known as Matthias Corvinus—has been called not only the greatest King of Hungary, but also the greatest sovereign of his age. By his military successes, sagacity, and love of learning he raised his nation to a high pitch of splendor. From the death of Matthias (1490) to the fatal day of Mohács, Hungary exhibited the fiercest strife of factions—a protracted agony, preceding the loss of national independence. Among the many calamities during the reign of Ladislas of Bohemia (1490-1516), the peasant war occupies a prominent place. Dózsa (q.v.) and his insurgent bands, after having committed great havoc, were exterminated by the famous John Zápolya, Waywode of Transylvania. Louis II. (1516-26), who was also King of Bohemia, was but ten years old at the death of his father, Ladislas. The Turks, who had been making incursions into the Kingdom since the early part of the fifteenth century, took advantage of the anarchy under the young Louis to attempt the conquest of Hungary. In 1521 they captured Belgrade, and on August 29, 1526, an army of 100,000 men under Solyman the Magnificent crushed the forces of the Hungarians at Mohács, where the King and more than 20,000 of his men perished. The national party in Hungary chose John Zápolya, Waywode of Transylvania, to be Louis's successor, while a part of the nobles offered the royal crown to Ferdinand of Austria (brother of the Emperor Charles V.), between whom and Louis a double marriage connection had existed. After

a struggle between the rivals and fresh invasions by Solyman the Magnificent (who had given his support to John Zápolya), Hungary, after 1541, remained rent into three parts. The central part of the Kingdom, with the capital, Buda, came into the immediate possession of the Turks.

The Austrian power for a long time was confined to the western part of the country. The religious policy of the Hapsburg Emperors and the activity of the Jesuits excited the fierce opposition of the Protestants, which culminated in 1604 in a great rising, headed by Stephen Bocskay (q.v.), who in the Peace of Vienna, in 1606, forced the Emperor Rudolph II. to grant religious freedom to his Protestant subjects in Hungary. At the beginning of the Thirty Years' War (1618-48), and toward its close, the princes of Transylvania were in arms for the Protestant cause against the Hapsburgs. Ferdinand III. (1637-57) was compelled to concede a large measure of self-government and religious freedom to the Hungarians; but his successor, Leopold I., initiated a policy of repression which led to a formidable uprising under Tökölyi (1678), who summoned the Turks to his aid. In 1683 Vienna, the capital of the Hapsburgs, after a heroic defense, was on the point of falling into the hands of the Moslems, when the victory achieved before the city by John Sobieski and the German princes turned the tide of war, and the power of Turkey collapsed. Buda was recovered by the Christians in 1686. After sanguinary vengeance had been wreaked on the leaders of the rebellion, Leopold I. forced the Hungarians in 1687 to declare the crown of Hungary forever hereditary in the House of Hapsburg. The dominion of the Turks rapidly disappeared from Hungary; the Treaty of Karlowitz (1699) left only the Banat in their hands; and that, too, was acquired by the Treaty of Passarowitz (1718) as a result of the victories of Prince Eugene. The Treaty of Karlowitz also secured Transylvania to the Hapsburgs. In 1703 Francis Rákóczy excited the Hungarians to rise in defense of their liberties against the Austrian House, and a struggle ensued which was not terminated until 1711, when Charles VI., immediately after his accession, found it necessary to come to terms with his Hungarian subjects. Charles VI. succeeded in gaining the approval of the Hungarians for his Pragmatic Sanction by the grant of extensive privileges; and after the Emperor's death, when the onslaught of Frederick the Great, the Saxons, the Bavarians, and the French threatened the dismemberment of the Austrian realm (1741), the nation rallied to the support of the young Queen, Maria Theresa, who had appealed to the National Diet, assembled at Pressburg. During her reign Hungary enjoyed an era of progress and prosperity. The reforms of Joseph II., her son and successor (1780-90), were received with violent opposition, because of their attack on the local liberties of the people through the institution of a strongly centralized administration. Bitter dissatisfaction was also aroused by the Emperor's attempts to make German the official language of the country. In 1790 Joseph II. saw himself driven to repeal his measures of reform, except those dealing with the abolition of serfdom and the establishment of freedom of worship. Under Leopold II. (1790-92) the old Constitution was restored; but his successor, Francis I. (1792-1835), ruled in an arbitrary

fashion, and seldom troubled himself to assemble the Diet. In his reign a great political upheaval began to manifest itself in Hungary. The period after 1815 witnessed the rapid development of an intense national (Magyar) consciousness, which evinced itself in the demand for a strictly constitutional government and the enactment of widespread reforms. The strife of parties was carried from the legislative hall to the press, and the Liberals grew in strength as their support among the mass of the people increased. This great national and reform movement, which was headed by such men as Széchenyi, Batthyányi, Eötvös, Deák, and Kossuth, and which was accompanied by remarkable activity in the field of literature, constitutes a brilliant and stirring episode in the annals of Europe in the second quarter of the nineteenth century. Notable gains were the law of 1843, which made men not of noble blood eligible for office, and the enactment of measures for making the Magyar tongue the official language of Hungary. The revolutionary movement of 1848, which, emanating from France, convulsed a great part of Europe, brought upon Hungary a sudden and terrible catastrophe. In March of that year, immediately after the downfall of Metternich, who had so long guided the reactionary policy of Austria, the Hungarians were accorded an independent Ministry. Under its guidance the progress of liberal reform continued. But the hostile attitude of the Austrian Court toward the new order, and the encouragement which it gave to the Croats and Wallachs, who rose in revolt against the Magyar rule, resulted in an open war between the House of Hapsburg and Hungary, which, under the lead of Kossuth, declared its independence in April, 1849. After an heroic struggle (the details of which will be found in the article AUSTRIA-HUNGARY), Hungary succumbed to the combined forces of Austria and Russia, and was deprived of its constitutional liberties and treated as a conquered country. Before many years, however, the Emperor Francis Joseph was forced to recognize the necessity of some kind of reconciliation with his Hungarian subjects, and the blow sustained by Austria at the hands of Prussia in 1866 brought about the reërection of Hungary as a constitutional kingdom. The demands of the Hungarian people, as set forth by their great spokesman, Francis Deák, were acceded to in the Ausgleich of 1867, by which the present dualistic frame of the Austro-Hungarian Monarchy was established. The settlement was sealed by the coronation of Francis Joseph as King of Hungary on June 8, 1867, the ceremony taking place at Buda with extraordinary pomp. The revived Magyar people now set itself with ardor to the task of the strengthening of its nationality, the introduction of political and ecclesiastical reforms, the extension of public education, and the development of the economic resources of the country. The nation enthusiastically followed the lead of the great Francis Deák, who, at his death, in 1876, had an able successor in Tisza. The patriotic zeal of the Magyars has at times transgressed the bounds of moderation, and the measures taken to extend the use of the Magyar tongue have excited fierce opposition, especially in Croatia. The economic progress of Hungary in the last three decades has been almost unprecedented, and the energy and enterprise displayed in the building of railways, the

construction of public buildings, and the commercial expansion of the country have elicited the wonderment of travelers. In 1896 the millennial anniversary of the coming of the Magyars was celebrated by a national exposition held at the capital.

HUNGARY WATER. A celebrated perfume or toilet water, the original receipt of which was given to a queen of Hungary by a hermit, in consequence of which it was called the 'Queen of Hungary Water,' subsequently abbreviated to 'Hungary Water.'

HUNGER. See DIGESTION.

HUNGERFORD, Mrs. MARGARET WOLFE (c.1855-97). An Irish novelist, known by her pseudonym The Duchess, though the majority of her books were published anonymously. She was born at Ross, County Cork, where her father, Fitzjohn Stannus Hamilton, was rector and vicar-choral of the cathedral. She was twice married—to Edward Argles and to Thomas H. Hungerford. The Duchess began to write in 1877, *Phyllis* appearing in that year, and her most successful novel, *Molly Bawn*, in 1878, and from that time to her death she published nearly thirty volumes of short stories and novels, which attained a remarkable popularity. They are sentimental and melodramatic; the plot, conventional; but the reproduction of the general air and small chatter of society, very truly done.

HUNG-SIU-TS'EUEN, hung'sé-ōō'chwēn, or **HUNG-HSIU-CHUAN** (1812-64). A Hakka schoolmaster who originated and was the leader of the Tai-ping Rebellion (1850-64). He was born in a small village, about 30 miles from the city of Canton, in 1812; attended school from 7 to 16; became village schoolmaster, continued his own studies and passed all the examinations preliminary to that for the first degree, but failed again and again in the competition for the degree. He was subject to frequent illnesses, and in one attack, in 1837, is said to have lain in a trance for nearly forty days, during which he had a religious vision which profoundly impressed him. A few years later a friend found in Hung's bookcase some Christian books and tracts which Hung had obtained in Canton in 1833. The two began to study them, and Hung found in them the key to his visions, and was thereby inspired to destroy idols. They became converted, baptized each other, and began to preach. Hung set out for Kwang-si to convert the aborigines there, but lack of acquaintance with their language made the work difficult. He met others, however, who gladly accepted his teaching and themselves became zealous propagandists. About this time he joined a society of 'God-worshippers,' which had been formed in 1836, and soon became supreme in it.

In 1845 he returned to his own province, made many converts, and in 1846 visited a Protestant missionary in Canton, and studied the Scriptures with him for two months, but was refused baptism, because the request was accompanied with an application for a monthly stipend. He returned to Kwang-si, and his disciples, mostly persons disaffected to the reigning dynasty, began to destroy temples and to demolish idols. In July, 1850, Hung and his followers, who were now numerous, broke out into open rebellion. At first Hung had styled himself the 'Brother of Christ'; he now became the 'Heavenly King' (T'ien Wang), and adopted the style of 'Heavenly Kingdom of Great Peace' (*Tai-ping Kwoh*) as that of the empire he was about to establish. He made Nanking his headquarters until 1864, writing Christian books, issuing edicts to his followers, attending to the printing and circulation of the Bible and other works, and directing the movements of his numerous generals and their immense armies.

On June 30, 1864, seeing the Imperial armies closing in on him and realizing that he could not hold out much longer, he poisoned himself. His body was later found and burned. (See TAI-PING REBELLION.) Consult: Meadows, *The Chinese and Their Rebellions* (London, 1856); Williams, *The Middle Kingdom* (New York, 1883); and Mayer's *Chinese Reader's Manual*.

HUNG-WU, hung'woō'. The name given to the period of years (1368-98) during which Chu Yüanchang, the founder of the Chinese dynasty of Ming (1368-1644), reigned, and commonly transferred by Europeans to the Emperor himself. He was a native of the Province of Ngan-hwei, and was born in 1328, the second son of a poor laborer. At 17 Chu entered a monastery as a novice, but in the troubles of the times this was burned down by rebels under the command of a maternal uncle of his, whose forces he joined. He was given a small command, scored victory after victory; and in 1355, on the death of his uncle, he was offered the post of assistant generalissimo. Declining this offer, he recovered from the Mongols, then the ruling dynasty, the whole left bank of the Yang-tse, and proclaimed himself Prince of Wu. Within two years he had become master of Kiang-si and part of Che-kiang; sent his generals north in 1367, in 1368 mounted the throne as Hung-wu, called his dynasty the Ming, or 'Illustrious,' and made his capital at the city which has since been known as Nanking, 'the southern capital.' In the same year he recovered the provinces of Fuh-kien, the two Kwang, and Shan-si, and brought Shen-si under his sway in 1369. In the following year the last Mongol Emperor died, the dynasty founded by Kublai Khan came to an inglorious end, and China was once more free from the yoke of aliens. In 1371 Sze-chuen and Liao-tung fell before him, and Yun-nan in 1381.

Hung-wu proved an able administrator, and became a liberal patron of education and of literature. He organized the present system of literary examinations, established a new penal code, abolished mutilation as a punishment, regulated taxes and placed the coinage on a proper basis, made Buddhism and Taoism State religions, and prohibited eunuchs from holding office. He also re-established the customs of the T'ang dynasty (618-907) and labored for the welfare of his people. He had 24 sons, all of whom became

princes, and set nine of them as governors over as many provinces. He died in 1398, and is known in history as *Tai-tsu*, his Temple name. He is popularly known, however, as the 'Beggars King,' in allusion to his early poverty. See Rémusat, *Nouveaux mélanges asiatiques* (2 vols., Paris, 1829).

HUNKERS (perhaps from Dutch *honk*, station, home). In American political history, the name applied for some years after 1843 to that part of the Democratic Party in the State of New York which stood for conservatism, and was arrayed against the radical faction of the same party, known as the Barnburners (q.v.). Factional differences had arisen in the party prior to 1843, but open and avowed antagonism may be said to date from that year. The Hunkers adhered to the regular Democratic Party in the Presidential contest of 1848, while their opponents united with the Free Soilers, and with them nominated Van Buren. After 1852 the two factions acted more or less in harmony in both State and National politics. Among the leaders of the Hunkers were Horatio Seymour, William L. Marcy, Samuel Beardsley, Edwin Crosswell, and Daniel S. Dickinson. The name 'Hunkers' was also applied at times to the Conservative element of the Democratic Party in other States.

HUN'NERIC, or **HUNERIC**. King of the Vandals in Africa (?-484). He was the son of Genseric, whom he succeeded in 477. In 435 he had been sent to Rome as a hostage for his father's fidelity. One of his wives was a daughter of Theodoric, King of the Visigoths. Suspecting her of a plot against him, Huneric cut off her nose and ears and sent her home. Another and later wife was Eudocia, the daughter of the Roman Emperor Valentinian III.

HUNNÉUS, un-ná'ús, GEORGE (1831—). A Chilean statesman, born in Santiago. He was educated there and became professor of jurisprudence and political economy in the university the year after his graduation (1858). A fine speaker and a leader of the Liberal opposition, he was sent into exile by President Montt, but improved his time by studying the government and people of the United States. Recalled to his native land in 1861, he was once more sent to the House of Representatives and became its Speaker, as well as the Secretary of Public Instruction and Justice. Besides lecturing in the Santiago University, where he was rector, he continued to occupy high positions in the Chilean Government, such as president of the Senate and Secretary of Foreign Affairs. He published *Historia política de Chile* (1862); *La administración Montt* (1863); *Historia de la guerra con España* (1866); and *Historia de la guerra del Pacífico* (1883).

HUNOLD, hōō'nōlt, CHRISTIAN FRIEDRICH (1680-1721). A German author, known by his pseudonym Menantes. He was born at Wandersleben, and was educated at Jena. But means to carry on his studies failed him, and in 1700 he went to Hamburg, then the literary centre of Germany. Here the success of his novel, *Die verliebte und galante Welt* (1700), put an end to his precarious teaching and writing. This was quickly followed by *Der europäischen Höfe Liebes- und Heldengeschichte* (1704) and by *Satirischer Roman* (1705), which told so plainly

the scandal of Hamburg—which Hunold knew only too well—that he was forced to leave the city (1706). He went to Thuringia; published *Die allerneueste Art zur reinen und galanten Poesie zu gelangen* (1706), besides text-books in rhetoric and style; and after many wanderings settled in Halle, where he became an instructor in literature, poetry, and jurisprudence, and where his works lost the earlier freedom and obscenity. Consult: Wedel, *Geheime Nachrichten und Briefe von Herrn Menantes Leben und Schriften* (Cologne, 1731), and Vogel, *Christian Friedrich Hunold* (Leipzig, 1897).

HUNS (Lat. *Hunni*, *Chunni*, Gk. Ὀῦννοι, *Oounnoi*, Ἰονννοι, *Chounnoi*, probably from Chin. *Hiong-nu*, name of a powerful Tatar tribe). The name of a nation of antiquity, which made repeated incursions upon the Roman dominions, and under Attila (q.v.), the most renowned of its leaders, brought the empires of both the East and the West to the verge of destruction.

The Huns are generally considered to be a people (or rather a collection of tribes) of Turko-Tatar affinities, the descendants perhaps of the Hiong-Nu, who figure in Chinese annals as making incursions and founding States in Central Asia as early as the second century B.C. Some authorities think that the bulk of Attila's hordes were of Turki stock, and Theophanes in the eighth century writes of 'the Huns whom we commonly call Turks.' The distinction between 'white' and 'black' Huns, made by the mediæval writers, has led Bloch (1901) to put forward the view that we have here a dark race in process of transformation into a white one, but the uncertainty of the connotation of these epithets makes such a startling view even less probable. Like the modern Magyars, Osmanli Turks, etc., the ancient Huns no doubt assimilated themselves to the populations of their environment, and in Europe lost more and more of the distinctly Asiatic character. The 'white' Huns were probably not a little mixed with Asiatic Aryan blood (Iranian, etc.), before they entered upon their career in Europe. About B.C. 200 the Huns overran the Chinese Empire, defeated the Chinese armies in numerous engagements, and drove the Emperor Kao-ti himself to a capitulation and treaty. During the reign of Wu-ti (B.C. 141-87), the power of the Huns was much broken. Eventually they separated into two distinct camps, one of which, amounting to about 50,000 families, went southward, while the other endeavored to maintain itself in its original seat, but finally the most warlike went west and northwest in search of new homes. Of those that went northwest a large number established themselves for a while on the banks of the Volga. They then advanced into the territories of the Alani, a people dwelling between the Volga and the Don. At what period this took place is uncertain, but probably it was early in the fourth century. The Alani resisted the incursions of the Huns until at length a battle was fought on the banks of the Don, in which the Alani King was slain, and his army utterly routed; the vast majority of the survivors joined the invaders.

The Huns now invaded the country of the Goths, whose aged King, Hermannich, roused himself to meet the invaders, but in vain. His successor, Withimir, encountered the Huns in a pitched battle, in which he was himself slain, and his countrymen utterly routed. The Goths

now threw themselves upon the protection of the Emperor Valens, who in A.D. 376 gave permission to a great number of them to cross the Danube and settle in the countries on the south side as auxiliaries to the Roman arms against further invasion. The Huns now occupied all the territories that had been abandoned by the Goths; and when the latter not long afterwards revolted against Valens, the Huns also crossed the Danube and joined their arms to those of the Goths in hostilities against the Empire of the East. In the wars that followed the Huns were not so conspicuous as the Goths, their former enemies, and but little is known of them during the remainder of the fourth century. It is supposed, however, that early in the following century they were joined by fresh hordes. In the reign of Theodosius the Younger they had increased so considerably in power that their sovereign Rugilas, or Roas, was paid an annual tribute to secure the Empire of the East from further injury.

Rugilas, dying in the year 434, was succeeded in the sovereignty of the Huns by his nephews Attila and Bleda. The latter was put to death by his brother about 444. Attila carried his arms as far west as Gaul, where the Romans and Visigoths successfully encountered him on the Catalaunian Plain. In the following year he ravaged Italy, and Rome itself was saved, it is said, only through the awe which its Bishop, Leo I., inspired in the barbarian conqueror. With Attila's death, about 454, the power of the Huns was broken. A few feeble sovereigns succeeded him, but there was strife now everywhere among the nations that had submitted to Attila, and the Huns especially never regained their power. Many of them took service in the armies of the Romans, and others joined fresh hordes of invaders from the north and east, aiding them in their repeated attacks upon the Empire.

HUNT, HELEN. See JACKSON, HELEN (FISKE HUNT).

HUNT, HENRY (1773-1835). An English politician, born at Widdington Farm, Wiltshire, and educated by tutors and in private schools. Though destined for the ministry, he turned to farming, which he followed intermittently until within a few years of his death. He was imprisoned in 1800 for challenging to a duel the commanding officer of the Marlborough Troop, in 1810 for an assault upon a gamekeeper, and again in 1819 for two years for his part in the Peterloo massacre. In politics he was a Radical, and allied himself with Sir Francis Burdett, Horne Tooke, William Cobbett, and others of the same party, though he later published a pamphlet in which Burdett was charged with wavering loyalty to the reform, and was alienated from Cobbett through his own over-zealousness and political mistakes. He was often a candidate for Parliament and contested many elections. In 1831, through the retirement of the successful candidate, he obtained a seat from Preston, and advocated strenuously women's rights, universal suffrage, and the repeal of the corn laws. He managed to exercise considerable influence upon local politics, and his public speeches, though positive and demagogic, were always impressive; but his disagreeable personality found him few followers in Parliament, and in 1833 he retired to private life.

HUNT, HENRY JACKSON (1819-89). An American soldier, born in Detroit, Mich. His father, Samuel W. Hunt, was an army officer, and after his death the son was appointed to West Point, where he graduated in 1839. He was immediately assigned to the artillery arm of the service. His first active service was on the Canadian frontier in the year of his graduation during the Canadian Rebellion of 1837-38, after which he continued in garrison duty until the Mexican War. He served with the Second Artillery in Scott's advance from Vera Cruz to the City of Mexico, distinguishing himself particularly at Contreras and Churubusco, and being twice wounded at the battle of Molino del Rey (September 8, 1847). He was brevetted captain and major for his services. He afterwards served on the frontier for some years, and in 1856 was appointed a member of the board to revise the system of light-artillery tactics. He was promoted captain in 1852, and at the outbreak of the Civil War was stationed at Fort Pickens, Fla., from April to June, 1861. Promoted major in May of that year, he commanded the artillery on the extreme left at the battle of Bull Run. He was in command of artillery in the defenses of Washington in the summer of 1861, and in the September following was promoted colonel, attached to General McClellan's staff, and assigned to organize and command the artillery reserve of the Army of the Potomac. He served throughout the Peninsular campaign, his disposition of the artillery at the battle of Malvern Hill (July 1, 1862) being especially praiseworthy, and in September became chief of artillery of the Army of the Potomac, a position which he held until the end of the war. He participated in the battle of South Mountain on September 14, 1862, and on the following day was appointed brigadier-general of United States volunteers. He served thereafter at Antietam, at Fredericksburg, where his artillery fire rendered possible the crossing of the Rappahannock, at Chancellorsville, and at Gettysburg, where the withering fire from his batteries rendered impossible the success of Pickett's brilliant charge and turned the tide of battle in favor of the Federal arms. After serving in the Wilderness campaign with distinction he continued on Grant's staff until the close of hostilities, receiving the brevet ranks of major-general of volunteers and brigadier-general in the United States Army. In the winter of 1865-66 he was in command of the military district of Arkansas. In 1866 he was made colonel in the reorganized army, placed in command of the Fifth Artillery, and appointed president of the permanent Artillery Board. He commanded the Department of the South from 1880 to 1883, when he retired and became governor of the National Soldiers' Home at Washington. He published *Instruction for Field Artillery* (1860), and three articles on the battle of Gettysburg in the *Century* (New York, 1886), later republished in *Battles and Leaders of the Civil War* (New York, 1887).

HUNT, ISAAC (1751-1809). An English lawyer and loyalist in the American Revolutionary era, father of Leigh Hunt, the poet. He was born in Barbadoes, West Indies, was sent to school in Philadelphia and studied law there, but the college declined to grant him an M.A. degree on account of his anonymous literary productions, which were highly displeasing to the popular sentiment of the time. When the Revolution was

actually in progress he was mobbed and imprisoned for his activity in the royal cause, but fled to England, where he entered the Church. After preaching in London for a time he turned private tutor and wrote *The Political Family, or a Discourse pointing out the Reciprocal Advantages which flow from an Uninterrupted Union between Great Britain and her American Colonies* (1775), and *Right of Englishmen, an Antidote to the Poison of Thomas Paine* (1791).

HUNT, JAMES HENRY LEIGH (1784-1859). An English poet and essayist, born at Southgate, Middlesex, October 19, 1784. He was a son of Isaac Hunt (q.v.). His mother was of Quaker descent. The boy was educated at Christ's Hospital, London. While at school he wrote verse in imitation of Collins, Gray, and others. A selection of these juvenile poems his father helped him to publish in 1801. In 1805 Leigh attracted some notice by his theatrical and literary criticism in the *News*, a short-lived paper started by his elder brother John. Two years later he made out of these contributions a book entitled *Critical Essays*. He also served as clerk in the office of his brother Stephen, who was an attorney, and for a short time he occupied a minor post in the War Office. In 1808 he joined with his brother John in founding a newspaper called the *Examiner*, of which he was editor for thirteen years. Hunt was a Liberal in politics before Liberalism had become fashionable; and for one of his articles, reflecting on the obesity of the Prince Regent—'a fat Adonis of fifty,' Hunt had called him—he was sentenced to pay a fine of £500, and to undergo two years' imprisonment. Hunt was happy enough in his confinement; he hid the prison bars with flowers, and received visits from Byron, Shelley, and Keats. Released in 1815, he published the next year *The Story of Rimini*, a verse narrative based on Dante's episode of Paolo and Francesca.

In 1818 appeared a volume of original poems and translations entitled *Foliage*. The next year he started another journal, the *Indicator* (continued for seventy-six weeks), in which first appeared some of his best essays. In 1821, having severed his London literary connections, he went to Italy to assume the editorship of a journal projected by Byron and Shelley. There were annoying delays; Shelley died; Byron and Hunt quarreled; and of this journal, called the *Liberal*, only four numbers appeared (1822-23). Returning to London, Hunt gave his version of the enterprise in *Lord Byron and Some of his Contemporaries* (1828). In the same year he began the *Companion* (28 nos.), a sequel to the *Indicator*. In 1834 he started the *London Journal*, which he edited for about two years. His principal works, besides those already mentioned, are: *Captain Sword and Captain Pen*, a poem (1835); *Legend of Florence*, a fine play (1840); *The Seer*, a selection from his essays in various magazines (1840); some remarkable prefaces to an edition of the Restoration dramatists (1840); *Palfrey, a Love Story of Old Times* (1842); *One Hundred Romances of Real Life* (1843), made up from contributions to the *London Journal* in 1834-35; *Imagination or Fancy*, containing the well-known essay on *What Is Poetry?* (1844); a volume of his collected poems (1844); *Wit and Humour*, selections from the English poets, with comments (1846); *Stories of the Italian Poets, with Lives* (1846); *Men, Women, and Books*, a de-

lightful collection of miscellanies (1847); *A Jar of Honey from Mount Hybla* (1848), made up mostly of contributions to *Ainsworth's Magazine* in 1844; *The Autobiography* (1850); *Table Talk* (1851); and *The Old Court Suburb* (1855). In spite of his industry, Hunt was always poor. In 1844 Sir Percy Shelley settled upon him a pension of £120, which was augmented in 1847 by a Government pension of £200. He died at Putney, August 28, 1859.

Hunt undoubtedly wrote too much, but the best of his poems and essays render his reputation secure. *The Story of Rimini* is one of the finest narrative poems since Dryden; his *Palfrey* is delightful from its good spirits and bright, sunny glimpses of landscape and character; and *Abou-ben-Adhem* is a charming fable. As an essayist he is always cheerful and fanciful, and as a critic he is subtle and appreciative. His style is graceful. Consult: *Autobiography*, ed. by his son, T. Hunt (London, 1860); *Poetical Works* (ib., 1860), and *Correspondence* (ib., 1862); *Recollections of Charles and Mary Cowden Clarke* (London, 1878); Ireland, *List of Writings of Hazlitt and Hunt* (ib., 1868); Monkhouse, *Life of Hunt*, in "Great Writers Series" (ib., 1893); Johnson, *Leigh Hunt* (ib., 1896); selections from works by Ollier (ib., 1869, new ed. 1890), Symons (ib., 1887), Kent (ib., 1889), Johnson (ib., 1900-02), and *Classical Tales* (ib., 1894); *Dramatic Essays*, selected by Archer and Lowe (ib., 1894); *Tales*, with memoir, Knight (ib., 1890); reprint of *The Months*, edition of 1821, with introduction by Andrews (ib., 1897).

HUNT, RICHARD MORRIS (1828-95). An American architect, born at Brattleboro, Vt., the brother of William Morris Hunt. At fifteen he began the study of architecture in Geneva, Switzerland, and later studied at the Ecole des Beaux-Arts in Paris. After travel in Europe, Asia, and Egypt, he was employed as inspector of works on the buildings connecting the Tuileries with the Louvre, under his old master Lefuel, who had succeeded Visconti as architect in charge. In 1855 he returned to his own country, and was architect of the Capitol extension at Washington, the Lenox Library, the *Tribune* Building, New York, the United States Naval Observatory at Washington, the Divinity College Building at Yale, the Administration Building for the World's Fair, Chicago, and the Yorktown Monument. Among private houses by him are: W. K. Vanderbilt's, New York; the country house of George Vanderbilt, Biltmore, N. C.; and several beautiful summer houses at Newport, R. I., including the 'Marble House' and the 'Breakers.' Mr. Hunt exercised a powerful influence on the architecture of America, and many prominent architects were his pupils. He was one of the founders, and in 1888 became president of, the Institute of Architects. He was a knight of the Legion of Honor and a foreign associate of the Institute of France. In 1898 the associated architectural and art societies of New York City erected a beautiful memorial to him, including a bust of Mr. Hunt, in the wall of Central Park opposite the Lenox Library. It was designed by Daniel C. French and Bruce Price.

HUNT, THOMAS STERRY (1826-92). An American scientist, born at Norwich, Conn. He studied chemistry and acted as laboratory as-

sistant at Yale College. In 1847 he was made chemist and mineralogist to the Geological Survey of Canada, and, while holding this position, was also for several years professor of chemistry at Laval and McGill universities. In 1872 he resigned his position on the Geological Survey to become professor of geology at the Massachusetts Institute of Technology, and six years later he retired from official service. His extensive and fruitful researches in general and economic geology, in pure and applied chemistry, and in mineralogy, have won for him a place of eminence in the scientific world, and universities and learned societies the world over conferred upon him their honors. He was made a Fellow of the Royal Society of London, a Chevalier of the Legion of Honor in France, an honorary Doctor of Laws of the University of Cambridge, president of the American Chemical Society (1880), and president of the Royal Society of Canada (1884). Besides a very large number of papers on special scientific topics, his publications include the following works: *Chemical and Geological Essays* (1874); *Azoic Rocks* (1878); *The Domain of Physiology* (2d ed. 1882); *Mineral Physiology and Physiography* (1886); *A New Basis for Chemistry* (1887).

HUNT, WARD (1810-86). An American jurist, born in Utica, N. Y. He was educated at Union College, prepared himself for his legal career in Litchfield, Conn., and after following his profession for many years in his native town, of which he was Mayor in 1844, he was raised to the Court of Appeals in New York (1865), and seven years later to the bench of the United States Supreme Court. This position he occupied for ten years, and then retired with a pension.

HUNT, WILLIAM HENRY (1790-1864). An English painter in water-colors. He was born in London, March 28, 1790, the son of a tin-plate worker. A cripple from childhood, he was apprenticed at an early age to John Varley (q.v.), and made such rapid progress in painting that he could exhibit at the Academy at the age of seventeen. He was much encouraged in his studies by the friendship and patronage of Dr. Thomas Munro, of Adelphi Terrace. He at first painted in oil, but later devoted himself exclusively to water-color. He became an important member of the Water Color Society in 1827, exhibiting a large number of drawings—usually twenty-five—each year. He began by painting landscapes and still life, but later did rustic scenes and sketches of the sea, visiting Hastings every year for thirty years. Toward the close of his career he made many drawings of flowers and fruits. He excelled in depicting common objects, seen in the sunlight, at a short distance, and he preferred pure to mixed colors. His genre subjects are nearly always rustic, and are distinguished by a delightful vein of humor. Among the best known are: "Too Hot," the "Cardplayers," the "Fly-fisher," the "Attack," and the "Defeat." The South Kensington Museum contains a large number of his aquarelles, but the best collections are those of James Orrock and Louis Huth. Hunt died in London, February 10, 1864. Consult: Redgrave, *A Century of British Painters* (London, 1890); Ruskin, *Notes on Samuel Prout and William Hunt* (London, 1879).

HUNT, WILLIAM HENRY (1824-84). An American lawyer and politician, born in Charleston, S. C. After studying for two years at Yale College in the class of 1843, he removed to Louisiana, studied law, and was admitted to the bar in 1844. For many years he was a professor in a law school in New Orleans. Throughout the Civil War he favored the Union cause, and ever afterwards remained a staunch Republican. In 1876 he was appointed Attorney-General of Louisiana to fill a vacancy, and was regularly nominated for that position in the same year; but the vote was contested, and largely through the agency of President Hayes the Democratic candidates were placed in office. Hunt was made a judge of the United States Court of Claims in 1878, was prominently mentioned two years later as a successor to Justice Strong on the Supreme Court bench, and in 1881 was appointed by Garfield Secretary of the Navy, after he had declined the judgeship of the United States Circuit Court of the Fifth District. He retired when Arthur reorganized Garfield's Cabinet, and in 1882 was made Minister to Russia.

HUNT, WILLIAM HOLMAN (1827—). An English historical painter. He was born in London in April, 1829. He was intended for commercial life, but his taste for painting prevailing, he studied for a short time under John Varley (q.v.), and in 1854 he entered the schools of the Royal Academy. At the age of nineteen he exhibited his first picture at the Academy exhibition. Together with Rossetti and Millais, Hunt founded the Pre-Raphaelite Brotherhood (q.v.). His first painting that was an exponent of its principles was "The Flight of Madeleine and Porphyrio," a subject taken from Keats's *Eve of Saint Agnes*. He has been the most consistent follower of the Pre-Raphaelite movement, and even in his later works has remained unaffected by a modern artistic development. He soon turned to religious subjects, to which he is peculiarly adapted, and became one of the greatest modern exponents of Christianity. His works are full of strong religious feeling, and are characterized by an absolute fidelity to nature, to the extent of a hard realism. Every detail, even the leaves and blades of grass, is painted with the utmost minuteness. His works are the triumph of industry. He went to Palestine to study the figures and landscapes of his religious subjects, spending four years there in preparation for his picture "Christ Discovered in the Temple." This industry has been richly rewarded by the public, which bought the latter picture for £5000, and "The Shadow of Death" for £10,000.

The best known of Hunt's works is his "Light of the World," now in Keble College, Oxford. It represents Christ wandering through the night, with a lantern in His hand, and an embroidered robe thrown over His shoulders; it is executed with great detail and realism. Among his earlier works are a "Converted Christian Family Sheltering Christian Missionaries from the Druids" (1849), in the Taylor Museum, Oxford; "Rienzi Vowing to Avenge His Brother's Death" (1841); the "Hiring Shepherd" (1852); and the "Awakened Conscience" (1854). The "Scapegoat" (1856) is a strange religious production, representing a goat perishing among the miasmas of the Dead Sea. In the Gallery of Birmingham is the "Christ Discovered in the Temple"

(1873); at Manchester, the "Shadow of Death" (1873), also called "Christ, the Carpenter," and "Valentine and Silvia;" at Liverpool, the "Triumph of the Innocents" (1885). Among his latest works are: "Isabella and the Pot of Basil;" "May Morning in Magdalen Tower;" "Holy Fire in the Church of the Sepulchre at Jerusalem."

HUNT, WILLIAM MORRIS (1824-79). An American landscape, figure, and portrait painter. He was born at Brattleboro, Vt., March 31, 1824. He entered Harvard College in 1840, but, compelled to leave on account of his health, he traveled in Europe. He at first studied sculpture at the Academy of Düsseldorf in 1846, and afterwards took up painting with Couture in Paris. Attracted to Barbizon, he became a friend and follower of Millet, who exercised the strongest influence on his art. In 1855 Hunt returned to the United States, and soon afterwards established himself in Boston. There he became a very successful teacher of painting, and exercised a marked influence upon American art. He taught his pupils the new art methods of Paris, and influenced large classes, not only by the superiority of his aims, but by his own work. His criticisms and sayings in his studio were compiled and edited by his pupil, Helen M. Knowlton, and published under the title *Talks on Art* (3 vols., Boston, 1875-82). Under sudden derangement he committed suicide on the Isle of Shoals, September 8, 1879. His work is fine in color, and masterly in execution. At first he showed a preference for figure subjects—peasants, children, flower-girls, and Parisian types. In portrait painting his aim was to represent the character of the person, even at the expense of finish in the accessories. His later subjects were principally landscapes, in which he showed largeness of style and vigor of execution.

Among his most important figure subjects are: "Head of a Jewess;" "Sheep Shearing at Barbizon;" "The Farmers' Return;" "The Fortune-teller;" "The Prodigal Son." The Boston Museum contains a number of his works: "Girl with the Kitten," "Girl Reading," "Peasant Girl at Barbizon," "Marguerite," "Hurdy-Gurdy Boy," and a portrait of the artist. His portraits include those of Chief Justice Gray, Mrs. F. G. Ward, Mrs. Charles Francis Adams, Mrs. G. W. Long, William H. Gardiner, and William M. Evarts. Among his landscapes are: "Gloucester Harbor," "Newton Lower Falls," "Coast Scene at Magnolia, Mass.," and "Dead in the Snow." His most ambitious works, the "Flight of Night," and other decorations in the Capitol at Albany, were executed in 1873, not long before his death.

HÜNTEN, hun'ten, EML (1827-1902). A German battle painter, born in Paris. He was a pupil of Flandrin and Vernet; later studied in Antwerp under Wappers and Dyckmans, and after settling at Düsseldorf received further instruction from Camphausen. His first picture of importance was the "Charge of the Cuirassiers of the Time of Frederick II." He was with the army in Schleswig (1864), accompanied the Army of the Main in 1866, and provided illustrations for a history of that campaign. Many of his other works illustrate episodes of the Franco-Prussian and the Seven Years' wars.

HUNTER, DAVID (1802-86). An American soldier, born in Washington, D. C. He graduated at West Point in 1822, and from 1833 to 1836 served as captain of dragoons in the far West. He held the rank of major throughout the Mexican War, entered the Civil War as colonel of the Sixth Cavalry, and headed the Second Division of the Army of the Potomac at the first battle of Bull Run, where he was severely wounded. He was afterwards promoted to be a major-general of volunteers (1861); commanded the Western Department, and the Department of Kansas; was then appointed head of the Southern Department, and was the first to enlist colored troops. He gave a premature order in 1862 for the manumission of slaves in Georgia, Florida, and South Carolina, which President Lincoln countermanded, but the Confederate Congress outlawed the author. In 1864 Hunter was head of the Department of West Virginia, and led 18,000 men to an unsuccessful attack upon Lynchburg, leaving the valley of Virginia exposed by his retreat. General Grant defended his reputation when it was attacked. Hunter presided at the court which tried the conspirators in the assassination of Lincoln. At the close of the war he was brevetted Brigadier and Major-General in the Regular Army.

HUNTER, EDWARD (1839—). An American soldier, born at Gardiner, Me. He graduated at West Point in 1865, was commissioned in the Army as second lieutenant of the Twelfth Infantry, U. S. A. In 1867-69 he was aide-de-camp to General Getty at Santa Fé, N. M., and participated in the battle of December 25, 1868, against the Arapahoe and Cheyenne Indians. Transferred to the First Cavalry, U. S. A., in 1870, until 1886 he served in California, Nevada, Washington, and Montana, and in 1879 was promoted to be captain. In 1888 he became major and judge-advocate, and as such served in the Division of the Pacific and the Department of California from 1889 to 1895. He was made lieutenant-colonel in 1895, and served as deputy judge-advocate in the Department of Dakota until 1898, and in that year went with General Brooke to Porto Rico as judge-advocate and mustering officer. In 1899 he was appointed judge-advocate of the Department of the Pacific.

HUNTER, JOHN (1728-93). A celebrated English physiologist and surgeon, born at Long Calderwood, Glasgow, Scotland, the youngest of ten children. After a deficient primary education he was apprenticed to a cabinet-maker; but in 1748 he began to make up deficiencies in his education, and applied himself to anatomy under his brother's tuition. He studied under Cheselden at Chelsea Hospital, and under Pott between 1749 and 1753, and at Oxford from 1753 to 1754; became a hospital pupil in surgery in 1754, and was made house surgeon at Saint George's Hospital in 1756. He joined the Army as staff surgeon, serving in France and Portugal from 1761 to 1763; practiced surgery in London from 1763; was made a Fellow of the Royal Society in 1767; became surgeon to Saint George's Hospital in 1768; surgeon extraordinary to the King in 1776; and deputy surgeon-general to the Army in 1786. He received the Copley medal from the Royal Society in 1787. He was a man of great industry, the boldest and best operative surgeon of his day, as well as the greatest anatomist known, and a marvelous zoölogist.

He invented the process of tying an artery on the cardiac side for cure of aneurism. His museum contained at the time of his death 10,563 specimens and preparations illustrative of human and comparative anatomy, physiology, pathology, and natural history. He died in comparative poverty, and his collection was purchased, two years after his death, by the Government for £15,000, and was presented to the Royal College of Surgeons. In addition to numerous papers contributed to the *Transactions* of the Royal and other learned societies, he published the following independent works: *A Treatise on the Natural History of the Human Teeth* (Part I. 1771; Part II. 1778); *A Treatise on the Venereal Disease* (1786); *Observations on Certain Parts of the Animal Economy* (1786); and *A Treatise on the Blood, Inflammation, and Gun-shot Wounds* (1794). Consult Palmer, *The Works of John Hunter, F.R.S., with Notes* (4 vols., London, 1838). To this is prefixed *The Life of John Hunter, F.R.S.*, by Otley.

HUNTER, JOHN DUNN (c.1798-1827). An American adventurer from a Southern settlement who claimed that he had been captured and reared by Western Indians. His account of explorations with them, and of their manners and customs, was ultimately discredited, but it is certain that when he came to New Orleans in 1817 he knew no English, and that he studied it there and in Kentucky. He was lionized while visiting England, but on his return to America did nothing but make trouble among the Mexicans and Indians, and was finally killed by one of the latter. The work by which he is known was published in London and Philadelphia, and translated into German and Swedish. The English edition is called *Memoirs of a Captivity Among the Indians of North America from Childhood to the Age of Nineteen* (1823).

HUNTER, JOSEPH (1783-1861). An English literary antiquary, born at Sheffield. He studied for the Presbyterian ministry; in 1809 was appointed to a congregation in Bath, and in 1833 removed to London, where he became sub-commissioner of the public records, and assistant keeper (1838). His researches began in early life and extended over his entire career. He edited various volumes of records, made discoveries in regard to the first settlements in America, and illustrated the text of Shakespeare's plays by investigations in many directions. His voluminous notes are now in the British Museum. Among his publications are: *Hallamshire* (1819); *Disquisitions on Shakespeare's Tempest* (1839); *New Illustrations of the Life, Studies, and Writings of Shakespeare* (1845); *Milton* (1850); *Robin Hood* (1852); *Early History of the Founders of New Plymouth* (1849); and *The Church and Congregation of Protestant Separatists at Scrooby* (1854).

HUNTER, MRS. LEO. A poet and lion-hunter, whose literary reception and recitation of her own "Ode to an Expiring Frog" form one of the amusing incidents in Dickens's *Pickwick Papers*.

HUNTER, PETER (1746-1805). A Canadian governor, born in Scotland. He chose the army as his profession, and in 1799 was made lieutenant-general. In the same year he was appointed Lieutenant-Governor of Upper Canada, and remained in office for six years. He was a fairly successful administrator, though he had little

sympathy with the wishes of the Legislative Assembly, and his acts were mainly dictated by an irresponsible executive council.

HUNTER, ROBERT (?-1734). A British Colonial Governor of New York and Jamaica. He belonged to an Ayrshire family. He served on the Continent, fought at Blenheim, and rose to be a colonel of dragoons before he was made Lieutenant-Governor of Virginia in 1707. The vessel in which he had sailed to the Colony was taken by the French, and he was held a prisoner, but soon was exchanged for the Bishop of Quebec. In 1710 he came to America again, this time with a ship-load of persecuted German Protestants who had sought an asylum in England, and Colonel Hunter, being now Governor of New York, was able to establish them comfortably along the Hudson, though the settlement was an unending care to himself. Difficulties between royal governors and colonial assemblies were rife even in his day, and he doubtless rejoiced to return to England in 1719; but he was sent out again ten years afterwards to be Governor of Jamaica and major-general of the local troops, positions which he filled most creditably until his death.

HUNTER, ROBERT MERCER TALLIAFERRO (1809-87). An American politician, born in Essex County, Virginia. He graduated at the University of Virginia in 1829, and after studying law at the Winchester (Va.) Law School began practicing in his native county. His political career began in 1833 with his election to the State Legislature, and in 1837 he took his seat in the National House of Representatives, to which he had been elected as a Democrat. From the beginning he attracted attention by his earnest opposition to Clay's protective policy and the United States bank scheme. Re-elected to the next Congress, the Twenty-sixth, he was, although only thirty years old, chosen Speaker of the House. He was re-elected to the Twenty-seventh Congress, and was defeated for the Twenty-eighth (1843-45); but was re-elected to the Twenty-ninth, and served until his elevation to the United States Senate in 1847. He served as Senator until the outbreak of the Civil War, withdrew after the secession of Virginia, and was expelled in July, 1861. He was a radical States-Rights Democrat, and a champion of Texas annexation, the Fugitive-Slave Law, and all other legislation favorable to the slave power. As chairman of the Senate Committee on Finance for many years, he was a prominent figure in financial legislation, was the author of the low tariff of 1857, and the originator of the bonded warehouse system. In 1860 he was a prominent candidate for the Democratic nomination for President before the Charleston Convention, receiving, next to Douglas, the highest number of votes. He was a member of the first Provisional Confederate Congress, was Secretary of State in the Confederate Cabinet for a few months in 1862, and was then chosen from Virginia a Senator in the Confederate Senate, where he served throughout the war, leading the opposition to the Davis Administration in that body. In 1865 he was one of the Confederate commissioners with Alexander Stephens and J. A. Campbell to confer with President Lincoln and Secretary Seward at Hampton Roads. (See HAMPTON ROADS CONFERENCE.) After the war he was Treasurer of the State of Virginia from

1874 to 1880, but took no part in national politics.

HUNTER, WILLIAM (1718-83). A celebrated Scotch surgeon, the elder brother of John Hunter. He was born at Long Calderwood, Lanarkshire. He took up the study of theology at the University of Glasgow, but decided to devote himself to the study and practice of medicine. In 1746 he was invited by a society of naval surgeons to deliver a course of lectures on operative surgery. After 1748 he confined himself almost exclusively to obstetrics, and became connected with the Middlesex and the British Lying-in hospitals. In 1764 he became physician extraordinary to Queen Charlotte; and in 1768 was appointed professor of anatomy in the Royal Academy. His principal work is an *Anatomical Description of the Human Gravid Uterus and Its Contents* (1783).

HUNTER, Sir WILLIAM WILSON (1840-1900). A British Indian administrator, scholar, and statistician, born in Glasgow. Educated at Glasgow, Paris, and Bonn, he entered the Indian civil service in 1862. Seven years after he was transferred from Orissa and put on special duty to plan an Imperial gazetteer of British India; in 1871 he was appointed director-general of statistics. Ten years later, after the appearance of the first edition of the *Imperial Gazetteer*, which was edited by Hunter, and is one of the greatest works of reference on India, he was made a member of the Governor-General's council, and in 1882 acted as president of the educational commission. He retired from the service in 1887, settled at Oxford, and became a regular correspondent of the *London Times* on affairs in India. He wrote in a vigorous and picturesque style, and for the most part with great scientific accuracy: *Annals of Rural Bengal* (5th ed. 1872); *Comparative Dictionary of the Non-Aryan Languages of India and High Asia* (1868), which has more valuable material than original induction, as Hunter himself saw afterwards; a *Statistical Account of Bengal* (1875-77); *Statistical Account of Assam* (1879); *A Brief History of the Indian Peoples* (1880); and, in more expanded form, 1895, under the title *The Indian Empire*; *Lord Mayo and Lord Dalhousie* (1890), in *Rulers of India*; *Bombay, 1885-1890* (1892); an idyll, *The Old Missionary* (1895); a biography of his friend Brian Houghton Hodgson (1896); *The Thackerays in India* (1897); and the incomplete but valuable *History of British India* (1899-1900). Consult Skrine, *Life of Sir William Wilson Hunter* (London, 1901).

HUNTING (AS. *huntung*, from *huntian*, to hunt; connected with Goth. *hinpan*, to seize, and probably with Eng. *hand*). The pursuit of game, especially as a recreation or sport. The true sportsman is a strong supporter of every law designed for the protection of game (see **GAME LAWS**), and rarely kills game for any other purpose than for eating, unless it is a dangerous creature or a nuisance. Thus an animal like the fox is hunted partly on account of its destructiveness and partly for the enjoyment to be obtained in its pursuit. *Drag-hunting*, in which the hounds follow the trail of an aniseed bag which has been previously dragged over a selected course, is a favorite substitute for fox-hunting. Hunting is a very ancient amuse-

ment, and the pursuit of game, either as a pastime or for the necessities of subsistence, has from the earliest times been one of the most prominent occupations of the human race. According to tradition, Alexander the Great paid a large sum for a treatise on this subject by Aristotle, while the chase has been described by Appianus, Nemesianus, and many other classic authors.

FIREARMS. The improvement in firearms has worked a great revolution in the hunting and shooting of such animals and birds as come under the game laws, or are regarded as permissible quarry by the huntsman. Nevertheless, it has made more necessary than ever the study of natural history and woodcraft by the would-be hunter. In order to be a first-class shot, or to attain dexterity in the use of the sporting gun, it is necessary that the weapon should 'fit' the shooter. Proper regard must be paid to the weight of the weapon, and the ease with which it can be manipulated; it must be adapted to his chest, length of arm, etc., so that it may be readily brought into service without any straining of the body, arms, or muscles of the neck. An experienced gunsmith should be consulted, who will easily decide the weapon best suited for his customer. The weight of the weapon depends largely on the size of the bore and the length of the barrels. For a more detailed description of the various types of shotgun for every variety of game, the reader is referred to **SMALL ARMS**.

DOGS. A description of the various varieties of dogs used in the hunting or pursuit of game will be found under **FIELD DOGS**. Other closely related articles are **GAME-PRESERVE**; **HORSE**; and **HORSEMANSHIP**.

There are many methods of hunting, and some animals necessitate a pursuit in special ways, but the killing of game by shooting is by far the most common method, and the one to which this article is largely devoted. In Europe, and in Great Britain particularly, the various forms of shooting may be grouped as follows: *Open Shooting*.—Partridge, grouse, plover, quail, landrail, snipe, etc.; hares and rabbits. *Covert Shooting*.—Pheasants, woodcocks, hares, and rabbits. *River and Pond Shooting*.—Wild duck, widgeon, teal, etc. *Salt-Water Wild-fowl Shooting*.—Such marine wild-fowl as the wild swan, wild goose, brent goose, etc. Formerly the game was hunted on open moors, stubbles, fens, and marshes, or in coverts, aided by spaniels and beaters; or else it was stalked on the hills (see **DEER-STALKING**), or along the shores of lakes and estuaries. This form or method still obtains in Continental Europe, the modern English method being the exception. In consequence of improved methods of agriculture, shooting over dogs in England and parts of Scotland and Ireland has become practically a thing of the past, and the 'drive' or *battue* has, of necessity, become the vogue. In America dogs may be regarded as a necessity. Many rules have developed for the guidance of sportsmen when shooting together in the field, some of the more important of which may be mentioned. Where two persons are shooting together it is the rule for one not to shoot at a bird which is flying toward his companion. It is very necessary to condemn the firing across a comrade's face; and good fellowship demands that a bird should never be fired at if it is flying so that it must cross before a companion until

he has failed with both barrels of his gun. Where the birds fly directly away from the sportsmen, shots are taken at them alternately unless several should rise at once, when it is permissible for each man to fire at the birds on his own side.

Snipe make their first appearance in spring-time, and are usually found in meadows and salt marshes. The element of chance enters very largely into the sport of snipe-shooting, but the hunter accustomed to their habits will usually be successful. Windy weather, if the wind is not too high, is a favorable time. Among experienced gunners, jacksnipe is a great favorite, owing to the impossibility of formulating for it any fixed rule. No two snipe fly alike; one may flush at fifteen feet and another at fifteen yards; one may steady thirty yards away, another at forty, and another may not steady until clear out of range. *Woodcock*.—During the day these birds may be found seeking for food in marshy thickets. When disturbed they fly in a rising straight line as far as the top of the bushes, and then after making some little distance horizontally, they settle down by means of a number of quick zigzag movements. *Grouse*.—The two most important varieties are the ruffed grouse and the pinnated prairie-chicken. In common with the Canada grouse (spruce partridge), and the blue and sharp-tailed grouse of the West, they have stout bills, short feathered legs, and dark plumage. The bird is found in thick woods, and is greatly protected by its color, which is so much like that of the ground that it is frequently overlooked. It is very shy and wild, and frequently will run far ahead of the dogs, and eventually rise completely out of range. Sometimes they are hunted with dogs and shot after they have taken refuge in a tree, but the keen sportsman never shoots unless he can secure them on the wing. The ruffed grouse is the most cunning game-bird to be found in the Northern States. *Quail* is often called a partridge in the Southern States, and is popularly known as the Bob White. There are almost fifty varieties of the bird, all of which have practically the same conformation. They are found in the Eastern and Middle States, but are more abundant in the South and Southwest. They afford good sport and are more easily got at than grouse or woodcock. After the pointers or setters have flushed them they make a very swift flight, and unless the hunter can come up with them immediately they are raised, they are likely to get out of range. *Wild fowl* (in which general description is included swans and geese, and among the ducks canvasbacks, redheads, mallards, teals, pintail, and wood-duck) abound especially in the lakes of the Northern States, along the New Jersey coast, Delaware and Chesapeake bays, Currituck Sound, the Mississippi Valley, Puget Sound, the Willamette and Columbia rivers, and all the lakes and bays of the Northwest. They are very fond of wild rice and wild celery, and are frequently lured to waters in which they have no natural food by hunters who plant wild rice. They are hunted in a variety of ways, among which may be enumerated the following: The hunter may station himself concealed near a point over which they fly, and shoot them as they pass; or he may put out decoys (see DECOY); or he may steal upon them while they are feeding or resting. In the Chesapeake Bay particu-

larly, and occasionally elsewhere, sink-boats are used, in which the gunners lie and shoot the birds as they fly over. Another method is to sink a box in the sand or shallow water in which the hunter lies as in a sink-boat. Another very successful way is to employ the trained Chesapeake Bay dog, which will run up and down the shore, and by its actions excite the curiosity of the birds, which, if they approach to satisfy their curiosity, are within easy range of the gun. This method is known as 'toling.' *Wild turkey* is hunted with or without a decoy call or whistle. They are easily tracked by their trail on the ground, and may be shot at their roosts if surprised at break of day. One of the hardest birds to secure is the *upland plover* or *Bartram's sandpiper*, which cannot be approached except by means of some trick. For instance, in Rhode Island it is frequently hunted from a carriage in which the huntsman hides while he is driven in gradually lessening circles around where the bird is supposed to be. He must, however, be ready to spring out and fire the moment the bird rises. Occasionally trained ponies are used in much the same way as the carriage, the huntsman being concealed by the animal's fore legs and shoulder. Another method is to build a house of boughs and wait for the birds to alight in its vicinity. *The rail*, or ricebird, as it is known in the South, is usually hunted from boats at flood tide—a method which demands considerable skill and experience on the part of the man who manipulates the boat. Although they fly very slowly and are within the capacity of an indifferent shot, they must be killed at the first shot, or they will dive, and in a majority of instances be entirely lost. *Cranes* are hunted in the Mississippi Valley, their plumage being the principal attraction.

The hunting of game animals, as the lion, tiger, leopard, etc., will be found treated under the titles by which they are described. (For the fox, see FOX-HUNTING.) *Bears* are still found throughout the United States, but owing to the increasing proximity of man, and the increased employment of arms of precision, they have become exceedingly wary, and in many instances even timid. They may be found in the Catskill and Adirondack mountains in the East, the mountains of North Carolina and West Virginia, and in South Carolina, Mississippi, Georgia, Florida, Arkansas, and the mountains and forests of the West. They are hunted with rifles, and by the aid of dogs. *Hunting the hare* with beagles (q.v.) is a very popular sport in England, partly for the exercise it affords, and partly for its economy, in that horses are not required. The following list gives the charge and gauge of shotgun suitable for the various kinds of game-birds. Larger and wild animals are usually shot with a rifle, for which see SMALL ARMS. The first figure after the name of the bird has reference to the gauge, and the second figure to the size and kind of shot: Sora, rail, etc., from 12 to 20; 10 trap. Woodcock, 10 and 12; 10 shot. Snipe, 10 and 12; 9 shot. Quail, 10 and 12; 8 trap. Prairie-chicken, 10 and 12; 8 shot. Ruffed grouse, 10 and 12; 7 trap. Squirrel, 10 and 12; 6 shot. Teal, 10 and 12; 7 shot. Pintail, 10 and 12; 6 shot. Mallard, 10 and 12; 5 shot. Redhead, 10 and 12; 4 shot. Canvasback, 10 and 12; 3 shot. Turkey, 10 and 12; 2 shot. Goose, 10 and 12; BB.

HUNTING CAT, or HUNTING LEOPARD. See CHEETA.

HUNTING DOG. This interesting animal (*Lycaon pictus*), which inhabits all the more open parts of Africa south of the Sahara and Abyssinia, is an aberrant species of dog distinguished from the typical *Canis* by having four toes on each foot, and other structural peculiarities. It is about as tall as a greyhound, its legs being relatively long and slender, and adapted to the swift and enduring speed upon which it must depend for a livelihood. The head is broad and flat, with a short muzzle armed with massive teeth, rather large upstanding furry ears, and a suggestion of the hyena in the physiognomy; hence it is sometimes called 'hyena-dog,' though the likeness (even to the spotted hyena) is wholly superficial. (See Plate of WOLVES AND DOGS.) The fur is short, thick, and smooth, and grows more shaggy about the cheeks and throat; and the tail is long and wolf-like. In general color this dog is yellowish gray, but it is marked most irregularly with a variety of colors, such as a combination of red, white, yellow, and black spots, so that the hyena-dog may be regarded as the most particolored of all mammalia. In the southern Sudan, where the animals are plentiful, Schweinfurth saw one specimen that was perfectly tame, required no other restraint than a cord, and yielded to its master with all the docility of an ordinary dog. This fact appears to corroborate the assertion of Livingstone that the natives of the Kalahari desert are accustomed to break in this animal and train it for the chase.

To the Africans generally, however, both white and black, the hyena-dog is one of the most truly wild and dangerous animals of the country, taking the place of the wolves of the northern part of the world. They gathered into packs, and astonished and terrified the early settlers and explorers by their numbers, audacity, and strange cries. They frequented mostly plains and scantily forested or brushy regions, where the small ante-

lopes abound, which were their principal prey, and which they would pursue in concert, often only two working together, until the baffled victim (often of the larger species) was cornered or exhausted and might be pulled down. They were a terrible scourge to the sheep and goats of the early frontier farmers, and killed or mangled many more of the flock in one of their nocturnal forays than they could possibly eat. The war waged against them in consequence, and the diminution of the wild game, has caused a great decrease in their numbers; but numerous bands still range the wilds of East and Central Africa, and the deserts west and north of Cape Colony. Consult: for early history of the animal, the books of Livingstone, Gordon-Cumming, Moffat, Harris, and their contemporaries; and for later facts, Schweinfurth, *Heart of Africa*, translated (London, 1873); Selous, *A Hunter's Wanderings* (London, 1890). See DOG.

HUNTINGDON. The capital of Huntingdonshire, England, on the Ouse, 17 miles south of Peterborough (Map: England, F 4). It is celebrated as the birthplace of Oliver Cromwell, the entry of whose birth is to be seen in the register of Saint John's Church. The grammar school, founded in 1260, where he was educated, has been restored. Of Saxon origin, the town was the seat of a royal castle built in 919. Huntingdon received its charter of incorporation in 1189. A fine bridge erected in the thirteenth century connects it with Godmanchester. Population, in 1891, 4350; in 1901, 4260.

HUNTINGDON. A borough and the county-seat of Huntingdon County, Pa., 98 miles west of Harrisburg; on the Juniata River, and on the Pennsylvania Railroad (Map: Pennsylvania, C 3). It is the seat of Juniata College (German Baptist Brethren), opened in 1876, and of the State Industrial Reformatory. The city is in an agricultural and fruit-growing section with valuable forests and deposits of iron, coal, fire-clay, and limestone, and has manufactures of flour, machinery, stationery, sewer-pipe, boilers, radiators, furniture, and knit goods. Huntingdon was settled about 1760 on the site of a famous Indian council ground, now marked by a 'Standing Stone Monument,' erected at the borough centennial. The government is administered under the original charter of incorporation, adopted in 1796, which provides for a chief Burgess, chosen every three years, and a council elected at large. Population, in 1890, 5729; in 1900, 6053.

HUNTINGDON, HENRY HASTINGS, Earl of (1535-95). An English noble, leader of the Protestant party, son of Francis Hastings, the second Earl, whom he succeeded in 1561. He was an intimate of Edward VI., who knighted him in 1548; and, through his mother's descent from George, brother of Edward IV., claimed after Elizabeth the succession to the crown. Especially in 1562, during her severe illness, he was considered as her probable successor. He hotly opposed the scheme to marry Mary Stuart to Norfolk, and was intrusted by Elizabeth to see that the Scotch Queen did not escape at the time of the threatened uprising in 1569. In the same year he was one of the council which considered the evidence against Mary: helped try Norfolk in 1573; and was prominent and active in the preparations of 1588 for the Spanish invasion.

Huntingdon was a zealous Puritan in sympathies, possibly for political reasons. He was succeeded by his brother, George.

HUNTINGDON, SELINA HASTINGS, Countess of (1707-91). One of the most influential promoters of the early Methodist movement. She was the second of three daughters of Washington Shirley, second Earl Ferrars, and was born at Stanton-Harold, Leicestershire, August 24, 1707. She married, in 1728, Theophilus, ninth Earl of Huntingdon. She adopted the principles of the Methodists, much to the dismay of her friends, and gave her life with increasing zeal as the years went on to the interests of the new sect, introducing its ideas into aristocratic circles, to which its other adherents had no access. She was an intimate friend of both Wesleys, of Whitefield, and of many other clergymen prominent in her time. She became a widow in 1746. In the dispute between the Wesleys and Whitefield she sided with the latter, and assumed a leadership among his followers, who came to be known as "The Countess of Huntingdon's Connection." For the education of ministers she established and maintained a college of Trevecca, in Wales; removed, in 1792, to Cheshunt, Hertfordshire, and built, or became possessed of, numerous chapels in different parts of the country, the principal one being at Bath. She likewise expended large sums in the support of young men trained to itinerant preaching, as well as in private charity. She died in London, June 17, 1791. By her will she created a trust bequeathing her chapels to four persons for their care and management after her death. The number of these chapels was then sixty-four, of which about half still survive. Consult *The Life and Times of Selina, Countess of Huntingdon* (London, 1839-40).

HUNTINGDONSHIRE. A south-midland county of England, bounded on the east by Cambridgeshire, on the south by Bedfordshire, and on the west and north by the County of Northampton. Area, 366 square miles, almost the whole of which is in arable or pasture lands (Map: England, F 4). Population, in 1891, 57,760; in 1901, 57,770. It is watered chiefly by the Ouse and by the Nene, which skirts its northern boundary. The northern portion of Huntingdonshire is included in the great fen-country. The soil is various; clay, however, predominates generally. Grain, beans, rape, and clover are the chief crops. Capital, Huntingdon.

Huntingdonshire was traversed by two Roman roads, and Roman remains, as coins, pottery, etc., have been found. In early Anglo-Saxon times it belonged to East Anglia, afterwards to Mercia.

HUNTINGTON. A city and the county-seat of Huntington County, Ind., 24 miles southwest of Fort Wayne, on Little River, and on the Wabash and the Chicago and Erie railroads (Map: Indiana, D 2). It has a United Brethren college and a public high-school library with 11,000 volumes. There are railroad shops of the Chicago and Erie, numerous lime-kilns and wood-working establishments, and manufactures of boots and shoes, pianos, bicycles, etc. The city has also important commercial interests. Settled in 1834, Huntington was incorporated as a town in 1848, and in 1873 was chartered as a city. Under the charter of 1873, the government is vested in a mayor, elected biennially, and a

city council. The water-works and electric-light plant are owned and operated by the municipality. Population, in 1890, 7328; in 1900, 9491.

HUNTINGTON. A town, including several villages in Suffolk County, N. Y., 30 miles east by north of New York City, on Long Island Sound and on the Long Island Railroad (Map: New York, G 5). It is in a fertile agricultural district and has manufactures of brick and pottery, but is primarily a residential suburb of New York and a popular summer resort. There are a public library of 3500 volumes and a monument marking the spot where Nathan Hale was captured. The government is administered by town meetings, which are held biennially. Population, in 1890, 8277; in 1900, 9483.

HUNTINGTON. A city and the county-seat of Cabell County, W. Va., 52 miles west of Charleston, on the Ohio River, and on the Chesapeake and Ohio, the Ohio River, and the Guayandotte Valley railroads (Map: West Virginia, B 3). It is picturesquely situated and well laid out, and has Marshall College (State normal school), the West Virginia Asylum for Incurables, and a Carnegie Library. The city controls an important commerce, and has several wholesale establishments, shops of the Chesapeake and Ohio Railroad, an extensive manufacturing concern, a steel plant, machine-shops, a brewery, and manufactures of glass, picture-frames, stoves, etc. Settled and incorporated in 1871, Huntington is now governed under a charter of 1895, revised in 1901, which provides for a mayor, elected every two years, and a unicameral council. Population, in 1890, 10,108; in 1900, 11,923.

HUNTINGTON, DANIEL (1816-). An American historical, genre, and portrait painter. He was born in New York, October 14, 1816, and was educated at Hamilton College. In 1835 he studied with Professor Morse, and later with Inman and Trumbull; in 1839 he visited Italy, studying with Ferrero in Rome. On his return to America he became a resident of New York. He was elected member of the National Academy in 1840, and held the office of president from 1862 to 1869, and from 1877 to 1891. He returned to Europe in 1854, and painted several important works at Florence and Rome.

His pictures are illustrations of taste rather than elaborate painting; his color is subdued but good, and his style is unaffected. He has been chiefly engaged in portrait painting, but he has also painted historical and genre works of note. Two of his largest canvases are "Lady Washington's Reception Day" and the "Atlantic Cable Projectors," in the Chamber of Commerce, New York, both containing exceptionally fine portraits. His other principal works are: "Florentine Girl" (1839); "Shepherd Boy" (1840); "Sacred Lesson" (1844); "Mercy's Dream" (1850), in the Corcoran Gallery, Washington (a replica in the Pennsylvania Academy, Philadelphia); "Henry VIII. and Catharine Parr" (1850); "Venice," owned by J. P. Morgan, New York; "Study in the Woods," owned by C. P. Huntington, New York; "The Sibyl," Historical Society, New York; "Republican Court" (1876), Stuart Collection, New York; "Philosophy and Christian Art" (1878). Among his portraits are those of Presidents Lincoln, Union League Club, New York; Van Buren, State Li-

brary, Albany; Gov. E. D. Morgan, William E. Dodge, Chancellor Ferris, New York University; Mr. and Mrs. Taylor, Corcoran Gallery, Washington; Bishop Whipple, Rev. Morgan Dix, Bishop Potter; Judge Blatchford (1879), United States District Court; Gen. John A. Dix (1880), Historical Society, New York; Hon. John Sherman (1881), Chamber of Commerce, New York; Rev. Dr. Adams (1883), Union Theological Seminary, New York; Hon. R. C. Winthrop, United States Congress; Julius Hallgarten, founder of prizes of the National Academy.

HUNTINGTON, FREDERICK DAN (1819—). An American clergyman, the first Protestant Episcopal Bishop of Central New York. He was born at Hadley, Mass.; graduated at Amherst in 1839, and at Harvard Divinity School in 1842, and was pastor of the South Congregational (Unitarian) Church, Boston. In 1855 he became preacher at Harvard and Plummer professor of Christian morals there. In 1860 he left the Unitarian Church to become an Episcopalian. Resigning his professorship, he organized a parish in Boston, and was its rector until 1869, when he was consecrated Bishop of the newly created Diocese of Central New York. Among his numerous works are: *Lectures on Human Society* (1860); *Memorials of a Quiet Life* (1874); *Christ in the Christian Year* (2 vols., 1877-81); and *The Golden Rule Applied to Business and Social Life* (1892).

HUNTINGTON, JABEZ WILLIAMS (1788-1847). An American jurist and legislator. He was born in Norwich, Conn., graduated at Yale in 1806, studied and practiced law in Litchfield, Conn., was a representative in Congress from 1829 to 1834, was then a judge of the highest courts in Connecticut, and was finally United States Senator from 1840 until his death.

HUNTINGTON, JEDIDIAH (1743-1818). An American general in the Army of the Revolution, born in Norwich, Conn., the son of Jabez Huntington (1719-1786). He graduated at Harvard in 1763, joined the American Army at Cambridge, became a brigadier-general in 1777, and took part in many important engagements until the close of the war, when he was brevetted major-general. He was one of the organizers of the Society of the Cincinnati. He became collector of the port of New London in 1789, and held the office twenty-six years.

HUNTINGTON, SAMUEL (1732-96). An American lawyer and signer of the Declaration of Independence. He was born at Wyndham, Conn., on a farm, educated himself for the law; practiced at Norwich, represented that constituency in the General Assembly, and became associate justice of the Superior Court (1774), of which, ten years later, he became Chief Justice. From 1776 to 1784 he was a member of the Continental Congress, of which he was president, as the successor of John Jay, in 1779-80. From 1786 to his death, Huntington was Governor of Connecticut. His nephew and adopted son, **SAMUEL HUNTINGTON** (1765-1817), graduated at Yale in 1785, was admitted to the bar in 1793, and in 1801 removed to Cleveland, Ohio. He passed the rest of his life in that State, and held the offices of Judge of the Superior Court, Chief Justice of the Supreme Court, State Senator, and Governor of the State from 1808 to 1810.

HUNTINGTON, WILLIAM HENRY (1820-85). An American journalist, born at Norwich, Conn. He spent most of his life in Paris, where for twenty years he was a correspondent of the *New York Tribune*. He remained in Paris during the siege of 1870-71, engaged in the relief of the suffering. His remarkable collection of portraits of Washington and Franklin was given to the Metropolitan Museum of Art.

HUNTINGTON, WILLIAM REED (1838—). An American clergyman, of the Protestant Episcopal Church. He was born in Lowell, Mass., graduated at Harvard in 1859, and became an instructor in chemistry there. Entering the Episcopal ministry, he was rector of All Saints Church, Worcester, Mass., in 1862-83, and of Grace Church, New York, after 1883. Dr. Huntington always took a prominent and influential part in public affairs. In his own communion he was active in the movement for liturgical revisions, and was long chairman of the Prayer-Book Revision Committee, and joint editor with Dr. Samuel Hart of the *Standard Prayer-Book* of 1892. In addition to sermons, his publications include: *The Church Idea, an Essay Toward Unity* (1870); *Conditional Immortality* (1878); *The Book Anceae, Its Critics and Its Prospects* (1886); *Short History of the Book of Common Prayer* (1893); and *A National Church* (1898).

HUNTLY, GEORGE GORDON, fifth Earl of (?-1576). A Scottish statesman. He was educated for the Church, but gave up the idea of entering it upon the death of his elder brother, and became Sheriff of Inverness and the keeper of its castle (1556). Entering into the political plots of his time, he was more than once imprisoned and condemned to death. Mary, Queen of Scots, released him and restored his estates and title, with a view to gaining his adherence; but he refused to turn Catholic to please her, though he sided with his brother-in-law, Bothwell, in the troubles that followed. Huntly tried to rescue Rizzio, and was a main mover in the murder of Darnley as well as in the Queen's subsequent marriage to Bothwell, to which he was a witness. He conspired to rescue his royal mistress from Lochleven (1568), and raised troops in her service; but his lifelong enemy, the Earl of Moray, vanquished him at last, and Huntly's resolve to give up her cause as hopeless was Mary's chief reason for surrendering to Elizabeth.

HUNTSVILLE. A city and the county seat of Madison County, Ala., 100 miles north of Birmingham, on the Memphis and Charleston and the Nashville, Chattanooga and Saint Louis railroads (Map: Alabama, C 1). It is in the fertile valley of the Tennessee River, and has important farming, cotton-growing, and stock-raising interests. There are cotton-mills, a foundry and machine-shops, saw-mills, sash and blind factories, etc. Among the educational institutions are the Huntsville Female College, Huntsville Female Seminary, a State normal and industrial school, and the Central Alabama Academy. The government, as provided by a charter of 1898, is vested in a mayor, elected biennially, and a council which controls appointments to all administrative departments. The city owns and operates its water-works. Settled in 1775, Huntsville was first incorporated in 1800. At one

time it was the capital of the State. Population, in 1890, 7995; in 1900, 8068.

HUNTSVILLE. A city and the county-seat of Randolph County, Mo., seven miles west of Moberly, on the Wabash Railroad (Map: Missouri, D 2). It has coal-mines and some manufactures, and a trade in coal, farm produce, live stock, etc. Population, in 1890, 1836; in 1900, 1805.

HUNTSVILLE. A city and the county-seat of Walker County, Tex., 75 miles north of Houston, on the International and Great Northern Railroad (Map: Texas, G 4). It is an important cotton market, and manufactures cotton goods, cottonseed oil, wagons, furniture, steam-engines and boilers, cigars, etc. The city has the Sam Houston Normal School (State), the State Penitentiary, and, of historic interest, the old home and grave of Gen. Sam Houston, and the grave of H. Yokum, the first historian of Texas. Huntsville was first settled about 1836. The government is administered by a mayor, elected every two years, and a unicameral council. Population, in 1890, 1509; in 1900, 2484.

HUNYADY, hun'yō-dī, JÁNOS (John Hunniades) (c.1387-1456). The national hero of Hungary. His origin is shrouded in obscurity. He saw his first military service under King Sigismund. Under Sigismund's successor, Albert II. (1438-39), he became known as a brilliant soldier, and was ban of a district on the borders of Transylvania, exposed to the Turkish attacks. It was the period when the Turkish power was at its height, and it seemed within the range of possibility that the Mohammedans would obtain possession of the greater part of the Danube Valley and seriously menace Western civilization. To Hunyady, more than to any other one man, Europe owes it that the danger was averted. Albert died in 1439, and as there was no male heir, the nobles elected King Ladislas, of Poland, to the Hungarian throne. Meanwhile the wife of Albert gave birth to a son, Ladislas Posthumus, and a civil war resulted, of which the Turks took advantage. Hunyady, however, defeated them in several battles, and in 1443 an advantageous peace was made. Nevertheless, King Ladislas, incited by the Papal Legate, Julian Cesarini, began war again, and on November 10, 1444, the Hungarian army under Ladislas and Hunyady was overwhelmed at Varna. Ladislas was among the slain, whereupon Ladislas Posthumus was recognized by all parties as King, and Hunyady was made Regent during the minority. War was actively carried on both against the Turks and Frederick III. In 1448 Hunyady was completely defeated by the Turks at Kossovo, after which he was held prisoner for a short time by the Serbians. His most splendid achievement was the defense of Belgrade in 1456 against the army of Mohammed II., the conqueror of Constantinople, in which he was aided by the celebrated John Capistrano (q.v.). On June 15, 1456, the Turkish attack began, and on July 14th Hunyady forced his way into the city, while Szilágyi, the commander of the town, made a sortie, and finally, on July 21st, the Turks were decisively repulsed and raised the siege, having lost 80,000 men. A few days after this glorious victory dysentery broke out in the army, and Hunyady, the great Christian hero,

after a short illness, fell a victim to the disease. He left two sons, Ladislas and Matthias Corvinus. The former was treacherously imprisoned and beheaded at Buda, by Ladislas Posthumus. Matthias, generally known as Matthias Corvinus, became King of Hungary in 1458. Consult Chassin, "Jean de Hunyad," in *La Hongrie* (Paris, 1856).

HUNZAS, hōn'záz. One of the Aryan tribes of Dardistan, inhabiting the district about Hunza.

HUON DE BORDEAUX, u'ōn' de bōr'dō'. A French *chanson de geste*, probably belonging to the thirteenth century, and then somewhat altered when rewritten for Charles Seigneur de Rochefort, early in 1454. The oldest printed edition is in folio and without date; the second, in quarto, bears the date 1516. The English translation was made by Lord Berners, in Henry VIII.'s time. The subject has proved a tempting one for poets, the famous *Oberon* of Wieland, and Weber's opera of the same name, being among the poems founded upon it, while Shakespeare drew from it in the *Midsummer Night's Dream*. A prose adaptation has been issued by Gaston Paris (1899).

HU'ON PINE. See DACRYDIUM.

HUPA, hōp'pā. A tribe of Athabaskan stock, originally occupying a number of small villages on the lower Trinity River, Lower California, now gathered on the Hupa Valley Reservation in the same region. Like some of the stock, they were formerly of warlike and aggressive character, and are said to have brought a number of surrounding tribes under regular tribute, besides compelling them to a certain extent to use their language. In their pristine condition, they subsisted chiefly upon salmon, dried and smoked, and acorns made into flour and porridge. They were noted for the variety and beauty of their basketry. They now number 420, not including some remote tribes.

HU-PEH, hu'pē (Chin., Lake North). One of the eighteen provinces of China proper, situated in the very centre of the country, and surrounded by the populous and important provinces of Hu-nan on the south, Sze-chuen on the west, Shen-si and Ho-nan on the north, and Ngan-hwei on the east. The Yang-tse from west to east runs through its southern part, while the Han, in its tortuous course from the north-west, irrigates its fields and provides a splendid waterway for its commerce. The province is mountainous in the north, being penetrated with spurs and outlines from the Tapan-shan and Fu-niu mountains. Toward the south-west it is low-lying, and is covered with many marshes, shallow lakes, and lagoons, the remains of that portion of the Tung-ting Lake which formerly spread much farther north than it does now. These sheets of water have been connected by navigable ditches, and serve as a safe short cut for the smaller class of native junks from Sha-shi (on the Yang-tse opposite the entrance to the Tung-ting) to Hankow, or to towns farther up the Han.

The area of the province is estimated at 70,450 square miles, and its population at 33,790,556. For administrative purposes it is divided into 10 fu, or departments, 1 sub-department, 60 hien (or hsien) or prefectures, and 10 subprefec-

tures. The capital is Wu-chang, on the Yang-tse, opposite Hankow, where the Futai or Governor of the province, and the Tsung-tuh or Governor-General of the united provinces of Hunan and Hu-peh reside. Three of the towns are treaty ports—Hankow, Sha-shi, and I-chang (q.v.)—all on the left bank of the Yang-tse. There are several extensive coal-fields in the province, and both coal and iron are now being actively mined by modern methods.

HUPFELD, hōp'fēlt, HERMANN (1796-1866). A German theologian and Orientalist. He was born in Marburg, studied at the university there, was professor from 1825 to 1843, and in the latter year succeeded Gesenius at Halle. His most important work is the *Uebersetzung und Auslegung der Psalmen* (1855-61), characterized by sound scholarship. His further publications include: *Exercitationes Ethiopicae* (1825); *Die Quellen der Genesis* (1853); and *Die heutige theosophische und mythologische Theologie und Schrifterklärung* (1861). Consult Riehm, *Dr. Hermann Hupfeld* (Halle, 1867).

HURA, hū'rā (Neo-Lat., from the native name). A genus of plants of the natural order Euphorbiaceae. *Hura crepitans*, a native of the West Indies and tropical America, is a tree which abounds in a very acrid milky juice, and has stalked, heart-shaped, acuminate, leathery leaves. The fruit is a woody capsule, of the size of a large apple, very much flattened, formed of 12 to 15 carpels, each containing a large seed. These carpels surround a common axis, and separate with great elastic force. The tree is called sandbox-tree, because, before the use of blotting-paper became general, the capsule was generally used in the West Indies as a sandbox for powdering letters with fine sand; but it was found necessary to bind it with a hoop of iron, as, even after being used for years, it would sometimes burst with a loud report. The seeds are a violent drastic purgative.

HURAM. See HIRAM.

HURD, RICHARD (1720-1808). An English prelate. He was born at Congreve, in Staffordshire, January 13, 1720; studied at Cambridge University, and became fellow of Emmanuel College in 1742. In 1749 appeared anonymously his first notable production, *Commentary on Horace's Ars Poetica*, in which he advocated the now discredited theory that the poem was a systematic criticism of the drama of the Romans. In 1750, on Warburton's recommendation, he was appointed one of the Whitehall preachers. He became Bishop of Lichfield and Coventry (1775), and in 1783 declined the Archbishopric of Canterbury. He died at Hartlebury Castle, May 28, 1808. His principal works are: *Moral and Political Dialogues*, in which historic characters are introduced as interlocutors on such themes as sincerity, retirement, the golden age of Elizabeth, and the constitution of the English Government (1759); *Letters on Chivalry and Romance* (1762); and *An Introduction to the Study of the Prophecies Concerning the Christian Church, and Particularly Concerning the Church of Papal Rome* (1772). His complete works with life appeared in eight volumes (London, 1811). Consult, also, his life by F. Kilvert (ib., 1860).

HURDWAR, hērd-wār'. See HARDWAR.

HURDY-GURDY (of onomatopoeic origin). A very old musical instrument of the stringed kind, which, under the name of leyer, or Bauern-leier, spread from its native country, Germany, over a great part of Europe. The hurdy-gurdy consists of a flat, oval-shaped sounding-board, over which the strings are stretched, with a back or bottom of the same size and shape. These are bound together by tolerably deep sides, or ribs. On one side are from ten to twelve finger-keys, for shortening the sounding lengths of the strings when required. There are four strings of gut which are put into a state of vibration by being rubbed by the edge of a small wooden wheel charged with rosin, and turned by a handle. Two of the strings are tuned in unison as a key-note, or one of them a fifth above; they are placed out of reach of the keys, and form a sort of drone-bass. The other two strings are acted on by the keys, and produce a diatonic scale of from ten to twelve notes. The hurdy-gurdy is only suited to simple music, and was used for such as had many repetitions. From the tenth to the twelfth century it was one of the most popular instruments, but was then superseded until the eighteenth, when it again, and especially in France, became very popular. It is now nearly obsolete. The name is also applied to a large street or barrel organ (q.v.). For illustration, see MUSICAL INSTRUMENTS.

HURLBUT, JESSE LYMAN (1843—). An American clergyman of the Methodist Episcopal Church. He was born in New York City; graduated at Wesleyan University in 1864, and held several pastorates in New Jersey. After 1879 he was connected with the Sunday-school and tract work of his denomination, spending much of his time as an editor of Sunday-school literature. He was secretary of the Epworth League in 1889-92, and for some time was associated with Dr. J. H. Vincent in the direction of the Chautauqua Literary and Scientific Circle. Among his works are: *Manual of Biblical Geography* (1882), and *Outlines in Old Testament History* (1890).

HURLBUT, STEPHEN AUGUSTUS (1815-82). An American soldier and diplomat, born in Charleston, S. C. He studied law, was admitted to the bar in 1837, and practiced in Charleston until 1845, when he removed to Belvedere, Ill. He was a Whig member of the Illinois State Constitutional Convention in 1847, served as a Whig Presidential elector in 1848, was in the State Legislature from 1859 to 1861, and in May, 1861, became a brigadier-general of volunteers. He commanded a division at Fort Donelson, after its capture, and at Shiloh; was promoted to be major-general of volunteers in 1862; commanded the Sixteenth Army Corps during Sherman's Mississippi campaign of 1863, and succeeded General Banks as head of the Department of the Gulf. He was returned to the Illinois Legislature in 1867, and was a Republican Presidential elector in 1868. From 1869 to 1872 he served as United States Minister to Colombia, was a member of Congress from 1873 to 1877, and in May, 1881, he was appointed United States Minister to Peru, where he died the following year.

HURLEY. The county-seat of Iron County, Wis., 40 miles east by south of Ashland, on the Montreal River, opposite Ironwood, Mich., and on the Wisconsin Central and the Chicago and

Northwestern railroads (Map: Wisconsin, C 2). It is in the productive Gogebic iron-mining district, several large mines being in the vicinity, and is engaged to some extent also in lumbering, farming, and stock-raising. Population, about 2000.

HURLING. A field sport, akin to the more modern game of hockey (q.v.). It is played today on a field 140 × 84 yards, with goals at each end, the posts of which are 21 feet apart and a cross-bar 8 feet high, and two point-posts 21 feet on each side of the goal-posts. The field is lined across, parallel with the goals, at 21 and 50 yards, and half-way down. The hurley-stick approximates to the ice-hockey stick in shape, but is held with the left hand below the right. The ball, or 'stiller,' is of cork, wound round with woollen threads and covered with leather. It is 5 inches in diameter and weighs 7 ounces. Play is begun by the 14 players on each side facing each other in the centre of the field. The referee then throws the ball between the two lines of players, who thereupon scatter to their respective positions in the field. The object of the players is to drive the ball through the space between their opponents' goal-posts. If the ball passes over the side line, previously appointed sidesmen throw it back into play. The use of the hands is barred, though in a scrimmage, a moderate use of the feet is tolerated. There are some very pretty strokes made with the hurley, notably that where the ball is raised in the air with the point and hit forward as it falls.

HURLOTHRUMBO. An operatic burlesque, written by one Samuel Johnson, a Cheshire dancing-master, in 1723, and produced at the Haymarket, April, 1729, the author himself taking the part of Lord Flame. Its prologue was written by Amos Meredith, and the epilogue by John Byrom. It was published by subscription, with a dedication to Lady Delves, in 1730, and a second edition, addressed to Lord Walpole, appeared the ensuing year. It was bitterly satirized by Fielding's *The Author's Farce* (1729).

HURON, hū'rōn. A city and the county-seat of Beadle County, S. D., 120 miles east of Pierre; on the Great Northern and the Chicago and Northwestern railroads (Map: South Dakota, G 5). It is a division headquarters of the Chicago and Northwestern Railroad, with machine-shops, roundhouses, etc., and has flour-mills and grain-elevators, carriage and wagon shops, a brick-yard, a creamery, and other industries. Population, in 1890, 3038; in 1900, 2793.

HURON. An Indian tribe. See WYANDOT.

HURÓN. The name of certain animals of the family Mustelidæ. See GRISON.

HURON, LAKE. One of the five Great Lakes on the northern frontier of the United States, lying between Lake Superior on the northwest and Lake Erie on the southeast, connected with Lake Michigan on the west, and bounded on the southwest by Michigan and on the north, east, and south by the Province of Ontario (Map: United States, J 2). It is the third in size of the Great Lakes, having a total area of 22,322 square miles, and being about 250 miles long and 190 miles wide. A large arm of the lake in the east, extending far into Ontario, is known as Georgian Bay. Lake Huron receives the waters of Lake Superior through the Saint Mary's River,

and those of Lake Michigan through Mackinaw Straits. Its outlet is the Saint Clair River, flowing into Lake Saint Clair, which is connected by Detroit River with Lake Erie. The general direction of the lake lengthwise is from north-northwest to south-southeast. The surface is 9 feet above the level of Lake Erie, 335 feet above Lake Ontario, and 582 feet above the sea, with occasional fluctuations as in the other lakes. Its depth varies from 200 to 700 feet. The waters are very clear and cold, especially in the northern part, and abound in fish, of which the whitefish is the most important. There are few harbors on the west side, but vessels find shelter in Saginaw Bay, about 70 miles north of the outlet, and also in Thunder Bay, as much farther north. Presque Isle is also a fair harbor, and there is good shelter under the south side of the island of Mackinaw. The lake is subject to violent storms, but navigation is safe from May 1st to December 1st. Mackinaw has long been an important post for fur trade with the Indians. Bay City, at the head of Saginaw Bay, is an important lumber depot, and copper-mines have been opened in the upper portions of Manitoulin Bay. Excellent grindstones are cut from the sandstone near Thunder Bay. The main body of water is unbroken by islands, but there is a group of islands in the north, most of them belonging to Canada, the largest of which is Grand Manitoulin. There is much geological evidence to the effect that Lake Huron was formerly deeper and more extensive than at present. See GREAT LAKES.

HURONIAN SERIES. See PRE-CAMBRIAN FORMATIONS.

HURRICANE. See STORM; WIND.

HURRUR. See HARAR.

HURST, JOHN FLETCHER (1834—). A Methodist Episcopal bishop and author. He was born in Dorchester County, Md., graduated at Dickinson College in 1854, and studied theology at the universities of Halle and Heidelberg. After his return to America he held a pastorate in New Jersey from 1858 until 1866. Again going to Germany, for three years he taught theology at the Mission Institute in Bremen, and Frankfort-on-the-Main, and then traveled extensively in Europe, Syria, and Egypt. In 1871 he was chosen professor of historical theology in the Drew Theological Seminary, Madison, N. J., becoming president of the institution two years later. In 1880 he was elected bishop, and has spent much time visiting missions and conferences in Europe and India. In 1891 he was chosen chancellor of the American University, Washington. He translated several theological works from the German, and wrote numerous works on Church history, including a *History of Rationalism* (1865); *Martyrs to the Tract Cause* (1873); *Our Theological Century* (1876); *Bibliotheca Theologica* (1883); and a *History of the Christian Church* (1897-1900).

HURTADO, hūr-tā'dō, LUIS DE TOLEDO (c.1530-c.1589). A Spanish poet and romancer, born at Toledo. He was the author of *Palmerin de Inglaterra* (1547), a famous romance which ranks next to *Amadis of Gaul*. It was exceedingly popular, and was immediately translated into French, Italian, and Portuguese. Hurtado also wrote: *Tragedia Policeana* (1548); *Comedia de Preteo y Tibaldo* (1552); and *Egloga selviana*

(1553), a pastoral comedy. Consult the study by Vasconcellos (Halle, 1883).

HURTADO DE MENDOZA, dá mân-dô/thá, GARCIA, Marquis of Cañete (1535-1609). A Spanish soldier and administrator, born at Cuenca. He fought in Italy and Germany, but by 1557 was Governor of Chile, where he took part in the local wars. Three years afterwards he was back in Spain, whose battles he fought in Portugal, but he returned to South America as Viceroy of Peru in 1590. He sent out expeditions which resulted in the discovery of the Marquesas Islands, called after him; but he resigned his post in 1596.

HURTER, hōōr'tēr, FRIEDRICH EMANUEL VON (1787-1865). A Swiss-Austrian historiographer, born at Schaffhausen, and educated there and at Göttingen. He was pastor at Beggingen (1808), and at Löhningen, and in 1835 was made dean and antistes of the Reformed synod. After the publication of his *Geschichte Papst Innocenz' III. und seiner Zeitgenossen* (1834-42) he became a Roman Catholic (1844). At about the same time he published *Die Befehdung der katholischen Kirche in der Schweiz seit 1831* (1842-43), and *Geburt und Wiedergeburt* (1845), an apologia for his conversion. In 1846 he settled at Vienna, and was made historiographer to the Emperor of Austria. Under the liberal rule of Pillersdorf he resigned this position, but was reappointed in 1851. His other historical works include: *Geschichte des ostgothischen Königs Theodorich* (1807); *Denkwürdigkeiten aus dem letzten Decennium des 18. Jahrhunderts* (1840); *Philipp Lang, Kammerdiener Rudolfs II.* (1851); *Zur Geschichte Wallensteins* (1855); and *Wallensteins vier letzte Lebensjahre* (1862). Consult Hurter (his son), *Friedrich von Hurter und seine Zeit* (Gratz, 1876-77).

HUSBAND AND WIFE. A man and woman married to each other. The modes of contracting marriage, with the accompanying ceremonies, and the impediments to marriage will be more properly described under the head of MARRIAGE (q.v.), and the mode of dissolving the marriage has been already described under DIVORCE (q.v.). The effects of marriage upon the rights of the parties and upon their property will here be described.

The effect of marriage at common law may be viewed under two heads: first, as regards the persons and the personal rights of the married persons, and, secondly, as regards their property. (1) AS TO THE PERSON. By marriage at common law the husband became legally bound to support the wife in a manner consistent with his resources and social position. He also became bound to pay all debts contracted by her before the marriage, and when sued with the wife became responsible for her torts committed either before or during the coverture. In all other respects he remained in precisely the same position as before marriage. Independently of his wife he could sue and be sued, enter into contracts, and bind himself as fully after as before marriage, and he could even make a will and bequeath all his property to strangers regardless of the wife. As regards the person and personal rights of the wife, however, there was a material difference. Her person is said to be merged in that of her husband, and for many purposes they

were treated as one person in the eye of the law. The wife could neither sue nor be sued independently of the husband. Her contracts were void even when made with her husband. Even the personal property she had before marriage became her husband's absolutely, and he could dispose of it at will. She had no power to make a will of real estate, and her will disposing of personal property owned by her before her marriage could be effective only when authorized or consented to by the husband at her death. As the husband, however, was bound to support the wife, she had authority in law without his consent to pledge his credit for necessities supplied by third persons. This obligation, being imposed by law, was not properly a contract, but a quasi-contract (q.v.). Necessaries are any articles of personal use, as food or wearing apparel, which are suited to the rank and position in life of the husband, and with which the wife is not provided. Therefore, if goods were ordered by the wife which were not necessary, the husband was under no legal liability to pay for them unless he expressly or impliedly ratified his wife's act in purchasing them. Thus he could not keep the goods and refuse payment. If, for example, he saw his wife wearing an expensive dress which he knew he did not himself order or pay for, and did not at once repudiate the purchase and return the goods, he would be held to have consented and approved of the purchase. Though the husband is bound to maintain his wife, there were, curiously enough, only circuitous means of enforcing this duty. The wife, for example, could not sue the husband herself, but having an implied authority to order necessities, the tradesman so supplying them could sue the husband for the price. The wife also might impose liability on the husband by contract for articles not necessities by virtue of an implied authority as agent of the husband to purchase such articles; thus, a husband might be liable to pay for articles such as he had regularly permitted his wife to purchase on his credit before, although he knew nothing of the particular purchase in question. See AGENT.

The husband, being entire master of his own actions, has the power to decide where to live, and the duty of the wife is to live with him in the same house. So long, then, as the husband and wife continue to live together, the domicile of the wife is determined by the domicile of the husband. If she ceases to live with her husband she may then acquire an independent domicile. If the wife lives apart from the husband without just cause he is not bound to support her even with necessities. If, however, she separates from him for just cause, the liability of the husband for necessities continues. There are, at common law, several just causes for her living apart from her husband. If the husband, for example, treats her with what is deemed cruelty in the eye of the law, as keeping a mistress in the house, or starving her, or assaulting her, she is entitled to leave him, and can order necessities at his expense from any tradesman willing to supply her. There are, however, many degrees of cruelty and ill usage for which the wife has practically no remedy, and of which the law can take no cognizance. The statement frequently found in the early treatises that the husband has at common law the right to reasonably chastise the wife was probably without authority, and certainly has no support

in modern law. The husband can enforce the wife's antenuptial contracts, and can recover for torts committed toward her either before or after the marriage by joining her with himself as plaintiff in an action. For torts resulting in loss of her services to him or requiring him to provide medical attendance or other necessities he can recover in his own name and right. He may also recover damages from a third person for unlawful intercourse with his wife, and either husband or wife might recover damages from a third person for alienating the affections of the other. As regards crimes committed by a wife, she is in general liable to be punished for them in the same way as if she were unmarried. But there is a peculiarity as regards crimes committed by the husband and wife jointly in the husband's presence. If the crime be treason or murder, both are punished precisely as if they were unmarried. But in all the lesser crimes the theory, as well as the practice, is that if the wife was a party to the crime, and committed it in her husband's presence, she is presumed by the law to have so acted under the compulsion or coercion of her husband, and is acquitted as a matter of course. The presumption, however, is a presumption of fact only, and may be rebutted by showing that in fact the wife was not coerced by the husband; but in the absence of any direct evidence one way or the other on the subject of coercion it is presumed that the wife acted under this marital coercion, and so she escapes punishment. Another curious anomaly arising from the common-law maxim that husband and wife are one person is that the wife cannot be convicted of stealing her husband's goods. If she absconds with his property, however valuable, she cannot be punished. But this rule is qualified by the circumstance that if she commits adultery, and afterwards absconds with the adulterer, both taking away the husband's goods, the adulterer may be convicted of the larceny, though it is doubtful if she is in that case liable to any punishment. Where the third party does not have in view any adultery with the wife, but joins her in taking away the husband's goods, neither he nor the wife can be punished criminally.

At the common law also husbands and wives may be witnesses for or against other parties in all civil cases, i.e. actions and suits relating to debts, contracts, and wrongs which are not crimes, and in all inquiries of a civil nature. But neither can testify for the other in an action to which the other is a party; but either can be compelled by the opposite party to be a witness. In all cases neither husband nor wife can be compelled to disclose any confidential communication made to him or her by the other spouse during the marriage. As regards all criminal proceedings instituted against either husband or wife, the other spouse is neither competent nor can be compelled to be a witness; but where the husband and wife are not parties, but are the prosecuting parties, then, inasmuch as the State is presumed to be the prosecutor, and the husband and wife are not parties, they may be both witnesses, subject to the qualification as to not being bound to disclose confidential communications made by and to each other during marriage. There is an exception also to the rule that neither can be a witness against the other in criminal proceedings—viz. where the wife charges her husband with an assault or other crime of greater degree upon her

person, she is in that case only a competent witness against him, for otherwise the crime might go unpunished. Moreover, in all proceedings instituted in consequence of adultery of the husband or wife, neither of the married parties is competent or can be compelled to be a witness.

(2) AS TO THE PROPERTY OF THE MARRIED PERSONS. As regards the husband, he not only remains sole owner of his property, and, subject to the wife's right of dower, can do what he likes with it, but he becomes absolute owner of her personal property of every kind which is capable of being reduced to possession. As will be hereafter explained, he also becomes a qualified owner of her choses in action (q.v.) and her chattels real. The legal title of the wife's real estate remains in the wife, but she cannot convey it without the husband joining in the conveyance by *fine and recovery* (q.v.), and the rents, issues, and profits of her real estate belong absolutely to her husband. Owing to the common-law rule that the husband is entitled to the services of the wife, he becomes entitled to her earnings acquired by rendering service to others. It will thus be seen that during the coverture the wife cannot, at common law, acquire any personal property, and her title to real property acquired before or after her marriage is subject to the rights of the husband, as stated. But as regards the wife the case is different. The old rule as to the wife's personal property becoming the husband's absolutely after marriage suffered qualification when such property consisted not of money or chattels, but of what are called chattels real, such as leases and mortgages. (See CHATTELS.) In such a case they become so far the property of the husband that he can sell them during his life, but he cannot bequeath them by will; and on his death they remain hers, while on her death they become his. Again, where the wife's personal estate before marriage consists of mere rights of action, or debts due to her, they become so far his that he can at any time sue for them, and so reduce them into possession, and make them his own absolutely; but he cannot bequeath them by will, and if he does not sue for them in his lifetime they survive to the wife after his death. As regards the wife's real estate—i.e. her lands and houses held in freehold—the husband does not acquire any legal interest in the title by the marriage, but, as has been pointed out, he acquires the right to the rents, issues, and profits, and consequently the right to dispose of the real estate during the coverture; and, if the wife bear him a living child, upon her death he becomes entitled to a life interest in her real estate, known as tenancy by the curtesy (q.v.). Upon marriage the wife also acquires an inchoate right to dower in real estate of which the husband may be seized or which he may thereafter acquire—that is, a life estate or interest in one-third of all such real estate. This right becomes complete only upon death of the husband before the wife, but it cannot be impaired by any act of the husband during the coverture or by the wife herself except by joining with her husband in a conveyance by *fine and recovery*. (See DOWER.) All real estate conveyed to husband and wife together, unless otherwise defined by the instrument of conveyance, is deemed to be an estate known as an estate by the entirety. Its peculiarity is that while the husband is entitled to the rents, issue, and profits during coverture,

neither can convey the title without the other, and the survivor becomes entitled to the property absolutely. On the death of one of the parties to the marriage the property is disposed of as follows: if the husband dies his will may, subject to the wife's right of dower, dispose of his whole property to strangers irrespective of the wife. But there are some things his will cannot take away from her, as, for example, her leases, choses in action not reduced to possession, and her real estate. To these may be added her paraphernalia, so called, which consists of her personal apparel and jewels; but even these may be taken by her husband's creditors if there be a deficiency of assets. When the wife dies before the husband he becomes entitled to all her personal estate, of whatever description, even though she leave children of the marriage; and it must be recollected that she can at the common law, generally speaking, make no will which has any effect if the husband chooses to repudiate it. The wife's real estate passes to her heirs unless a child has been born of the marriage, in which case the husband is entitled to curtesy in the entire estate. The English courts of chancery, by application of the doctrine of uses and trusts (q.v.), mitigated to some extent the harshness of the common-law rules relating to married women. By an ante-nuptial agreement between the parties to the marriage, sometimes called a marriage settlement, not only all the property she may have had before marriage, but property to which she may afterwards be entitled, may be given to trustees to hold for her separate use. The agreement may give her a practically unlimited right over the property thus settled upon her which equity would enforce, and she may thus receive regularly the income of the trust and use of it for her own purposes. She may bind her separate estate by contract, and even dispose of it by will. Courts of equity will also in a proper case enforce agreements made between husband and wife, and in certain cases will enforce a conveyance made by the husband to the wife when made for the purpose of providing for the wife. The various rights with reference to separate property thus created and enforced by courts of equity are known as married women's separate estates.

STATUTORY MODIFICATION OF THE COMMON LAW. The preceding statement is an outline of the rights and liabilities of the husband and wife according to the common-law rules. Half a century ago public attention was first directed toward the essential injustice of the common law to married women. The agitation which followed took fast hold upon the public conscience, and ultimately found expression both in England and the United States in a series of statutes known as married women's enabling acts. New York was the first State to adopt this reform, by an act framed in 1848, and its example was followed by other States in rapid succession. The various statutes relating to the subject have been repeatedly revised, and their scope widened by amendment, until at the present time in most jurisdictions, though the statutes differ in minor particulars, married women are on a substantial equality with their husbands with reference to both personal rights and rights of property, and each is practically independent of the other with reference to all matters outside the obligation of the status marriage or the marriage contract

itself. The effect of modern statutory law will be best understood by briefly mentioning some of the more important exceptions to the foregoing statement. In probably all jurisdictions the husband is still under obligation to support his wife, and to provide her with necessaries, and the wife, by acting as his agent, may still bind the husband by contract. As the husband no longer acquires any interest in the wife's personal property or choses in action, he is not subject to the corresponding obligation to answer for her torts and contracts, they being an obligation of the wife alone, for which she may be separately sued. Either may sue or be sued independently of the other. While the husband may no longer take the wife's earnings, he is in a general sense still entitled to the wife's services, so long as she continues to give them to him; and he may sue in his own right to recover for torts causing loss of her services or expenditure by him for necessaries, and either may sue for alienation of the affections of the other. The law of domicile of the husband and wife remains unchanged. The wife still has dower in the husband's real estate, and in some of the Southern and Western States she has by statute a homestead in the husband's lands. In many States the husband may acquire curtesy in the wife's real estate, but in some, like New York, the wife may defeat his right by conveyance or will. In some States, as New Jersey, the wife cannot convey her real estate as freely as the husband may, but must be examined apart from her husband by a notary, commissioner, or judge before making the conveyance, who must ascertain whether the conveyance is freely made without coercion by the husband. Estates by the entirety are now generally obsolete, the husband and wife taking as co-tenants, or tenants in common. In nearly all jurisdictions statutes of distribution (q.v.) have been enacted, by which either party to the marriage may acquire a part of the personal property of the other in case of his or her death without having disposed of the personal property by will. In other particulars these statutes follow closely the analogy of the law of inheritance. Provision has also been made by statute in most jurisdictions for directly compelling the husband to support the wife by means of a quasi-criminal proceeding brought at her instance. The same result may be obtained by the various statutory forms of judicial separation (see DIVORCE), by which the husband may be compelled to pay the wife certain sums of money, or alimony (q.v.).

SCOTLAND. The law of husband and wife in Scotland as regards their personal rights and disabilities, and the property during the marriage, does not substantially differ from the law of England, but the following points may be noticed: As regards their persons and personal rights and crimes the law is the same. It is often said that in Scotland the movable property of both husband and wife becomes a kind of joint-stock property, called *goods in communion*; but this phrase has no meaning except with reference to the principle of the division of the property after the death of one of the parties and the dissolution of the marriage. The husband is, as in England, entire master, except that he cannot on his death-bed bequeath more than a share of the property away from the wife. The wife's movable property becomes the husband's, and her

heritable property remains subject to the husband's life-rent. When she disposes of her heritable property she must ratify the deed by going before a magistrate, and acknowledging that she acts of her own free will. When the husband deserts her she may, as in England, obtain a judge's order to protect her earnings and moneys, and she has a preferable right to a reasonable provision out of any property to which she may succeed (Conjugal Rights Amendment Acts, 1861 and 1874). By the Married Women's Property (Scotland) Act, 1877, the produce of a wife's industry or skill is excluded from the rights of her husband, and his liability for her antenuptial debts is restricted to the amount she brought into the marriage. A wife has, in Scotland, the power to bind her husband for necessaries; but the husband can, by a process of inhibition, give notice to tradesmen not to supply her at his expense, and this notice will be binding on all the King's subjects.

CIVIL LAW. In the early period of the Roman law the power of the husband over his wife and her property was absolute, as the *patria potestas*. Whatever property the wife acquired, both before and after marriage, became the property of the husband; but in case the wife survived the husband she was entitled to share her husband's property equally with the children. At a later period, but before the time of Justinian, owing possibly to the lack of any formal marriage, we find a fully developed system of law relating to married women which, unlike the common law, was based upon the theory that husband and wife were in law distinct persons having independent rights and liabilities. The wife remained responsible for her own debts. She could sue and be sued independently of her husband, and her husband could not subject her property to any disability. While there were some restrictions upon the power of women to contract, there was no distinction in this respect between married women and unmarried women. The husband, as at common law, was bound to support the wife; but as compensation for this liability his wife or her family was required at the time of the marriage to provide the husband with the *dos* or dowry. The increase from the *dos* was the husband's property. He could also dispose of the *dos* so far as it was personal property, but not if it were real estate; and in the case of termination of the marriage by death or divorce, the *dos* was required to be returned to the wife. Corresponding to the *dos* was the *donatio ante nuptiam* or the *donatio propter nuptiam*, a gift made by the husband to the wife before the marriage. Not much is known of these, but it seems probable that the *donatio* was not required to be equal to the *dos*, but was given as a provision for the wife after her husband's death, she having lost the right to share equally in her husband's property with the children of the marriage. These rules of law might, however, be freely modified by antenuptial contracts, which were enforced much as courts of equity enforced antenuptial contracts entered into at common law.

COMMUNITY PROPERTY. Occupying an intermediate ground between the common law and the civil law relating to the husband and wife is the law of community property. The notion of a community of interests by husband and wife in all property acquired during the coverture

seems to have been derived from the civil law and the mediæval customary law, and is now incorporated into the Code Napoleon and most of the other European codes as fixing the rights of husband and wife in the abuse of contracts. The most important peculiarity of community property is the partnership of husband and wife in all property acquired by them during the coverture, and under some systems in property acquired before the marriage. The husband is the *curator* of the wife, who has no power to contract independently of her authority; but she retains her joint interest in the community property; and after her husband's death is entitled to one-half the community property, the other half passing to the heirs. The husband has the same right in case of the wife's death. See **COMMUNITY OF PROPERTY.**

GANANCIAL SYSTEM. For the particular doctrine of community property belonging to the Spanish law, and adopted in New Mexico, and to some extent in Arizona, California, Nevada, Idaho, Texas, and Washington, see **GANANCIAL SYSTEM.**

The criminal law relating to husband and wife remains substantially unchanged. The husband and wife are now generally competent witnesses in all civil actions with the exception of an action for divorce brought by one against the other, in which case neither is allowed in most jurisdictions to testify against the other or to acts of adultery; and in no case is either allowed to testify as to any confidential communication made to or received from the other during coverture. In case of testimony as to a transaction with a deceased person by or against whose representative an action is brought, a husband or a wife, because of his or her interest in the other spouse's property, may be an interested witness, and so be barred from testifying on that ground. (See **EVIDENCE.**) The competency of husband and wife to testify in criminal proceedings remains as at common law. Consult: *The Commentaries of Kent and Blackstone*; Hammick, *Marriage Laws of England* (2d ed., London, 1887); Macqueen, *Rights and Liabilities of Husband and Wife* (3d ed., London, 1885); Schouler, *Domestic Relations*; the statutes of the various States in the United States; and the authorities referred to under **DOMESTIC RELATIONS.**

HUSBANDRY, PATRONS OF. See **GRANGE.**

HUSBANDS, hüz'bandz, HERMAN (?-1795). An American revolutionist. He was born in Pennsylvania, but settled in North Carolina, and was a member of the Legislature of that Colony. In 1768 he became one of the leaders of the 'Regulators' (q.v.), an organization formed to redress grievances. After several times coming into conflict with Governor Tryon, at last, in 1771, his force of 2000 Regulators was defeated, and Husbands fled from the State, settling near Pittsburg. He was a member of the Pennsylvania Legislature in 1778, and at the time of the 'Whisky Insurrection' (q.v.) of 1794 was a member of the Committee of Safety with Albert Gallatin and others.

HUSCHKE, hūsh'ke, GEORGE PHILLIP EDUARD (1801-86). A Prussian jurist, born at Münden, and educated at the universities of Göttingen and Berlin. At Göttingen he was made instructor in Roman law (1821). Afterwards he was professor of law at Rostock (1824) and at Breslau (1827).

He took a prominent part in ecclesiastical politics, and was so strong a partisan of the Lutheran communion that his opponents brought criminal suit against him for inciting an insurrection, but unsuccessfully (1835). Later he held high ecclesiastical offices in the gift of the State, and was made Privy Councillor. As a jurist he combined the historical and philological methods. His more important works are: *Studien des römischen Rechts* (1830); *Die Verfassung des Königs Servius Tullius* (1838); *Ueber den Census und die Steuerverfassung der frühern römischen Kaiserzeit* (1847); *Gaius. Beiträge zur Kritik und zum Verständnis seiner Institutionen* (1855); *Jurisprudentie Antejustinianæ quæ Supersunt* (5th ed. 1886); and the valuable works on the Italic dialects: *Die oskischen und sabelischen Sprachdenkmäler* (1856); *Die Iguvischen Tafeln nebst den kleinern umbrischen Inschriften* (1859); *Zu den altitalienischen Dialekten* (1872); and *Die neue oskische Bleitafel* (1880).

HUSEMANN, hōō'ze-mān, THEODOR (1883-1902). A German pharmacologist, born in Detwold and educated at Göttingen, Würzburg, Berlin, and Prague. He practiced medicine for five years, and in 1860 went to Göttingen, where he became docent (1865) and professor (1873) of pharmacology and toxicology. He wrote: *Handbuch de Toxikologie* (1862-67) and *Die Pflanzenstoffe in chemischer, physiologischer, pharmakologischer und toxikologischer Hinsicht* (1871), both with his cousin AUGUST (1833-77), who was professor at Chuv; contributed to Maschka's *Handbuch der gerichtlichen Medizin* (1882) and to the Penzold Stintzing *Handbuch der speciellen Therapie* (1895); and wrote a *Handbuch der gesamten Arzneimittellehre* (3d ed. 1872) and a study on the pharmacopœias of the sixteenth century, *Die Kölnischen Pharmacopœien und ihre Verfasser* (1899).

HUSH, hūsh. See HUSI.

HUSI, hōō'sè, *Rum. pron. hōōsh*, or **HUSH**. The capital of the Rumanian District of Falcui, Moldavia, situated a short distance west of the Pruth, and 38 miles south-southeast of Jassy (Map: Balkan Peninsula, G 1). It has a fifteenth-century cathedral and a theological seminary. Population, in 1889, 12,660; in 1899, 15,484.

HUS'KISSON, WILLIAM (1770-1830). An English statesman. He was born in Worcestershire, and in 1783 sent to Paris to study medicine. He took part in the storming of the Bastille, and as a member of the Club of 1789 delivered before his associates a speech on the currency. After his return to England in 1792 he received a subordinate appointment under the Tory Government, and formed an intimate acquaintance with Pitt and Canning. As Under-Secretary of War (1795-1801), he did most of the work of that office. In 1796 he entered Parliament, and, with the exception of two years, remained a member for various constituencies to his death. He held several offices under Pitt, with whom he retired in 1801. In 1804 he was appointed Secretary of the Treasury in the new Pitt Cabinet, and on Pitt's death in 1806 he lost his office, but was restored to it by Mr. Perceval in 1807. In 1814 he was made Chief Commissioner of the Woods and Forests; in 1823 president of the Board of Trade, and in 1827 Secretary of State for the Colonies. Through his exertions the old

restrictions on the trade of the Colonies with foreign countries were removed. He also obtained the removal or reduction of many import duties, considerable relaxation of the navigation laws, and is in fact mentioned as the great pioneer of free trade. His death, September 15, 1830, was caused by injuries received that day at the opening of the Liverpool and Manchester Railway. Consult: *Speeches*, with biographical memoir (3 vols., London, 1831); from the comprehensive views which they exhibit, as well as from their full and accurate details, these speeches are valuable to students of political economy; Wright, *Life of Huskisson* (privately printed, 1831); Hansard, *Parliamentary Debates*; Greville, *Memoirs: A Journal of the Reigns of George IV. and William IV.* (London and New York, 1874-75).

HUSS, HENRY HOLDEN (1862—). An American composer, born in Newark, N. J. He studied first with his father, George J. Huss, and in 1882 entered the Munich Conservatory, Germany, taking up the study of counterpoint, composition, and instrumentation, and the organ under Rheinberger. During his stay in Germany he studied the pianoforte under Giehl, and conducting under Abel. In 1885 he became a resident of New York, and subsequently became well known throughout the country as a composer, pianist, and teacher. His compositions, many of which have a European reputation, include a scena for soprano and orchestra, *Cleopatra's Death*; bagatelles, anthems, intermezzi, songs, part songs, and very charming chamber music.

HUSS, JOHN (c.1370-1415). A Bohemian religious reformer. He was born at Husinetz (or Husinec), Bohemia, northwest of Budweis. His baptismal name was Jan; from his birthplace he was called Johannes de Hussynecz, or, in English, John Huss. The day and year of his birth are unknown. His parents were Czech peasants. He studied at the University of Prague, where he soon made a reputation for scholarship, became M. A. (1396), university lecturer (1398), dean of the philosophical faculty (1401), and was rector in 1402 and 1403. In philosophy he was a realist. He became a priest in 1401. Owing to the marriage in 1382 of Anna, sister of King Wenceslas, to King Richard II. of England, there was much intercourse between Bohemia and England. So the writings of the great English theologian, Wiclif (died 1384), came into Bohemia. Huss read them eagerly, and availed himself of permission to lecture upon them in the university. He went further, and translated them into Bohemian, and the world has given Huss credit for writings which were merely translations from Wiclif. He also defended Wiclif's opinions, not only in the lecture-room, but from the pulpit. As he was a very popular preacher in the Bethlehem Chapel in Prague, and confessor to the Queen and a scholar of high repute, this stand attracted wide attention.

Wiclif had, however, not escaped the charge of heresy, and so in 1403 Huss was forbidden by the university authorities to discuss forty-five sentences or theses which he had derived mostly from Wiclif; and in 1409, when the Pope, Alexander V., had issued his bull against the teachings of Wiclif and the Archbishop of Prague had burned Wiclif's writings, Huss felt the effect of the opposition he had stirred up on the part of the

hierarchy, the priests, and the monks by denouncing, in imitation of Wiclif, the corruption of the Church. In 1410 he and his followers were put under the ban. Undeterred, he kept on preaching as before. In 1411 Pope John XXIII. proclaimed a crusade against King Ladislas of Naples, and promised indulgences to the volunteers. Huss the next year gave out a university debate upon the question of indulgences, which only widened the breach between himself and the university authorities and the clergy. In 1412 a Papal interdict was issued against him. In reply he wrote his book *On the Church*, again drawing heavily from Wiclif, and appealed from the Pope to a general council and to Christ; and then, feeling no longer safe in Prague, he withdrew to the castles of certain friendly noblemen. In 1414, obedient to a summons, but under the protection of King Wenceslas, and with a safe conduct to go and return, given by the Emperor Sigismund, he went to the general council which had been convened in Constance.

His journey thither was a triumph, and he entered the city (November 3d) in great state. At first he was a free man, but on November 28th he was apprehended on the trumped-up charge of attempting to leave the city, and cast into prison, in spite of the indignant protests of the Bohemian and Polish nobles. He may have fancied that he would have opportunity to defend his views in open debate, but he quickly learned that the council intended to try him as a heretic. He was, however, long kept in suspense, for it was not till June 5, 1415, that he was first formally accused. On June 8th thirty-nine charges were exhibited against him, some of which he acknowledged as fairly based upon his teachings, while others he declared to be misrepresentations. Being required to recant his alleged errors, he refused to do so until they should be proved to be errors. On June 18th the articles of his condemnation were prepared; on June 24th his books were burned; on June 31st his attempts to come to an understanding with his prosecutors failed, and on Saturday, July 6th, he was condemned to be burned at the stake for heresy. The same day the sentence was executed, and the martyr's ashes were thrown into the Rhine. The Emperor, probably influenced by the fact that condemned heretics had no claim to protection, did not interfere, as he might have done. The death of Huss caused sorrow and indignation throughout Bohemia, and led to the so-called Hussite War. See HUSSITES.

A critical edition of Huss's writings, distinguishing between his own works and his translations from Wiclif, is lacking. The best we have is F. Palacky's *Documenta Magistri Joannis Hus* (Prague, 1869). The works of Huss in Bohemian were published by K. J. Erben (Prague, 1865-68). E. de Bonnechosa published a French translation of his letters (Paris, 1846), from which an English translation was made (London, 1846); F. B. Mikowec prepared one in German (Leipzig, 1869). Nowotny began a German translation of his sermons (Gürlitz, 1855). For his biography, consult: Gillett (Boston, 1863-64), and Wratislaw (London, 1882); for his relations to Wiclif, Loserth, *Wiclif and Huss*, translation (London, 1884).

HUSSARS, hüsz-zärz'. Light cavalry. Originally a distinct type of Hungarian mounted troops, receiving their name, it is said, from the

circumstance of their origin, Matthias Corvinus having in 1458 raised a body of cavalry to operate against the Turks by taking one man out of every twenty inhabitants; hence the use of the word husz-ár, in Hungarian, *the twentieth*. The demand for cavalry possessing greater mobility than the dragoons, as yet the only type, led to the formation of light-cavalry regiments on the hussar model. Nearly two-thirds of the entire cavalry strength of Great Britain consists of hussar and lancer regiments, the general proportion throughout Europe being almost as great. The original Hungarian hussars had several peculiarities of dress and equipment, the most conspicuous of the former being a loose jacket suspended in part from the shoulders, a feature still preserved in several countries. See CAVALRY.

HUSSEIN AVNI PASHA, hü-sin' äv'né pá-shä' (1819-76). A Turkish general and statesman, born at Dost Koj, near Isparta, in Western Asia Minor, and educated after his sixteenth year in Constantinople. In 1853 he entered the General Staff under Omar Pasha, and with him directed the fortification of the Balkan passes. He commanded a division in the war with Montenegro (1859-60), became General of the Guard (1864), and in 1867-69 put down the rising in Crete. As a reward for this service he was made Minister of War, from which post he was retired in 1871, after the death of Aali Pasha, his protector. In 1872, on the accession of Midhat Pasha to the Grand-Viziership, he returned to Constantinople from his exile at Isparta, became Grand Vizier in 1874, and Governor of Smyrna in 1875. In the same year he was again Minister of War for six weeks, and in May, 1876, was a leader in the plot which deposed Abdul Aziz and put Amurath V. on the throne. Less than a month later he was assassinated by an officer, Hassan Bey, at a Ministerial meeting.

HUSSITES. The followers of John Huss (q.v.). Honoring him as a martyr, about 450 Bohemian nobles formed a league, protesting against the action of the Council of Constance which had condemned Huss to be burned, and bidding defiance to decrees of bishops and the Pope. The symbol of their confederacy was the cup, the use of which in the Lord's Supper they extended to the laity, as had already been done with the approbation of Huss. King Wenceslas of Bohemia was constrained to grant them the use of many churches. After his death (August, 1419) the majority refused to recognize as King his brother, the Emperor Sigismund (q.v.), who had broken his safe-conduct given to Huss. The so-called Hussite wars followed. For eight years (1420-27) the Hussites, led by their generals Ziska (q.v.) and Procopius (q.v.), were victorious against the forces sent against them by the Emperor and the Pope, and in 1429 and 1430 they carried terror into the countries of Germany bordering on Bohemia. Convents and churches were reduced to ashes, and priests and monks were slain. From the beginning the Hussites had included two parties—the more conservative, called Calixtines (q.v.), or Utraquists, more in sympathy with the Church, and hoping for an ultimate reconciliation, and the radical, called Taborites (q.v.), who went much further in rejecting doctrines and practices of the Church. A third faction, intermediate between the two, called Orphans, also

developed. In 1431 the Council of Basel (q.v.) undertook to conciliate the Hussites, and succeeded in coming to an agreement with the Calixtines by the 'Compactata of Prague' in 1433, after which the latter acknowledged Sigismund as King and made peace with the Church. The Taborites and Orphans were completely defeated in a battle near Böhmischbrod, May 30, 1434, and soon disappeared as a political power, but continued to exist as the Bohemian Brethren (q.v.).

HUSTINGS (AS. *hūsting*, from Icel. *hūsping*, council-place, from *hūs*, AS., OHG. *hūs*, Ger. *Haus*, house + *ping*, thing, assembly, OHG. *ding*, Ger. *Ding*, thing; connected with Goth. *þeihs*, Lat. *tempus*, time). An English term applied to the place or platform where, before 1872, members of Parliament were nominated for election, or from which a candidate addressed his constituents. The term is still applied to any electioneering platform. A court of hustings formerly existed in many English cities for the trial of suits brought for the recovery of land situated within the city limits. Such a court still survives in London; but its authority, which at one time extended to all actions between citizens, has now practically disappeared. The hustings court existed in the towns of Virginia founded during the eighteenth century. Thus the charter of Norfolk Borough, incorporated in 1736, established a hustings court to be held once a month, with jurisdiction over actions of ejection, trespass, and writs of dower, as well as all other actions, personal and mixed, involving not more than £20. A hustings court is still one of the municipal tribunals of Richmond. It is held by a judge elected in the same manner as the circuit judges, and has original and exclusive jurisdiction of most criminal offenses committed within the city limits.

HUTCHESON, FRANCIS (1694-1746). A moralist of the eighteenth century, born August 8, 1694, in the County of Armagh, Ireland. His father was a Presbyterian minister. He studied for the Church at the University of Glasgow, but after a short term of preaching he was induced, in 1719, to open a private academy in the city of Dublin, which proved highly successful. In 1725 he published his *Inquiry into the Original of Our Ideas of Beauty and Virtue*, etc., which was the means of introducing him to the notice of many influential personages, such as Archbishops King and Boulter, and Lord Granville, then Lord Lieutenant of Ireland. This work was followed, in 1728, by his *Essay on the Nature and Conduct of the Passions and Affections*, and in the year after he was appointed professor of moral philosophy in the University of Glasgow. Here he died, in 1746. His largest and most important work, *A System of Moral Philosophy*, was published at Glasgow in 1755 by his son, Francis Hutcheson. From the period of Hutcheson's lectures, according to Dugald Stewart, may be dated the metaphysical philosophy of Scotland. But it is as a moral philosopher, rather than as a metaphysician, that Hutcheson is noteworthy. His system is, to a large extent, that of Shaftesbury, but it is more complete, coherent, and clearly illustrated. Hutcheson emphasized the importance of 'calm benevolence,' and was a strong opponent of the doctrine that it has a selfish origin. Equally important with benevolence in his system is the

moral sense, "which does not impel toward good actions, but merely judges the moral quality of actions and gives its approval to benevolence;" the latter is the mainspring of good conduct. All action prompted by benevolence is formally good; but to be naturally good it must be an action which "procures the greatest happiness for the greatest numbers." In this respect he was a forerunner of the English Utilitarians. Consult Fowler, *Shaftesbury and Hutcheson* (London, 1882); Albee, *History of English Utilitarianism* (London, 1902); Martineau, *Types of Ethical Theory* (Oxford, 1886); Scott, *Francis Hutcheson* (Cambridge, 1900).

HUTCHINS, THOMAS (1730-89). An American geographer. He was born in New Jersey; entered the British Army at an early age, and participated in the French and Indian War. Being in London in 1779, he was imprisoned on suspicion of favoring American independence; but escaped by way of France, went to Charleston, S. C., entered the Continental Army, and was appointed 'geographer-general' by General Greene. He was the author of several geographical works, including a *Topographical Description of Virginia, Pennsylvania, Maryland, and North Carolina* (1778), and *History, Narrative and Topographical Description of Louisiana and West Florida* (1784).

HUTCHINSON. A city and the county-seat of Reno County, Kan., 235 miles southwest of Kansas City, Mo.; on the Arkansas River, and on the Atchison, Topeka and Santa Fe, the Missouri Pacific, and the Chicago, Rock Island and Pacific railroads (Map: Kansas, D 3). It has a fine court-house, Riverside and Hutchinson parks, a public library, and the State Industrial Reformatory, the building covering fifteen acres of the entire 640 included in the grounds. The city is the centre of an agricultural and stock-raising district, and has an important wholesale trade, and extensive manufactures of salt, large deposits of rock salt being found here. Settled in 1872, Hutchinson was incorporated two years later. Its government is administered under a charter of 1872 which provides for a mayor, elected biennially, and a unicameral council. Population, in 1890, 8682; in 1900, 9379.

HUTCHINSON, ANNE (c. 1590-1643). A religious enthusiast, of American celebrity, born in Lincolnshire, England, 1590 or 1591. She was a daughter of Rev. Francis Marbury, married William Hutchinson, 1612, and emigrated to Boston, Mass., in 1634. Living in a community prone to religious excitement, she claimed to be a medium of divine revelation, and held meetings for women, in which she set forth the doctrine that those who were in the covenant of grace were not under the covenant of works, which was considered as Antinomian by the State clergy, and likely to have sad practical consequences. Great controversies arose, and a synod was called, in which her teachings were condemned, and she was banished from the Colony. She and her friends now obtained from the chief of the Narragansett Indians liberty to reside in Rhode Island, where they set up a community on the highly commendable principle that no one was to be 'accounted a delinquent for doctrine' (1638), and founded the town of Portsmouth. After the death of her husband (who shared her opinions), in 1642, she removed to the west of

Stamford, Conn., which was then Dutch territory, and there in September, 1643, she and her whole family of fifteen persons were taken prisoners by the Indians, and all but one daughter murdered. Consult: her life in Sparks's *Library of American Biography*, vol. xvi.; Adams, *Three Episodes in Massachusetts History* (Boston, 1893).

HUTCHINSON, JOHN (1615-64). An English regicide, born in Nottingham, and educated at Cambridge. After a short study of the law at Lincoln's Inn, he identified himself with the Parliamentary side in the struggle against the King, became a member of the committee for Nottinghamshire, and throughout 1644 and 1645 acted as Governor of both Nottingham and Nottingham Castle, successfully holding them against repeated Royalist attacks, attempted bribery, and internal dissensions. In 1646 he succeeded his father, Sir Thomas Hutchinson, as a member of the Long Parliament, and two years afterwards he sat as one of the King's judges, and signed the royal death-warrant. He served under Cromwell in the Council of State until 1653, when he retired from politics, and refused further office under the Protector. He seems to have worked for a restoration of the Long Parliament, and during its short session, from May to October, 1659, he returned to his seat. He was a member from Nottingham to the Convention Parliament in 1660, but was immediately expelled as a regicide, though his life was spared through the intercession of relatives. In 1663 he was arrested as an accessory to the Yorkshire Plot, and, despite meagreness of evidence against him, was imprisoned in the Tower. In May, 1664, he was removed to Sandown Castle in Kent, where he died from fever in the following September. His wife *LUCY* (1620-c.1680), was very influential in saving his life when the Restoration took place, and after his death wrote a *Life of Colonel Hutchinson* (first published in 1806).

HUTCHINSON, JOHN (1674-1737). An English theological writer. He was born at Spennithorne, near Middleham, in Yorkshire. For some time he was steward of the household of the Duke of Somerset, and left his service to devote himself to religious studies, the Duke procuring for him a sinecure appointment from the Government. In 1724 he published the first part of a work called *Moses' Principia*, in which he defended what he regarded as the Mosaic cosmogony, and assailed Newton's theory of gravitation. He continued to publish a succession of works till his death, in London, August 28, 1737. The leading principle of his religious system is that the Holy Scriptures contain the elements not only of true religion, but of all rational philosophy, which, however, was to be derived only from the original unpointed Hebrew; and for that purpose, it was subjected to strange critical or rather fanciful processes. His works at one time exercised a considerable influence, and his followers, called 'Hutchinsonians,' included some persons of considerable learning and celebrity. His works appeared in 12 volumes (London, 1748), with life by Spearman in supplement (ib., 1765).

HUTCHINSON, THOMAS (1711-80). An American loyalist, the last royal Governor of the Province of Massachusetts Bay. He was born in Boston, where his father, the great-grand-

son of Anne Hutchinson (q.v.), was a wealthy merchant and ship-owner. He graduated at Harvard in 1727, entered his father's counting-room, early showed remarkable aptitude for business, and by the time he was twenty-four had accumulated considerable property in trading ventures on his own account. The social prominence of his family, as well as his own position in the business world, made him, while still a young man, a person of considerable importance in the community. In 1737 he was elected a member of the Boston Board of Selectmen. Later in the same year he was chosen a representative to the General Court of the Colony, and at once took a strong stand in opposition to the views of the majority with regard to a proper currency. His proposal to borrow silver in England to redeem the outstanding bills of credit, and his opposition to the revival of the Land Bank, made him unpopular with the people, and impelled his constituents in town meeting to draw up 'instructions,' disregard of which led to his retirement in 1740. In that year he went to England as a commissioner to represent Massachusetts in a boundary dispute with New Hampshire. In 1742 he was reelected to the General Court, and was thereafter chosen annually until 1749, serving as Speaker from 1746 to 1749. He continued his advocacy of a sound currency, and when the British Parliament reimbursed Massachusetts in 1749 for the expenses incurred in the Louisburg expedition, he proposed the abolition of the bills of credit, and the utilization of the Parliamentary repayment as the basis for a new colonial currency. The proposal was finally adopted by the Assembly, and its good effect on the trade of the Colony at once established Hutchinson's reputation as a financier. On leaving the General Court he was appointed at once to the Governor's Council; in 1750 he was chairman of a commission to arrange a treaty with the Indians in the District of Maine; and he served on boundary commissions to settle disputes with Connecticut and Rhode Island. In 1752 he was appointed judge of probate, and a justice of the Common Pleas. In 1754 as a delegate from Massachusetts to the Albany Convention (q.v.) he took a leading part in the discussions, and favored Franklin's plan for colonial union, although doubting its practicability. In 1758 he was appointed Lieutenant-Governor, and in 1760 Chief Justice of the Province. In the following year, by issuing writs of assistance (q.v.), he brought upon himself a storm of protest and criticism. His distrust of popular government as exemplified in the New England town meeting increased. Although he opposed the principle of the Stamp Act (q.v.), considered it impolitic, and later advised its repeal, he accepted its legality, and as a result of his stand, his city house was sacked by a mob in August, 1765, and his valuable collection of books and manuscripts destroyed. In 1769, upon the resignation of Governor Bernard, he became Acting Governor, serving in that capacity at the time of the 'Boston Massacre' (q.v.), March 5, 1770, when popular clamor compelled him to order the removal of the troops from the city. In March, 1771, he received his commission as Governor. His administration, controlled completely by the British Ministry, increased the friction with the patriots. The publication, in 1773, of some letters on colonial affairs written by Hutchinson, and obtained by Franklin in

England, still further aroused public indignation, and led the Ministry to see the necessity for stronger measures. The temporary suspension of the civil Government followed, and General Gage was appointed military Governor in April, 1774. Driven from the country by threats in the following May, and broken in health and spirit, Hutchinson spent the remainder of his life an exile in England. There, still nominally Governor, he was consulted by Lord North in regard to American affairs, but his advice that a moderate policy be adopted, and his opposition to the Boston Port Bill, and the suspension of the Massachusetts Constitution, was not heeded. His American estates were confiscated, and he was compelled to refuse a baronetcy on account of lack of means. He wrote a *History of Massachusetts Bay* (vol. i. 1764, vol. ii. 1767, and vol. iii. 1828), a work of great historical value, calm, and judicious in the main, but entirely unphilosophical and lacking in style. His *Diary and Letters* were published in 1884-86. Consult also: Hosmer, *Life of Thomas Hutchinson* (Boston, 1896); and the chapter "Thomas Hutchinson, the Last Royal Governor of Massachusetts," in Fiske, *Essays, Historical and Literary*, vol. i. (New York, 1902).

HUTCHINSON, THOMAS JOSEPH (1820-85). An English explorer, born at Stonyford, Ireland. He studied medicine and, after a trip to West Africa in 1851, was chief surgeon on the Niger Expedition (1854-55). After two years as English consul at the Bight of Biafra and Fernando Po, he became Governor of the latter place (1857), and in 1861 was transferred to the consulate at Rosario in Argentina, where a year later he took part in the Salado Expedition. In 1870 he was appointed consul at Callao, and three years later retired to his Irish property. He wrote: *Narrative of the Niger Tshadda Binuë Exploration* (1855); *Impressions of Western Africa* (1858); *Ten Years' Wandering Among the Ethiopians* (1861); *Buenos Ayres and Argentine Gleanings* (1865); *Parana and South American Recollections* (1868); *Two Years in Peru* (1874); and *Summer Rambles in Brittany* (1876).

HUTCHISON, JOHN (1832—). A Scottish sculptor, born in Edinburgh. He learned his trade there as a wood-carver, but was attending the art school at the same time, and graduated as a sculptor after studying for some time at Rome. His early work was exhibited in the Royal Scottish Academy, but his first appearance in the corresponding London Gallery was in 1862. Apart from purely imaginative work, he made statues of Robert Bruce, John Knox, Norman McLeod, Queen Victoria, and the Prince Consort, as well as of other personages less notable, while he left his mark conspicuously upon his native city in the figures representing four of Scott's characters in the monument to Sir Walter on Princes' Street.

HUTIA, ᠬᠤᠲᠢᠠ (Sp. from the native name). A West Indian rodent or hog-rat, of the family Octodontidae, differing from rats in having four grinders on each side in each jaw, with flat crowns. The tail is round and slightly hairy, and is used for support in sitting erect, as by kangaroos, and for aid in climbing trees. They make much use of their fore paws as hands. They are closely allied to the coypu (q.v.), but are not aquatic, and make their home in the

woods. The best-known species is the hutia-couga (*Capromys pilorides*) of Cuba, which is about 22 inches long to the root of the tail. The fur is long, coarse, and yellowish brown, with the paws and ears blackish. Another Cuban species is the hutia-carabali (*Capromys prehensilis*), the tip of whose tail is prehensile. The hutia-couga is a skillful climber, and lives in dense forests. Its food is chiefly fruits, leaves, and bark; but it also eats the flesh of small animals, particularly that of a kind of lizard. It is easily tamed, and the Cubans consider its flesh a delicacy, for which reason it is much hunted by the natives. The smaller hutia-carabali is said to live chiefly in the tops of trees.

Jamaica has a short-tailed hutia (*Capromys brachyurus* (see Plate of CAVIES, ETC.), locally called 'coney,' which has become rare; and Ingraham's hutia (*Capromys Ingrahami*) inhabits the Bahamas. Consult Poey, *Memorias* (Havana, 1860-62).

HUTTEN, hüt'ten, PHILIP VON (c.1515-46). A German adventurer, and relative of Ulrich von Hutten (q.v.). He was one of the 600 adventurers collected from all parts of Europe who went out under George Hohermuth (better known as George of Speyer) to conquer the Province of Venezuela, which had been granted by Emperor Charles V. to the great Augsburg family of Welser (q.v.). When Hohermuth died in 1540, Hutten became Captain-General, and the next year, in company with young Bartholomäus Welser, eldest son of the head of the family, left Coro with a well-equipped force to seek the mythical El Dorado (q.v.). After wandering about for five years, the remnant of the expedition returned to Venezuela to find a new Governor in power. Juan de Caravajal had been appointed by the Audiencia of Santo Domingo to preserve order in Venezuela, but as the years went by with no news of Hutten and his followers, he began to feel secure in his position. Consequently, the return of the adventurers was anything but welcome to him. When he saw how diminished they were in number he thought to force from them an acknowledgment of his authority. In this, however, he was unsuccessful, as he also was in an attempt to seize them. In fact, this last effort was well nigh disastrous to himself, for he was wounded by Welser, and forced to pledge the Germans safe passage to the coast. Relying upon Caravajal's word of honor, the adventurers took no precautions against attack, and were easily captured by the treacherous Spaniard, who, after keeping Hutten and Welser in chains for a time, had them beheaded. Hutten seems to have been a man of higher character than most of those with whom he was associated. He left a narrative of his adventures entitled *Zeitung aus Indien* (1785).

HUTTEN, ULRICH VON (1488-1523). A scholar, poet, and reformer of the German Renaissance, one of the most celebrated of the Humanists. He was descended from an ancient and noble family, and was born at the Castle of Steckelberg in Hesse, April 21, 1488. At the age of ten he was placed in the neighboring monastery of Fulda, but, disliking this mode of life, fled in 1505 to Cologne, where he met Hoogstraten, Johannes Rhegius, and other scholars of the day. In 1506 he came to Erfurt, but soon after rejoined Rhegius at Frankfort-on-the-Oder. There he took his master's degree and

published his first poem. In 1507 he followed Rhegius to Leipzig. He was stricken down with the pestilence in the following year, but recovered, and at Wittenberg in 1511 published his *Ars Versificatoria*. During these years he led the life of a wandering poet, subsisting on the bounty of those who admired his talents or feared his mordant wit. In 1512 he went to Pavia to study law. He had been there only a short time when the city was plundered by the Swiss, and Hutten was deprived of all he possessed. For a short time he served as a soldier in the Imperial army, but soon returned to Germany, where he boldly entered into a quarrel with the Duke of Württemberg, who had murdered a kinsman of Ulrich's, and brought about the Duke's punishment. In the dispute between Reuchlin (q.v.) and the Dominicans, Hutten came to the support of the former, and displayed no small learning and great power of satire. He went again to Italy in 1515, to take the degree of doctor of laws, and returned to his native country in 1517. He was crowned with the poets' laurel crown at Augsburg by the Emperor Maximilian, who conferred on him the honor of knighthood. While in Italy Hutten had become imbued with a fierce hatred for the Papacy, which he bitterly attacked in his preface to an edition of Laurentius Valla's *De Donatione Constantini*, published in 1517. In the following year he accompanied his patron, Albert, Archbishop of Mainz, to the Diet of Augsburg, where Luther had his famous conference with Cajetan. Subsequently he established a small printing press of his own, and employed himself in putting forth pamphlets written in the German language violently attacking the Pope and the Roman clergy. The Archbishop Albert denounced him at Rome, whereupon Hutten took sides with Luther, whom he had hitherto affected to despise. Persecuted by his enemies, he availed himself of the protection of Franz von Sickingen, but was forced to flee from the latter's castle after a two years' residence (1520-22). Going to Basel, he was coldly received by Erasmus, who did not approve of his extreme measures, and a breach took place between the two men which culminated in a great literary quarrel. From this time Hutten was compelled to adopt a wandering life. He died August 23, 1523, on the island of Ufnau in the Lake of Zürich. Hutten was more open in the expression of his opinions than any other man, probably, of his age. He did much to prepare the way for the Reformation and to promote it. He was a master of the Latin language, and excelled in satirical and passionate invective. His literary life is generally divided into three periods: (1) Period of Latin poems (1509-16); (2) period of letters and orations (1515-17); (3) period of dialogues and letters in Latin and German (1517-23). In all he published some forty-five different works, but his most noteworthy contribution to literature was his portion of the immortal *Epistolæ Obscurorum Virorum* (q.v.). Hutten's collected works, *Opera Omnia*, were published at Leipzig in seven volumes (1859-70) under the editorship of Böcking. Among several biographies by German authors that by Strauss (6th ed., Bonn, 1895), abridged in English by Sturge (London, 1874), is especially to be recommended. Consult also: the monographs by Reichenbach (Leipzig, 1877), and Schall (Halle, 1890); and Szamotłski, *Ulrich von Hutten's deutsche Schriften*

(Strassburg, 1891). A good brief sketch in English is Jordan, "A Knight of the Order of Poets," in *The Story of the Innumerable Company* (San Francisco, 1896).

HUTTER, hut'tēr, LEONHARD (1563-1616). A German Lutheran theologian, born at Nellingen, near Ulm. He studied at the universities of Strassburg, Leipzig, Heidelberg, and Jena, and after lecturing at Jena for several years, answered a call to Wittenberg. He was one of the most resolute and influential representatives of the Lutheran faith, and was known as Redonatus Lutherus. He attacked the Calvinist doctrines in his *Concordia Concors* (1614), which he wrote as an answer to Hospinian's *Concordia Discors* (1607).

HUTTON, CHARLES (1737-1823). A self-educated English mathematician, born at Newcastle-on-Tyne, of humble parentage. He received most of his education in a school at Jesmond, where, at the age of eighteen, he became master. The number of pupils having increased, he, in 1760, opened a mathematical school in Newcastle, and also taught mathematics at the Head School of the city. Among his pupils was John Scott, afterwards Lord Eldon, Chancellor of England. In 1770 he was engaged by the city of Newcastle to draw up an accurate map of the city and the suburbs. He became professor of mathematics in the Royal Military Academy at Woolwich (1773), and the following year was made a fellow of the Royal Society. He made important contributions to the *Philosophical Transactions*, and in 1778 gained the Copley medal for his papers on "Force of Exploded Gunpowder," and "Velocities of Balls." He was appointed by the Royal Society to determine the mean density and mass of the earth. His report appeared in the *Philosophical Transactions* for 1778. In 1779 he was made foreign secretary of the Royal Society, but resigned in 1783. Owing to failing health, he resigned his professorship in 1807, and was granted a pension of £500 a year. He was editor of the *Ladies' Diary* from 1774 to 1817. The most important of his works are, besides those mentioned above: *The Diarian Miscellany* (1775); *Mathematical Tables* (1785); *Mathematical and Philosophical Dictionary* (1795); *A Course of Mathematics* (1798 and subsequent editions); *Recreations in Mathematics and Natural Philosophy*, from the French of Montucla (4 vols., 1803); "On Cubic Equations and Infinite Series," in the *Philosophical Transactions* for 1780.

HUTTON, FREDERICK REMSEN (1853—). An American mechanical engineer, born in New York City, and educated at Columbia College, and the School of Mines, where he became assistant on being graduated, and in 1891 professor of mechanical engineering. In 1883 he had been elected secretary of the American Society of Mechanical Engineers, and in 1892 became an associate editor of the *Engineering Magazine*, and in 1893 became an editor of *Johnson's Cyclopædia*. Hutton wrote reports on machine tools for the Census of 1880; and *Mechanical Engineering of Power Plants* (1897).

HUTTON, JAMES (1726-97). An eminent British geologist. He was born in Edinburgh, and educated at the university in that city. After serving a year's apprenticeship in a law office, he relinquished his plan of joining the legal profession, and entered upon the study of medi-

cine, taking courses at Edinburgh, Paris, and Leyden. In 1750 he returned to Scotland, and for several years was engaged in agricultural pursuits. Upon removing to Edinburgh in 1768 he came in contact with Ferguson, Black, and other savants, who encouraged and directed his scientific investigations. The results of a long and careful research into geological processes were formulated in a paper entitled "Theory of the Earth," which he read before the Royal Society in 1785, and afterwards amplified and published as *The Theory of the Earth, with Proofs and Illustrations* (1795). This work, although attracting little notice at the time, established a place for its author among the foremost thinkers in the realm of geological science. One of the fundamental principles of Hutton's theory was based on the internal heat of the earth, which has shown itself in past ages by the intrusion of molten rocks into the crust, and by upheaval of the superficial strata. This view was combated by the followers of Werner, but it is now generally accepted as correct. He further developed the principle that the study of geological phenomena should be based upon observation of changes going on at the present time, and thus in a way originated the doctrine of uniformitarianism (q.v.), afterwards elaborated and expounded by Lyell. The great value of Hutton's work was not fully appreciated until several years after his death, when Playfair brought out the "Illustrations of the Huttonian Theory." Hutton contributed frequently to the "Transactions of the Royal Society of Edinburgh," and also published several extended works, among the most important of which are: *Dissertations on Different Subjects in Natural Philosophy* (1792); *Investigation of the Principles of Knowledge* (1794); and *A Dissertation upon the Philosophy of Heat, Light, and Fire* (1794).

HUTTON, LAURENCE (1843—). An American essayist and critic, born in New York City. He was educated privately and at the age of nineteen entered commercial life, which proved uncongenial. Various visits to European cities strengthened an inborn taste for letters, and after acting from 1872 until 1874 as dramatic critic of the *New York Evening Mail*, he devoted himself entirely to literature. From 1886 till 1898 he was the literary editor of *Harper's Magazine*. He was one of the organizers of the Authors' Club, and of the International Copyright League. The private collection of literary curiosities gathered by him is unique, one of the most complete in the world. In 1892 he received the degree of A.M. from Yale, and in 1897 from Princeton. His writings on dramatic subjects include: *Plays and Players* (1875); *Curiosities of the American Stage* (1887); *Memoir of Edwin Booth* (1893); and with Brander Matthews, *Actors and Actresses of Great Britain and of the United States* (1886-87). He edited the *American Actor Series* (1881-82); compiled other books on subjects connected with the American stage; and published a group of delightful literary guide-books including *Literary Landmarks of London* (1887); of *Edinburgh* (1892); of *Jerusalem* (1895); of *Venice* (1896); of *Florence* (1897); of *Rome* (1897).

HUTTON, RICHARD HOLT (1826-97). An English journalist and critic. He was the son of a Unitarian minister, and was born June 22,

1826, in Leeds, Yorkshire. The family removed to London in 1835. Hutton was educated at University College School, and subsequently at the college itself, with a view to the Unitarian ministry. After two semesters in Germany, he returned to London; and finding no adequate sphere in the ministry, he became principal of University Hall. Resigning on account of ill health, which necessitated a trip to the West Indies, he studied law. Under the influence of F. D. Maurice he entered the Church of England. In 1861 Meredith Townsend bought the *Spectator*, and called in Hutton to aid him in conducting it. As editor of this paper for twenty-five years Hutton exerted great influence. Liberal but not radical in tone, it became in his hands the organ of the very best contemporary thought. As a critic Hutton came to speak with much authority. His best work is represented by *Essays, Theological and Literary* (1871), containing under the second division essays on Goethe, Wordsworth, Shelley, Byron, Browning, George Eliot, and Clough; *Essays on Some Modern Guides of English Thought* (1887), treating of Carlyle, Newman, Matthew Arnold, George Eliot, and F. D. Maurice. He also wrote a life of Scott (1878), and edited the *Biographical Studies of W. Bagehot* (1881). Hutton died September 9, 1897, at Crossdepe. Consult Hogen, *R. H. Hutton, a Monograph* (Edinburgh, 1900).

HUXLEY, THOMAS HENRY (1825-95). An English naturalist and comparative anatomist. He was born at Ealing, now a suburb of London, May 4, 1825. He studied in the Medical School of Charing Cross Hospital, and in 1845 was graduated as M.B. and medalist at the University of London. In 1846 he was appointed assistant surgeon on the *Rattlesnake* of the Royal Navy, commanded by Capt. Owen Stanley, which was to survey the region of the Great Barrier Reef, east and north of Australia. Imbued with a passion for natural history, Huxley devoted himself to the study of the marine animals seen and collected during the four years of this survey service. His most important research, "On the Anatomy and the Affinity of . . . the Medusæ," was published during his absence and placed its author in the front rank of biologists. He demonstrated that the body of the medusa is essentially built up of an inner and an outer membrane, which he asserted were the homologues of the two primary germinal layers in the vertebrate embryo. (See EMBRYOLOGY.) This discovery stands at the basis of modern philosophical zoölogy, and of a true conception of the affinity of animals.

In 1850, on his return to England, Huxley began a hard struggle against adversity and discouragement. Disappointed in the hope that the Admiralty would provide for the publication of his notes and drawings, he published the more important in the *Philosophical Transactions* (1851), and in the same year was elected a fellow of the Royal Society, which in 1852 gave him its medal. In 1854 he succeeded Edward Forbes as professor of natural history and paleontology at the Royal School of Mines. This was in the line of direct advancement, for his great ability as an educator and administrator, as well as in original research, brought him to many posts of honor, such as, in 1855, the Fullerian professor-

ship of comparative anatomy at the Royal Institution; in 1863, the Hunterian professorship at the Royal College of Surgeons; in 1868, the presidency of the Ethnological Society; in 1869, the presidency of the Geological Society; in 1870, the presidency of the British Association for the Advancement of Science, and a seat on the first school board of London; in 1871, the secretaryship of the Royal Society, of which he became president in 1883; in 1872, the lord rectorship of Aberdeen University; in 1881, the professorship of biology in the Royal College of Science (an expansion of the earlier chair in the Royal School of Mines); in 1892 Privy Councillor. He served on no fewer than ten royal commissions, of which the most important were that of Inquiry into the Sea Fisheries (1864-65), and that on Scientific Instruction, and the Advancement of Science (1870-75).

Huxley's gifts of exposition were as remarkable as his powers of research. His scientific lectures, like his papers, were models of clearness, as well as accuracy, and he was both cogent and eager in debate, and fascinating in popular address. In 1858 he delivered the 'Croonian' lecture on the "Origin of the Vertebrate Skull," in which he disposed forever of the hypothesis that the skull is, homologically, an expanded section of the vertebral column. The very next year *The Origin of Species* was published. Convinced by its arguments, Huxley threw himself heart and soul into their support, adducing much telling corroboration from his own investigations. His series of lectures to London workmen in 1860 had this for their theme, and did much to further the acceptance of the new doctrines. They were the basis of the powerful book *Man's Place in Nature*, and were succeeded by many addresses, essays, and debates, influential in informing the public and overcoming both scientific objections and religious alarm. It may fairly be said that science as contained in the doctrines of organic evolution, and especially in the views of Darwin, is almost as much indebted to the lucid exposition and bold championship by Huxley as to the originators of the theories. Nevertheless Huxley accepted Darwin's hypothesis of natural selection with a qualification. He pointed out the lack of evidence that any group of animals has, by variation and selective breeding, given rise to another group in the least degree infertile with the first; but he believed this objection might disappear under prolonged observation and experiment. As to Lamarck's theory of use-inheritance (q.v.), he declared, in 1890, his absolute disbelief, as the evidence then stood.

Huxley came to America in 1876, and delivered in New York three lectures on Evolution, taking as his texts the series of fossil horses. During that visit he delivered the opening address at Johns Hopkins University. Huxley's contributions to science were of the widest range, and embraced every department of biology. His exposition of the relations of protoplasm as the physical basis of life is particularly masterful. He was not only a man of science, but a publicist. His services were always at command for the promotion of political, social, and moral reform—first and chiefly for the cause of national education. His devotion to labors thus entailed, added to professional toil, did much to undermine his health, which for some

years toward the end of his life was very poor. He died at Eastbourne, June 29, 1895.

Professor Huxley bore an honorable part in creating the knowledge which will make the nineteenth century memorable; and a great part of it was made permanent in a series of books, of which the following is a complete list: *Oceanic Hydrozoa* (1859); *Evidence as to Man's Place in Nature* (1863); *Elementary Physiology* (1866; 4th ed. 1885); *Lay Sermons, Addresses, and Reviews* (1870; 3d ed. 1887); *Anatomy of Vertebrated Animals* (1871); *Critiques and Addresses* (1873); *Elementary Biology* (with Dr. H. N. Martin) (1875; 2d ed. 1876; 3d ed., edited by G. B. Howes and D. H. Scott, 1877); *American Addresses* (1877); *Anatomy of Invertebrated Animals* (1877); *Physiography* (1877); *Hume* (1878); *The Crayfish: An Introduction to the Study of Zoölogy* (1880); *Collected Essays* (9 vols., 1893-94). These contained some reprinted material as follows: *Method and Results; Darwiniana; Science and Education; Science and Hebrew Tradition; Science and Christian Tradition; Hume, Man's Place in Nature; Discourses, Biological and Geological; Evolution and Ethics*, and other essays. Four volumes of Huxley's *Scientific Memoirs*, edited by Sir Michael Foster and Prof. E. Ray Lankester, were published between 1898 and 1902. An authorized collection of his minor writings appeared in eight duodecimo volumes (New York, 1897-1900).

His *Elements of Biology* became the model for a large number of laboratory manuals, and his *Crayfish* is a classic of the methods of the investigator and the instructor combined. Whatever his theme, the weight and honesty of his thought and the distinction of his style make his works part and parcel of the best books of his time.

Consult: *Life and Letters of Thomas Henry Huxley*, by his son, Leonard Huxley (2 vols., London, 1900), which contain a complete list of his writings and of the honors awarded him; *Thomas Henry Huxley: A Sketch of His Life and Work*, by P. Chalmers Mitchell (London, 1900); *Thomas Henry Huxley*, by Edward Clodd (London and New York, 1902).

HUY, u'è. A strongly fortified town of Belgium, in the Province of Liège, situated amid lofty rocks on both banks of the Meuse, 18 miles by rail from Liège (Map: Belgium, D 4). Its citadel, dating from 1822, is partly excavated in the solid rock and commands the passage of the river. The Church of Notre Dame, a graceful Gothic edifice, was begun in 1311 and restored after having been partially destroyed by fire in the sixteenth century. The town contains distilleries and paper-mills, and in the vicinity are iron-works and coal-mines. Population, in 1890, 14,486; in 1900, 15,061. In one of the suburbs of Huy was formerly situated the Abbey of Neufmoustier, founded by Peter the Hermit, who was also interred within it. Huy was taken repeatedly by the Dutch and French in the many wars which swept over this region, and was last captured by Marlborough and Coehoorn in 1703.

HUYDECOPER, hoï'de-köpër, BALTHASAR (1695-1778). A Dutch poet and critic, born at Amsterdam. One of his first books, *Proeve van taal- en dichtkunde op Vondel's Herscheppingen van Ovidius* (1730), or annotations to Vondel's translation of Ovid's *Metamorphoses*, is an important contribution to classical study. So is

THOMAS HENRY HUXLEY
FROM THE PORTRAIT BY A. LEGROS

his edition of the chronicle of *Melis Stoke* (1772). He was the most notable of those who attempted to purify the Dutch language, and to render it more flexible. His collected poems were published in 1788. As a dramatist he was not so successful. Among his plays are a translation of Corneille's *Œdipe*, and *Achilles* (1719), an original drama, for some time very popular. He also made a verse translation of the *Satires* and *Epistles* of Horace (1737).

HUYGENS, hi'gēnz, Dutch pron. hoi'gēns, CHRISTIAN (1629-95). A celebrated Dutch mathematician, physicist, and astronomer. He was born at The Hague, the second son of Constantijn Huygens van Zuylichem, a poet and secretary and counselor to the Princes of Orange. He studied at Leyden and Breda, devoting himself at first to law, and then pursuing the study of mathematics. At the invitation of Minister Solbert of France, he settled in Paris, being given rooms in the Royal Library and made a member of the Academy. After the revocation of the Edict of Nantes he returned to Holland, where he lived the rest of his life. His early work, *Theoremata de Quadratura Hyperbolis, Ellipsis, et Circuli, ex Dato Portionum Gravitatis Centro* (1651), is an example of the talent which lay at the foundation of all his scientific achievements. This was followed by his *De Circuli Magnitudine Inventa* (Leyden, 1654), reprinted in Rudio, *Archimedes, Huygens, Lambert, Legendre* (Leipzig, 1892), the object of each work being to expose the fallacies of Gregoire de Saint-Vincent. He also worked on the doctrine of probabilities already founded by Pascal and Fermat and published *De Ratiocinatione in Ludo Aleæ* (1656). Huygens was the first to apply the pendulum to clocks and to use the device to determine the acceleration of gravity. A complete description of Huygens's apparatus is contained in his great work, *Horologium Oscillatorium, sive de Motu Pendulorum* (1673). He also developed and gave precision to the investigations of Galileo upon accelerated motion under the action of gravity; and there is no doubt that to his studies and discoveries his great successor, Newton, in preparing his magnificent development of the principle of accelerating force, was largely indebted. Newton was a student and admirer of his works, and assigns to him, along with Sir Christopher Wren and Wallis, the distinguished epithet of *hujus ætatis geometrarum facile principes*.

Huygens was the first to construct powerful telescopes, and in 1655 discovered the ring of Saturn and the fourth satellite of that planet. In 1659 he published an account of these discoveries in a work entitled *Systema Saturnium*. In the end of this work is described an invention of great importance in astronomy; namely, the micrometer (q.v.), by which small angles between objects viewed by a telescope are accurately measured.

In 1660 Huygens visited England, where he was admitted a member of the Royal Society. Huygens was the originator of the wave theory of light; and this theory, now accepted, was first stated by him in 1678, in his *Traité de la lumière* (first printed in 1690; modern German translation in *Ostwald's Klassiker No. 20*, Leipzig). In this theory light is conceived to be a form of motion in the medium through which it passes. (See LIGHT.) Later (1690) he was able

to explain both reflection and refraction by wave-motion in the ether, and was also able to account for double refraction. To Huygens is due the discovery of polarization, a phenomenon which could not then be explained by the undulatory theory, and led Newton to adopt the emission theory. Huygens was in error, however, in believing that the vibrations were longitudinal rather than transverse. The undulatory theory, however, did not gain general acceptance until the nineteenth century, when the experiments of Young and Fresnel placed it on a firm basis.

A new edition of Huygens's collected works has been published by the Holland Academy of Sciences in six volumes (The Hague, 1888-95). For his biography, consult Bosfcha, *Christian Huygens*, German translation by Engelmann (Leipzig, 1895).

HUYGENS, CONSTANTIJN (1596-1687). One of the greatest writers in Dutch literary history. He was born at The Hague. His father was secretary to the State Council, and from childhood he was trained to diplomacy and in every polite art. Intellect in him was joined to beauty and strength. He studied at Leyden, London, and Oxford, and became a warm friend of Dr. Donne. Returning to Holland in 1620, he was sent on a diplomatic mission to Venice and twice to London (1621-23). Meantime he had published *Batava Tempe*, a versified series of local legends and scenes, and a volume of satires, *Costelick Mal*. Then followed (1625) a large volume of miscellaneous poems, *Otia, Ledighe uren*. That year he was made private secretary to the Stadtholder, and in 1630 member of the Privy Council, wherein he long used political power with vigor and wisdom. In 1634 he translated Donne's poems, and on the death of his wife (1637) composed *Daguerck*, a sort of didactic elegy suggesting the manner of Tennyson's *In Memoriam*. *Hofwijck*, a poem on moral life, appeared in 1654. A collected edition of his poems appeared as *Korenbloemen* in 1658; his solitary drama, *Trijntje Cornelis*, in 1659. Although Huygens was not the greatest of Dutch poets or of Dutch statesmen, he was, in the combination of his qualities, one of the most dignified and brilliant talents of the days of Holland's greatness. As a poet he had more feeling for form and mastery of language, more ease and facility, than any other in his language. Consult Jorissen, *Constantijn Huygens* (Amsterdam, 1871).

HUYGENS'S PRINCIPLE. See LIGHT.

HUYSMANS, u'ēs'män', JORIS-KARL (1848—). A French novelist, born in Paris, of a Flemish family, some members of which had achieved distinction as painters at Antwerp in the seventeenth century. He began literary life as a disciple of the crassest realism, as one may see by his contribution to *Les Soirées de Médan*. (See ZOLA.) His novels present every stage of an evolution from sensual materialism, through spiritualism and Satanism to Christian mysticism, in which there is indeed a curious strain of the sensual and material still. *Marthe* (1877) is a study of sordid prostitution, coinciding significantly in date with Goncourt's *Fille Eliza* and Zola's *L'assommoir*. In *Les sœurs Vatard* (1879) Huysmans shows himself still a dilettante of moral anguish, sordid wretchedness, and contemptible vice. *En ménage* (1881) is a cynical commendation of marriage and *A rou-veau*

(1894) is a *tour de force* in nauseating description. Then in *A rebours* (1884) Huysmans turns as it were in a fierce desperation from materialism to a frenzied spiritualism. "All that transfigures or transforms reality enchants him," he makes his hero say. After this there are some barren years save for the insignificant *En rade* (1887) and *Un dilemme* (1887). Then *Là-bas* (1891) carries the psychic evolution a step further in a morbid treatment of astrology and Satanism. This recrudescence of the occult and reassertion of the extra-natural suggests a fascinated contemplation of religious mysticism, and in *En route* (1896) we find Huysmans indeed 'on the road' toward such Christianity as may be consistent with pessimism. From this point the progress is steady and the course plain. *La cathédrale* (1897) carries the reader to the door of a Benedictine retreat, and *L'oblate* (1898) ushers him within. All this latter work is full of "fingering spiritual muscles to see if they are growing;" it is thoroughly morbid, but thoroughly characteristic, too, of a French generation weary of material progress and of all problems save those that defy solution. Yet in spite of glaring errors of taste, in spite of a recondite vocabulary and of a studied absence of structural unity, these novels are perhaps the frankest and subtlest analyses of the progress of a pilgrim soul since Bunyan's Christian allegory. And they are essentially autobiographic; for Huysmans, like his hero, retreated for some time to a Trappist monastery, and became an unprofessed member of the Benedictine community at Solesmes, "too much a man of letters to be a monk, too much a monk to stay among men of letters," as is said of Durtal in the conclusion of *En route*, which is to English readers the most attractive of all his works and "one of the most characteristic novels of our quarter century." It is well translated by Kegan Paul.

HUYSUM, hoi'sum, JAN VAN (1682-1749). A celebrated Dutch painter of flowers and fruits. He was born at Amsterdam, April 15, 1682, and required the rudiments of his art from his father, JUSTUS (1659-1716), a landscape painter of considerable talent. Jan at first devoted himself to landscapes, in the classic style, smooth and lifeless, and only later in life began to paint fruits and flowers, studying especially the works of De Heem and Abraham Mignon (q.v.). His work differed from that of his predecessors in that he preferred to paint upon a light background. He surpassed in mellowness, purity, and delicacy of coloring, and in the exquisite disposition of his lights and shadows. He was fond of introducing birds' nests with eggs, dewdrops, insects, butterflies, and like motifs, rendered with such realism as almost to produce an illusion. The tissue of his flowers and the soft down of his fruit are incomparable in delicacy. His works were very popular and commanded the highest prices. He died at Amsterdam, February 7, 1749. Huysum's masterpieces are to be found in the chief German and Dutch galleries, especially those of Berlin and Amsterdam; the Louvre is the richest of all, having ten pieces, and there are excellent examples in the English private collections.

HUZVARESCH, hōōsh-vā'rēsh. See PAHLAVI.

HWANG-HO, hwāng'hō'. See HOANG-HO.

HWANG-TI, hwāng'tē' (Chin., Yellow Emperor, or Ruler). The third of the *Wu Ti*, or 'Five Sovereigns,' who are reputed to have governed China in its legendary period, prior to B.C. 2356. Like Fuh-hi (q.v.) and many more of the great leaders of Chinese primitive times, his birth was miraculous, and many wonderful things are attributed to him. The year B.C. 2697 is given as the first of his reign, and as he ruled under the influence of the element *earth*, he became known as the 'Yellow Emperor,' a circumstance which, if he ever lived, might point to the region now known as Shen-si (q.v.) as the location of his realm. There the earth is yellow, the atmosphere is tinged with yellow, and trees, houses, etc., are covered with the yellow dust from the mantle of loess (q.v.) which covers half the province. Yellow is still the Imperial color. He is said by the Chinese to have regulated the calendar, and to have introduced in the sixty-first year of his reign the sexagenary cycle by which successive days have ever since been designated, the application of the cycle of years dating only from the Han dynasty (which began in B.C. 206). He is also credited with having introduced a decimal system, the arts of wood, pottery, and metals, boats and wheeled vehicles, and many other beneficent things. To Hwang-ti's wife is due the credit of having been the first to instruct the people in the rearing of silkworms. That Hwang-ti was a virtuous ruler and his reign a prosperous one are vouched for by the statement that both the Fū-hwang and the K'i-lin (qq.v.) appeared in his court. He died at the age of 111, and was succeeded by Shao-hao, B.C. 2597. See the *Chinese Repository*, vol. xi.; Mayer, *Chinese Reader's Manual* (Shanghai, 1874); De la Couperie, *The Western Origin of Chinese Civilization* (London, 1884); and Dyer Ball, *Things Chinese* (London and New York, 1893).

HWEI-SANG, hwā'sāng' (c.420-c.505). A Buddhist monk, who traveled to the land Fusang, which has been identified by some with Mexico. In 499 Hwei-sang came to King Chow, the Imperial city of the dynasty of Tsi, and in 502 told the Emperor the story of his travels in Fusang, a country to the east, so called from a plant, the *fusang*. His story was taken down in writing; its principal point was that Fusang had been converted to Buddhism by monks from Cabul in 458. The identification of Fusang with Mexico was first made by De Guignes in 1761, in the *Mémoires de l'Académie des Inscriptions et Belles-Lettres*, vol. xxviii., and was laughed at. In later times (1862-63) Gustav d'Eichtal upheld the theory, and (1875) so did Charles G. Leland. (Consult his *Fusang, or the Discovery of America*.) But the strongest impetus given to this belief was by Vining, *An Inglorious Columbus* (1885), and by John Fryer (1901), in *Harper's Magazine* (vol. ciii., p. 251 sqq.), and in *Harper's Encyclopædia of United States History*, "Hui Shen," which should be consulted. He finds traces of Buddhist art in the idols of the Aztecs; of *lama* in the Aztec *tlama*; of *Gautama*, in *Guatemala*, *Huatomo*, *Guatemotzin*; of *Sakya* in *Oaxaca*, *Zacatecas*, *Sacatepec*, *Zacatlan*, *Sacapulcas*, and *Taysacca*; of a correspondence between *Fusang* from *fusang*, and *Mexico* from *maguey* (or agave); while he explains away all difficulties by mistakes in the report of Hwei-sang's

story due to his imperfect knowledge of Chinese and by the changes wrought in Mexico by the invasions of the Spanish.

HYACINTH (from OF. *hyacinthe*, from Lat. *hyacinthus*, from Gk. ἵακινθος, *hyakinthos*, hyacinth; of doubtful etymology, hardly connected with Lat. *juvenis*, Skt. *yuvan*, Eng. *young*), *Hyacinthus*. A genus of bulbous plants of the natural order Liliaceæ, with linear radical leaves and many flowers on leafless scapes. The blossoms are either erect, spreading, or drooping, and arranged in loose or dense racemes. The genus comprises about thirty species, of which three are natives of Southern and tropical Africa, and the rest of Asia Minor, Syria, and Persia. The few cultivated species are native to the region east of the Mediterranean Sea, and among them *Hyacinthus orientalis*, which has become naturalized in Southern Europe, is by far the most important. The numerous varieties have single and double flowers of many different colors. The hyacinth has long been in cultivation, and about the beginning of the eighteenth century it stood almost first in popularity among florists' flowers, and many new varieties were produced. Then, as now, Holland, owing to its favorable climatic and soil conditions, was the principal hyacinth-growing country. Hyacinths are grown in the open, under glass,

DUTCH HYACINTH.

and as house plants. For outdoor growth, a good, well-drained garden soil is required. Well-rotted cow manure is the best fertilizer for hyacinth-beds, and horse manure should never be used. Neither should the bulbs be brought in direct contact with freshly applied manure. The bulbs, planted from September to November, are usually placed from six to eight inches apart, and about five inches deep in beds spaded to the depth of twenty inches. The main root-growth is made during the fall. In winter the beds are protected with litter, leaves, or well-rotted manure. The plants flower early in the spring. In the summer when the leaves have withered, the bulbs are taken up and stored in dry soil or sand until planting time. For winter flowering the bulbs are started in the dark, and later on the plants are brought to bloom in the foreing house. As house plants, they are grown in hyacinth glasses with water only. Roman hyacinths are a form of *Hyacinthus orientalis* which produce three or four small flower-spikes instead of a single large one. Two other species, *Hyacinthus amethystinus*, or Spanish hyacinth, and *Hyacinthus ciliatus*, are also cultivated to a small extent. There are a number of other plants commonly called hyacinths, which belong to other genera of Liliaceæ. Among these are the grape or globe hyacinth and the musk-hyacinth of the genus *Muscari*; the *Hyacinthus candicans* of gardeners, which is *Galtonia candicans*; the wild or wood hyacinth of Great Britain (also

called bluebell) is *Scilla festalis*. The water-hyacinth (*Eichhornia speciosa*), which occurs in American tropical and sub-tropical streams, often constitutes a hindrance to navigation. It belongs to the order Pontederiaceæ. See Colored Plate of AQUATIC PLANTS.

HYACINTH. The brownish or reddish transparent variety of zircon, especially that found in Ceylon, frequently used as a gem. The name is also applied to similarly colored transparent minerals, chiefly to the hessonite variety of garnet.

HYACINTHE, é'a'sánt', PÈRE. See LOYSON, CHARLES JEAN MARIE.

HY'ACINTHUS (Lat., from Gk. ἵακινθος). According to the usual story, the son of Amyclas, and beloved by Apollo. While throwing the discus from its course against Hyacinthus. His grave was shown at Amyclæ, and on the throne of the image of Apollo, which stood over the grave, was represented the reception of Hyacinthus and his sister into Olympus. The Hyacinthia, celebrated in his honor for three days each spring, were among the greatest Laconian solemnities, and Amyclæ the most sacred place in Laconia. From the blood of Hyacinthus sprang the hyacinth, with the lament AI on each leaf. This flower seems to be a species of iris; but is almost certainly not our hyacinth.

HYADES, hi'a-déz (Lat. nom. pl., from Gk. Ἰάδες, rainy). In German mythology, nymphs of Dodona, associated with the fructifying effect of moisture. They were the nurses of the newborn Bacchus, and were rewarded by Zeus by being placed among the stars near the head of the Bull. Their number varies from two to seven. According to another account they were daughters of Atlas and Æthra or Pleione, and sisters of the Pleiades, and were changed into stars after their death from grief at the loss of their brother Hyas, who was killed by a snake. The rising of these stars in spring and autumn was looked on by the Greeks and Romans as a sign of wet weather. The name was sometimes rendered by the Romans *Suculæ*, little pigs, either by mistaken derivation from *ūs*, sow, or because the Roman name, for which a derivation from *succus*, moist, has been assigned, existed independently of the Greek term.

HYÆNODON. An extinct dog-like creodont mammal, fossil skeletons of which have been found in the late Eocene and early Miocene terrestrial deposits of North America and Europe. It was the latest and most specialized member of the Creodonta. Its head is very elongate with a strong posterior crest, the lower jaw is long and slender, and the canine teeth of both jaws are prominent. The body was of slender build, the legs rather short, the feet semi-plantigrade, each foot with five clawed toes. The finest examples are from the White River formation of Nebraska, Montana, and Dakota.

HY'ATT, ALPIEUS (1838-1902). An American naturalist. He was born at Washington, D. C., and was educated at the Maryland Military Academy, at Yale College, and the Lawrence Scientific School, Cambridge, from which he graduated in 1862. He served as a volunteer

throughout the Civil War, rising to the rank of captain. He afterwards renewed his studies, becoming curator of the Essex Institute in 1867. He was the principal founder of the American Society of Naturalists; organized a seaside laboratory at Amusquam, Mass.; took part in the organization of the Marine Biological Laboratory at Wood's Holl, Mass.; and assisted in the founding of the Peabody Academy of Sciences, and became its curator in 1869. He was also one of the founders of the *American Naturalist*. In 1870 he became custodian, and in 1881 curator, of the Boston Society of Natural History, and in 1881 was appointed professor of zoology and paleontology at the Massachusetts Institute of Technology and at Boston University.

He was elected a member of the National Academy of Sciences in 1875; was a corresponding member of the Geological Society of London; and in 1898 received the degree of LL.D. from Brown University, and was a vice-president of the American Academy of Arts and Sciences, Boston. His work as a paleontologist was masterly; besides making many innovations in the classification of the nautiloids and ammonites (q.v.), the final results form the most valuable contribution to the philosophy of biology. He was the founder of the new school of invertebrate paleontology. In systematic zoology he will be remembered for being next to the first one to refer the sponges to a distinct phylum. He also proposed many new genera, families, and numerous suborders of fossil cephalopods. He discovered the law of acceleration in the evolution of Cephalopoda, and the mechanical causes of their evolution; of his work on the fossil pond-snails of Steinheim and the origin of their various forms, Sir R. Owen wrote that it was "a model of the way and aim in and by which such researches should be conducted."

Hyatt wrote, besides many shorter articles: *Observations on Freshwater Polyzoa* (1866); *Revision of North American Porifera* (1875-77); "The Genesis of the Tertiary Species of Planorbis at Steinheim," in *Memoirs of the Boston Society of Natural History* (1880); *Genera of Fossil Cephalopods* (1883); *Larval Theory of the Origin of Cellular Tissue* (1884); *The Genesis of the Arietidae* (1889). He has edited *Guides to Science Teaching*, and revised the part of the *Zittel-Eastman Text-book of Paleontology* on Nautiloids and Ammonoids. These works make him prominent among the new school of American zoologists, led by Cope and Packard, which called itself 'Neo-Lamarckian.' Professor Hyatt died at Cambridge in 1902.

HYATT, JOHN WESLEY (1837-?). An American inventor. His education was very meagre, and while yet in his teens Hyatt started upon his career as an inventor. His first important invention (1865) was that of a composition billiard-ball which, by reason of the scarcity of ivory, became very popular. Four years later, by his discovery of a means for dissolving pyroxylin under pressure, he laid the foundations for the present immense celluloid industry. Undoubtedly Hyatt's greatest contribution to science, however, was the scheme he devised in 1881 for the purifying of large bodies of water. The success of his method has been attested by the general use made of it both in the United States and abroad.

HYBLA (Lat., from Gk. Ἵβλη). The name of two towns in Sicily. Hybla Major was situated on the seacoast, not far from Syracuse, and Hybla Minor at the foot of Etna. Both were originally cities of the native inhabitants, and were afterwards Hellenized. From one of these came the Hyblæan honey, rendered so famous by the poets.

HYBODUS, hib'ô-dûs (Neo-Lat., from Gk. ὕβος, *hybos*, hump + ὀδός, *odous*, tooth). An extinct genus of cestraciant sharks found fossil in the Triassic and Jurassic rocks. Finely preserved skeletons of this shark have been found in the Liassic deposits of England. These fish had blunt heads, jaws armed with nine to ten rows of sharp, conical teeth, fins armed with long, sharp, anterior spines, and the skin was covered with shagreen, consisting of small pointed plates. Two sharp curved spines on each side of the head behind the eyes are present on the males only, and perhaps served as offensive organs. The species varied from three to six feet in length. See SHARK; TRIASSIC SYSTEM.

HYBRID (from Lat. *hybrida*, *híbrida*, *íbrida*, hybrid), in plants. The progeny of parents which belong to different species or races. See HYBRIDITY.

HYBRIDITY. The phenomenon of the sexual crossing of two individuals belonging to distinct species. A hybrid is the product of this crossing, and is contrasted with a mongrel, or the product of individuals belonging to distinct races or varieties of the same species. The importance of hybridity is threefold:

(1) *A Test of Species*.—Hybridity has been used by Cuvier and others as a test of species, as contrasted with varieties. It has been asserted that hybrids are sterile, whereas mongrels are fertile. So long as infertility of descendants is used as a criterion of species, this tenet is unassailable; the difficulty arises from the fact that the strict application of the criterion leads us to deny specific distinctions to animals that are commonly regarded as such—e.g. the dog and wolf, dog and jackal, the hare and rabbit, various species of Bovidae or oxen, sheep and goat, and, among plants, various forms of *Rhododendron*, *Gladiolus*, *Dianthus*, *Nicotiana*, etc. Focke says concerning plants: "Many hybrids, especially those between unlike lines of descent, are infertile, most show a diminished fertility, some a nearly normal fertility." It may be concluded, therefore, that the Cuvierian definition of species will not hold. While fertile hybrids are thus not common, the capacity for hybridization in the first generation is widespread.

The question arises, Why are hybrids so often sterile? Various hypotheses have been proposed, but none can be said to be proved. Darwin's hypothesis is thus summarized: "The sterility of first crosses and of their hybrid progeny has not been acquired through natural selection. In the case of first crosses it seems to depend on several circumstances; in some instances on the early death of the embryo. In the case of hybrids, it apparently depends on their whole organization having been disturbed by being compounded from two distinct forms, the sterility being closely allied to that which so frequently affects pure species when exposed to new and unnatural conditions of life. He who will explain these latter cases will be able to explain the

sterility of hybrids. Wallace has a somewhat different view. A new species arises in connection with some slightly varying conditions of environment. If these are sufficient to create a change in coloration or form, they will, by virtue of correlation, affect also the germ cells, and may give rise to a certain amount of infertility. Now the infertility will be beneficial whenever new species arise in the same area with the parent form, because it would result in a destruction of both of the adapted forms. Consequently, whenever two species which are at the same time adapted and infertile arise, they will retain their respective adapted conditions and will survive. Finally, Catchpool and Romanes have independently suggested an explanation that is worthy of consideration—it is that the sterility of species is not something acquired, but is primary. Whenever from any cause two lots of individuals of one species become partly infertile *inter se*, those lots are, as it were, segregated. Each of them can develop its own way and give rise to a distinct species. If the species were not thus sterile at the beginning, differentiation would be difficult.

(2) *Relation to Inheritance.*—Hybridity is important for the study of the laws of inheritance. Since the parents are more unlike, the nature of their combinations is still more interesting than in the case of ordinary sexual reproduction. Hybrids are particularly apt to show a reversion to an ancestral condition, especially when opposing characters are intermingled. The following rules concerning hybrids have been formulated by Focke: (a) "All the individuals formed by the crossing of two pure species or races are, if they have been produced and grown under the same conditions, exactly like each other as a rule, or they differ hardly more than specimens of one and the same species are apt to do." This proposition is subject to many exceptions. In certain crosses the female element is predominant in the progeny; in others the male. Especially in cases of alternative heritage (see HEREDITY) the hybrids may be of two types, the one resembling more the one parent, the other type the other parent. (b) "The characteristics of the two crosses may be different from those of the parent species. They differ most from both parent species in size and luxuriance, as well as in fertility." In the case of alternative heritage an interesting rule was worked out by Mendel. He finds that one of the species is prepotent (*p*), the other subpotential (*s*). The hybrids will be either of the *p* or the *s* species, and the relative proportion will be *p* 75 per cent., *s* 25 per cent. If, now, self-fertilization occur, 50 per cent. of the plants will produce either *p* or *s* progeny in the proportions 75 per cent. *p*, 25 per cent. *s*. All the descendants of *p* and *s* breed true. The consequence of Mendel's 'law of dichotomy' in hybrids is that the proportion of the pure races is constantly increasing in the successive generations descended from a hybrid. "Malformations and curious forms are much more common, especially in the flower parts of hybrids, than in individuals of a pure descent." Double flowers appear to be formed especially easily in hybrids. Hybrids are frequently infertile, because the pollen is imperfectly formed.

(3) *Utility.*—Hybridity has great practical utility in agriculture. Many varieties of our domesticated plants have arisen from artificial

hybrids. The first generation of hybrids usually gives few results, but great variations continue to appear in subsequent generations. Thus, when two species of hybrid foliaceous plants are crossed, the leaves of the second or third generation are often highly variable. This great variability, on the other hand, renders any favorable variation liable to be lost unless great pains are taken to fix the desired quality by in-and-in breeding, or unless the quality can be reproduced vegetatively—i.e. by cuttings and grafts. The diminished fertility of some hybrids is agriculturally advantageous in the case of plants that can be reproduced vegetatively. Some of the advantageous results of hybridization are as follows: (a) *Increased Size and Vigor.* The hybrid between the English walnut and the California black walnut is of exceptional value, "for it grows twice as fast as the combined growth of both parents. The wood is very compact, with lustrous silky grain," etc. Another hybrid of the black walnut and the California black walnut produces fruit of much larger size than that of either parent. These are illustrations of a common result of hybridization—increased size and vigor. (b) *Increased Hardiness.* The production of hardy races of plants is very important, because it carries farther north the limits of agriculture and increases the area of cultivation. Every few years the orange and lemon trees of the Gulf States and California are greatly damaged by freezing weather. The Japanese trifoliate orange is hardy, but has fruit of small size. It is hoped that a hybrid may be obtained between it and the ordinary orange which shall have increased hardiness without loss of size or flavor in the fruit. (c) *Adaptation to Warmer Climate.* The Kieffer and LeConte pears, which have revolutionized pear agriculture by extending the range of profitable pear-growing hundreds of miles southward, are said to be hybrids between the common pear and the Chinese sand pear. (d) *Increased Resistance to Disease.* When the vast grape industry of France was threatened with destruction on account of the ravages of the bug *Phylloxera*, immune American species were crossed with the French species and immunity was gained by them. Similarly, the black-rot disease in grapes has been fought by introducing the blood of immune races. (e) *Increased Percentage of Starch, Sugar, etc.* By hybridization the production per acre of the potato has been doubled, and the starch percentage increased from 15 to 26. While the percentage of sugar in the sugar-beet has been hitherto chiefly increased by selection, there seems to be a chance for improvement by hybridization. A hybrid *cinchona* produces three to four times the ordinary percentage of quinine. (f) *Change of Season and Duration of Life.* By hybridization plants have arisen fruiting at unusual times, like Burbank's blackberry and raspberry hybrids. A fairly successful attempt to make the pansy perennial resulted from crossing the garden pansy with the perennial *Viola cornuta*. (g) *Acquisition of Odor.* The fragrance of the pansy has been improved by crossing with odoriferous Alpine species. (h) *Improvement of Quality and Flavor.* This result is illustrated by the case of smoking tobaccos, in which the superior-flavored Havana race has been crossed with other races having larger leaves, so that a greater quality of well-flavored leaf has been produced. Alto-

gether, many breeders conclude that by systematic hybridization most species of plants will be found capable of almost indefinite improvement.

In connection with the artificial production of hybrids, the phenomenon of 'xenia' has recently attracted much attention. This term is applied to cases in which characters of the pollinating parent appear directly in the fruit or seed. It was once thought that only the embryo could show hybrid characters, which would become evident, therefore, only upon the germination of the seed. In cases of xenia, however, the regions of the seed outside of the embryo show hybrid characters, so that it is evident that they too have been influenced by the pollinating parent. The crossing of the races of maize has proved to be most favorable for studying this phenomenon. If a race of maize normally producing white grains be pollinated by one producing red grains, the resulting grains will show the red coloration in various ways. The same result is also obtained in crossing races of sweet and dent corn. This phenomenon was inexplicable until the recent discovery of 'double fertilization' among flowering plants. This phrase means that both of the male cells were brought by the pollen-tube to the ovule function—one fertilizing the egg, which then produces the embryo, the other uniting with the 'endosperm nucleus,' which then produces the endosperm or food substance of the seed about the embryo. It is evident, therefore, that where double fertilization occurs in connection with hybridizing, the endosperm as well as the embryo is a hybrid, and that the resulting seed may show characters of the pollinating parent. See ANGIOSPERMS; FERTILIZATION; PLANT-BREEDING.

METHODS OF HYBRIDIZING.—The methods of hybridizing plants are simple. If the flower is hermaphroditic its stamens must be cut away before they are ripe—usually before the corolla opens—and the flower must be tied up in a paper bag. When the stigma is ripe the pollen is placed on it, and the bag tied over the flower again and not removed until the seed begins to form. If the flower bears no stamens, it requires, of course, no operation except the tying up while in the bud to prevent the access of foreign pollen. Among animals, much less experimentation in producing hybrids for commercial purposes has been done.

HYBRIDITY IN ANIMALS.

The number of animal hybrids known to have been produced or to actually exist is not large. The only special work on hybrids is that of Suchetot, the first volume (1001 pages) being devoted to birds alone.

Of hybrids produced by nature we have on record comparatively few examples, but the number is probably quite considerable. It is known that fish, especially the Salmonidæ, readily hybridize. There are on record over a hundred cases of hybrids among insects, and the number probably runs into the thousands. Of amphibians, species of diverse frogs have been seen mating, but it is not definitely known that such unions have given rise to hybrids. Natural hybrids among birds have been described—e.g. between the flicker of the Eastern United States and the Mexican flicker, between two species of warblers of the genus *Helminthophila*, between species of geese, various European grouse, and certain Asiatic pheasants.

HYBRIDS PRODUCED ARTIFICIALLY. By artificial fertilization of the ova of different species, and even genera and families, of sea-urchins, the early larval stages have been reared, but never carried to maturity; the resulting pluteus stages are more or less monstrous. In one case early larval hybrids between species of two different classes of echinoderms, starfish and sea-urchins, were produced. The cases of fertile hybrids of birds and mammals mentioned below were produced in captivity; besides these there have been instances of hybrids between the brown and polar bear, the leopard and jaguar, the lion and tiger, the sea-lion and fur-seal, between the zebra and horse, the horse and ass, and the common ass and varieties of the kiang.

Hybrids are also known to occur between the dog and fox (Darwin), but this case is doubted by Ewart.

VARIATIONS OF HYBRIDS. Darwin has shown that hybrids are more variable and have a greater tendency to vary than the products of pure race of both parents. He also has shown that the products of hybrids are much more variable than the hybrids themselves.

RESULTS OF RECENT EXPERIMENTS. As a result of experiments by Standfuss on thousands of specimens of the higher Lepidoptera, the following results have been obtained:

(1) The intercrossing of two species may result in anything, from complete sterility to the production of the normal number of fertile eggs. These extremes may even occur as the result of crossing different individuals of the same two species. Hence a cross must not be pronounced infertile on the evidence of a single failure.

(2) Individual differences in the structure of the genital apparatus may prevent effective crossing between some members of two given species, though other members of the same two species may pair freely.

(3) Some crossings have resulted entirely in male, others entirely in female, offspring. A third class has given both sexes in various proportions.

As regards the fertility of hybrids, in no case observed by Standfuss or known to him has the female of a true hybrid been shown to be fertile. But the occurrence of undoubted cases of fertility in male hybrids has been proved by crossing the male hybrids with the females of both parent species, and in one case with the female of a third species.

The silk-moth hybrids of *Philosamia cynthia* and *Philosamia ricina*, the arrhindy moth, two closely allied species, are also said to have been fertile for eight generations.

FERTILITY OF THE HYBRIDS. It is well known that the mule is infertile, and though there are reported to be three cases where a mule has produced young, they are doubtful. Ewart, in referring to the instance of the Paris Jardin de l'Acclimatation mule, doubts whether these animals are mules, quoting Ayrault's opinion that the Paris mule was an ordinary mare. Darwin states that he knows of no thoroughly well authenticated cases of perfectly fertile hybrid animals, though he adds: "I have reason to believe that the hybrids from *Cervulus vaginalis* and *Reevesii* and from *Phasianus colchicus* with *Phasianus torquatus* are perfectly fertile." The hare and rabbit are supposed to have fertile offspring; the hybrids of the common and Chinese

geese (*Anser cygnoides*) are fertile, as are hybrids between the common duck and the pintail duck. The crossed offspring from the Indian humped and common cattle interbreed. Caton has hybridized the Virginia deer with the Ceylon deer and the Acapulco deer, and says that the hybrids seem perfectly healthy and prolific. The Indian dog and coyote are said by Coues to interbreed, and on the upper Missouri dogs have been seen having every appearance of being such hybrids. Hybrids of hares and rabbits have continued fruitful for generations; the same is true, says Hertwig, of hybrids obtained from the wild buck and the domesticated she goat. The American bison is known to breed with the domestic cattle, and it seems to be a well-established fact that the hybrids are fertile. Ewart states that the Indian buffalo and the American bison produce fertile hybrids with the wild ox of Europe. Among fishes, fertile hybrids have been obtained from the carp and goldfish, and from the charr and the brook trout.

RELATIVE STRENGTH OF HEREDITARY INFLUENCES. The three following conclusions rest on an elaborate series of experiments by Standfuss with three European species of Saturnia moths:

(1) The freshly hatched hybrid larva closely resembles that of the female parent, but with the process of growth a resemblance to that of the male parent gradually increases.

(2) The extent of approximation toward the male parent depends on the relative phylogenetic age of the two species, the older being able to transmit its properties, whether of structure or habit, better than the younger.

(3) In reciprocal pairing, the male is able to transmit the characters of the species in a higher degree than the female. This influence, however, is less regular and potent than that spoken of in the preceding paragraph.

The result of crossing a parent species with a local race, or with an aberration of the same species, is as follows:

(1) When the normal form of a species (*Grundart*) is crossed with a gradually formed local race of the same species, the result is a series of intermediate forms. (2) On the other hand, when the normal form is crossed with a sporadic aberration, the result in many cases is that the issue divides itself sharply between the normal form and the sport, intermediate forms being absent.

In commenting on these results, Dr. F. A. Dixey remarks: (1) The experiments afford fresh illustrations of the manner in which the physiological isolation of an incipient species may be brought about. (2) They show that the statement of Focke as to the great variability of the offspring resulting from the crossing of a plant hybrid with one of the parent species holds good in the case of insects. (3) What Standfuss speaks of as the prepotency of the phylogenetically older of the parent species is probably only another expression of the principle established by Darwin that in many cases crossing causes reversion to a remote ancestor. (4) The general conclusion as to the prepotency of the male parent accords so far with one result of Galton's investigation of the late Sir E. Millais's breed of basset hounds. (5) The result of crossing a parent species with a gradually formed local race, though less in degree, is much the same in kind as that of crossing two distinct species. (6) The result

of crossing the normal form of a species with a sporadic aberration of the same species appears to show that the latter stand biologically on an entirely different footing from the regularly developed variety, even though it may indicate (as alleged by Eimer and by Jordan) the direction in which variation for that species is possible. With Standfuss's instances may be compared the well-known case of the 'otter sheep,' which similarly, when crossed with a sheep of ordinary breed, gave no true intermediates. (7) Certain experiments with aberrations of this kind, of which exact numerical records have been kept for several generations, are of special interest in connection with Galton's law of heredity. See Galton, *Natural Inheritance*, p. 134 (London, 1889).

In still later experiments by Standfuss (1898) he shows that the crossing of two distinct species gives rise to a *zwischenform*, but not to a *mittelform*. The latter may, however, exist as a temporary stage in larval growth. This depends on the following principles: (1) The freshly hatched larva closely resembles the female parent; (2) with the process of growth a resemblance to the male parent gradually increases; (3) the final extent of approximation toward the male parent depends on the relative phylogenetic age of the two species, the older being able to transmit its properties, whether of structure or habit, better than the younger; (4) in reciprocal pairing the male is able to transmit the characters of the species in a higher degree than the female; (5) when the normal form of a species (*Grundart*) is crossed with a gradually formed local race of the same species, the result is a series of intermediate forms; (6) when the normal form is crossed with a sporadic aberration, the result in many cases is that the issue divides itself sharply between the normal form and the sport, intermediate forms being absent.

Hence, according to Standfuss, adds Dixey, "the process of species formation must be gradual; for when two distinct species are crossed the issue does not split up into two parental forms, as in the case when one parent is a suddenly formed aberration. On the contrary, the behavior of the issue of two distinct species is very similar in kind to that of a species crossed with a local race or variety which is being gradually established by the accumulation of slight changes. It would seem, therefore, that although an aberration or sport may be perpetuated by inheritance, it can never acquire distinct specific rank. No doubt, however, it may, if selected, eventually replace the original form of the species."

Dixey also makes the interesting suggestion that these sporadic color aberrations "seem to have many points of resemblance with the color varieties in domestic animals, such as the 'lemon and white' and 'tricolor' of the basset hounds, or the well-known tortoise-shell, tabby, and black of cats. The fact that these domestic varieties exist side by side in the same race, and even in the same litter, and that true intermediates are rare or absent, seems to suggest that they originally appeared as sports, and that their perpetuation has been insured or favored by artificial selection."

ZEBRA HYBRIDS. In his *Penycuik Experiments* (1899) Ewart states that he bred nine zebra hybrids by crossing mares of various sizes and breeds with a Burchell zebra stallion 'Matopo.'

The hybrids are interesting because of the curious blending of characters, derived apparently partly from their actual and partly from their remote ancestors, and because they shed new light on many questions of general interest, such as the origin of stripes, reversion, interbreeding, and prepotency.

REVERSION. He concludes that "some of the hybrids in make and disposition strongly suggest their zebra sire, others their respective dams; but even the most zebra-like in form are utterly unlike their sire in their markings. It is not a matter of taking after a grandparent, but after an ancestor in all probability thousands of generations removed, an ancestor probably far more like the Somali than any of the Burchell zebras." (This confirms Standfuss's conclusion stated above.) Ewart adds (p. 21): "The reversion may be to recent, remote, or intermediate ancestors, and the tendency will in most cases be to revert to sports that here and there mark the route along which the development has proceeded."

He also, by breeding pigeons, restored the rock pigeon, or primitive form. "In the case of my most typical bird there is, as far as an external examination can show, practically complete reversion." Reversion, he says, "seems to lead to a form of rejuvenescence." He regards polydactylism in the horse as in part due to reversion to the Hipparion or the three-toed fossil horse. As he well puts it, the cases of reversion that he cites "must be more or less accurate restorations of their comparatively remote ancestors." Reversion also indicates that in some cases "varieties and breeds which have, through interbreeding, undergone senile degeneration, may be regenerated without the loss of their best and most prized characteristics."

PREPOTENCY. It is generally assumed that an old species or variety is prepotent over a more recent species or variety. It is impossible to say whether zebra hybrids in their markings take after a remote zebra ancestor, or after an ancestor common to both zebras and horses, or after a hypothetical mid-parent combining the characters of the less remote ancestors of both zebras and horses. There is, however, no difficulty in seeing that while some zebra hybrids, apart from their stripes, closely resemble the zebra parent, others take after their horse parent, thus showing that the wild sire is not necessarily the most prepotent. "But even when the hybrids are distinctly horse-like they never repeat recently acquired peculiarities, such as a blaze, or short ears, high withers, or a small head and long neck."

He believes that sports and certain marked variations are often prepotent; and also that inbreeding (see **CROSS-FERTILIZATION**) is "common among wild animals, and that by inducing prepotency it plays an important part in the origin of species." It may be here observed that Ewart's experiments lead him to reject telegony (q.v.), and to explain such occurrences by cases of reversion. The zebra hybrids are also interesting as being "in some respects almost intermediate between their parents." Each parent, he says, hands on its most fixed individual characters. His zebra hybrids are neither new creations nor yet intermediate forms.

Sterility in Hybrids.—Ewart concludes that, as there is no hard and fast line between species and varieties, there can be "no fundamental difference

between a hybrid and a cross, nor yet any *a priori* reason why any given hybrid should be sterile, or any given cross fertile." "Sterility has doubtless been acquired in some cases slowly, in others abruptly, but how it has been acquired it is impossible in most cases even to guess."

MENDEL'S LAW. Great interest has been excited among biologists by Mendel's law, and his discovery of certain principles of heredity which will prove of much practical value to breeders of plants and animals, and lend a new phase to the theory of heredity and also of evolution, since the results thus far obtained point to discontinuing evolution and the absence of intermediate forms. Mendel's original paper was published at Brünn, Austria, in 1865, but was overlooked until De Vries in 1900 published an exact counterpart of Mendel's theory, while Correns and also Bateson hit upon the same law. As stated briefly by Spillman, it is as follows: In the second and later generations of a hybrid, every possible combination of the parent character occurs, and each combination appears in a definite proportion of the individuals. A parent character which is fully developed in the hybrid is said to be 'dominant;' if it is apparently absent it is said to be 'recessive.' A case in illustration is thus stated by Bateson: "In breeding crested canaries, the kind of crest desired for exhibition can, according to canary-fanciers, be produced most easily by mating crested birds with non-crested, or 'plain-heads,' as they are called. If it be supposed that the crested character is usually dominant, we have a simple explanation. When crested birds are bred together, a number of birds are produced whose crests are coarse and stand up, and others without crests. The latter are the recessives; the former we may suppose to be the pure dominants." The fact that the hornless breeds of goats will give off some horned offspring is probably due to the fact that they are what Bateson terms 'heterozygotes,' under what is usually called 'reversion.' From the analogy of cattle, it may be anticipated that the hornless form is dominant. Consult Bateson, *Mendel's Principles of Heredity*, with a translation of Mendel's original papers on hybridization (London, 1902).

Mendel's more important discoveries are also thus stated by Castle: "(1) His law of dominance; when, for example, the offspring of two parents differing in respect of one character all resemble one parent, and possess therefore the dominant character, that of the other parent being latent or recessive. (2) In place of simple dominance, there may be manifest in the immediate hybrid offspring an intensification of character, or a condition intermediate between the two parents; or the offspring may have a peculiar character of their own (heterozygotes). (3) A segregation of characters united in the hybrid takes place in their offspring, so that a certain per cent. of these offspring possess the dominant character alone, a certain per cent. the recessive character alone, while a certain per cent. are again hybrid in nature."

HYBRIDIZING. See PLANT-BREEDING.

HYDAS'PES. The ancient name of the river Jhelum, in Northwestern India. See JHELUM.

HYDATHODE, hī'dāth-ōd (from Gk. ὑδῶρ, *hydōr*, water + ὁδός, *hodos*, way). In botany an organ that exudes water. Usually hydathodes occur at the tips of the main veins or branch veins of leaves, and commonly appear to the unaided eye as leaf-teeth. At the apex of the organ is a pore which has been variously called water-pore and water-stoma. These pores differ from ordinary stomata in the absence of turgor movements, often in size and in their function; they are passageways for liquid water rather than for water vapor. Hydathodes commonly occur in connection with the vascular system, and may be regarded as a sort of safety apparatus to prevent injection of the air-space with water at times when root-pressure is high and transpiration low.

(1) Longitudinal section through leaf-tooth of Chinese primrose (*Primula Sinensis*), showing the divergent tracheids, terminating the vascular bundle, the loose epithem, and the terminal pore.
(2) Surface view of a water-stoma (terminal pore of a leaf-tooth).

HYDATID (Gk. ὑδαρίς, *hydatis*, water-vesicle, hydatid, from ὑδῶρ, *hydōr*, water; connected with OChurch Slav. *voda*, Skt. *udan*, water, and ultimately with Goth. *watō*, OHG. *wazzor*, Ger. *Wasser*, AS. *wæter*, Eng. *water*; AS. *wæt*, Eng. *wet*; OHG. *ottar*, Ger. *Otter*, AS. *otor*, Eng. *otter*). The bladder-worm. It is allied to the tapeworm, but differs in being bladder-like, and similar in shape to the 'cysticercus' of the

tapeworm. The heads bud on special brood-capsules in such a way that their invagination is turned toward the cavity of the vesicle. About 5000 eggs are developed in a single segment (proglottis). The six-hooked embryos develop, are expelled from the dog, the first host, and find their way in drinking-water or in food into the human intestines, whence they bore into the liver, their favorite habitat, or are carried along the blood-vessels into some other organ, where they develop into bladder-like bodies or 'hydatids' (*Echinococcifer echinococcus*). By the fourth week the young is $\frac{1}{2}$ mm. (1-50 inch) in length, and it is probably many months before the echinococcus heads are entirely developed. The worms become sexually mature in from seven to nine weeks after this stage is reached, when the milk-white worms may usually be found imbedded in the mucus of the duodenum and upper part of the small intestines, with their heads attached to the villous surface of the intestine. The parent vesicle may grow as large as a man's head. The cyst in which the bladder-worm lies, and which is caused by it, is called a 'hydatid cyst.'

There are two forms of this hydatid, one (*Echinococcifer hominis*) living in man, and the other (*Echinococcifer veterinorum*) in domestic animals. When these echinococcus cysts remain sterile, as they frequently do, they are called 'acephalocysts.' "Another, and indeed pathological form," says Sedgwick, "is the so-called 'multilocular' echinococcus, which was for a long time taken for a colloid cancer. It is also found in mammalia (in cattle), and here presents a confusing resemblance to a mass of tubercles. The echinococcus disease (*hydatid plague*) was widely spread in Iceland. This disease, likewise, seems endemic in many places in Australia."

HYDE. A manufacturing town in Cheshire, England, seven miles east-southeast of Manchester (Map: England, D 3). Since the extension of the cotton trade, it has rapidly increased in size. Besides numerous cotton factories, print and iron works, there are considerable manufactures of machinery and hats. Coal abounds in the neighborhood. The neighboring district is densely peopled, and has abundant means of communication, by railway and canal, with all the important towns in the vicinity. Hyde is mentioned as a village in the reign of King John; it was incorporated as a municipal borough in 1881. It owns its water, markets, cemetery, and maintains free baths, library, hospital, and fire brigade. Refuse is consumed by a destructor, and sewage is chemically treated for fertilizing purposes. Population, in 1891, 30,700; in 1901, 32,800.

HYDE, ANNE (1637-71). The first wife of James II. of England. She was the eldest daughter of the Duke of Clarendon, and was born at Cranbourne Lodge, the house of her grandfather, Sir Thomas Aylesbury, in Windsor Park. When she was twelve years old she went to Holland with her mother and sisters, and in 1654 was appointed maid of honor to the Princess of Orange, at whose Court she was a great favorite. It was while accompanying the Princess on a visit to Paris in 1656 that she first met James, then Duke of York. She became engaged to him about a year before his return to England in the spring of 1660, and in spite of the most vehement opposition from all quarters, was privately mar-

ried to him in September. Her father disapproved of the affair with great ostentation, and afterwards, with more sincerity perhaps, attributed his downfall to the match. At first the royal family would not recognize her, and fruitless attempts were made, by attacking her character, to influence the Prince to put her aside. Although they were more or less prone to quarrel, Anne even being accused of poisoning one of her husband's mistresses, she influenced him for good in many ways. She was an accomplished and attractive woman, though not by any means handsome, and she maintained her position with regal dignity. She joined the Roman Catholic Church soon after 1667, and converted her husband to that faith. Her daughters, however, were educated as Protestants. Anne and Mary, who became Queens of England, were her only children that lived beyond infancy.

HYDE, DOUGLAS (1860—). An Irish scholar and writer, son of the Rev. Arthur Hyde of Frenchpark, County Roscommon. He was educated at Trinity College, Dublin. In 1891 he was interim professor of modern languages in the State University of New Brunswick, and he was afterwards made examiner in Celtic to the Royal University of Ireland.

Hyde early took up the study of Irish literature, and in particular the collection and publication of Gaelic songs and folk-tales, and his labors in the preservation of native folk-lore constitute his most valuable services to Celtic scholarship. His *Literary History of Ireland* is noteworthy as being really the first attempt to write a comprehensive and systematic history of Gaelic literature. He is a skillful writer of prose and verse in both English and Gaelic, and under his assumed name, 'An Craoibhin Aoibhinn,' he is well known among the Irish-speaking people. His translations of modern Gaelic lyrics are often particularly happy in rendering at once the simple feeling and the complicated metrical structure of the native poetry. He took a prominent part in the organization of the popular movement for the preservation of the Irish language. He was made president of the Gaelic League (q.v.) in 1895, and of the Irish Text Society at its foundation. In 1894-95 he was president of the Irish National Literary Society. He was also made a member of the Royal Irish Academy. His principal works are the following: *Leabhar Sgeuluigheachta* (1889); *Cois na Teineadh: or Beside the Fire* (1891); *Love Songs of Connaught* (1894); *The Three Sorrows of Story-Telling* (1895); *The Story of Early Irish Literature* (1897); *An Sgeuluidhe Gaodhalach* (1898-99); *A Literary History of Ireland* (1899); *The Lad of the Ferule*, etc. (vol. i. of the publications of the Irish Texts Society, Dublin, 1899); and *Ubhla de'n Chraoibh* (1900). Part of his *Songs of Connaught* were contributed to the *Dublin Nation*. In the same way his edition of the *Poems of Raftery* has been published in the *Dublin Weekly Freeman*.

HYDE, EDWARD. See **CLARENDON, EDWARD HYDE**, Earl of.

HYDE, EDWARD (c.1650-1712). A Colonial Governor of North Carolina. He was appointed by the proprietors to be Governor of the Albemarle District in the Province of North Carolina, but on his arrival in August, 1710, found that the Governor of the Province, from whom he was

to receive his commission, had died, and that a former Deputy Governor, Thomas Carey, was leading an insurrection. A number of the more respectable residents requested Hyde to assume the office of Governor, which he did, and with the aid of Governor Spotswood of Virginia succeeded in putting down Carey's rebellion. Soon after, however, the North Carolina Indians, led by the Tuscaroras, went on the war-path and massacred many of the settlers. Hyde called on the neighboring Colonies of South Carolina and Virginia for aid, and on January 23, 1712, a body of South Carolina and North Carolina militia under Colonel Barnwell defeated the Indians on the Neuse River, about twenty miles from Newbern. Before these Indian troubles were settled Governor Hyde died, during an epidemic of yellow fever.

HYDE, THOMAS (1636-1703). An English Orientalist, born at Billingsley in Shropshire. Educated at Cambridge, he was an assistant to Walton in an edition of his *Polyglot Bible*. Besides correcting the Arabic, Syriac, and Persian texts, he transcribed in Persian characters the Persian translation of the Pentateuch which had been printed in Hebrew letters at Constantinople, and appended a Latin version of his own. In 1658 Hyde entered Queen's College, Oxford, to which he was shortly after made Hebrew reader. In the following year, after graduating as M.A., he was chosen under-keeper and finally librarian-in-chief of the Bodleian Library. In 1660 he was made a canon of Salisbury; in 1678 archdeacon of Gloucester. He succeeded Pockocke in 1691 as Laudian professor of Arabic; and soon after, on the deprivation of Altham, became regius professor of Hebrew and Canon of Christ Church. Worn out by his unremitting labors, he resigned his librarianship in 1701, and died at Oxford. Hyde's most important work was the *Historia Religionis Veterum Persarum eorumque Magorum* (1700; 2d ed. 1760). A number of other works were collected and published in 1767 under the title *Syntagma Dissertationum et opuscula*.

HYDE PARK. An inclosure of nearly 400 acres in London, England, about two and one-quarter miles west of Saint Paul's Cathedral (Map: London, E 6). It derives its name from Hyde Manor, which belonged to the Abbey of Westminster. It became the property of the Crown on the dissolution of the monasteries, in the reign of Henry VIII. Ben Jonson speaks of the show of coaches which it presented in his time; and it was constantly resorted to on the morning of May Day for the sports comprehended under the term Maying. In the seventeenth century it contained deer; races, military reviews, and duels were held there. After the Restoration it became the favorite drive and promenade which it has ever since continued to be. It also serves as the place of large popular meetings. It has nine carriage entrances, and among its prominent features are: the Serpentine, an artificial sheet of water constructed by order of Queen Caroline in 1730, Rotten Row, the Ladies' Mile, the Marble Arch, the Hyde Park corner gateway, and the colossal statue of Achilles, erected in honor of the Duke of Wellington.

HYDE PARK. A town in Norfolk County, Mass., including the villages of Readville, Clarendon Hills, Hazlewood, and Fairmount; eight

miles from the State House, Boston; on the Neponset River, and on two divisions of the New York, New Haven and Hartford Railroad (Map: Massachusetts, E 3). It has a public library of over 14,000 volumes; and extensive manufactures of cotton, woolen, and rubber goods, paper, dyestuffs, looms, morocco, tools and machinery, and curled hair. Hyde Park was incorporated in 1868; its government is administered by town meetings. Population, in 1890, 10,193; in 1900, 13,244.

HYDE PARK. A village in a town of the same name, and the county-seat of Lamoille County, Vt., 28 miles north of Montpelier; on the Lamoille River, and on the Boston and Maine Railroad (Map: Vermont, D 3). It is the centre of a farming and lumbering district, which also possesses considerable mineral wealth, and has extensive leather interests. Population (village), in 1900, 422; (town), in 1890, 1633; in 1900, 1472.

HYDERABAD, more properly, **HAIDARABAD**, hi'der-â-bâd', or **NIZAM'S DOMINIONS**. A large native State of southeastern India, bounded on the north by Berar and northeast by the Central Provinces, on the southeast by Madras, and on the west by Bombay (Map: India, C 5). Area, 82,698 square miles. The surface is an elevated plateau 1800 to 2000 feet above sea-level, diversified by mountain, valley, and plain, and watered by the Godavari with its affluents the Dudna, the Manjara, and Pranhita; the Kistna with its affluents the Bhima and Tungabhadra; and the Wardha with its affluents the Painganga and Wainganga. The climate is fairly healthful; the annual precipitation registers 28 to 32 inches. The geological formation is a base of granite, gneiss, and talc slate, superimposed by clay, limestone, sandstone, hornblende, feldspar, and in some districts columnar basalt. Iron and coal are mined, and gold, garnet, and diamond beds, which formerly supplied the Golconda treasury, still exist, although modern mining operations for the precious minerals have hitherto been unremunerative. The soil is comparatively fertile, but sparsely cultivated. Cotton, maize, wheat, millet, and rice are the chief agricultural products, and tobacco, sugar-cane, and indigo are also grown. Fruit culture, market gardening, pasturage of cattle and of sheep, and horse-breeding are other agricultural branches. Bad seasons, notably in 1900, have resulted in famine. There are domestic manufactures of silk, woolen and cotton fabrics, carpets, and leather. Raw silk, cotton, hides, dyestuffs, gums, and resins are exported, and cereals, cloth goods, hardware, salt, and timber are imported. Good military roads traverse the State, and in 1901 there were 715 miles of railroad open. The ruler of Nizam is a Mohammedan, as are also the Government officials, although the subjects are chiefly Hindus. There is a British Resident and adviser at Hyderabad, the capital. The annual revenue is about 39,000,000 rupees. The population, in 1891, was 11,537,040; in 1901, 11,141,142, or 135 to the square mile; of the population in 1901, 9,870,839 were Hindus; Mohammedans numbered 1,155,750; Christians, of whom half were Roman Catholics, 22,996; Jains, 20,345; Sikhs, 4335; and Parsis, 1463. A native army is maintained, consisting of 7660 men, infantry, artillery, and cavalry, officered by British soldiers. Education made considerable prog-

ress during the latter decades of the last century; but only a small per cent. of the children attend school, and the mass of the population is illiterate.

Hyderabad, formerly attached to the dominions of the Rajahs of Terlingana and Bijanagur, in 1512 became a separate kingdom, but in 1687 lapsed into a province of the Mogul Empire. In 1730 Azof Jah, one of Aurungzebe's warriors, was nominated Nizam-ul-Mulk—Regulator of the State—and Subahdar of the Deccan, and eventually made himself independent. After his death in 1748, the throne was contested by his son, Nazir Jung, supported by the British East India Company, and his grandson, Mirzafa Jung, whose cause was espoused by the French under Dupleix. The latter triumphed until Mirzafa was murdered by Patan chiefs. Anarchy reigned until Nizam Ali, who ascended the throne in 1761, was defeated by the British, and signed the Treaty of 1766, which ceded the Northern Circars to the East India Company. The subsequent misrule of Nizam Ali's successors increased the territorial debt, which was liquidated by a further cession of land to the East India Company, with the stipulation that part of the revenues should maintain the Nizam's contingent, a subsidiary force of 8000 men for the protection of his dominions. During the mutiny of 1857 an unsuccessful attack was made on the British Residency at Hyderabad; the Nizam and his troops, however, remained faithful to the British, and the State has since been distinguished for its loyalty to the Imperial power. Consult Gribble, *The History of the Deccan* (London, 1896).

HYDERABAD, or **HAIDARABAD**. The capital of the Nizam's Dominions (q.v.), India. It stands on the Musi River, in latitude 17° 22' N., and longitude 78° 32' E., 1800 feet above the sea (Map: India, C 5). It is an important railroad and commercial centre, and its well-stocked and extensive bazaars are particularly picturesque. The splendid building of the British Residency stands on the opposite side of the river, the stream being here bridged by nine spacious arches of squared granite connecting the Residency with the Nizam's palace. The city is surrounded by a fortified wall six miles in circuit. The most conspicuous building is the principal mosque, fashioned after the model of the Kaaba at Mecca; while at the meeting of the four principal streets of the city rises another remarkable edifice, the Char Minar or College with four minarets, resting on connected arches, through which run the four converging thoroughfares. Water is supplied from huge tanks, one of which, close to the British cantonment of Secunderabad, measures three miles by two; another is said to be 20 miles round. The city owns its water-works, and maintains schools, a hospital, and pleasure grounds with a zoölogical section. Population, with suburbs, in 1891, 415,039; in 1901, 448,466.

HYDERABAD. The chief city of a district of the same name in the Sindh Division, Bombay, British India, four miles east of the left bank of the Indus (Map: India, A 3). The ancient capital of the Sindh Kingdom, it has been famous from earliest times for its manufactures, including arms of various kinds, lacquered ware, gold and silver articles, and silks. It is an im-

portant railway junction and commercial centre. The chief object of interest is the fort commanding the town. It covers an area of 36 acres. A modern section of the town has fine wide streets, public buildings, and a market place. The cantonments containing model barracks are to the northwest of the town. Population, in 1891, 58,048; in 1901, 69,378.

HYDER ALI, hī'dēr ā'lē (more accurately, *Haidar 'Alī*) (c.1720-82). Ruler of Mysore, and one of the greatest Mohammedan princes of India. He is said to have been originally a sepoy in the French Army, which may explain the friendship which he always felt for the French. He won the favor of the minister of the Rajah of Mysore by the valor which he displayed at the siege of Trichinopoly in 1749, and, by a rapid rise not infrequent in the East, soon became the power behind the throne. Hyder Ali, in 1759, dispossessed his master, allowing him, however, to retain his title, while he himself took that of *daiva*, or regent. He then conquered Calicut, Bednor, Kananur, and other neighboring States; and in 1766 his dominions included more than 84,000 square miles. He waged two wars against the British, in the first of which (1767-69) he was completely successful, although deserted by his confederate Nizam Ali, a former friend of the English, and a treaty of peace was signed under the walls of Madras. According to the terms of this treaty, as he claimed, Hyder Ali asked the English in 1772 to help him against his old foes, the Mahrattas, who had already defeated him in 1764, but his request was refused. When a conflict broke out between the English and the French in 1778, he sought his revenge. With his son, Tipu Sahib, he entered the Carnatic in 1780, and proceeded to devastate it. After inflicting two severe defeats on the English, he was routed by Eyre Coote at Porto Novo. Two years later he died very suddenly. Consult Bowring, *Haidar Ali and Tipu Sultan*, Rulers of India Series (Oxford, 1893).

HYDRA, hē'drā or ē'drā (Lat. *Hydrea*, Gk. Ὑδρα). An island of Greece, situated off the eastern coast of Morea, from which it is five miles distant (Map: Greece, E 4). It is about 11 miles long and three miles broad, and has an area of 22 square miles. The shores are rocky and steep, and the interior, rising to about 1800 feet in height, is destitute of vegetation and of water. On the northwest coast is the town and seaport of Hydra, the white, flat-roofed houses of which are ranged on the side of a hill. The streets, owing to the irregularity of the site, are steep and uneven, but remarkably clean. In ancient times the island of Hydra was a dependency of the city of Hermione, and was later ceded to the Trezenians. During the fifteenth and sixteenth centuries it was settled by fugitives from Albania, Argolis, and Attica. In the Grecian War of Independence the Hydriotes took a most active part, and none were more liberal in their contributions to the patriotic cause. In 1825 the population was estimated at 40,000. At the time of the outbreak of the Revolutionary War, 1821-29, the islanders were considered the richest in the archipelago. They possessed the carrying trade of the Black Sea, and shipped to England, the Baltic, and even to America. Since the Revolution, however, more accessible ports have risen to be the centres of Greek commerce, and Hydra has greatly declined. The

population, in 1896, was 7177, almost all concentrated in the town of Hydra.

HYDRA (Lat., from Gk. Ὑδρα). A fabulous monster, offspring of Typhon and Echidna, dwelling on a hill near the spring Amymon in the marshes of Lerna near Argos. The hydra had many heads, of which the central one was immortal. The number of heads varies from 9 to 50, or even 100. In works of art she is shown with from 3 to 12 heads, except in Hellenistic times, when the hydra is often represented as a serpent with a woman's head. Hercules cut off the heads, while his companion, Iolaus, seared the stumps with a brand, as otherwise two heads grew wherever one was cut off. The immortal head was buried beneath a huge rock. The hero dipped his arrows in the blood and thereby made the wounds which they inflicted incurable. The hydra with its poisonous breath seems a personification of the malarial vapors arising from the swamps of Lerna.

HYDRA (Lat., from Gk. ὕδρα, water-snake, Skt., Lith. *udra*, OChurch Slav. *vydra*, OHG. *ottar*, Ger. *otter*, Eng. *otter*, with Gk. ὕδωρ, *hydōr*, water). A minute polyp or hydrozoan, common in still, fresh waters. It possesses a gelatinous, subcylindrical body, which, from its contractility, undergoes various alterations of form. One end expands into a disk or foot, which adheres to a leaf or twig; while a mouth surrounded by a circlet of tentacles, varying from five to twelve or more in number, is at the opposite end. These tentacles are exceedingly contractile; at one moment they are thrown out as long, delicate threads, at the next, drawn up into minute wart-like knobs. Numerous thread-cells project from their surface, the larger ones possessing a sheath and three recurved darts or barbs, and terminating in a large and extremely slender filament. The mouth leads into a capacious cavity, excavated throughout the entire length of the animal, which, exclusive of its tentacles, seldom exceeds three-fourths of an inch. The food of the hydra consists of such minute living organisms as come within the reach of its tentacles, and by these apparently fragile threads, which the animal projects like a lasso, crustaceans, worms and the like are seized, which would be deemed at first sight superior to their captor in strength and activity. The tentacles, however, exert through the action of the thread-cells a powerful numbing or paralyzing influence. The prey when mastered, but often when still alive, is thrust into the internal cavity, where the nutritive parts are absorbed by the hydra, while the indigestible parts are expelled through the mouth.

Although the hydra is usually found adhering to submerged supports, it is not permanently fixed. It often moves on surfaces under water somewhat after the manner of a leech, and occasionally the disk is protruded above the water, and thus acts as a float. Sometimes, especially

HYDRA VIRIDIS.
t, tentacles; q, a bud;
a, young hydra, developed from a bud.

in the autumn, true reproductive organs may be observed, both male and female organs being usually situated on the same animal. Propagation by gemmation is, however, the most common mode of increase. Minute tubercles appear on the body of the parent animal, which, as they increase in size, gradually become perforated at their free extremity, and acquire tentacles. The pedicel by which they originate by degrees becomes thinner, and finally gives way, leaving the young hydra perfectly independent. One of the most remarkable points in the history of this animal is its power of being multiplied by mechanical division. If a hydra be cut into two or even more pieces, every one will in time assume the form and functions of the original animal. Several species of hydra have been described, which differ in size, color, and other respects. Two species are common in America, in still water in nearly all parts of the country. One of these (*Hydra viridis*) is bright green in color, while the other (*Hydra fusca*) is grayish-brown. The green hydra is notable because its color is due to the presence of chlorophyll, the coloring matter characteristic of plants. Both may easily be reared in aquariums.

HYDRAGOGUES (from Lat. *hydragogus*, Gk. ὑδραγωγός, water-carrier, from ὑδωρ, *hydōr*, water + ἄγωγός, *agōgos*, carrying, from ἄγειν, *agein*, to lead). Active purgatives which give rise to large, watery stools. The most important are colocynth, elaterium, gamboge, jalap, croton oil, and scammony. These are all powerful drugs, and their administration requires skilled advice.

HYDRANGEA, hi-drăn'jê-â (Neo-Lat., from Gk. ὑδωρ, *hydōr*, water + ἄγγειον, *angeion*, pail). A genus of about 25 species of ornamental deciduous shrubs of the natural order Saxifragaceæ, natives of North and South America, China, and Japan. The flowers are white, pink, or bluish,

HYDRANGEA.

and small, but are borne in large, showy corymbs or panicles, the exterior flowers of which are sterile. The pink varieties, when grown on some soils, produce bluish flowers. The hardier cultivated hydrangeas are *Hydrangea paniculata*, used as specimens or in borders, *Hydrangea arborescens*, and *Hydrangea radiata*. *Hydrangea Hortensia*, or *Otaska*, is a rather

dwarf variety, which is extensively grown in greenhouses, especially for the Easter trade. Hydrangeas require a rather heavy, rich soil, well manured and well watered. They are propagated for the most part by cuttings and division, but sometimes by seed.

HYDRAS'TIS (Neo-Lat., from Gk. ὑδωρ, *hydōr*, water + δράν, *dran*, to act), or **WARNEBIA**. A genus of plants of the natural order Ranunculaceæ, allied to Anemone, the members of which have flowers destitute of petals, and succulent or baccate fruit, collected into a head. The only known species, *Hydrastis Canadensis*, a perennial herbaceous plant, with tuberous roots, and head of fruit resembling a raspberry, is common in watery places in Canada, and among the Alleghanies as far south as the Carolinas. Its root is used for dyeing yellow, and also in medicine as a tonic. Yellowroot, orangeroot, and goldenseal are its American names.

HYDRATE (from Gk. ὑδωρ, *hydōr*, water). A name applied to substances whose molecules contain either one or more entire molecules of water; or, synonymously with the term hydroxide, to metallic compounds whose molecules contain one or more hydroxyl groups (OH). Thus, for example, the question has been discussed, whether substances exist in aqueous solution in the form of 'hydrates,' or not; that is to say, whether the dissolved molecules are associated into definite groups with those of the solvent. In the same sense a substance containing water of crystallization is sometimes spoken of as a hydrate, and its crystals as 'hydrated crystals,' particularly when they are to be distinguished from the 'anhydrous crystals' of the same substance. On the other hand, chemists often use such terms as potassium hydrate, or calcium hydrate, in the same sense as they use the terms potassium hydroxide and calcium hydroxide. The hydrates, or hydroxides, of the metals are true chemical compounds. The assumption that substances are *chemically* combined with their water of crystallization, while corroborated by many facts, has not yet been brought into harmony with the doctrine of valency (q.v.), and cannot therefore be granted unconditionally.

HYDRAULIC CEMENT. See CEMENT.

HYDRAULIC ELEVATORS. See ELEVATORS.

HYDRAULIC ENGINE. See HYDRAULIC-PRESSURE ENGINE.

HYDRAULIC FORGING. See FORGE, FORGING.

HYDRAULIC JACK. See JACK.

HYDRAULIC PRESS (from Lat. *hydraulicus*, Gk. ὑδραυλικός, *hydraulikos*, pertaining to the water-organ, from ὑδραυλις, *hydraulis*, water-organ, from ὑδωρ, *hydōr*, water + αὐλός, *aulos*, pipe). An apparatus for obtaining a heavy pressure for compacting fibrous substances, raising heavy weights, etc., by means of water under pressure. The first design of a working hydraulic press is credited to Joseph Bramah, and for this reason such machines are sometimes called Bramah presses. The operation of the hydraulic press is based upon the principle of hydrostatics that a pressure exerted on any part of the surface of a liquid is transmitted undiminished to all parts of the mass and in all directions. Thus, if we have a cylinder filled

with water in one end of which works a plunger one inch square, and in the other end of which works a plunger twelve inches square, and we exert a pressure of one pound on the smaller plunger, this pressure will be transmitted undiminished by the water, and will exert a total pressure of $1 \times 12 \times 12 = 144$ pounds.

The essentials of a hydraulic press are, therefore, a small cylinder containing a plunger, to which pressure is applied, connected by pipe with a large cylinder containing a plunger, which transmits the multiplied pressure to the object to be pressed or lifted. It is evident, furthermore, that the two cylinders may be located any desired distance apart, the only limit being that at which the pipe and cylinder friction reduces the available pressure for performing work below practicable amounts. (See TRANSMISSION OF POWER.) In modern practice the pressure pump commonly feeds into a hydraulic accumulator (see ACCUMULATOR), and the press cylinder is operated from the accumulator and not directly from the pump. The construction of hydraulic presses varies with the purposes for which they are employed. Hydraulic presses for baling hay and cotton and expressing the oil from seeds, etc., are built substantially as follows: Four iron pillars are erected at the corners of a horizontal square, and carry a cast-iron cap rigidly fastened to their tops. The under face of this cap forms the surface against which the material is pressed. At the bottom of the four pillars there is a similar casting which has a circular hole in the centre down through which passes the cylinder casting for the plunger. The plunger has an upward motion in the act of pressing, and carries on its top a head or platen consisting of a square casting. The material to be pressed is placed between the lower face of the top casting and the upper face of the platen. Often a boxing is placed around the four sides of the space in which the head moves to prevent the material being pressed from squeezing out laterally. The construction of a press for hydraulic forging differs from the above as follows: The cylinders and plungers are carried by the top casting or column cap and the plungers work downward in the act of pressing; the bottom casting carries the anvil; the plungers carry a die for the head; and two or more cylinders are provided for raising the plunger and die for a fresh stroke. Generally, also, two pressure plungers and cylinders are employed instead of one. Forging presses are made of all sizes, from that required in pressing out articles like revolver cartridge cases to those used in forging steamship shafts and armor plates. Armor-plate presses having a capacity of 14,000 tons are in use.

HYDRAULIC PRESSURE ENGINE. A motor in which water is made to do work by means of its pressure only acting on a piston or plunger reciprocating in a cylinder, or, in some cases, on a revolving piston similar to those employed in a rotary steam-engine. In the case of a turbine the pressure of a column of water is, in the first instance, employed in giving motion to the fluid itself, and after this motion has been produced the energy due to it is utilized in doing work. In the case of the pressure engine the only pressure expended in giving motion to the fluid is that needed to make the water follow the piston and escape from the motor, and to secure efficiency this piston should be

as small as practicable. This end is most nearly secured when the pressure is great and the speed of the engine is low. The first pressure engine was designed by Sir William Armstrong (q.v.), and was of the rotary type. This engine was never actually used, and was replaced by a reciprocating engine designed by the same engineer. Since Sir William Armstrong's invention a great variety of hydraulic pressure engines have been invented, the majority of which are of the reciprocating type. Hydraulic pressure engines are particularly adapted to the use of high-pressure water in comparatively small quantities, and where these conditions prevail they have a considerable field of usefulness, particularly as secondary motors for operating mechanical contrivances, such as the opening machinery for swing bridges, cranes, hoists, etc. For further information consult Bodmer, *Hydraulic Motors, Turbines, and Pressure Engines* (New York, 1889). See TURBINE.

HYDRAULIC RAM. Primarily, a device by which the momentum of water flowing by gravity in a pipe is utilized to lift a portion of itself through another pipe to an elevation greater than the source of supply. The flow of water in the main or drive pipe is automatically checked by the closing of a valve at its foot. When the valve is open the water escapes freely and flows to waste, but very soon a sufficient momentum is attained to close the valve. The confined water then lifts another valve, opening into an air-chamber mounted over the foot of the drive-pipe. The water partially fills this chamber, and in so doing compresses the air therein until the pressure in the chamber just balances that of the column of water in the drive-pipe. The valve at the foot of the drive-pipe then opens, and the process is repeated. The pressure of the compressed air in the air-chamber forces the water in the bottom of the chamber out through a small supply pipe to the desired ele-

RIFE HYDRAULIC RAM.

vation. A snifting valve is provided to supply air to the chambers to make good the losses due to absorption of air by the water. Theoretically, 100 gallons of water falling 15 feet would raise 15 gallons 100 feet, and other quantities and heights in like proportion; but some water is wasted during each cycle, and there is more or less friction to be overcome, depending on the design of the ram and the length and diameter of the pipes. An efficiency of 75 per cent. would be high. With the increase in the ratio of the fall of the driving water to the elevation to be overcome, the efficiency decreases, particularly

when the ratio exceeds 1-12 (i.e. 1 foot fall for 25 feet raised). Where the fall is great, the wear and tear on the ram is excessive. Some authorities give the desirable working limit for a hydraulic ram as $1\frac{1}{2}$ to 10 feet fall of drive water and a lift of not over 250 feet, but with so great a lift a large proportion of the water will be wasted. The ram, as described, was invented by Joseph Michael de Montgolfier, of France, in 1796; but in 1772 an Englishman named John Whitehurst built a machine embodying the same principle, except that the valve at the foot of the drive-pipe had to be closed by hand. His device was described in the *Philosophical Transactions* for 1775. Many improvements have been made in the machine of Montgolfier, the most important of which, perhaps, aim to lessen the shock of the operation of the valves. Springs have been used to that end; the drive-pipe valve has been counterweighed, and a portion of the air compressed in the chamber has been used to drive a small air-motor, so connected as to aid in the gentle closing of the valve at each cycle. Another improvement is the equipment of rams so that a supply of dirty water may be used to lift clean water, either when the supply of the latter is scanty, or is not available under a sufficient head. Finally, hydraulic rams are used to drive pumps, when they are properly classed under pumping engines. See PUMPS AND PUMPING MACHINERY.

HYDRAULICS. See HYDRODYNAMICS, and HYDROSTATICS.

HYDRAZINE, or AMIDOGEN, $H_2N = NH_2$. A basic compound of nitrogen and hydrogen, which may be obtained by heating triazo-acetic acid with water. Hydrazine hydrate, $N_2H_4 \cdot H_2O$, is a strong reducing agent precipitating metallic silver and platinum from solutions of their salts. With acids it forms crystalline salts, such as the hydrochlorides, $N_2H_4 \cdot HCl$, and $N_2H_4 \cdot 2HCl$, the sulphate, $N_2H_4 \cdot H_2SO_4$, etc. The hydrogen of hydrazine may be partly replaced by either hydrocarbon groups, such as methyl (CH_3), ethyl (C_2H_5), phenyl (C_6H_5), etc., or organic acid radicals, such as acetyl (CH_3CO), benzoyl (C_6H_5CO), etc. The most important of these organic derivatives of hydrazine is phenyl hydrazine, $C_6H_5HN = NH_2$. The benzoyl compounds include benzoyl-hydrazine, $C_6H_5CO \cdot HN = NH_2$, and symmetrical dibenzoyl-hydrazine, $C_6H_5CO \cdot HN = NH \cdot COC_6H_5$. The presence of hydrazine in aqueous solutions may be readily detected by the use of a few drops of benzaldehyde, with which it forms a yellow crystalline precipitate of benzalazine, $C_6H_5CH \cdot N = NH_2$. Compounds of similar constitution are formed by the action of hydrazine on other aldehydes. See DIAZO-COMPOUNDS.

HYDRIDE. A name applied, in chemistry, to the compounds of the metals with hydrogen. Notable hydrides are those of palladium, sodium, potassium, calcium, strontium, barium, and magnesium. The hydrides have, at least as yet, no practical value; but when more thoroughly investigated they will present considerable interest in connection with the doctrine of valency (q.v.). The term hydride was formerly employed in connection with certain hydrocarbons.

HYDRIODIC ACID (from *hydr*-ogen + *iod*-ine), HI. An acid compound of hydrogen and iodine, analogous to hydrochloric acid. It may

be prepared by the action of phosphoric acid on potassium iodide. In its isolated state, it is a colorless gas with an odor resembling that of hydrochloric acid. Usually it is kept in aqueous solution, and is thus employed in a number of chemical processes. It decomposes somewhat easily into its components, hydrogen and iodine, and by giving up its hydrogen acts as a reducing agent. The salts of hydriodic acid are termed *iodides* (q.v.). Hydriodic acid is sometimes used medicinally instead of its salts.

HYDRIOTAPHIA, or URN BURIAL. A quasi-scientific, quasi-religious treatise by Sir Thomas Browne (1658). Its explanatory subtitle is: *A Discourse of the Sepulchral Urns Lately Found in Norfolk*, which leads to the account of the rites of burial of various ages, and ends with an eloquent disquisition on death and immortality. It shows an acquaintance with Dante remarkable for that age, and was greatly admired by Charles Lamb.

HYDROBROMIC ACID (from *hydro*-gen + *brom*-ine), HBr. An acid compound of hydrogen and bromine, analogous to hydrochloric acid. It may be prepared by the action of phosphoric acid upon potassium bromide. In the isolated state it is a colorless gas with an odor resembling that of hydrochloric acid. Like the latter, it is very soluble in water, the solution being sometimes used in synthetic chemistry. The salts of hydrobromic acid are termed *bromides* (q.v.).

HYDROCARBONS (from *hydro*-gen + *carbon*). A class of chemical compounds containing only carbon and hydrogen. Their commercial value is very considerable inasmuch as they form the principal ingredients of petroleum, illuminating gas, caoutchouc, gutta-percha, essence of turpentine, etc. They are the simplest of the compounds of carbon, and the fundamental ideas of organic chemistry have been derived largely from a careful study of their properties and reactions. They are obtained when various organic substances are subjected to a process of destructive distillation, and are subdivided principally into *aliphatic*, or fatty, and *aromatic* hydrocarbons.

FATTY HYDROCARBONS. These form an important class, and are subdivided into the paraffin, olefin, and acetylene series.

(1) *The Paraffins*, or saturated hydrocarbons of the methane series, are very stable compounds and do not react even with the strongest acids and alkalis; hence their name, paraffins, derived from the Latin *parum affinis*, which means 'having little affinity.' Large quantities of them occur in nature as petroleum, natural gas, ozokerite, etc. They are also obtained by the destructive distillation of coal, cannel, shale, etc. When they are arranged in the order of their molecular weights, the following 'homologous series' is obtained:

Methane,	CH_4 ,	molecular weight 16.
Ethane,	C_2H_6 ,	molecular weight 30.
Propane,	C_3H_8 ,	molecular weight 44.
Butanes,	C_4H_{10} ,	molecular weight 58.
Pentanes,	C_5H_{12} ,	molecular weight 72.
Hexanes,	C_6H_{14} ,	molecular weight 86.
Heptanes,	C_7H_{16} ,	molecular weight 100, etc.

The difference in molecular weight between any two consecutive members of the series is evidently the same. It amounts to 14, the sum of the 'weights' of one carbon atom (which is 12) and two hydrogen atoms (which is 2). To obtain the formula of any member, we may substitute a

methyl group, CH_3 , in place of a hydrogen atom in the member immediately preceding it. Thus, by substituting CH_3 in place of one H in ethane, C_2H_6 , we get propane, $\text{C}_2\text{H}_5\text{CH}_3$ or C_3H_8 . The transformation of ethane into propane may be actually effected as follows: First, mono-iodo-ethane ($\text{C}_2\text{H}_5\text{I}$) is obtained by substituting one iodine atom in lieu of one atom of hydrogen in ethane (C_2H_6); then mono-iodo-ethane is treated with methyl iodide (CH_3I) and metallic sodium. The iodine is thus all removed, and the remaining C_2H_5 group unites with CH_3 group to form the compound propane ($\text{C}_2\text{H}_5\text{CH}_3$ or C_3H_8).

The first four members of the above homologous series are liquefiable gases, and each member is more easily liquefied than the one preceding it; the next eleven members are liquids, each having a higher boiling-point than the one preceding it; finally, the higher members are solids, each having a higher melting-point than the one preceding it. The lower members burn with a pale, scarcely luminous flame; the higher members give a bright light, and paraffin wax, which is a mixture of solid paraffin hydrocarbons, is used for the manufacture of candles. The paraffins are all colorless, chemically inert, and insoluble in water.

The composition of any single paraffin hydrocarbon is expressed, of course, by its own molecular formula. Thus, the formula C_2H_6 shows the chemical composition of ethane; the formula C_3H_8 shows the composition of propane, etc. On the other hand, the composition of the paraffin hydrocarbons in general is expressed by a typical formula, in which algebraic symbols stand for the numbers of atoms of the component elements. Thistypical (general) formula is, $\text{C}_n \text{H}_{2n+2}$. The formula permits readily to calculate the number of hydrogen atoms in any one of the members of the above homologous series, if the number of its carbon atoms is given. Thus, if $n = 1$, then $2n + 2 = 4$, and $\text{C}_n \text{H}_{2n+2}$ becomes CH_4 (the formula of methane). The highest member of the series that is actually known to chemists contains 60 carbon atoms, and hence, the typical formula tells us, the number of hydrogen atoms in the molecule of that hydrocarbon (called *hexacontane*) is $2n + 2 = 2 \times 60 + 2 = 122$, and its molecular formula is therefore $\text{C}_{60}\text{H}_{122}$. It is a well-known fact that compounds exist which have the same chemical composition and yet differ in their physical and chemical properties. Such compounds are termed 'isomeric,' and their mutual relations are explained on the assumption that the atoms in their molecules, though the same in kind and number, are differently grouped. In the above homologous series, the first three members have no such isomers, i.e. only one variety of each could be obtained; the fourth member, butane, has two isomers (called butane and isobutane); the fifth member, pentane, has three isomers; the sixth, hexane, has five isomers, etc. The higher the molecular weight, the greater the number of isomeric formulas which could be constructed according to the structural theory. Not all of these theoretically possible hydrocarbons have been actually prepared in the laboratory. Most of them have no practical value and are interesting only inasmuch as they go to prove the validity of the 'structural theory' of compounds; but the number of cases of isomerism in which the theory has been found to hold true is so great that

chemists are no longer anxious to obtain new proofs by artificially producing all of the possible isomeric compounds. See CARBON COMPOUNDS.

(2) *The Olefins*, or hydrocarbons of the ethylene series, have the characteristic property of directly taking on bromine and other elements to form *additive* products. This shows that the combining capacity of the carbon contained in them is not completely satisfied by their hydrogen; so they are said to be 'unsaturated compounds.'

When arranged in order of their molecular weights, they form the following homologous series:

Ethylene, C_2H_4 ,	molecular weight 28.
Propylene, C_3H_6 ,	molecular weight 42.
Butylenes, C_4H_8 ,	molecular weight 56.
Amylenes, C_5H_{10} ,	molecular weight 70.
Hexylenes, C_6H_{12} ,	molecular weight 84, etc.

In this series, too, each member contains one carbon and two hydrogen atoms more than the member immediately preceding it; that is to say, the difference in molecular weight between any two consecutive members of the series amounts to 14. Here, too, as in the paraffin series, a certain amount of regularity is found in the variation of the physical properties of the compounds on passing up the series. The first four members are gases, and each one is more easily liquefied than the one preceding it. Hexylene and the following 13 members are liquids, each one boiling at a higher temperature than the one preceding it. The higher members are solids, and each one has a higher melting temperature than the one preceding it. The olefins are colorless and insoluble in water. They contain a high percentage of carbon and burn with a luminous flame.

The composition of *all* the olefins is expressed by the typical formula of the series, $\text{C}_n \text{H}_{2n}$. The ratio of the numbers of hydrogen and carbon atoms is the same throughout the series; showing that the different members of the series have all the same percentage composition. They are, however, not isomeric, in the ordinary sense of the term; for their molecules evidently contain different numbers of atoms. Thus ethylene (C_2H_4) contains two carbons and four hydrogens; propylene (C_3H_6), three carbons and six hydrogens, etc. But, beginning with butylene, each single member represents several compounds which must be considered as isomeric, since they have precisely the same molecular composition and yet differ in their properties. The structural theory lets us foresee the existence of three isomeric butylenes, five amylenes, thirteen hexylenes, etc. Again, as in the paraffin series, the higher the molecular weight, the greater the number of isomers possible, according to both theory and experience.

Nascent hydrogen adds itself readily to the olefins (unsaturated), yielding hydrocarbons of the paraffin series (saturated).

(3) *The Acetylene Hydrocarbons*, when arranged in the order of their molecular weights, form the following homologous series:

Acetylene, C_2H_2 ,	molecular weight 20.
Allylene, C_3H_4 ,	molecular weight 40.
Crotonylene, C_4H_6 ,	molecular weight 54, etc.

Like any other homologous series, the acetylene series presents a certain amount of regularity in the variation of the physical properties

of the compounds with increase of their molecular weight.

The acetylenes are unsaturated; in fact, 'doubly unsaturated' compounds (see ACETYLENE), as is shown by their capacity for taking on bromine and other elements to form additive products. The acetylene hydrocarbons burn with a very smoky flame, unless by some method enough oxygen is supplied to burn up completely the large amount of carbon they contain. The general formula of the series is C_nH_{2n-2} . Nascent hydrogen adds itself readily to the acetylene hydrocarbons, yielding still unsaturated hydrocarbons of the ethylene series.

AROMATIC HYDROCARBONS. The principal groups into which these hydrocarbons are subdivided include the *Benzene series*, the *Naphthalene series*, and the *Anthracene series*. The typical formulas representing these three series are, respectively, C_6H_{2n-6} , $C_{10}H_{2n-12}$, and $C_{14}H_{2n-18}$. Other hydrocarbons, not included in these series, are represented by the formulas C_nH_{2n-8} , C_nH_{2n-10} , C_nH_{2n-22} , etc.; but these are not important enough to be mentioned here. The most important members of the benzene series are benzene (C_6H_6), toluene (C_7H_8), and xylene (C_8H_{10}). The most important substance of the naphthalene series is naphthalene itself ($C_{10}H_8$); that of the anthracene series, anthracene ($C_{14}H_{10}$). All these are described in special articles. Suffice it to mention here that the chief source of aromatic hydrocarbon is the coal-tar (q.v.) obtained as a by-product in the manufacture of coal-gas, and that it is principally from these hydrocarbons that innumerable artificial dyestuffs, drugs, etc., are now made on a very large industrial scale. See also CARBON COMPOUNDS.

The hydrocarbons should not be confounded with the 'carbohydrates,' like sugar, starch, or cellulose, which contain besides carbon and hydrogen also oxygen.

HYDROCELE (Lat., from Gk. ὑδροκήλη, *hydrokēlē*, from ὑδωρ, *hydōr*, water + κήλη, *kēlē*, tumor). The medical term for dropsy of the tunica vaginalis, a serous membrane or sac investing the testes. Hydrocele occurs as a smooth, pear-shaped swelling, fluctuating when pressed, devoid of pain or tenderness, but sometimes causing a slight uneasiness from its weight. The quantity of serous fluid in the sac is usually from 6 to 20 ounces, but it occasionally exceeds 100 ounces. Hydrocele may occur as a result of acute inflammation, but it most commonly comes on without any apparent local cause. It is most frequently met with about or beyond the middle period of life, and generally in persons of feeble power, or with a tendency to gout; sometimes, however, it occurs in young children, either in the same form as in adults, or as what is termed *congenital hydrocele*, when the communication between the tunica vaginalis and the abdominal peritoneum is not obliterated, as it normally should be. Palliative treatment consists in the use of suspensory bandages, strapping, and tapping with a fine trocar. Tapping seldom gives more than temporary relief, the swelling usually regaining its former bulk in three or four months. A cure is sometimes effected after tapping by the injecting of irritating substances, such as tincture of iodine and carbolic acid. The only certain method of cure, however, consists in excision of the tunica vaginalis.

HYDROCEPH'ALUS (Neo-Lat., from Gk. ὑδροκέφαλος, *hydrokephalon*, water in the head, from ὑδωρ, *hydōr*, water + κεφαλή, *kephalē*, head). A collection of serous fluid in the cranium. If it is within the ventricles of the brain, the condition is known as *internal hydrocephalus*. If beneath the arachnoid membrane, *external hydrocephalus*. The disease may be *primary*, being then usually tuberculous in origin, or it may follow some other disease, in which case it is termed *secondary*. Three types, the *acute*, the *chronic*, and the *congenital*, are described. Hydrocephalus may occur in children or in adults as a secondary lesion resulting from meningitis. In such cases, the bones of the skull having united, there is much less opportunity for distention.

ACUTE HYDROCEPHALUS. This is usually a sudden disease, marked by an acute collection of fluid within the skull, internal or external to the brain ventricles. It may be primary or secondary to such diseases as whooping cough, heart disease, rachitis, tumors within the skull-cavity, or acute fevers, such as pneumonia or typhoid. The symptoms are various, much depending on its cause. The most characteristic symptoms are those due to the pressure on the brain. In addition to the enlargement of the head, there may be much restlessness, inability to sleep, nausea and vomiting, paralysis or convulsions. The pupils are apt to be unequal and sluggish. In the severer cases pressure upon the brain causes death.

CHRONIC HYDROCEPHALUS. This may follow an acute attack, or the disease may begin very insidiously. The symptoms again are those due to pressure. The fontanelles in the skull are apt to bulge, the eyeballs protrude somewhat, the blood-vessels on the outside of the head are apt to be swollen and prominent. Headache is common. A peculiar sidewise shifting movement of the eye, termed nystagmus, is very constant, and crossed eyes are not uncommon. There is usually much restlessness, and if the patients live they are apt to be dull mentally or idiotic. Some of these patients live to middle age, but most of them die young. The treatment requires the greatest medical and surgical skill.

CONGENITAL HYDROCEPHALUS. The distention may be so slight at birth as to be scarcely evident, or the distention may be considerable, or so advanced as to preclude the birth of a living child. After birth the progress of the disease may be gradual or rapid. The lateral ventricles usually show the greatest distention, although all the ventricles may be involved as well as the central canal of the cord. The condition of the brain-tissue depends entirely upon the amount of pressure. It may be little different from normal, or the convolutions may be flattened, or the hemispheres may be reduced to a thin layer under the dura mater. The brain-tissue itself is apt to be soft and flabby, and the base of the brain is usually less affected than the hemispheres. The openings between the bones of the skull are large in size, the bones thin, and tending to bulge forward, making the forehead prominent.

HYDROCHLORIDEÆ, *hi'drō-kā-rīd'ē-ē*, or **HY'DROCHAR'IDA'CEÆ**. See ANACHARIS and VALLINERA.

HY'DROCHLOR'IC ACID (from *hydro*-gen + *chlor*-ine), or MURIATIC ACID, HCl. A gaseous compound of hydrogen and chlorine, the

aqueous solution of which is extensively used in the arts. It was known to the alchemists, who refer to it as *spiritus salis*; Glauber prepared it by treating common salt with sulphuric acid. Priestley obtained it similarly and called it *marine acid air*. Lavoisier introduced the view that all acids necessarily contain oxygen, and hence hydrochloric acid was for years believed to contain oxygen. About 1810 Sir Humphry Davy had established the elementary nature of chlorine, and hence the true nature of its hydrogen compound—hydrochloric acid; and within ten years the correctness of his results became generally recognized. (See CHEMISTRY.) Hydrochloric acid occurs in the exhalations from active volcanoes, especially from Vesuvius and the fumaroles of Hecla. It is also a constituent of the waters of certain South American rivers that have their source in the volcanic districts of the Andes. Also it is a constituent of the gastric juices in man and animals, and plays an important part in the digestive process. When sodium chloride (common salt) is decomposed by heating with sulphuric acid, as in the Le Blanc process for making soda, sodium sulphate (Glauber's salt) remains behind, while gaseous hydrochloric acid is evolved. The acid was formerly allowed to pass off into the air, and naturally had a very injurious effect on the vegetation in the vicinity of the manufacturing establishments. At present the acid vapors are carefully collected, and thus hydrochloric acid constitutes an important by-product of the manufacture of soda.

Hydrochloric acid is a colorless gas, with a pungent odor and taste, and fuming strongly in the air. On the application of pressure and cold it can be condensed to a colorless liquid; but the commercial product is usually dissolved in water. The commercial acid is generally colored by the presence of some iron; it also usually contains arsenic and sulphuric acid, from all of which impurities it may be freed by distillation. The acid is used in preparing the chlorides of various metals, for extracting phosphates from bones, in dyeing and tissue printing, and in the manufacture of coal-tar colors. For works on hydrochloric acid, consult the various books on the manufacture of soda ash.

CHLORIDES. The salts of hydrochloric acid are termed chlorides. By far the most important of these is the chloride of sodium or common salt, which is described in a special article. Very similar to it is the chloride of potassium, KCl, which occurs extensively (combined with magnesium chloride) in the mineral carnallite, and in smaller quantities in sea-water. It is manufactured from carnallite, and is purified by recrystallization from water. The chloride of aluminum, Al₂Cl₆, is obtained by treating aluminum oxide with charcoal in a current of chlorine. It is readily soluble in water, alcohol, and ether, but on evaporating its aqueous solution it combines with water to form aluminum hydroxide and free hydrochloric acid. Aluminum chloride is largely used in organic chemistry in the so-called Friedel and Crafts reaction. (See FRIEDEL.) For other chlorides, see BARIUM; CALOMEL; GOLD; MANGANESE; MERCURIC CHLORIDE; and SAL AMMONIAC. See also BLEACHING-POWDER.

HYDROCOR/ALLI'NA (Neo-Lat., from Lat. *hydra*, water-snake + *corallinus*, coral-red, from *corallium*, coral). An order of Hydromedusæ, in-

cluding the important Paleozoic family Stromatoporidae. See CELENERATA; HYDROZOA.

HYDROCYANIC ACID (from *hydro*-gen + *cyan*-ogen), HCN, or HCy. A chemical compound often called *prussic acid*, from its having been first obtained by Scheele in 1782 from the substance known as Prussian or Berlin blue. Hydrocyanic acid is of equal interest to the chemist, the physician, and the toxicologist. The pure anhydrous acid is a limpid volatile liquid of a strong, penetrating odor resembling that of peach-blossoms or oil of bitter almonds. At low temperatures it solidifies to a crystalline mass that melts at -15° C.; at 18° C. it has a specific gravity of 0.697, and it boils at 26° C. (78.8° F.). Its volatility is so great that if a drop be allowed to fall on a piece of glass, part of the acid becomes frozen through the cold produced by its own evaporation. It burns with a pale-blue flame, reddens litmus paper slightly (its acid properties being feeble), and is very soluble in water and in alcohol. In the anhydrous state it is not affected either by the action of air or by that of light. In the presence of moisture, however, it is decomposed with formation of a brown substance known as azulmic acid. If its aqueous solution is exposed to light, decomposition rapidly takes place, with formation of a number of different substances, including ammonia, formic and oxalic acids, etc.

Hydrocyanic acid is made by heating yellow prussiate of potash (potassium ferrocyanide) with dilute sulphuric acid, the reaction taking place according to the following chemical equation:

In this manner a more or less dilute solution of hydrocyanic acid is obtained, and by fractional distillation and drying over calcium chloride, the anhydrous acid may be prepared. An aqueous solution of hydrocyanic acid may also be obtained by shaking silver cyanide with dilute hydrochloric acid. Hydrocyanic acid occurs, both free and in combination, in various plants, and it is readily produced by macerating bitter almonds or cherry kernels with water. Bitter almonds, as well as many other vegetable products, contain a glucoside called *amygdalin*, and a peculiar ferment called *emulsin*. When brought into contact with water, the amygdalin is acted on by the emulsin, hydrocyanic acid being formed along with other substances, according to the following equation:

The dilute acid of the U. S. Pharmacopœia contains 2 per cent. by weight of anhydrous hydrocyanic acid; while what is known as "Scheele's Prussic Acid" contains from 4 to 5 per cent. of the absolute acid. The presence of hydrocyanic acid in solutions may be best proved by one of the following methods:

(1) To the solution in which the presence of hydrocyanic acid is suspected, caustic potash is added to strongly alkaline reaction, then a few drops of ferrous sulphate are added, and heat is

applied; the solution is now acidified with hydrochloric acid, and some ferric chloride is added. If hydrocyanic acid was present in the original solution, a precipitate of Prussian blue, or at least a blue coloration, is produced.

(2) A few drops of ammonium sulphide are added to the suspected liquid, and the mixture is evaporated on the water-bath; the dry residue is moistened with ferric chloride, when, if hydrocyanic acid was present in the original solution, an intense red coloration is produced.

The quantity of hydrocyanic acid in a solution may be determined by adding to the latter a solution of silver nitrate, separating the precipitated cyanide of silver by filtration, washing, drying, and weighing. The amount of hydrocyanic acid may be readily calculated from the weight of silver cyanide found. We are indebted to the Italians for the introduction of hydrocyanic acid in the *materia medica*. There are no cases in which it is so serviceable as in those affections of the stomach in which pain is a leading symptom, as in gastrodynia, water-brash, and in cases of intense vomiting. It is also useful in allaying spasmodic cough, and has been employed with advantage in chronic skin-diseases, to allay pain and irritation, no matter what the cause. A mixture of one part of the dilute acid (of 2 per cent. strength) with about 48 parts of water forms a good lotion.

Hydrocyanic acid is one of the most energetic poisons, and is frequently employed both in murder and suicide. A single drop of the pure acid causes instant death if placed inside the eye. When a small poisonous dose (about half a dram of the 2 per cent. acid) has been taken, the first symptoms are weight and pain in the head, with confusion of thought, giddiness, nausea (and sometimes vomiting), a quick pulse, and loss of muscular power. If death result, this is preceded by tetanic spasms and involuntary evacuations. When a large dose has been taken (as from half an ounce to an ounce of the 2 per cent. acid), the symptoms may commence instantaneously, and it is seldom that their appearance is delayed beyond one or two minutes. The patient is insensible; his eyes are fixed, the pupils are dilated and unaffected by light; the limbs are flaccid, and the skin is cold and clammy; the respiration is slow and convulsive, and the pulse is imperceptible.

Hydrocyanic acid causes paralysis of the heart, of the respiratory centre, and of the vaso-motor centre in the medulla. The spinal cord, too, is paralyzed shortly before death. The immediate cause of death is, in most cases, obstruction of the respiration; but in some cases it lies in stoppage of the heart's action.

Where the fatal action is so rapid antidotes are of comparatively little value. Chlorine, ammonia, peroxide of hydrogen, cold affusion, and artificial respiration are the most important agents in the treatment. Cold affusion on the head, neck, and down the spine is a valuable remedy, and it is asserted that its efficacy is almost certain when it is employed before the convulsive stage of poisoning is over, and that it is often successful even in the stages of insensibility and paralysis. One-fiftieth grain of atropine should be injected subcutaneously. Artificial respiration should never be omitted.

Among the compounds of hydrocyanic acid may be mentioned the cyanides of potassium and mer-

cury. The more important ferrocyanides and ferricyanides are described in the articles on hydro-ferrocyanic and hydro-ferricyanic acids (qq.v.).

Potassium cyanide is an extremely poisonous white crystalline substance soluble in water, but insoluble in absolute alcohol. It may be melted without undergoing chemical decomposition; its aqueous solutions, however, readily decompose on boiling. It is made on a large scale by heating yellow prussiate of potash (potassium ferrocyanide), the decomposition of the latter taking place according to the following equation:

The cyanide is separated from the carbide of iron formed along with it, by filtering through hot porous crucibles. Potassium cyanide is largely employed in extracting gold and in electro-plating. In the molten state it acts as a powerful reducing agent, readily setting free metals from their oxides; for example, lead oxide is reduced by it according to the following equation:

Mercuric Cyanide, $\text{Hg}(\text{CN})_2$, may be obtained by heating potassium ferrocyanide with mercuric sulphate in water, or by dissolving mercuric oxide in aqueous hydrocyanic acid. It is a colorless substance of a bitter metallic taste, and is moderately soluble in water and in alcohol. When heated it decomposes into metallic mercury and cyanogen gas. It is very poisonous, but is, in highly dilute solution, sometimes useful in syphilis and diphtheria.

HYDRODYNAMICS (from Gk. *ὕδωρ*, *hydōr*, water + *δύναμις*, *dynamis*, power, from *δύνασθαι*, *dynasthai*, to be able). Strictly speaking, that branch of mechanics which is the application of dynamics to liquids; it should therefore include both the statics and the kinetics of liquids; that is, a study of their properties both when they are in equilibrium and when not. In general, however, the former phenomena are treated separately under hydrostatics (q.v.), leaving for hydrodynamics simply the phenomena of kinetics. Further, although gases are easily compressed, while liquids are not, yet, if a gas is flowing slowly and without great fluctuations, it will have properties closely resembling those of a flowing liquid. Consequently hydrodynamics also includes most of the phenomena of the kinetics of gases. If a liquid is flowing regularly through a tube of an irregular cross-section, or if a gas is flowing slowly and regularly through such a tube, the mass of the fluid which passes each point in the tube in a given time must be the same; otherwise there would be a state of compression or rarefaction somewhere in the tube; it follows, then, that where the tube is narrow the velocity must be large, and conversely, like a river flowing first through a lake and then through a narrow channel. If the velocity at any point in the tube is greater than in another, it shows that there must be a force acting in the direction from the second point toward the first, so as to increase the velocity of the moving fluid; but the force must always be produced by a *fall* in pressure, and so the pressure at the second point is greater than at the first. It follows, then, that in a fluid

flowing in a steady state where the velocity is small the pressure is large, and conversely if friction is supposed to be excluded. This general principle is illustrated by the 'ball nozzle,' the injector of a boiler, the common atomizer, the 'ball in the fountain' experiment, and many others. If a fluid is flowing through a long pipe, e.g. water or gas in city mains, there is of course always a great amount of friction between the moving fluid and the layer that sticks to the tube. Owing to this, the pressure decreases along the pipe, and the velocity of flow is decreased also.

If an opening is made in the side of a vessel containing a liquid, the latter will make a jet out into air. If the opening is a small one in a thin wall, it may be observed that the cross-section of the jet a short distance from the wall is less than that of the opening itself: this place of smallest cross-section is called the 'vena contracta.' If a quantity of liquid of mass m escapes having a velocity v , its kinetic energy is $\frac{1}{2}mv^2$. This energy is evidently due to the fact that the effect inside the vessel is just as if these m grams had been taken off from the free surface; and so, if the centre of the opening is at a depth h below the free surface, the m grams have lost an amount of potential energy mgh . Therefore

$$mgh = \frac{1}{2}mv^2;$$

or $v^2 = 2gh.$

This value of the velocity of efflux was first deduced by Torricelli, the pupil of Galileo. This theorem may be stated in a slightly different way. The liquid is forced out owing to a difference of pressure on the two sides of the opening equal to ρgh . (See HYDROSTATICS.) Calling this difference of pressure P , the formula for v^2 becomes

$$v^2 = 2 \frac{P}{\rho}.$$

In this form it may be applied to the rate of escape of a gas from a vessel through a small opening in a thin wall. It is seen that the square of the velocity of efflux varies inversely as the density of the gas and directly as the pressure forcing the gas out, that is as the difference of the partial pressures of that particular gas on the two sides of the opening, regardless of what other gases are present or what their pressures are. (See EFFUSION.) If the escape of the fluid takes place through a thick wall or through a tube, the phenomena are entirely different, owing to friction. It is observed that the rate of escape is independent—within certain limits—of the material of the tube, showing that there is a layer of the fluid adhering to the inner walls of the tube, thus forming a tube of the fluid through which the flow takes place. The following formula has been found by experiment to hold approximately for capillary tubes:

$$v = \frac{Pr^2}{6\eta l},$$

where r is the internal radius of the tube, l is its length, and η is a constant.

If an obstacle is placed in a stream of liquid or of gas, it experiences certain forces. One of the most interesting cases is that of an oblong solid in a fluid stream; it will tend to place itself with its length at right angles to the current.

This is illustrated by the fact that when a small piece of paper falls it does not do so edge down, but face down; if a coin is dropped in water, it falls face down, 'wabbling' as it sinks. (See PROJECTILE.) Other cases of fluid motion are too difficult for discussion here. It should be noted, however, that there are two great divisions of such motions: irrotational and rotational. The former is such that, if a small portion of the fluid were suddenly solidified and freed from the rest of the fluid, it would have simply motion of translation, no rotation. The latter is such that if a small portion of the fluid were suddenly solidified and freed from the rest of the fluid, it would be spinning round a definite axis. It was proved theoretically by Lagrange that if a certain portion of a perfect fluid free from viscosity was set in irrotational motion, it would never have its character changed (if certain conditions are satisfied, as they would be in general). Helmholtz has proved, further, that if a portion of a perfect fluid is moving rotationally, it will always do so; and that it is as impossible to produce this motion in a perfect fluid as it is to destroy it. He showed, too, how lines can be imagined drawn in the fluid so that at each of their points they coincide with the axis of rotation of the portion of fluid at that point. Such a line is called a 'vortex-line;' and a solid tube made up of such lines is called a 'vortex.' A vortex once existing in a perfect fluid moves through it, keeping its identity, i.e. always being made up of the same particles and preserving certain other properties. If two vortices were to collide they would rebound, being perfectly elastic. It is possible to devise many forms of vortices which are stable and can keep their general shape. Many of the properties of vortices can be imitated by smoke-rings, but the air is, of course, not a perfect fluid, and so the vortices do not persist.

HYDRO-FERRICYANIC ACID (from hydro-gen + ferricyanic), $H_3Fe(CN)_6$. A brown crystalline substance obtained by decomposing potassium ferricyanide with dilute mineral acids, in aqueous solution.

Potassium ferricyanide, or red prussiate of potash, $K_3Fe(CN)_6$, is a dark-red soluble crystalline salt obtained by passing chlorine-gas into solutions of potassium ferrocyanide (see HYDRO-FERROCYANIC ACID), the transformation of the latter taking place according to the following chemical equation:

Potassium ferricyanide is used principally for making *Turnbull's blue*, or ferrous ferricyanide, $Fe_3[Fe(CN)_6]_2$, which is prepared by mixing potassium ferricyanide with ferrous salts in aqueous solution.

HYDRO-FERROCYANIC ACID (from hydro-gen + ferrocyanic), $H_4Fe(CN)_6$. A white crystalline substance readily soluble in water and in alcohol. If exposed to the air, it soon assumes a blue coloration. It may be obtained in the free state by decomposing an aqueous solution of its potassium salt with dilute mineral acids.

The *ferricyanide of potassium*, $K_4Fe(CN)_6 + 3H_2O$, often called yellow prussiate of potash, is a yellow crystalline substance produced when a

solution of potassium cyanide is boiled with ferrous hydroxide, the reaction taking place according to the following chemical equation:

Cyanide of potassium	Ferrous hydroxide	Potassium ferrocyanide	Caustic potash
-------------------------	----------------------	---------------------------	-------------------

On a large scale, potassium ferrocyanide is made from animal refuse, such as dried blood, hair, horn-shavings, etc. These products are charred and then heated to a high temperature with scrap iron and crude potash. By this process the potassium carbonate contained in crude potashes combines with the charcoal and nitrogen of the refuse, and yields potassium cyanide; on the other hand, the scrap-iron combines with the sulphur likewise contained in crude potash, forming sulphide of iron; and when potassium cyanide combines with iron sulphide, potassium ferrocyanide is produced. The chemical transformation taking place during this manufacturing process may, therefore, be represented by the following equations:

Large quantities of potassium ferrocyanide are at present made also from one of the by-products of the manufacture of coal-gas. When coal is heated out of contact with air, part of its nitrogen is obtained in the form of ammonium cyanide. In the manufacture of illuminating gas the cyanogen thus produced is for the most part retained by the iron oxide used in purifying the gas, and when the iron oxide has become useless for the latter purpose, it is employed in making potassium ferrocyanide after another valuable product, ammonium sulpho-cyanate, has been extracted from it with warm water. The mass remaining behind is mixed with lime and heated with steam; the calcium ferrocyanide thus produced is first transformed into potassium-calcium ferrocyanide $\text{K}_2\text{CaFe}(\text{CN})_6$, by boiling with potassium chloride; finally, potassium ferrocyanide is obtained by heating the potassium-calcium salt with caustic potash.

Potassium ferrocyanide is extensively used for the manufacture of cyanide of potassium and of Prussian blue, as well as for a variety of other purposes.

Prussian blue, or Berlin blue, ferric ferrocyanide, $\text{Fe}_4[\text{Fe}(\text{CN})_6]_3$, is obtained by mixing potassium ferrocyanide with ferric salts, in aqueous solution.

HYDROFLUORIC ACID (from *hydro-gen* + *fluor-ine*), HF. An acid compound of hydrogen and fluorine, analogous to hydrochloric, hydrobromic, and hydriodic acids. It may be prepared by the action of sulphuric acid upon cryolite (q.v.) in an appropriate apparatus made of lead or of platinum. It may thus be readily obtained in liquid form, or rather in the form of an aqueous solution. The anhydrous acid may be obtained by heating acid potassium fluoride. As thus prepared, hydrofluoric acid is a colorless liquid, boiling at 19.5°C . (67.1°F). Its vapors are exceedingly poisonous, and the liquid itself, even when mixed with more or less water, causes swellings on the skin that heal with extreme difficulty. Great care must therefore be taken

in working with the acid. Solutions of hydrofluoric acid are used in analytical chemistry for breaking up minerals that are insoluble in strong hydrochloric and sulphuric acid; another way of breaking up such minerals consists in fusing them with the carbonates of sodium and potassium, but then, of course, the amounts of these metals in the mineral cannot be determined, and hence it is usually necessary to treat a separate portion of the mineral with hydrofluoric acid. Hydrofluoric acid dissolves glass, forming hydrofluosilicic acid (H_2SiF_6) with its silica, hence its use for making etchings on glass, the acid being, for this purpose, often replaced by its ammonium and certain other salts. (See ETCHING.) The acid is now often kept in bottles made of a wax-like substance called 'ceresine.'

HYDROFLUOSILICIC ACID. See HYDROFLUORIC ACID.

HYDROGEN (from Gk. *ιδωρ*, *hydōr*, water + *-γενής*, *-genēs*, producing, from *γίγνεσθαι*, *gignesthai*, to become). A gaseous element, discovered in 1766 by Cavendish, who called it 'inflammable air.' Paracelsus had already obtained hydrogen by treating iron with dilute mineral acids. But the existence of gases essentially different from air was not generally recognized until about the middle of the eighteenth century, and the properties of hydrogen gas were not definitely known before the researches of Cavendish. Lavoisier recognized its elementary nature, and gave it its present name. In the free state, hydrogen is found in the exhalations from volcanoes, in the gases issuing from the salt beds at Stassfurt and Wieliczka, in gases given off by oil-wells, in the intestinal gases of animals, etc. The spectroscope reveals its existence in the atmosphere of the sun and of many stars, and it has been found 'occluded' in meteorites. In combination it occurs as water, of which it forms very near one-ninth by weight, and as a constituent of almost all organic matter. It may be obtained by the electrolysis of acidulated water; by the action of sodium, potassium, and certain other metals on water; by passing steam over red-hot iron wire, etc. But the most convenient method, and the one generally employed, consists in allowing dilute hydrochloric acid, or preferably dilute sulphuric acid, to act on metallic zinc. Owing, however, to the impurities ordinarily present in zinc, as well as in mineral acids, the hydrogen thus obtained is impure and has a disagreeable odor. A large percentage of hydrogen is contained in ordinary coal-gas, in which it is formed as a product of the destructive distillation of coal (organic matter). Much hydrogen is also contained in ordinary water-gas, in which it is formed by the action of red-hot coal on water-vapor.

Hydrogen (symbol H; atomic weight—either 1, the standard of atomic weights, or 1.01, when the figure 16 for oxygen is adopted as the standard; see ATOMIC WEIGHTS) is a colorless, tasteless, and odorless gas, whose critical temperature is -234.5°C ., the critical pressure being 20 atmospheres (300 pounds to the square inch). It was first solidified in 1899, by causing it rapidly to evaporate when in the liquid state. In the gaseous state, it is the lightest substance known, being fourteen and one-half times lighter than atmospheric air, and about 256,000 times lighter than the mineral platinum. One liter, at

0° C. and under normal atmospheric pressure (760 millimeters of mercury), weighs .08952289 gram. In accordance with the atomic and molecular theory, the molecule of ordinary gaseous hydrogen is assumed to consist of two atoms, and is therefore usually represented by the formula H_2 . The gas burns in the air with a non-luminous flame of very high temperature, combining with the oxygen to form water. When pure, though it cannot support animal life, hydrogen is not poisonous, and when mixed with a sufficient quantity of oxygen or atmospheric air, may be inhaled for some time without inconvenience; but it weakens the voice, and renders it high-pitched. Hydrogen gas is capable of being absorbed by certain metals, such as iron, platinum, and especially palladium. Graham, who studied this phenomenon, maintained that when thus 'occluded' hydrogen assumed a true metallic form, and named that form of the element *hydrogenium*. Troost and Hautefeuille, too, believed that hydrogen is capable of forming alloys with metals, and some of the alloys obtained by them were found to have the composition of true chemical compounds; for example, the hydride of sodium, Na_2H , and the hydride of potassium, K_2H . If this is true, then hydrogen cannot be assumed to be invariably univalent in its compounds. (See VALENCY.) At ordinary temperatures, hydrogen is chemically inert toward most of the other elements; with chlorine, however, it combines gradually in diffused, and with explosive violence in direct, sunlight. Its mixture with double its volume of oxygen explodes violently if ignited; the explosion is somewhat less violent if instead of two volumes of oxygen, about two and a half volumes of air are mixed with one volume of hydrogen. At elevated temperatures, or when in the nascent state (i.e. while being formed, say by the action of dilute acid on zinc), hydrogen is a powerful reducing agent, i.e. it readily abstracts oxygen from compounds or adds itself to them. Nascent hydrogen is thus often employed in the preparation of organic compounds from given materials. With oxygen, hydrogen forms two different compounds: water, H_2O , and hydrogen peroxide, H_2O_2 . With sulphur it combines directly, at the boiling temperature of the latter, forming sulphureted hydrogen, H_2S . The ordinary compound of hydrogen with nitrogen is ammonia, NH_3 ; another compound of hydrogen and nitrogen, termed hydrazine, has the formula N_2H_4 . Hydrochloric acid, HCl , is the compound of hydrogen with chlorine, the two elements combining, as stated above, under the influence of sunlight at ordinary temperatures. At somewhat elevated temperatures, hydrogen similarly combines with the vapors of bromine and iodine, forming, respectively, hydrobromic acid, HBr , and hydriodic acid, HI . For the compounds of hydrogen with phosphorus, see PHOSPHORUS. For its compounds with carbon, see HYDROCARBONS.

Among the ordinary uses of hydrogen may be mentioned its use for the production of high temperatures, as in the ordinary oxy-hydrogen flame. In ordinary illuminating gas, hydrogen acts as a diluent for the light-giving constituents, and its combustion yields much of the heat without which the flame could not be luminous. On account of its great lightness, hydrogen is used to give buoyancy to balloons.

HYDROGEN, SULPHURETED. See SULPHURETED HYDROGEN.

HYDROGEN DIOXIDE, PEROXIDE OF HYDROGEN, or OXYGENATED WATER, H_2O_2 . A colorless compound of hydrogen and oxygen containing, for the same amount of hydrogen, twice as much oxygen as water. It was discovered in 1818 by the French chemist Thénard. Minute quantities of it occur in the air, in rain-water, and in snow, and, according to some, in the juices of certain plants. It may be prepared by the action of cold diluted hydrochloric or sulphuric acid on hydrated barium peroxide. It can also be prepared by the action of hydrofluoric, hydrofluosilicic, phosphoric, or compressed carbonic acid on barium peroxide; and it has been prepared on a somewhat large scale by the action of acids on the peroxide of sodium. By any of these methods the peroxide is obtained in the form of a dilute aqueous solution. This may be concentrated by allowing the water to freeze out, or by passing a current of dry air through the solution kept at ordinary temperatures, or by allowing it to evaporate in a vacuum over sulphuric acid. The anhydrous peroxide thus obtained is a colorless, odorless, oily liquid with a harsh, bitter, metallic taste. It remains unfrozen at $-30^\circ C.$, and when heated to the boiling-point of water it decomposes with violence into oxygen and water. When brought in contact with the skin it causes a white blister, which after a time produces an irritating, itching sensation. It is a powerful bleaching agent and is largely used to remove color; it is particularly valuable for bleaching ostrich-feathers, bones, ivory, silver, wood, silk, cotton, etc. Dilute solutions of it under special trade names are employed to produce a light color in hair. It has also been used to restore paintings that have become darkened by age. The peroxide is very useful in medicine and surgery as an antiseptic, rapidly destroying pus and similar discharges, in consequence of which it has been employed in diphtheria. Hydrogen dioxide has the power of freeing water from micro-organisms, which has led to its use in brewing. It also destroys the acid and mold ferments in the wort. If taken internally, it has the effect of improving digestion, and has therefore been used in certain forms of dyspepsia. Ordinarily the peroxide acts as a strong oxidizing agent, owing to the ease with which it parts with half of its oxygen. In certain cases, however, the same property has the effect of causing reduction. This happens, namely, whenever the peroxide is brought into contact with substances like oxide of mercury, or ozone, which readily undergo decomposition. The reduction of such substances is accompanied by the evolution of much heat, great volumes of oxygen being given off by the peroxide itself as well as by the substances undergoing reduction. The peroxide itself is readily decomposed into water and free oxygen by mere contact with certain substances, e.g. gold, without these undergoing any change. Among the substances that have this effect on the peroxide are most alkalies, and hence the peroxide can only be preserved in slightly acid solution. Before using such a solution, a few drops of ammonia may be employed to neutralize the acid.

HYDROGEN SULPHIDE. See SULPHURETED HYDROGEN.

HYDROGRAPHIC OFFICE. A Government institution for the preparation, publication, and distribution of charts, and nautical information. It is a bureau, or office of a bureau, in the Navy Department. The principal hydrographic offices of the world are the British, French, United States, Russian, German, Italian, Japanese, Netherlands, and Spanish. The United States Hydrographic Office is third in the number of different charts published. It was established by act of Congress approved June 21, 1866. Before that date both the navy and merchant marine depended upon foreign offices for their supply. Charts for the navy were supplied through a depot of charts located in Washington, which purchased and kept on hand the charts needed for use. The Navy Department published a few charts prior to the establishment of the Hydrographic Office—notably those of the Wilkes Exploring Expedition—but such publications were exceptional.

The present Hydrographic Office was for a time a branch of the Bureau of Navigation of the Navy Department, but some years since it was transferred to the Bureau of Equipment. It is composed of the divisions of Chart Supply, Chart Construction, Sailing Directions, and Meteorology. The head of the Office, a captain or commander, is styled the *Hydrographer to the Bureau of Equipment*. The chiefs of divisions except that of Chart Construction are naval officers; the chief of the division of Chart Construction is a hydrographic engineer, and in 1901 was an ex-naval officer. On July 1, 1901, the number of engraved chart plates on hand was 1169, in addition to which there were 28 photographic plates. Besides these a considerable number of charts are produced by photolithography for temporary use until the engraved plates can be prepared. The total number of charts published and sold or issued to United States vessels or for governmental purposes during the preceding fiscal year was 62,194.

In addition to charts of the usual character there were published about 50,000 copies of the Pilot Chart (see CHART) of the North Atlantic Ocean, and 21,000 copies of the Pilot Chart of the Pacific Ocean. The Office also issues weekly a pamphlet of several pages called *Notices to Mariners*, which give accounts of all newly discovered dangers and changes in lighthouses, buoys, and aids to navigation reported during the week, and other information of importance to navigators; of these pamphlets 885,725 copies were published during the fiscal year 1900-01. The pilot charts are only issued monthly, and a weekly supplement called the *Hydrographic Bulletin* serves to bring the information up to date. The Office publishes lists of lighthouses, buoys, etc., throughout the world, and volumes called sailing directions, which contain full information in regard to ocean currents, weather, character of the seacoasts of different parts of the world, descriptions of harbors, aids to navigation, and other matters of interest to navigators and mariners generally. The other publications of the Office are *Bowditch's Practical Navigator* (q.v.), *Azimuth Tables*, and similar books for the use of mariners.

For the purpose of gathering and disseminating information of interest to mariners and assisting them as much as possible, branch hydrographic offices have been established in the ports

of Baltimore, Boston, Buffalo, Chicago, Cleveland, Duluth, Galveston, New Orleans, New York, Norfolk, Philadelphia, Portland (Me.), Portland (Ore.), Port Townsend, Sault Ste. Marie, San Francisco, and Savannah. Additional branches are contemplated in Porto Rico, Hawaiian Islands, and the Philippines. The charts published by the Hydrographic Office cover the Great Lakes and their coasts and harbors, the Philippines, Samoa, Hawaiian Islands, Guam, Porto Rico, foreign territory, and the oceans. Only general sailing charts of the United States' own coast are published by it, the detail charts being published by the United States Coast Survey.

For further information, consult: Hughes, *Founding and Development of the Hydrographic Office* (Washington, 1887); and *Annual Reports* of the Hydrographer to the Bureau of Equipment (Washington). See HYDROGRAPHY; CHART; and section on Navy under UNITED STATES.

HYDROGRAPHY (from Gk. ὑδωρ, *hydōr*, water + -γραφία, *-graphia*, writing, from γραφειν, *graphein*, to write). That branch of the science of physical geography which treats of the surface waters of the earth particularly with reference to their bearing on navigation. Practically every civilized nation, and particularly all maritime nations, have special governmental departments whose duty it is to survey and chart the navigable waters belonging to the nation, and also the waters of the oceans wherever navigation extends. The hydrographical work performed by these organizations may be divided into two branches: (1) The collection of hydrographic data; and (2) the recording of these data, and marking the records available for the mariners. In the succeeding discussion these two branches of hydrographic work will be considered separately. First, however, it will be interesting to note very briefly the earliest attempts at systematic hydrographic work. The first step in the modern science of hydrography was made in the fifteenth century by Henry, 'The Navigator,' who was the first to construct a sea chart worthy of the name. Not much of importance in the way of hydrographic work was accomplished, however, until Captain James Cook, of the English Navy, commenced his long career of ocean surveying in 1759. Captain Cook's first work was the hydrographic mapping of the Saint Lawrence River from Quebec to the Atlantic Ocean, which he accomplished while stationed with the British fleet coöperating with General Wolfe in the attack upon Quebec. In 1763 Captain Cook was sent to survey the coast waters of Newfoundland, and in 1764 he performed a similar duty for the coast of Salvador, and thereafter he continued similar hydrographic observations wherever he was ordered until his death in 1779. The French had been observers of the operations of Captain Cook, and in 1785 La Pérouse was sent with two ships and a corps of scientists to visit the northwest coast of America and to explore other parts. He made important observations there, and also on the northeast coast of Asia. After spending two years and a half he went to Botany Bay, after which he was never heard from, except that information was obtained seven or eight years afterwards which made it probable that the ships were wrecked on a coral reef on the coast of Mallicollo. La Pérouse had, however, sent duplicates of charts and journals

up to the time of his arrival at Botany Bay. The navigating officer of the expedition, Beautemps-Beaupré, sent out to search for La Pérouse in 1791 under the command of D'Entrecasteaux, wrote a work on marine surveying, which was published in an appendix to the narrative of the voyage (1808). This, however, had been preceded by Alexander Dalrymple's essay on marine surveying, published in 1771. Beautemps-Beaupré was placed in charge of the survey of the French coast, where he trained a number of hydrographers, the commencement of a corps of engineers for future exploration and surveying. The work done by these early English and French navigators was imitated by those of other nations, and now, as previously stated, practically every civilized nation has its hydrographic office.

COLLECTION OF HYDROGRAPHIC DATA. The sources from which hydrographic data are gathered are numerous. One of the most important is the system of surveys made directly by the Hydrographic Office (q.v.). Some of the objects of these surveys are the determination of depths for mapping and navigation purposes; the location of buoys, rocks, signals, etc.; the location of channels, the directions and velocities of currents, and the determination of the changes in the same, the measuring of the cross-sections of streams, the mean velocities of the water across such sections, and the slope of the water surface, and the determination of the quantity of sediment carried in suspension, the volume of scour or fill on the bottom, or of the material removed by artificial means as by dredging. The fixed points of reference for the survey are usually on shore, but sometimes buoys are anchored off shore and used as points of reference. The depth of water is determined by taking soundings along certain definite lines, these lines being established from the reference points just mentioned in coast and harbor work, and by the sextant and mariner's compass in deep-sea work. The operation varies in its nature, but consists commonly in rowing a boat at uniform speed and making soundings at regular intervals of time. The steersman keeps the boat true to the line by starting from a known point and steering directly toward another known visible point. In deep-sea sounding the ship keeps to a compass course, the latitude and longitude being established at suitable intervals by the ordinary means. In a harbor survey the soundings are generally taken along two sets of parallel lines, one set crossing the other at approximately right angles, and thus dividing the harbor area into checker-board divisions. In river work the soundings are usually made along lines crossing the streams transversely at regular intervals.

Numerous modifications of these two methods are practiced. The means used for making the sounding or measuring depth ranges from a long graduated rod in shallow waters to the deep-sea lead. (See **LEAD**; **SOUNDING**.) To determine the direction and velocities of currents various means are employed, the most perfect of which are ingenious instruments known as current-meters (q.v.). In these devices a small water-wheel or screw propeller is operated by the current, and registers the number of revolutions made. As the wheels are regulated to make a certain number of revolutions at each speed of current, the registered record shows by a simple calculation the velocity of the current at the point where the

meter was sunk. For collecting samples of the subsurface water instruments are used which consist essentially of a small water-tight vessel which can be tightly closed below water, and thus enable a sample to be brought to the surface by means of the line to which the instrument is attached. For obtaining samples of the bottom the sounding-lead may have a cup-shaped vessel, with self-closing cover, attached to it, or a deep-sea dredge may be employed. See **DEEP-SEA EXPLORATION**; **DREDGE**.

The great bulk of the hydrographic surveying done by commercial nations is performed in the waters contiguous to the coast-lines, since it is here the shoals, reefs, currents, etc., whose location is of concern to the mariners, are chiefly found. Deep-sea surveying is more purely of scientific interest only, the principal direct commercial purpose of such deep-water surveys being the location of submarine telegraph cables.

Turning now to the sources for gathering hydrographic data outside of the surveys conducted directly by the Hydrographic Office, reference has already been made to the surveys performed in locating submarine cable routes. The various cable companies have ships continuously at work making such surveys or repairing and relaying old cables, and the numerous data collected by these vessels are forwarded to the Hydrographic Office for record and compilation. In the United States the Hydrographic Office also has the aid of the work done by the Coast and Geodetic Survey in surveying and mapping the coast-line, by the Engineer Corps United States Army in improving harbors and rivers, and by the United States Lighthouse Board in establishing lighthouses, buoys, beacons, etc. In addition the United States Commission of Fish and Fisheries collects considerable hydrographic information in the course of its work which is of value to the hydrographer. It is also the accepted duty of every master of a vessel to report to the proper authorities every fact of importance to mariners which he may observe in his voyages. Finally, there are the various expeditions which are organized from time to time, sometimes by the Government and sometimes by scientific bodies, to study the physical geography of the ocean. The first, and in some respects the most important, of these expeditions was that of the *Challenger*, sent out by England in 1872, and a reference to the brief description of its work (see **CHALLENGER EXPEDITION**) will serve to explain the nature and purpose of subsequent similar expeditions.

The hydrographic work so far mentioned has referred exclusively to navigable waters. In recent years constantly increasing attention has been devoted to the conservation and utilization of surface waters for irrigation in arid regions, for water-power and water-supply, and for various other utilitarian purposes. In the United States there is a special department of the Geological Survey devoted to the collection and publication of hydrographic data of this sort. Similar work is done by other governments, particularly that of England in India. As in the case of navigable waters, here also much information is obtained from the work done in developing private enterprises, such as water-power and water-works undertakings.

RECORDING AND PUBLICATION OF HYDROGRAPHIC DATA. The work of placing on record and making public the facts collected by the Hydrographic

Office through its surveys, and from other sources of information, is quite as important as the work of collecting such facts. In this way only is it possible to make the collected facts of value. So far as the mariner is concerned the most important work of the Hydrographic Office is the charts of navigable waters which it issues. These charts are made up by compiling the data collected as previously described from it, constructing maps or charts, showing the configuration of the coast-line and the ocean bottom, the depths of water, the location of channels, rocks, reefs, buoys, lighthouses, etc. As changes occur in these particulars they are recorded, and new charts made showing the changed conditions. Information which is not suitable for representation on charts is published in book form, or in periodicals called *Notices to Mariners*. When it is stated that the Hydrographic Office of each nation publishes not only its own charts, reports, and notices, but reproduces a considerable portion of the similar information published by other nations, it will be seen that the task of recording and making public hydrographic information is one of magnitude. See HYDROGRAPHIC OFFICE.

HYDROID (from Gk. *ὑδροειδής*, *hydroeidēs*, like water, from *ὑδωρ*, *hydōr*, water + *εἶδος*, *eidōs*, form). One of a class of cœlenterate animals, notable for their delicacy and beauty, and receiving their name from their structural resemblance to Hydra (q.v.). The name is now generally restricted to the polyp forms of the Hydromedusæ. (See HYDROZOA.) They exist in compound colonies, one kind having the office of feeding the community, another of protecting it, and another of reproduction. The feeding hydroids are usually fixed, or attached to some object, and proceed from eggs of the reproductive hydroids, or medusæ, the latter in turn growing from buds produced by the former. The medusæ sometimes remain attached to the stem, or become free-swimming. The body of the nutritive hydroid is usually supported by a stem of variable length, but may rest immediately upon the bottom. From one individual buds appear and produce branching colonies of hundreds or thousands, often having a height of fifteen or twenty inches, and the giant hydroid of Japan is more than three feet high. The reproductive hydroids are sometimes developed into perfect medusæ before leaving the parent stem, but they usually break away before attaining their perfect state. Some buds never become much developed, and are called gonophores. These usually remain attached, but attain sexuality and reproductive power. Most hydroids are covered with a chitinous envelope, which is continuous over the branching stem of the entire colony, but some species are naked, and soft. In tubularian hydroids, the chitinous envelope, when present, simply incloses the stem and branches, but is not expanded around the individual polyps (*hydranths*) in the form of a cup. In campanularian hydroids, however, each hydranth is surrounded by a cup, a continuation of the chitinous envelope, into which it can withdraw itself. Hydroids abound in the ocean in various parts of the world, notably the northwest coast of America, the Caribbean Sea, and around Australia. Their colors are usually not brilliant, brown, flesh-color, and white being the most common. A familiar and beautiful example is the Portu-

guese man-of-war (q.v.). Consult Agassiz, *North American Acalæphæ* (Museum of Comparative Zoölogy, Cambridge, 1875). See SIPHONOPHORE, ALTERNATION OF GENERATIONS, and the accompanying illustration.

HY'DROMAN'CY. See DIVINATION.

HYDROM'ETER (Gk. *ἰδρομέτρον*, *hydrometron*, vessel for hydrostatic measurement, from *ὑδωρ*, *hydōr*, water + *μέτρον*, *metron*, measure), also known as AREOMETER. An instrument used in determining the specific gravity of liquids, and in some instances of solid bodies.

Specific gravity, for determining which the hydrometer is used, is the ratio between the weight of a given quantity of a substance and that of an equal volume of water at its temperature of maximum density, 4° Centigrade, so it follows that the specific gravity of two substances must be directly proportional to their weights when the volumes are the same, or inversely as their volumes when the weights are equal. The hydrometer, which is a hollow instrument of glass or metal designed to float upright in a liquid, makes use of the principle of Archimedes that the weight of the volume of liquid displaced by a body is equal to the weight of the body itself. In its simplest form a hydrometer might consist of a graduated scale floating vertically in a liquid, and on which the level of the surface of the liquid it displaces could be measured. For example, an ordinary ruler if allowed to float upright in water would sink until a certain division on the scale is reached. This reading multiplied by the area of the cross-section of the ruler will give the volume of a mass of water equal to that displaced by the ruler, and equivalent to the weight of the ruler itself. Immersing the ruler in a liquid of different specific gravity, it will sink until the surface touches some other division on the scale, and as before the volume of a mass equivalent to the weight of the ruler will be obtained. A ratio made with these two quantities representing the volumes of the two liquids would give the specific gravity, but as the cross-section of the ruler is a constant quantity, it is only necessary to compare the two readings on the scale. The ordinary hydrometer consists of a glass tube terminating in two bulbs, the lower of which is filled with mercury or shot in order to keep the instrument steady in an upright position when immersed in a liquid. Such a hydrometer is extensively used in scientific and commercial work, as it can be graduated to furnish direct readings of the specific gravity of a liquid. The mark to which the instrument would sink when placed in water is usually marked 1.000, and the weight of water displaced is equal to the total weight of the hydrometer. If the instrument be placed in a liquid that has a less specific gravity than water, alcohol for example, it will sink until the surface of the liquid touches some point higher up on the stem, as in this case it takes a greater volume of the lighter liquid to be equivalent to the weight of the hydrometer. The scale on which the readings are made is on a piece of paper contained inside of the stem, and the method of graduation forms the chief distinction between the different instruments. In the instrument of Gay-Lussac, which is known as a volumeter, the water-point was marked 100, and the division was carried along the stem both

above and below this mark on the basis that the amount of the stem between any two scale divisions should equal $\frac{1}{10}$ of the volume of the part immersed in water. With an instrument graduated in this manner the specific gravity is obtained by dividing the reading into 100. In practice, it is more convenient to use a hydrometer whose scale is graduated to read specific gravity direct, but in this event the scale is irregular, and great care must be exercised in the construction and testing of the instrument. The accuracy of a hydrometer is greatly increased by making its stem as slender as possible, and consequently increasing the space between the divisions, so it is customary to construct a number of instruments, each having a limited range, and designed for liquids of different densities. The hydrometer when used for a special purpose or substance, frequently undergoes modifications. The alcoholmeter, for example, is so graduated as to give at once the percentage of pure alcohol in a mixture of alcohol and water. The urinometer, lactometer, sacharimeter, and other instruments are all hydrometers used for special purposes. Hydrometers with arbitrary scales also play an important part in scientific work, though the present tendency is toward the exclusive use of specific gravity values. In the Baumé scale, which is encountered frequently in chemical processes, a second fixed point on the hydrometer stem is determined in addition to that given by water. This is obtained by dissolving one part by weight of common salt in nine parts of water, and then the space between these two points is divided into ten equal parts, which are called degrees. The water-point is marked 10 on the scale, and the division is carried beyond for 40 degrees. For liquids heavier than water the second fixed point is determined by immersion in a solution of 15 parts of salt in 85 parts of water, and the space between it and the water-point, which is marked 0, is divided into 15 equal divisions. The scales of Cartier and Beck are also used, though less frequently than that of Baumé. The following tables from Kohlrausch, *Leitfaden der praktischen Physik* (Leipzig, 1900), afford a comparison of these scales with the true values of specific gravity:

LIQUIDS LIGHTER THAN WATER

SP. GR.	Baumé	Beck	Cartier
.75.....	58.4°	56.7°
.80.....	46.3	42.5	43.°
.85.....	35.6	30.	33.6
.90.....	26.1	18.9	25.2
.95.....	17.7	8.9	17.7
1.00.....	10.	0.	11.

LIQUIDS HEAVIER THAN WATER

SPECIFIC GRAVITY	Baumé	Beck
1.0.....	0.0°	0.0°
1.1.....	13.2	15.4
1.2.....	24.3	28.3
1.3.....	33.7	39.2
1.4.....	41.8	48.6
1.5.....	48.8	56.7
1.6.....	54.9	63.7
1.7.....	60.	70.
1.8.....	65.	76.
1.9.....	69.	81.
2.0.....	73.	85.

The specific gravity of liquids changes with the temperature so that it is of the utmost importance to have the liquid at the temperature for

which the instrument is made, or to use a thermometer, and then apply suitable corrections. For this purpose many of the finer hydrometers contain within their stems a thermometer tube whose bulb is placed in the lower portion of the instrument.

In the United States Internal Revenue Service the hydrometers furnished to the inspectors are so graduated as to indicate the number of parts by volume of proof spirit equivalent to the volume of the liquor at the standard temperature, which is 60° Fahrenheit. They are constructed so as to read 100 for proof spirit, and 200 for absolute alcohol. Proof spirit in the United States is defined by law to be that mixture of alcohol and water which contains one-half of its volume of alcohol, the alcohol when at a temperature of 60° Fahrenheit being of specific gravity .7939 referred to water at its maximum density. Proof spirit has at 60° Fahrenheit a specific gravity of .93353, 100 parts by volume of the same consisting of 50 parts of absolute alcohol, and 53.71 parts of water.

A hydrometer of a different type from those described above is the weight hydrometer, where the submerged volume remains constant, but as the specific gravity of the liquids changes, the weight of the instrument must be varied in order to immerse it to a given point. The Nicholson hydrometer is representative of this class, and consists of a brass tube with conical ends, which floats upright and carries above a thin stem the carrying pan in which may be placed a substance whose specific gravity is to be found. When used to determine the specific gravity of a liquid the weight of the apparatus is first ascertained, and then it is placed in water and weights added until a marked point on the stem is at the surface of the water. If the instrument is placed in a liquid of greater specific gravity, then additional weights must be placed on the pan in order to sink the stem to the mark, while if the liquid is less dense the number of the weights must be diminished. The weight of the instrument increased by the amount of the weights added when the instrument was placed in water, divided by the weight of the instrument and the weights added when the instrument was in the liquid under test, will give the specific gravity. This hydrometer can also be used to determine the specific gravity of a solid, in which case the latter is first placed in the upper pan, while the instrument is in water, and the number of weights which must be removed is noted. The substance is then placed in the lower pan, and the amount of weight which must be removed to restore it to its former position ascertained. The difference in the two amounts

SET OF UNITED STATES STANDARD HYDROMETERS AS USED BY THE INTERNAL REVENUE OFFICE.

represents the weight of the water displaced by the substance, and if divided into the sum of the weights removed when the body was placed in the upper pan, will give the specific gravity. The hydrometer of Fahrenheit is based on a similar principle, but is made of glass instead of metal, and has a bulb filled with mercury at its lower end instead of a weighted cup. It can only be used for liquids. These instruments are not as reliable as the ordinary hydrometers, and are not as widely used. In the most accurate determinations of specific gravity a chemical balance is employed, and equal volumes of the liquid actually weighed, or if the substance is a solid it is weighed both in the air and in distilled water, suitable corrections being applied for temperature, and other disturbing influences.

The hydrometer is without doubt one of the earliest pieces of physical apparatus, its invention being generally ascribed to Archimedes, to whom is due the principle on which it is based. The instrument is mentioned by Priscian, who died about A.D. 500, and it is also described by Synesius of Ptolemais in a letter to Hypatia of Alexandria, under the name of hydroscoptium, as follows: "It is a cylindrical tube the size of a reed or pipe, a line drawn along it lengthwise which is intersected by others, and these point out the weight of water. At the end of the tube is a cone the base of which is joined to that of the tube so that both have but one base. This part of the instrument is called *baryllion*. If it be placed in water it remains in perpendicular direction so that one can readily discover the weight of the fluid." The date of this letter can be approximately fixed by the fact that Hypatia was murdered in A.D. 415. The use of the hydrometer was known to the Saracens of the tenth and eleventh centuries, and one of their writers, Al-Khazini, attributes its invention to a Greek philosopher named Poppus, a contemporary of Theodosius the Great. In this connection this same writer refers to the fundamental discovery of Archimedes.

HYDRONITRITES. See HYDRONITROUS ACID.

HYDRONITROUS ACID, HN_3 . An acid gaseous compound of hydrogen and nitrogen first obtained by Curtius in 1890. An easy method of preparing this acid was subsequently worked out by Angeli, and consists in adding hydrazine hydrate (see HYDRAZINE) to a concentrated solution of silver nitrate, the result being a precipitate of silver, hydronitrite, AgN_3 , from which free hydronitrous acid may be obtained by decomposing with sulphuric acid. The salts of hydronitrous acid, or *hydronitrites*, are violently explosive compounds, and their preparation should not be undertaken by inexperienced persons.

HYDROPATHY (from Gk. *ὕδωρ*, *hydōr*, water + *πάθος*, *pathos*, disease). A synonym for hydrotherapy, the method of treating diseases by external and internal use of water. See HYDROTHERAPY.

HYDROPHANE (from Gk. *ὕδωρ*, *hydōr*, water + *φανός*, *phanos*, clear, from *φαίνω*,

phainein, to appear). A translucent variety of opal that is either whitish or light-colored, and becomes more transparent or translucent in water.

HYDROPHIDÆ. See SEA-SNAKE.

HYDROPHILIDÆ (Neo-Lat. nom. pl., from Gk. *ὕδωρ*, *hydōr*, water + *φίλος*, *philos*, loving). A family of scavenger beetles, most of which swim in the water or crawl on the submerged parts of plants in quiet pools. They are elliptical black beetles which club-shaped antennæ. Because of the fact that they carry a film of air on the ventral surface of the body, this part has a silvery appearance. The larvæ are carnivorous, but the adult beetles live chiefly on decaying vegetation. There are one hundred and fifty species of this family in the United States. One of the most common species is *Hydrophilus triangularis*. A few forms live in moist earth or dung, and subsist upon maggots which inhabit such places.

HYDROPHILOUS. A term which has been applied particularly to plants which are pollinated through the agency of water. It has also been applied by some authors to hydrophytic plants, but should be entirely discarded there, both because of its previous use in another sense and because it is an undesirable word in all senses. The term water-pollinated is preferable in the first sense. See POLLINATION.

HYDROPHOBIA (Lat., from Gk. *ὕδροφοβία*, hydrophobia, from *ὕδροφοβος*, *hydrophobos*, dreading water, from *ὕδωρ*, *hydōr* water + *φόβος*, *phobos*, fear), or RABIES, also called LYSSA. An acute infectious disease of warm-blooded animals produced in man by the implantation of a specific virus through the bite of an animal sick with the disease. This disease has been known since the earliest historical times. Democritus of Abdera gave an account of it in the fifth century B.C. Aristotle in the fourth century B.C. described it. Celsus, B.C. 21, detailed some of its symptoms. Xenophon, Ovid, Vergil, Horace, Plutarch, all referred to rabies in their works. Boerhaave (q.v.) and Van Swieten described the disease intelligently. John Hunter (q.v.), Magendie (q.v.), Marochetti, Morgagni, Trousseau, and Dupuy all wrote of it. Youatt (1850), the celebrated veterinarian, considered rabies at length in his books, and relied on early cauterization with nitrate of silver to obviate infection. Yet after being bitten seven times with impunity, he is reported to have died of rabies at the last. Virchow and Von Ziemssen propagated the disease by the hypodermic injection of saliva of a rabid animal. After many others had added to our knowledge of hydrophobia, Pasteur (q.v.), in 1882, began to treat the disease with scientific accuracy.

The geographic distribution of the disease is wide. It has been found in Greenland, where it was epidemic in 1860; in Constantinople, where it prevailed in 1839; in Egypt, in London, in Hamburg, in Saxony, in Bavaria, and in many parts of the United States, the prevalence of the disease in Washington, D. C., in 1899-1900 raising grave apprehension. In Russia and Siberia very many instances of rabid wolves have been recorded. The disease is found most frequently in the dog, the wolf, the cat, and the cow. The skunk, also, seems to be peculiarly liable to hydrophobia, and the disease in this animal has

NICHOLSON
HYDROMETER.

been considered distinct and worthy its own name of *rabies mephitica*. A careful consideration of all the known facts, however, leads to the conclusion that the disease is one to which all the lower animals, and man also, are liable; that it is protean in its manifestations, chiefly because of the thousand and one concomitant circumstances and elements; and that the collected statistics are mostly so tainted, from manifold sources of error, that they need to be scanned and sifted with the utmost discretion and care. It is, however, safer to treat every skunk-bite as though certainly by a rabid animal, since in most cases the facts cannot be known. (The curious will find the question most interestingly discussed in a candid manner in Coues's *Fur Bearing Animals*.) The nature of the infecting virus is as yet unknown. It is probably found in the saliva. In man there is a variable incubation from three weeks to six months, the period depending largely on the site of the infection. Wounds about the neck and face are especially unfavorable in prognosis; next are those of the hands. Punctured wounds, because of the difficulty of cauterizing them, are most dangerous. Three stages are described. In the *premonitory stage* there is pain, numbness, or irritation about the bite. Irritability, nervousness, and depression are common. In the *stage of excitement* there is great hyperæsthesia. Almost any slight stimulus will cause intense reflex excitability and convulsions. The muscles of deglutition are extremely rigid, or even paralyzed, and any attempt at swallowing may cause spasms of the throat and general convulsions; these may even follow the thought of swallowing. The name hydrophobia is erroneous, and based upon false inferences from these facts. The sufferer from rabies does not fear water—he intensely desires it, as he is devoured with thirst, but he cannot swallow it, nor even “go through the motions” of swallowing. There is also a secretion in the throat and mouth of a thick, viscid mucus, with thickened saliva, and the effort to get rid of this with muscles refusing to act, causes the bark-like cough and hawk so often described as ‘barking like a dog.’ The patient does not bark, and it is doubtful if he bites. The temperature rises, and the patient may become maniacal. This stage may last from one to four days, and then the *paralytic stage* supervenes. In this stage the spasms stop, unconsciousness supervenes for the first time, the action of the heart ceases, and the patient dies.

The pathological changes found after death from hydrophobia are not characteristic. The most constant are found in the nervous system, especially in the region of the medulla oblongata and pons. The changes consist in a varying degree of inflammation, marked by small round cell infiltration of the blood-vessel walls, exudation into the pericellular lymph-spaces, small hemorrhages, and sometimes thrombosis of the small blood-vessels. More recently extensive degenerative changes in the nerve-cells have been described. Lesions have also been noted in the sympathetic, consisting in degeneration of the nerve-cells and increase in the thickness of their endothelial capsules. In addition to the changes in the nervous system, there is usually congestion of the mucous membrane of the gastro-intestinal tract and of the pharynx, larynx, and bronchi. Despite the fact that innumerable attempts to discover the cause of the disease have been made

without success, it still seems probable that hydrophobia is due to a micro-organism. This organism is not apparently widely distributed throughout the body, but confined mainly to the saliva and the central nervous system. An emulsion made of the medulla of a rabid animal, injected into dogs, cats, rabbits, guinea-pigs, etc., produces symptoms characteristic of the disease, although in rodents there is little or none of the stage of excitement.

Although we have no knowledge as to the specific germ of the disease, hydrophobia furnishes our most remarkable example of the success of artificial immunization by means of protective inoculation. To the French student Pasteur (q.v.) is due the credit not only of the discovery of the preventive treatment of hydrophobia, but of demonstrating through it a principle in therapeutics which is of constantly widening application. Pasteur found that he could induce the disease in rabbits by inoculations with portions of the spinal cords of rabid animals, and that the spinal cords of these rabbits possessed a high degree of virulence. Drying in air reduced the virulence in direct proportion to the length of the drying. It was found that, while inoculation of man or animals from the fresh rabbit-cords was invariably fatal, if the man or animal was first inoculated from one of the cords the virulence of which had been greatly reduced by the drying, and then from cords of gradually increasing virulence, he could become so accustomed to the virus that injection of the fresh cord would no longer be fatal, and such a series of inoculations made sufficiently soon after the bite of a rabid animal was found to prevent entirely the development of the hydrophobia. Advantage is taken of the long period usually elapsing between the bite and the onset of the disease to practice these preventive inoculations, and the result has been a marked decrease in the mortality from the bites of rabid animals. In view of the uniformly fatal results of hydrophobia and the success of the Pasteur treatment, the importance of determining at the earliest possible moment whether the animal by whom a person has been bitten had rabies can be readily appreciated. The animal should not be killed, for as rabies is invariably fatal to canines, the recovery of a sick animal definitely disproves rabies. On the contrary, the animal should be carefully watched, and if it dies, should be sent to a laboratory where examination can be made and the question of rabies definitely settled by inoculation experiments on animals. The treatment should be cauterization in every case, less than one hour after the bite, by means of the actual cautery, strong acid, or acid nitrate of mercury. Wounds must be opened by the surgeon, and even amputation may be necessary. Washing and syringing wounds with water at 130° F. is desirable. Sucking the wound to draw out the poison has been practiced, and may be safely done if there are no breaks of the membrane of the lips or mouth. Administration of morphine or alcohol does harm. Immunizing by the Pasteur method should be practiced in all cases. By this method the patient is inoculated with attenuated virus by the injection hypodermically of emulsion made from the brain of a rabid animal, repeated in stronger and stronger concentration during twenty-one days. The results of the Pasteur method are now indisputable,

HYDROPHYTES

RED ALGÆ

- 1. *Ptilota californica*
- 2. *Scinala furcellata*
- 3. *Delesseria sanguinea*

- 4. *Polysiphonia Brodiaei*
- 5. *Nemalion multifidum*
- 6. *Porphyra laciniata*

but it is of the utmost importance to begin the treatment as soon as possible after the injury, as the prospect of success grows less and less day by day of delay. Following are the results of the antirabic treatment at the Institut Pasteur, Paris, from 1886 through 1899; 21,631 cases were treated, with 99 deaths; showing a mortality of 0.45+ per cent. In 1900 there were thirty-five Pasteur institutes in the world, at the following places: Eight in France, six in Russia, five in Italy, two in Austria, one in New York City, one in Chicago, one in Baltimore, one in Havana, one in Rio Janeiro, one in Buenos Ayres, one in Saragossa, one in Malta, one in Bucharest, one in Constantinople, one in Aleppo, one in Tiflis, one in Algiers, and one in Athens.

PSEUDORABIES, or LYSSOPHOBIA, is a neurasthenic or hysterical condition, in which the patient, who imagines that he has rabies, in his morbid condition of mind enacts some of the symptoms, and may even be frightened to death. Consult: Youatt, *On Canine Madness* (London, 1830); Suzor, *Hydrophobia: An Account of M. Pasteur's System* (London, 1887); Babes, in *Annales de l'Institut Pasteur*, vol. v. (Paris, 1892); Byron, *Researches in the Loomis Laboratory* (New York, 1890); Pasteur, in *Comptes rendus de l'Académie des Sciences* (Paris, 1881 and 1889), and in *Annales de l'Institut Pasteur* (Paris, 1887-88); Salmon, "Development of Knowledge Concerning Animal Diseases," in *U. S. Department of Agriculture, Bureau of Animal Industry, Sixteenth Annual Report* (Washington, 1899).

HYDROPHYTES (from Gk. ἵδωρ, *hydōr*, water + φυτόν, *phyton*, plant). Plants which grow naturally either in water or in very wet soil. This term is contrasted with mesophytes and xerophytes (qq.v.). Common illustrations of hydrophytic plant societies are swamps of all kinds, pond societies, and ocean plants. Various classes of hydrophytes are taken up under separate heads, where the main features of the various hydrophytic societies will be discussed. It will be desirable, however, to give a short account of the characteristic hydrophytic structures. The roots of hydrophytic plants are in most cases very greatly reduced, and in some cases altogether lost, as in some of the duckweeds. Root-hairs are also commonly lacking in water plants. The stems and leaves are not as a whole conspicuously reduced in water plants, but they show peculiarities of structure that are quite interesting. The leaves of hydrophytes are frequently finely divided, as in the water-milfoil and mermaid-weed. In many cases where the leaves are not finely divided, they are very thin; for example, in tape grass. An examination of the structure of the leaves shows the entire absence of stomata in the submerged parts, complete or almost complete absence of palisade cells, and a very thin epidermis which contains chlorophyll. The stems suffer a noteworthy reduction in the size and development of the water-conducting vessels and mechanical tissues, and a great increase in air-spaces. The structures just described are found in their highest development in submerged water plants. Hydrophytes whose leaves are aerial show no conspicuous differences from ordinary land plants in most respects. One class of hydrophytes, which may perhaps be called amphibious plants, shows some remarkable variations, especially in structure.

Leaves which are developed under the water show the characteristic structures outlined above, including the fine leaf division, whereas leaves of the same plant developed in the air show typical aerial leaves without these divisions and with palisades, stomata, and a thick cuticle. The stimulus or stimuli which cause these wide variations are not certainly known, but they are discussed to some extent in the article LEAF. Common American plants, which show variations to a high degree, are the aquatic buttercups, the mermaid-weed, some of the cresses, and water-hemlocks.

However the hydrophytic structures that have been described in the preceding paragraph may have arisen, certain advantages can be clearly seen, at least in some cases. The thin walls of the epidermis, which are in striking contrast to the thick cutinized walls of many aerial leaves, permit the easy entrance of water and substances dissolved in the water. On this account many submerged plants are practically independent of soil relations; they take in most of their material directly from the water. It is easily possible to grow cultures of many of these plants without having any root connection whatsoever. While certain forms, such as the water-milfoil and the water-weed (*Elodea*), develop roots in ordinary aquarium cultures, other forms, such as hornwort (*Ceratophyllum*), never develop roots and yet grow quite as vigorously as in their natural rooted condition. A few forms, such as the bladderwort (*Utricularia*) and some of the duckweeds, have no roots in nature. Of course, in such cases, the entire absorption of nutriment must take place through the leaf epidermis. The fact that the leaf epidermis contains chlorophyll is also a matter of advantage, since water very soon destroys the efficiency of rays of light. At a comparatively shallow depth there is a cessation of the development of green plants. A reduction in the water-conducting tissues, while not necessarily an advantage, is, nevertheless, not harmful, inasmuch as the absorption is so largely through the leaf, instead of the root, as in land plants. The reduction in root development is not so easy to understand, since it would seem that holdfast organs would ordinarily be of advantage; then again, any absorption which the roots might make would so much the more increase the capacity of the plant. A high development of air-cavities is a distinct advantage, not only to help float the plant, but probably to a much higher degree to act as a sort of air-storage. It can readily be seen that the conditions for obtaining air underneath the water are not of the best, and that any additional means for obtaining or for storing air would increase the plant's efficiency. The reduction in the development of mechanical tissues, of palisade cells, and of stomata is not necessarily an advantage to water plants, but since these tissues are not actually needed, the plant loses nothing by its failure to develop these structures. The peculiar leaf forms that have been noted above are, perhaps, not necessarily of any exceptional advantage. It must not be supposed that everything in a plant can be explained in accordance with the need of the plant. It is much more likely that the explanations should be referred to definite chemical and physical causes. However, in the case of finely divided leaves, it can be seen that a much larger proportion of cells comes in

contact with the material than is true with the more compact air leaves. Thus the absorption capacity of the leaf is increased. Finely divided leaves are also doubtless more able to escape the dangers coming from currents of water than leaves which are more compact.

The hydrophytic plant societies are essentially all edaphic, that is, they are conditioned by local causes. In this respect there is a wide contrast as compared with the xerophytic plant societies. Perhaps some of the ocean formations may be conditioned by climatic causes to some extent, but the ordinary hydrophytic societies of swamps and ponds are due to essentially local conditions. Perhaps no plants have such a wide distribution as certain of the hydrophytes. This is particularly true of ocean plants, where it can easily be accounted for by the almost universal distribution of the oceans themselves. It is true, to a striking degree, as well of the pond and swamp plants. Such plants as the pond weeds, cattails, and bulrushes, are found almost throughout the world where the habitats are favorable. Perhaps the chief reason for the wide distribution of hydrophytic species is the great ease of dispersal by means of the water itself, but a reason, almost if not quite as important, is furnished by the wide degree of uniformity of hydrophytic conditions. Since water is colder in summer and warmer in winter than adjoining portions of the land, it is obvious that water plants can, for reasons of temperature, have a much wider distribution than land plants.

The hydrophytic plant societies may be roughly subdivided into those associated with salt water and those with fresh water. The former are treated under the heads PLANKTON; BENTHOS; MANGROVE SWAMP; and HALOPHYTES; the latter under the head of SWAMPS, where it will be convenient, not only to treat the swamps proper, but also, to some extent, the development of the swamps from ponds and lakes. See DISTRIBUTION OF PLANTS.

HYDROSTATIC PRESS. See HYDRAULIC PRESS.

HYDROSTATICS (from Gk. ὑδωρ, *hydōr*, water + στατικός, *statikos*, causing to stand, from ἵσταναι, *histanai*, to stand). That branch of mechanics which treats of the properties of liquids in equilibrium, and of solids either totally or in part immersed in liquids. Many of the laws and phenomena of hydrostatics apply equally well to both liquids and gases, i.e. to fluids. A fluid may be defined to be such a form of matter that it yields to any force, however small, which acts to make one layer of the substance move over another; thus the shape of a liquid or gas depends entirely on the forces acting on it, however small, and not on the body itself, as in the case of a solid. A portion of liquid left to itself—as a falling drop—assumes a spherical shape owing to the contraction of the surface layer. (See CAPILLARITY.) Under the action of gravity a liquid contained in an open vessel takes the shape of the vessel so far as all the surface is concerned, except that portion in contact with the air and the portions near the edges of this 'free surface.' This portion is horizontal, being perpendicular to the vertical force of gravity if the liquid is at rest; because, if it were inclined to this, there would be a component of gravity tending to make the higher portion of

the liquid slide down. When a fluid is said to be at rest, it is not implied that there is no motion of the molecules, but simply that there is no *blowing*, i.e. no currents, no wind. In the case of the open vessel, there is a force pressing down on the free surface due to the weight of the atmosphere, and, since the liquid presses against the solid walls, they have a force of reaction against the liquid; thus it is exactly as if the liquid were contained in a vessel and a tight-fitting piston were pressing down on its top surface. If a gas is contained in a balloon or in a room, it expands and is uniformly distributed throughout the space open to it; it presses against the containing walls, and they have an equal reaction on the gas. If a small quantity of a certain liquid is poured into a tall cylindrical vessel, then another liquid with which the first does not mix is poured carefully on top of this, etc.; the equilibrium—if there is any—will be stable only if the density of any one liquid is less than that of the liquid below it and greater than that of the one above it. For, if the density of any layer is greater than that of the one below it, the potential energy of the two will be decreased if the heavier liquid gets to the bottom, and so comes closer to the earth.

FLUID PRESSURE. As a result of the reaction of the containing walls on a liquid or a gas there is always a 'pressure' at each point throughout the fluid, i.e. there is a force acting over any surface immersed in the fluid; the numerical value of the pressure over any area is by definition the force per square centimeter, and the 'pressure at a point' is the limiting value of the force acting on any surface at that point divided by the area of the surface, as the area is supposed to be taken smaller and smaller until it becomes practically a point. This pressure, due to the reaction of the walls, is the same for all points in the fluid. There is also an additional pressure at each point of a fluid on the surface of the earth owing to the fact that any horizontal plane passing through that point has to support the *weight* of the column of fluid vertically above it. If the area of this plane is A ; the vertical height above it to the top of the fluid, h ; the average density of the fluid, ρ ; the acceleration due to gravity of a falling body, g ; the upward force will be ρhgA , and, therefore, the pressure is ρgh . These two pressures are the only ones which affect our senses or produce mechanical effects in general; but there is also, of course, at any point in a liquid what may be called 'cohesion,' or pressure due to the action of the molecules on each other. Some idea of the magnitude of this may be obtained by separating the molecules, e.g. by boiling the liquid. It is greatly affected by dissolving substances in the liquid. The pressure against any surface immersed in a fluid at rest is always at right angles to it, otherwise there would be produced a flowing owing to the component of the pressure along the surface. Further, the pressure at any point in a fluid at rest is the same in all directions, because, if it were greater in one direction than in another, the fluid would flow. Therefore the pressure at any point in a fluid at rest is the sum of the pressure due to the reaction of the walls, P , and that due to gravity, ρgh . As noted above, the former is the same for all points in the fluid. As a consequence, if a fluid is inclosed in a cylinder into which fit two pistons of

4. *Fucus vesiculosus*

different areas, A_1 and A_2 , the forces which must be applied to these pistons from without to prevent the fluid from pressing them outward are PA_1 and PA_2 —omitting any action of gravity. Therefore, if A_1 is small compared with A_2 , the force on the former piston is small compared with the balancing force on the latter; so a small force may produce a large one. In a liquid which is almost incompressible, P may be very great; and so the force produced may be enormous; but in a gas, which is easily compressed, P is never very large; and so the force produced is small. (This principle is that of the hydrostatic press. See HYDRAULIC PRESS.)

The total pressure, i.e. $P + \rho gh$, at all points in the same horizontal level in any one fluid, regardless of the shape or size of the containing vessel, is the same; for imagine a vessel with a horizontal bottom, all points of the fluid along this must have the same pressure, otherwise the fluid would flow; the pressure at any point at a level h centimeters above this bottom plane is less than that at the bottom by an amount ρgh —the same for all points in the plane. If, now, portions of the vessel are imagined removed, so as to leave a vessel of any shape, the pressure at the various points remains unaffected. The pressure on any portion of the containing walls varies with the depth; so the thrust outward on this portion is the resultant of a series of parallel forces, increasing from top to bottom; the point of application of this resultant is called the 'centre of pressure.' If the wall is a vertical rectangle, the centre of the pressure, due to gravity, for a liquid, is at a distance one-third the height from the bottom, etc.

ARCHIMEDES'S PRINCIPLE. If a solid is completely immersed in a fluid, the latter exerts on it pressures from all directions perpendicular to the elementary portions of the surface of the solid. These pressures will produce an upward force on the solid equal to the weight of the fluid displaced by it; because, if the space occupied by the solid were to be filled with the fluid, there would be equilibrium; and, as this substitution has not changed the pressures at the boundary surface of the volume formerly occupied by the solid, the resultant of these surface pressures must just balance the weight downward of the fluid. This buoyant force acting on the solid must then equal the weight of the fluid displaced by the solid and must have a vertical line of action passing through the centre of gravity of the displaced fluid. This is called 'Archimedes's principle.' The apparent loss in weight of a body immersed in water, the suspension of a balloon, etc., are illustrations of it. It evidently gives a method for comparing the density of a solid with that of a liquid; for the weight of a solid in a vacuum is ρgv , if ρ is the density of the solid and v its volume; and its apparent loss in weight when weighed suspended in the liquid is $\rho'gv$, if ρ' is the density of the liquid; both the weight and the loss in weight may be measured, and thus the ratio of ρ and ρ' determined.

FREE SURFACE WAVES. Liquids differ from gases in having definite volumes; consequently, as noted before, if a liquid is poured into an open vessel, it will have a surface in contact with the atmosphere. This is called the 'free surface.' If the liquid is an equilibrium, this surface must be at right angles to the forces acting on it.

Thus a liquid at rest in an open vessel has a horizontal surface owing to the earth's force of gravity. If this surface is disturbed, e.g. by dropping in a stone, the displaced portion will return to its previous level owing to the action of gravity, but its inertia will cause it to continue its motion, making a displacement in the opposite direction; then it will return, etc., thus vibrating up and down and producing waves out over the surface. These gravitational surface waves on a liquid advance with a velocity which depends upon the nature and depth of the liquid and the wave-length of the waves. Thus, if the liquid is shallow compared with the wave-length, the velocity is given by the formula $v = \sqrt{hg}$, where h is the depth of the liquid and g is the acceleration of a falling body. If the liquid is deep compared with the wave-length, the velocity of the waves is

$$v = \sqrt{\frac{g\lambda}{2\pi}}$$

where λ is the wave-length of any train of waves, and $\pi = 3.1416$. If the waves are extremely short—i.e. ripples—their motion is not due to gravitation, but to capillarity (q.v.), because the surface is increased in area by the ripples; and the capillary forces are, in this case, large compared with the gravitation ones, the surface being so slightly elevated or depressed. The velocity of these capillary waves is

$$v = \sqrt{\frac{2\pi T}{\lambda\rho}}$$

where T is the 'surface-tension' of the liquid. (See CAPILLARITY.) If the vessel containing the liquid is cylindrical, and if this is set rotating rapidly about its axis, the free surface will no longer be horizontal, because now the surface is acted upon by both gravity and 'centrifugal force.' The shape of the surface will be such as to be at right angles to their resultant, and will actually be a paraboloid of revolution.

If a liquid is poured into a vessel which consists of several parts, the liquid will stand at the same height in all parts provided they are wide and open to the atmosphere; for, as has been proved, all points at the same horizontal level in a fluid are at the same pressure, and conversely; and the points in the free surfaces are at the same pressure, viz. that of the atmosphere. If, however, a liquid is poured into a U-tube which stands erect, and then a lighter fluid, which does not mix with the first, is poured into one arm, the level of the surfaces of the liquids in the two arms is not the same. The pressure at points which lie in the horizontal plane passing through the surface of separation of the two liquids must be the same, because they are all connected by one liquid. The pressure at the points in one arm in this level is $\rho_1gh_1 + P$, where ρ_1 is the density of the liquid in that arm, h_1 is the vertical height of its free surface above the level plane, and P is the pressure of the atmosphere on the free surface; similarly the pressure at this level in the other arm is $\rho_2gh_2 + P$, where ρ_2 is the density of the liquid whose vertical height from the level to the free surface is h_2 . Therefore

$$\rho_1gh_1 + P = \rho_2gh_2 + P$$

or

$$\rho_1h_1 = \rho_2h_2$$

This principle evidently furnishes a method for

the comparison of the densities of two liquids which do not mix.

FLOTATION. If a body less dense than a liquid is immersed in the liquid and allowed to come to equilibrium, it will rise to the surface and 'float' with only part of its volume below the surface. By Archimedes's principle the upward force equals the weight of the liquid displaced; and, since the body does not move in a vertical direction, this force must equal the weight of the body itself. Therefore, a floating body displaces a volume of the liquid of weight equal to its own. The upward force acts through the centre of gravity of the space formerly occupied by the liquid displaced, while the downward force acts through the centre of gravity of the floating body. If the body is in equilibrium these two forces must have the same line of action, or the two centres of gravity must lie in the same vertical line. In most cases this equilibrium is stable, but it may be unstable, e.g. an oblong block set floating with its long direction vertical. The test of stability is to give the floating body a small displacement, i.e. tip it slightly, and to see if the forces acting on it tend to restore it to its previous position or to make it tip still further. See **METACENTRE**.

CAPILLARITY. Where the free surface of the liquid meets the wall it is not horizontal; and, when a tube of fine bore dips into a liquid, the free surface inside the tube is at a different level from that outside. These variations are said to be due to capillary action, and they may all be shown to be due to the fact that a liquid surface contracts so as to have the smallest area compatible with existing conditions.

The principle of Archimedes, discussed above, is attributed correctly to the philosopher of Syracuse; and many facts in regard to liquids were known to him and other scientists of antiquity. Galileo first stated the law of connecting tubes, and Pascal was the first to recognize the fact that the reaction of the walls produced a pressure which was the same at all points throughout the fluid. The ordinary statements and proofs of hydrostatics are given to-day exactly as they were by Stevinus (1548-1620). For further information, consult Greenhill, *Hydrostatics* (London, 1894).

HYDROSULPHURIC ACID. See **SULPHURETED HYDROGEN**.

HYDROTHER'APY, or HYDROP'ATHY (from Gk. ὑδωρ, *hydōr*, water + θεραπεία, *therapeia*, cure, from θεραπεύειν, *therapeucin*, to cure, from θέρω, *therōn*, attendant). Water treatment. The efficacy of water in the cure of numerous forms of disease has long been recognized. Water was largely employed by Hippocrates in the treatment of many kinds of disease. Horace speaks of Antonius Musa, the hydropathic physician of the Emperor Augustus (Epist. i. 15). Both Celsus and Galen speak favorably in their writings of the use of water in the cure of disease, regarding it as of high value in the treatment of acute complaints, particularly of fevers. Throughout the Middle Ages, likewise, many physicians, including Aëtius, Paulus Ægineta, and Paracelsus, were advocates of the remedial virtues of water; all of them, however, having faith in its uses in the treatment rather of acute than of chronic disorders. In 1723 Niccolò Lanzani, a Neapolitan physician, published a learned

treatise on the subject. In England, about the beginning of the eighteenth century, Sir John Floyer and Dr. Baynard made large use of water. Their conjoint work, denominated *Psychrolousia*, or the "History of Cold Bathing, both Ancient and Modern," is replete with quaint learning and practical shrewdness and sagacity. But the most able and scientific among the older treatises that have appeared in England on the subject of the water treatment is the work of Dr. Currie, published in 1797, entitled *Medical Reports on the Effects of Water, Cold and Warm*, etc. In this work Currie recommends the cold affusion in typhus and other fevers, and gives practical directions in regard to the cases and the times when it may be used with advantage, although he appears to have limited his use of water to acute ailments exclusively.

We have thus seen that up to the beginning of the nineteenth century, by some of those who employed it as a curative agent, water was used in the treatment of acute, and by others of chronic, diseases; by some as an internal agent alone; by others as an external application in the various forms of the bath; but never in all the manners combined. This combination was first effected by the original genius of Vincent Priessnitz, a Silesian farmer, with whom began a new era for the water cure. It was owing, we are told, to his successful treatment of more than one bodily injury which he had sustained in his own person that, about the year 1820, Priessnitz became so convinced of the curative powers of water as to employ it medically in the cure of others. Beginning with the external application of water for trifling diseases among the poor of his neighborhood, he gradually undertook an extended range of cases, and multiplied the modes of administration, introducing the wet compress, the douche bath, partial baths of all kinds, the sweating process, the wet sheet, together with copious drinking of pure water. In addition to water in all these forms, he insisted on the value of exercise, diet, fresh air, and mental repose in the cure of disease, thus practically calling to his aid the entire resources of hygiene, and establishing by a simple, yet thoroughly original combination, nothing less than a new system of medical treatment. As to the success which attended Priessnitz's practice, it is an historical fact that of 7500 patients who had gone to Gräfenberg for advice and treatment up to the year 1841, or within the space of about twenty years, there had been only 39 deaths. It is to be regretted, however, that the founder of the new system was not himself an educated physician, so that he could have understood better the philosophy of his own practice and explained it more correctly. He would not have called his system the 'water cure,' a name scientifically one-sided and incomplete, and therefore misleading.

The undoubted merits of hydropathy at length called to its defense many men of standing in the profession, who, allowing for some of its early extravagances, explained it scientifically, and from their advocacy has sprung up a school of hydropathic physicians. Dr. Winternitz, of Germany, in 1883 laid down the scientific principles of modern hydrotherapy. The fundamental principles of hydrotherapy are very simple. The art of applying these principles requires much teaching, but any one with even moderate sense and intellect can grasp the essential features. Water

may be used either internally or externally. Internally it may be used simply to wash out a cavity—the nose, the mouth, the stomach, the bladder, or the rectum. In addition, it may be taken internally hot or cold and passed into the blood. It may be used hot in the rectum, as a simple enema, or for purposes of stimulation. Externally, water may be used in many conceivable ways, but essentially the use of water means with it the use of two very necessary aids, heat and cold. Hydrotherapy, apart from the use of heat and cold, is of secondary importance. The action of water in the treatment of disease is therefore largely mechanical. The psychical side is not unimportant. It has been used by enlightened physicians ever since the dawn of medicine, and its effects taught in all medical schools. Only the quack and the charlatan will claim that hydrotherapy is a cure-all. Eccentricities, like the Kneipp cure and others, are to be avoided by the sensible. Water acts physically and mechanically. It is capable of readily taking up heat and of giving it up; it thus lends itself most readily to the use of thermal agents. It may be used in gaseous form (steam), liquid form, or solid form (ice). The action of heat and cold are essentially important. Smooth muscle-fibre expands under the action of moderate heat and contracts under the influence of cold. Its contracting power may be destroyed by an excess of either. Cold and heat, therefore, act as irritants to the nervous system, and through their agency we can act upon all of the organs, to stimulate or depress their activities. The heart, lungs, kidneys, liver, spleen, skin, etc., may all be influenced; the body heat and the output of moisture and secretions may be regulated. Thus by the use of heat or cold to certain portions of the skin or internally, almost every organ in the body can be influenced through its blood-vessels, and the skilled physician can, by guiding and directing these effects, bring about changes in vascular states; can remove excess of blood from one part of the body and bring it to another; can impart tone to a flagging organ, as the heart, or to the muscles or to the spinal cord; can increase the secretions from organs, such as the skin or the kidneys, and thus assist in excreting poisonous products from the body.

The applications of water to disease are well systematized by Baruch as *ablution, affusion, sheet bath, drip sheet, compresses, wet pack, tub bath, and douche*.

ABLUTION. Simple application of water by the hand or moist cloth over the body. In fevers the abdomen, the back, the chest, the lower extremities as far as the knees are bathed successively every two or three hours. A temperature of 75° F. should be used at first, and gradually reduced to 60° F. Chilling is to be avoided. Reaction is to be gained, the superficial capillaries becoming suffused and the body assuming a pinkish hue. Rubbing should always be used in ablutions.

AFFUSION. The patient, with a cold wet cloth about the head, sits or stands in a tub containing about a foot of water at 100° F. A broad stream of water from a bucket or pitcher is poured with force directly over the body. The stimulation will depend upon the temperature of the water and its force of delivery. This is often used in states of profound prostration, in coma, and in stuporous, delirious states.

SHEET BATH. A rubber sheet is laid down over one-half of the bed. This is covered by a blanket. Then a linen sheet is dipped in water at a temperature of from 60 to 70° F., and while still wet is wrapped about the patient while he lies upon the blanket. The face is bathed in ice-water and the head covered with a wet towel. The nurse or attendant rubs the patient energetically over the body. As the body reacts and becomes warm, water at still lower temperatures may be sprayed over the sheet. Afterwards the patient may lie wrapped up in the blanket. This is an excellent method for reducing temperature in fevers, and is applicable in practically all acute diseases accompanied by high temperature.

DRIP SHEET. The patient, standing in a tub of water at 100° F., has a wet sheet, wrung out, wrapped about him. He is then firmly rubbed until a reaction occurs. He may be slapped gently instead of being rubbed. This procedure forms an excellent tonic in nervous exhaustion, in the early stages of tuberculosis, and in chlorosis or anæmia.

COMPRESSES. These consist of bands or squares of old linen to which flannel is attached and strings made to fasten the appliance about a part. The linen piece is usually wrung out of hot or cold water and applied to the part and wrapped about by the flannel to prevent evaporation. These compresses are valuable in sore throat, tonsillitis, rheumatism, pneumonia, sprains, etc. They should be renewed hourly in acute processes.

WET PACK. This is similar to the sheet bath, save that the sheet covering the body is wrung dry and then the patient is rolled up completely in thick blankets. The air should be kept out by fixing the blanket very securely about the feet and neck. The wet pack is more useful in chronic cases. Friction is essential in the acute cases, in order to bring about quicker reaction; hence in these the sheet bath is usually preferred to the wet pack.

TUB BATH. A trained nurse should give this bath. See TYPHOID FEVER.

DOUCHE. This apparatus throws a jet of water against the body from a hose, and is best given in a special institution devised for this work. Arrangement is made in the apparatus whereby the force of the jet and its temperature can be regulated.

Consult Baruch, *Principles and Practice of Hydrotherapy* (New York, 1900). See BATH; TYPHOID FEVER.

HYDROTHORAX (Neo-Lat., from Gk. ὑδωρ, *hydōr*, water + θώραξ, *thōrax*, chest). The term applied to dropsical collections in the pleura (q.v.), a closed serous sac enveloping the lung on either side. When it exists to any extent, the pressure which it exerts on the lungs impedes the passage of the blood through them, and occasions difficulty of breathing, lividity of countenance, etc., and more or less dropsy in the face, ankles, etc., soon appears. The physical signs by which the disease can be detected are changes in the condition of the chest, as ascertained by auscultation, percussion, and succussion by the physician.

Hydrothorax may depend upon inflammation of the secreting membrane, or it may be a consequence of organic disease of the heart or lungs, liver, or kidneys. With regard to treatment, when the disease seems to depend upon inflammation

of the pleura, great advantage may often be derived from occasional cupping and repeated blistering, hydragogue catharsis, tapping of an ascitic abdomen, etc., according to the cause.

HYDROTROPISM (from Gk. ὑδωρ, *hydōr*, water + τροπή, *tropē*, a turning, from τρέπειν,

FIG. 1. NEGATIVE HYDROTROPISM.

Culture of the black mold on bread in a moist chamber. The hyphæ carrying the thread-like sporangia grown in such directions as to be as far as possible from the surfaces of bread and glass from which moisture is diffusing. Diagrammatic.

trepein, to turn). The sensitiveness of certain plant organs to the presence of unequal moisture,

FIG. 2. POSITIVE HYDROTROPISM.

Grains of corn, planted in wet sand in a funnel whose outer surface is covered with wet blotting-paper, have germinated. The roots, *r*, instead of growing straight down, as they would do in saturated air, have applied themselves to the wet paper. Hydrotropism under these conditions overpowers geotropism.

which causes them to curve toward the source of moisture. Among the fungi hydrotropism is

shown particularly by those filaments (hyphæ) which bear the sporangia. While most of the hyphæ ramify through the moist substance on which the fungus grows, the sporangial hyphæ rise at right angles to it. If they start from a salient angle on the substratum (e.g. the edge of a slice of bread), they may take the position shown at Fig. 1, growing equidistant from the two moist surfaces. If they arise from a re-entrant angle, they place themselves likewise so as to be as far away from each moist surface as possible. The roots of higher plants are also sensitive to moisture, the stimulus of which may exceed that of gravity, as shown in Fig. 2. Here roots of corn planted in the heaped-up sand have come over the edge of the glass funnel, and have started to grow downward in the moist air. As they get farther from the surface of the wet paper covering the outside of the funnel, they find drier and drier air. A stream of water particles, however, is reaching them from one side. At a certain point the stimulus of the diffusing moisture overcomes the geotropism (q.v.) and the root, growing more rapidly on one side, is directed toward the moist surface. When it comes into the neighborhood of the moist paper again the sides are less unequally stimulated, the stimulus of gravity reasserts itself, and the tip again grows downward. The alternating prevalence of hydrotropism and geotropism is shown in the wavy course of the longer roots. It will be observed that the more rapid growth which directs the tip toward the moist surface is not due merely to the absorption of water, for it occurs on the drier side of the root. Hydrotropism is a form of chemotropism (q.v.).

HYDROZOA (Neo-Lat. nom. pl., from Gk. ὑδωρ, *hydōr*, water + ζῷον, *zōon*, animal). A class of Cœlenterata in which the simplest form of the body, as in the polyps, is a sac attached by its posterior end, and with a digestive cavity communicating with the exterior by a mouth only. The mouth is surrounded by hollow tentacles. The body is composed of two cellular layers, the ectoderm and endoderm, separated by a gelatinous, non-cellular 'mesogloea.' The body is usually differentiated into two sorts of zooids, i.e. 'polyps' or nutritive zooids, which are usually sexless, and 'medusæ,' or reproductive zooids. The latter produce medusa buds, which on being set free are called medusæ, and are bisexual. In these medusæ the body is greatly more complicated than in the polyps, being bell or umbrella shaped, with a well-developed nervous system, composed of a thread-ring around the eye of the disk and with ganglia near the 'eyes' or sense organs. The digestive cavity is differentiated into a central and a peripheral portion, the latter forming radial and circular canals. The eggs and sperm are discharged externally, and fertilization of the egg takes place in the sea. Nettling organs (see NEMATOCYST) are usually present; they arise from some of the interstitial cells, and are most abundant in the tentacles. Many Hydrozoa (Hydra and Hydractinia excepted) exhibit the phenomenon of alternation of generations (q.v.). The asexual polyps give rise to buds which develop into medusæ, and the latter lay the eggs from which are hatched the polyps. The medusæ are more or less phosphorescent. They abound in all seas, while Hydra is a minute fresh-water form. Very primitive

HYENAS AND PROTELES

1. AARD WOLF (*Proteles lalandi*).
2. STRIPED HYENA (*Hyaena striata*).

3. BROWN HYENA (*Hyaena brunnea*).
4. SPOTTED HYENA (*Hyaena crocuta*).

fresh-water forms are Protohydra and Microhydra, which are without tentacles.

The Hydrozoa are grouped in four orders: (1) *Leptolinæ*, having a fixed zoöphyte or polyp stage, and the sense organs exclusively ectodermal (Anthomedusæ and Leptomedusæ); (2) *Trachylinæ*, having no fixed zoöphyte stage, all being locomotive medusæ (Trachymedusæ and Narcomedusæ); (3) *Hydracorallina*, coral-making polyps (Millepora and Stylaster); (4) *Siphonophora*, pelagic hydrozoans in polymorphic colonies; (5) *Graptolithoidea*, an extinct Paleozoic group, related to (6) the *Hydromedusæ*. The Hydromedusæ are a very heterogeneous assemblage of polyp and medusa forms, arranged in several families. In some species we find only hydroids, in others only medusæ; but in many the hydroids and medusæ are alternate generations of a common stock.

Of the orders above mentioned, the Hydrocorallinæ and Graptolithoidea are of importance to the geologist, for they contain fossils of considerable interest. (See STROMATOPORA, and GRAPTOLITE.) Fossil representatives of the Scyphomedusæ are rare, but have been described from Cambrian, Jurassic, and other formations.

Consult: Parker and Haswell, *Text-Book of Zoology* (London and New York, 1897); Huxley, *The Oceanic Hydrozoa* (London, 1859); Fowler, "The Hydromedusidæ and the Scyphomedusidæ," in Lankester's *Treatise on Zoology*, part ii. (London, 1900). See CORAL; CTENOPHORA; HYDRA; HYDROID; JELLYFISH; MEDUSÆ; POLYP; SIPHONOPHORA; etc.

HYENA, hí-ě'ná (Lat. *hyæna*, from Gk. *haina*, *hyaina*, hyena, from *hys*, hog, Lat. *sus*, AS., OHG. *sū*, Ger. *Sau*, Eng. *sow*, Av. *hu*, pig; connected either with Skt. *sū*, to bear, or with Skt. *sūkara*, swine, *sū*, maker, so called from the grunt). One of a family (Hyænidæ) of carnivorous animals remarkable for their generalized structure, which unites features characteristic of the cats, the civets, and the dogs. Their dentition is cal-

DENTITION OF HYENA.

i, incisors; *c*, canine; *p*, premolars; *m*, molars.

culated for great tearing and crushing power, and includes six incisors and two canine teeth in each jaw, five molars on each side of the upper jaw, and four in the under. This dentition and other features place them between the dogs and the civets, with the latter of which they are connected by Proteles. (See AARD-WOLF.) They seize an object with so firm a hold that among Arabs they are proverbial for obstinacy. The vertebræ of the neck sometimes become ankylosed in old hyenas. In size they equal the largest dogs. The hind quarters are lower and weaker than the fore quarters of the body, so that hyenas move with a shambling gait. The body is covered with long coarse hair, forming a mane along the neck and back. The feet have each four toes. The claws are strong, fit for digging, and not retractile. The tail is short. Beneath the anus is a deep glandular pouch, contributing much to the offensive odor which is one of their

many disagreeable characteristics. Hyenas eat carrion as well as newly killed prey, and are of much use, like vultures, as scavengers, clearing away the last remnants of carcasses. They sometimes attack cattle, especially if they flee, but rarely man, though they sometimes seize children. Selous gives surprising instances of their boldness and strength in East Africa. During the day they hide themselves in caves, old rock tombs, and ruined edifices; by night they roam singly or in packs. They prowl about towns and villages, and often dig up corpses that have not been deeply buried. This, together with their aspect and manners, has caused them to be generally regarded with horror, and very exaggerated accounts of their fierceness have been prevalent. Instead of being untamable, as was long the popular belief, they are capable of being completely tamed, and show an attachment to man similar to that of the dog; they have even been used as watch-dogs. Hyenas are found only in Africa and in South-Central Asia.

The most typical and at the same time familiar form is the striped hyena (*Hyæna striata*), which ranges from Abyssinia and the Libyan Desert eastward to India, where it is common throughout all the more open country, roaming widely at night in search of carrion, or living sheep and dogs. It is dirty gray, with narrow tawny or zebra-like stripes, a coarse mane along the back, and a bushy tail. It is cowardly, silent, and both hated and feared by the rural people. Two other species are exclusively African, and differ much from the striped, so that some naturalists put them in another genus (*Crocuta*). The spotted hyena (*Hyæna crocuta*) is larger than either of the others, and is yellowish, thickly spotted with black, and the nose and feet are also dark. It inhabits nearly all Africa south of the Sahara, hunts in packs, is courageous, and really does most of the ravaging it is accused of. Its unearthly coughing cry is one of the most terrifying of animal utterances. Owing to the peculiar arrangement of the reproductive organs in this species, it is extremely difficult, except by careful examination, to distinguish the sexes by external characters, and from this fact the old myth that hyenas are hermaphrodites has doubtless arisen.

Between these two stands the brown hyena (*Hyæna brunnea*), found on both sides of Southern Africa near the coast, and often on the mountains. It is a less repulsive looking animal than the others; has a dog-like mantle of long brown hair which half conceals its barred legs, and becomes white on the sides of the head and chest, giving a quaint appearance to the front view, since the face itself is black, while the tall ears are gray.

The hyena family, of comparatively recent origin, appears to have evolved from the Viverridæ, through such intermediate genus as *Ictitherium* of the Lower Pliocene of Southern Europe. That *Ictitherium* ate bones in the same manner as do the modern hyenas has been proved by the nature of the coprolites found associated with their skeletons. True hyenas are common fossils in the Pliocene and Pleistocene deposits of Europe, during which periods they roamed in abundance as far north as France and England, as is exhibited by their remains in cave floors; and they are known in deposits of similar age in Asia. None have been found in America.

Consult: *Blanford, Fauna of British India: Mammals* (London, 1888-91); *Zoology of Abyssinia* (London, 1870); and the writings of sportsmen-travelers in Africa and India. See Plate of HYENAS.

HYENA DOG. See HUNTING DOG.

HYÈRES, é'ar'. A town in the Department of Var, France, three miles from the Mediterranean and eight miles east of Toulon (Map: France, N 8). It is a fashionable winter resort picturesquely situated on the southern slope of a castle-crowned hill 670 feet high, in a district noted for its mild climate, sheltered location, and luxuriant vegetation. Its chief buildings are the restored twelfth-century cathedral Church of Saint Louis, the hôtel de ville, public library, and museum. There is a considerable export trade in flowers, fruits, cork, and salt, the extensive salt marshes in the vicinity yielding over 20,000 tons annually. The neighborhood has the remains of a Roman town. In mediæval times, as Hiedera, Hyères was a favored port of call for Oriental pilgrims, and as late as the fourteenth century was of greater importance than Toulon. Population, in 1901, 17,659.

HYGEIA, hi-gé'yá (Lat., from Gk. Ὕγεια, *Hygieia*, Ὕγεια, *Hygeia*, health, from ὑγιής, *hygiēs*, healthful; connected with Skt. *ugra*, mighty). In the ordinary tradition, the goddess of health, daughter of Asclepius, and honored with him at Athens, Epidaurus, Sicyon, Corinth, Titane, and elsewhere. She was joined with the god of healing, Amphiaraus, at Oropus, and on the Acropolis at Athens was an ancient cult of Athena Hygeia, to whom a statue and altar were erected after the great plague, and before the introduction of the worship of Asclepius in Athens. In the art of the fifth and fourth centuries B.C., Hygeia is represented as a maiden, but of the fully developed and vigorous type, while later her form is more youthful and girlish. She is represented in company with her father, or sometimes alone, with the snake by her side or drinking from the patera in her hand. Hygeia seems to be an originally independent divinity, but later came into connection with various deities who had become associated with the cure of disease.

HYGIENE, hi'jī-ēn (from Fr. *hygiène*, from Gk. ὑγιαίνω, *hygiainein*, to be healthy, from ὑγιής, *hygiēs*, healthy). The branch of medical science which deals with the preservation of health. Within its scope are all measures taken for the acquisition and preservation of health, except those involving purely medical and surgical means. Hygienic measures were a part of religious observance among the Jews, as well as among the people of Assyria and India, and their enforcement lay with the priests. Among the Greeks these duties were transferred to the physicians. Hippocrates's work on *Air, Water, and Places* was largely responsible for this change. (See HIPPOCRATES.) In the twenty-second book of Homer's *Odyssey* there is an account of the sanitary precautions taken by Ulysses after the killing of the wooers. The place of slaughter was cleansed and disinfected by scraping and washing, and by burning sulphur. Little attention appears to have been paid to the infected individual in the olden time, when the panic ensuing upon a plague caused expulsion or expatriation of the sufferers. Laws were framed

to protect the public from lepers, for example, by expelling them and burning their houses. In 1423 Venice established its first lazaretto, and in 1485 a permanent health magistracy was created in that city. In 1532 an act of Parliament authorized in England the issue of commissions of sewers for "the overlooking of sea banks and sea walls, and the cleansing of rivers, public streams, and ditches." In 1552 Shakespeare's father was fined for throwing filth into the street, and again in 1558 for not keeping his gutter clean.

Roman law provided no protection for the individual. Greek and Latin writers treated of diet and exercise for the patrons of literature, for princes, and for the wealthy. From the school of Salerno, about the twelfth century, issued the *Code of Health*, which was printed in 1480, and for two centuries thereafter remained the standard work on personal hygiene. Despite the stringent laws seeking to prevent plague which were enacted by James I., and the establishment of lazarettos into which ships discharged their cargoes for detention and airing, serious outbreaks of the dread disease occurred in 1625 and 1629-31. In 1665, according to Macaulay's estimate, the number of deaths from plague during one period of six months reached more than 100,000.

At the close of the eighteenth century little advance had been made in hygienic knowledge beyond the discovery by Woodhall, in 1617, that scurvy was prevented by the use of lemon-juice; the discovery by Morton, in 1697, that foul air produced disease in some way; and the introduction from China into England in 1717 of inoculation with smallpox virus by Lady Mary Wortley Montagu. Differentiation of fevers began early in the nineteenth century. Following the cholera epidemic in London of 1831-32, newly awakened interest resulted in the formation in 1838 of a system of registration of deaths in that city. The establishment of the fact of water-borne diseases was made by the investigations of Dr. John Snow into the cholera outbreak in London, in 1848-49. From this date investigation has been systematically pursued into the causes of death; the causes of disease, its spread, and the agencies that produce it; and into the conditions that promote health. The use of the microscope, the study of bacteriology, of pathology, of the chemistry of food, of climate, and of exercise have all added to the knowledge that has increased the useful application of hygienic principles in our day. Sanitary laws have been enacted which control unhealthful agencies and aim to safeguard and regulate commercial as well as domestic relations.

Hygiene may be variously classified, according to its relations, and the objects in view. There is the hygiene of the individual, of the family, and of the municipality or State; which may be denominated personal, domestic, and public hygiene.

PERSONAL HYGIENE. This includes the study of (1) *Food*, including water and beverages. Food should be adapted to the season of the year, the age, occupation, and the condition of health of the individual. An increase in the quantity of fruit and of water, a greater proportion of vegetables and smaller meals are desirable in hot weather, while an increase in meat and in cereals

is desirable in cold weather. Infants require principally milk, with the proportions of proteids, fats, and sugar graded according to age and digestive capacity. Older children require small quantities of meats, cereals, fruits, and vegetables. In regard to occupation, it may be said in general that active laboring men, like carpenters, wheelwrights, and farmers, may partake of food which takes a considerable time to digest, with more advantage than sedentary men may. Pork and corn-cake or bread is a nutritious and sustaining diet to an active laborer, but should not form the habitual diet of a sedentary person. (See DIET, paragraph *Diet in Disease*; see also FOOD.) The investigation of water-supply, examination for noxious ingredients or medicinal properties in drinking-water, as well as directions for its use, come within the province of hygiene, as does also the use of coffee and tea, which are both stimulating drugs, causing in some persons overaction of the heart, cerebral activity resulting in insomnia, and indigestion; of cocoa, which is slightly stimulating, but contains food; of wine, beer, and distilled liquors, all of which are drugs in the eyes of the physician and the sanitarian, to be used with accurate calculation of their nutrient and stimulant properties. (See ALCOHOL; BEER; WINE.) (2) *Clothing* should be suited to the temperature, the age, and the occupation. Ventilation as well as materials—wool, cotton, linen, and silk—must be considered. (3) *Work and Exercise* are necessary for every one. Regular physical activity is essential to proper development, and to the maintenance of normal action of the vital organs, and the repair of tissue. Even those who are confined to bed by disease need exercise, which is secured by passive motion or massage. (See GYMNASTICS; EXERCISE; MASSAGE.) To work must be joined the consideration of rest and sleep, which should be enjoyed at regular intervals, and in quantities proportioned to individual conditions and occupations. (See SLEEP.) (4) *Personal Cleanliness* includes regular evacuations of the bowels daily; daily bathing, securing constant removal of perspiration; care of the hair and scalp, and care of the nostrils, of the cavity of the mouth and teeth, of the genitals, and of the anal orifice. (5) *Special Habits* which tend to undermine health should be controlled; the use of tobacco, of other narcotics, and of stimulants should receive consideration. Tobacco should never be used before the age of twenty-one or twenty-two years has been reached, and should rarely be used by neurasthenics. In certain diseases, as Bright's disease and syphilis, and certain conditions of the heart, tobacco is pernicious. All other narcotics are distinctly deleterious, and should be forbidden. (6) *Control of Sexual and Other Passions* has much to do with personal health. Indulgence in masturbation by the young delays development, and in a vast majority of cases causes mental enfeeblement. Excessive sexual intercourse has a similar effect, with greater disaster to the male. Perhaps the most undermining of normal mental activities are anger and grief, and these should be avoided or limited. The thoughts should be calm, and mental exercise, as well as physical, should be regularly taken. Mental indolence leads more often to mental disorder than does mental overwork.

DOMESTIC HYGIENE. This includes the study of (1) *The Management of Infancy*, (2) *Preparation of Food*, with regulation of meals, as well as supervision of cooking, and (3) the *Hygiene of the Sick-Room*, including removal of dust-catching furnishings, regulation of heat, light, and ventilation, provision of utensils which may be sterilized, care of bedding and bed-linen, and arrangements for proper bathing and nursing. Besides these subdivisions, others might be made which would duplicate some of the titles more properly assigned to personal or public hygiene; such as *air*, and *hygiene of the school*.

PUBLIC HYGIENE. This comprises care of the surroundings of man, as well as prevention of disease, and disposal of the dead; and therefore includes a consideration of: (1) *Climate*, as one of the agencies active in man's environment, is used as an elastic term to embrace the range of temperature of a locality, the prevailing winds, the rainfall, the vegetation, and the soil. (2) the *Soil under Dwellings*, with reference to possibilities of drainage-proximity to underground water, etc. (3) *The Character of Dwellings*, especially tenements, as to ventilation, and air-space, position, and materials used in construction, and provision for regulating temperature, water-supply and drainage. (4) *Cleansing of Dwellings and Disposal of Refuse*. (5) *Cleansing of Streets* in towns. One of the most important questions of public hygiene is the cleaning of streets, and matters connected therewith. Filthy streets are productive of disease not only by the generation of poisonous gases, but also the dust which results from the long-continued trituration of excrementitious and decaying substances is extremely injurious to the mucous membrane of the air-passages, and productive of contamination to blood and tissue. The habit of casting the sweepings of houses and stores upon the sidewalks, especially during the hours in which pedestrians are passing, is a greater evil than many suppose. The dust of these places is often of the most objectionable character, containing the germs of contagion, and there is no doubt that many 'filth diseases' (q.v.) are propagated in this manner. (6) *Regulation of Public Conveyances*. Public conveyances are frequent causes of disease from various sources. The dust which is allowed to collect in street cars, and also ordinary steam railway cars, is of itself a frequent cause of diseases of the air-passages; but compared to the evils which result from overcrowding and bad ventilation, it is of minor importance. Pneumonia, pleurisy, bronchitis, and laryngitis are frequent results of street-car exposure. But one of their greatest evils, and one not yet sufficiently recognized by the public, although well known to the medical profession, is the want of attention paid to the smoothness of the track and the springs of the cars. On street cars undue jarring should not be permitted. When they are properly supplied with springs, and when wheels that are flattened are promptly replaced, all injurious vibrations will be avoided. (7) *Control of Air-spaces in Public Buildings*, such as hospitals, asylums, orphanages, lecture-rooms, theatres, school-houses, etc. The vitiation of air due to impurities added to it by respiration is a subject of great moment. Following are figures showing the difference in the proportion of the constituents of the percentages of expired air and of ordinary air:

	Ordinary air	Expired air
Oxygen.....	20.96	16.40
Nitrogen.....	79.00	79.19
Carbon dioxide.....	0.04	• 4.41

From these figures it is seen that expired air contains over one hundred times more carbon dioxide and nearly 5 per cent. less oxygen than ordinary atmospheric air. Experiments have shown that the average adult emits with each expiration 22 cubic inches of air; or, assuming 18 respirations a minute, 570,240 cubic inches or 330 cubic feet of air in 24 hours. In this total of expired air there is 14.52 cubic feet of carbon dioxide. This amount is increased with increase of physical activity. The figures of De Chaumont, which are generally accepted, show that there is 0.6 part of carbon dioxide per 1000 in the air of a closed and occupied space, or 0.2 part in excess of that in ordinary atmosphere. Burning of coal or illuminating gas adds to the impurity, and hence ventilation is essential. In public buildings, such as those named, there should be three cubic feet of space per person in each room, after deducting from the total room-space the amount occupied by furniture and the bodies of the persons. (8) *Prevention of Disease*. This is a very large topic, and necessarily bears close relation with personal as well as domestic hygiene. It includes notification of diseases to a health officer; most of the activities of municipal departments of health (see HEALTH, BOARDS OF); control of streets and houses, and disposal of refuse (see DISINFECTANTS); control of disease entering our ports (see QUARANTINE); prophylaxis of special kinds against spread of disease (see ANTITOXIN; SERUM THERAPY; VACCINATION); cleansing of public vehicles, to which reference has been made, etc. Overcrowded and dark tenements are the most frequent causes of the spread of disease in a community. They keep alive the diseases of childhood—measles, scarlet fever, diphtheria, etc.—and are the most frequent hiding-places for the germs of tuberculosis. (9) *Disposal of the Dead* is regulated by sanitary laws, which provide, in cities, that undertakers shall obtain permits for removal of dead bodies, and proper disposition shall be made of them by burial or cremation. Public funerals in the case of contagious diseases are often forbidden, and hermetically sealed caskets are enjoined in such cases by many municipalities.

MENTAL AND PHYSICAL HYGIENE. To regard the matter from another view-point, hygiene may be also divided into mental and physical. The former will necessarily include many questions that belong to the latter, for the healthy action of the mind depends to a great extent upon the health of the body. A sufficient amount of sleep ought to be taken to refresh the powers of the mind, as well as those of the body, and that sleep ought not to be much disturbed by dreams. Of course there are those whose occupation demands varied, sometimes excessive exertion, and who must be 'a law unto themselves.' The great time for practically applying the laws of mental hygiene is during the years of childhood and youth. The method of teaching the child should be of the simplest, as well as of the most comprehensive character, and the periods should be frequent during which its mind is completely relieved of all serious study, and allowed to come

to a perfectly natural and passive condition by roomful and affectionate enjoyment. The school-rooms should be commodious, and well ventilated, and they should not be overcrowded. Too many studies should not be required, so that hours which should be given to recreation or sleep will not be occupied with laborious efforts of study, which often do little more than produce a disturbed and unrefreshing sleep, and pervert or destroy the appetite for wholesome food. In the matter of school hygiene, great importance is attached to the amount, arrangement, and distribution of light in the class-rooms; the construction of the seats and desks; the type and paper used in making the text-books, etc. Carelessness in these matters is known to be one of the most fruitful sources of imperfect sight, such as myopia, as well as of various deformities, especially spinal curvature.

MILITARY HYGIENE. This term is applied to the sanitary care of the soldier in camp and garrison, and while on the field. Military hygiene embraces a consideration of: (1) *The Selection of the Recruit*, his exercise and training, his general development, and his mental and moral education. (2) *The March in Campaign*; the work done on the march, the equipment, rests, use of fluids, mental occupation, accidents, strain, and the general health of the troops. (See MARCHING.) (3) *Water for Drinking*, its purification and protection. (See ENCAMPMENT.) (4) *The Ration*: its choice, amount, and variety; cooking of meals, disease as related to food, emergency or reserve ration, and travel ration. (See RATION.) (5) *Military Clothing and Equipment* (see UNIFORM, MILITARY); head-covering, underclothing, disposition of the equipment. (6) *Camp Sites, and Camps*, with attention to soil, vegetation, shelter, and area, and their sanitary administration. (See ENCAMPMENT.) (7) *Posts, Barracks, and Hospitals*. (See HOSPITALS, par. Military.) (8) *Ventilation, Heating, and Lighting*. (9) *Disposal of Ecreta and Waste*. (10) *Personal Cleanliness of the Soldier*. (11) *The Soldier's Diseases and Mortality*. (12) *Disinfection*. (13) *The Habits of the Soldier as Affecting His Efficiency*. (14) *Climate, and Life on a Troop-Ship*. (15) *Disposal of the Dead*.

HYGIENE OF FOOD. See FOOD.

HYGINUS, GAIVS JULIVS. A Latin author. He is generally supposed to have been a native of Spain, though some writers claim that he was born in Alexandria, Egypt, and that he came to Rome with Julius Cæsar when a mere child. He is known to have been a favorite with Augustus, who made him chief librarian in the new Palatine Library. He was a voluminous writer on many subjects, including biography, agriculture, bee-keeping, and military arts, as well as comments on the poems of Vergil and Cinna. These have all been lost. There are also two works still in existence that are assigned to him, one, a text-book on mythology, entitled *Fabularum Liber*,

consisting of 277 mythological legends, valuable chiefly because of the use made of the Greek tragedies; the other, an astronomical treatise entitled *Poeticon Astronomicon Libri IV.*, of little value now. The *Fabulæ* are edited by Schmidt (Jena, 1872), and the *Astronomica* by Bunte (Leipzig, 1875). Another Hyginus, known as *Gromaticus*, lived probably in the second century, and wrote a work on surveying; edited by Gemoll (Leipzig, 1879).

HYGINUS, SAINT. Pope, or Bishop of Rome, about the middle of the second century, possibly 137-141. Very little is known about him.

HYGROMETER (from Gk. *ὕψος*, *hygros*, moist + *μέτρον*, *metron*, measure). An instrument for measuring the quantity of moisture in the atmosphere. In addition to the gases of which it is composed, the air contains the vapor of water, which is invisible except when it is condensed in the form of fog or cloud. The amount of this aqueous vapor varies greatly, and depends chiefly on the temperature, being at a minimum on cold days, and on warm days forming as much as one-fiftieth part of the air. This vapor has a certain tension or pressure depending upon the temperature, and when the latter is sufficiently reduced condensation takes place and dew is formed. The temperature at which the air contains a maximum of moisture for a given pressure is called the temperature of saturation for that pressure, and if the temperature is reduced below this point condensation takes place. The temperature at which condensation occurs is known as the dew-point (see DEW) temperature. The less moisture the air contains the lower will be the dew-point, and when this is ascertained experimentally, we can use it to determine the pressure of the vapor at that temperature, as the pressure of water-vapor and its relation to temperature has formed the subject of extensive and elaborate experimental researches that are now embodied in carefully prepared tables. It is known that the quantity of water contained in the air varies directly (or nearly) as the vapor pressure, consequently a ratio between the vapor pressures at an observed temperature, and at the temperature of condensation for the atmospheric condition at the time of observation, would give the relative humidity. It is in terms of relative humidity that the amount of moisture in the atmosphere is expressed in the daily weather reports, and the chief function of the hygrometer is to afford such data as will enable us to determine this quantity.

Hygrometers can be divided into several classes. There are those in which use is made of the property of certain substances of altering their dimensions or weight upon absorbing moisture from the air. Of this class the most used are those in which a hair expands and contracts according as the air is more or less moist, and moves a pointer or index over a scale, and indicates relative humidity direct. This form was invented by Saussure, the Swiss physicist, and a somewhat similar instrument was devised by Deluc in which a strip of whalebone was employed. The instruments are known as hygrosopes, and may be used indoors or where only an approximate reading is desired. Another class of hygrometers is based on the principle that certain chemicals will absorb moisture, and the amount thus abstracted from a given volume

of air will give the quantity present in the atmosphere. The apparatus consists of a series of drying-tubes containing some hygroscopic material, as substances which readily absorb moisture are termed, through which air is forced by means of an aspirator or other device. The substances which may be used for this purpose are strong sulphuric acid in pumice-stone, calcium chloride, phosphoric acid, and potassium or sodium oxide. The amount of moisture is determined by the increase in weight. The class most generally used, however, includes apparatus where the temperature is reduced until condensation takes place, or this temperature can be determined from the temperature of evaporation. Knowing the dew-point for a given condition of the atmosphere, the other data can be readily ascertained.

The Daniell hygrometer, which figures extensively in the earlier works on physics and meteorology, consists of two bulbs connected by a bent tube, as represented in the figure, and inclosing a thermometer together with some ether, and vapor of ether, the air having been expelled before the tube was sealed. One bulb is either blackened or coated with metal, while the other is covered with muslin. The observer's hand is placed for a short time on the muslin-covered bulb to drive the ether into the opposite bulb, leaving the first bulb and the tube filled with the vapor of ether. A little ether is then dropped from the bottle on the muslin-covered bulb;

DANIELL HYGROMETER.

evaporation instantly takes place, and the temperature is reduced, thus condensing the vapor inside; a fresh evaporation from the other bulb fills the vacuum, and the vapor is again condensed by dropping more ether on the muslin covering, the process being repeated until the temperature of the bulb containing the thermometer is so reduced by successive evaporations (see EVAPORATION) that dew begins to be formed on the outside of the bulb. At the instant this occurs, the height of the mercury in the two thermometers is accurately noted, the one giving the dew-point temperature, and the other the temperature of the air. There are other forms of dew-point apparatus, all depending upon this same principle, and the hygrometer of Regnault was devised to remedy some of the defects of the Daniell apparatus. In this instrument a current of air is used to increase the evaporation of the ether, and instead of a glass tube and bulb there is a brightly polished thimble of silver at the base of one of the thermometers, which contains the ether. The air bubbles through the liquid, and the rate of evaporation becomes much more rapid. Knowing the dew-point, a reference to the table will furnish the pressure of aqueous vapor at that temperature, and other tables or the appli-

cation of a formula will give the amount of moisture in a given quantity of air.

Instead of the dew-point apparatus, the wet and dry bulb thermometers, or psychrometer, is now generally employed in making ordinary observations, especially by meteorologists. The instrument consists of two ordinary thermometers—one has its bulb bare, and thus shows the temperature of the air, while the other has its bulb covered with muslin which is kept wet with water.

U. S. WEATHER BUREAU SLING PSYCHROMETER.

The thermometers are often so united that they can be rapidly revolved in order that the wet bulb may be exposed to a constant current of air. In the illustration is shown the sling psychrometer issued by the United States Weather Bureau, where the thermometers are mounted in such a manner that they can be whirled about the hand of the observer. The evaporation from the muslin and the consequent cooling of the bulb being proportional to the dryness of the air, the difference between the readings of the two thermometers is greatest when the air is driest, and zero when it is completely saturated. The readings of the psychrometer and the dew-point apparatus at the same time have been carefully compared, and it has been ascertained that the vapor pressure at the dew-point of air is equal to the vapor pressure corresponding to the temperature of the wet-bulb thermometer minus the number .011, multiplied by the difference in degrees between the dry and wet bulb thermometers. This rule is stated as applying when the psychrometer is whirled, and when the pressure of the barometer is equal to 30 inches. From the difference in readings between the thermometers the vapor pressure can be calculated by formulas which, with certain modifications, are based on those used by Regnault.

Ferrel's formula, used by the United States Weather Bureau in calculating its tables, is as follows:

Let p = vapor pressure of saturation at dew-point temperature.
 p' = vapor pressure of saturation at wet-bulb temperature.
 P = barometric pressure, taken as 29.4 in computing the tables.
 t = reading of dry thermometer.
 t' = reading of wet thermometer.

then for dew points below 32°

$$p = p' - .000360 P (t - t') (1 + .00065 t')$$

and for dew points above 32°

$$p = p' - .000367 P (t - t') \left(1 + \frac{t - t'}{1571}\right)$$

In practice, however, it is usual merely to take the difference between the wet and dry bulb thermometers, and refer at once to the tables, which will give the relative humidity, the amount of moisture in a given quantity of air, and other desired data. These tables and full directions for practical hygrometry are contained in the

publications of the United States Weather Bureau, to which the reader is referred for further information, while nearly all the larger treatises on physics contain satisfactory treatment of the subject. Consult also Preston, *Theory of Heat* (New York, 1894). See HUMIDITY.

HYGROPHYTES (from Gk. *ὕγρoς*, *hygros*, moist + *φύτoν*, *phyton*, plant). Plants which grow naturally in regions where the atmosphere is moist. Hygrophytes differ from hydrophytes in that they are not necessarily associated with water in the liquid state. Hygrophytic leaves show a number of peculiarities in contrast with xerophytic leaves. For example, hygrophytic leaves do not suffer, but rather thrive, in very moist atmospheric conditions. The leaves themselves are also easily moistened. This type of leaf is very characteristic of the tropical rainy forests. Xerophytic leaves, in contrast with hygrophytic leaves, are not readily moistened, and commonly die if subjected to a moist atmosphere. See HYDROPHYTE.

HYGROSCOPE. See HYGROMETER.

HYKSOS, hīk'sōz. The name of a dynasty of Egyptian Kings, who are known also as the Shepherd Kings. Manetho, of whose annals an excerpt is preserved in Josephus, narrates that foreign conquerors from Asia took possession of Egypt who were called Hykussos. This name seems to mean 'foreign kings' (*hyku-khesou*); the explanation, based on the mutilated form Hyksos and interpreting *so* as Egyptian *shōs*, 'shepherd,' although attributed to Manetho, seems to have originated at a later time. Consequently, we have in this no basis for determining the nationality of those foreigners, 'of unknown race,' as Manetho says. Usually, historians, following this later etymology and the insertion in Manetho ("they are said to have been Phœnicians or Arabs"), consider them as nomadic Semites, either Arabs or Canaanites, recently settled in Palestine. Others have supposed them to be Turanians, thinking that they found Mongolian features on statues which were for a long time attributed to the Hyk(us)so, but are now generally recognized as belonging to an earlier period. Nothing positive can be said as to the origin of this people; it is only known that the conquerors had first founded an empire in Syria (coming from the north from Asia Minor?) before conquering Egypt. This explains why many Semites came thither along with them and, later, under their rule. The date of their conquest is doubtful. From the confused extracts from Manetho, they would seem to have formed Dynasties Fifteen and Sixteen, lasting 259 and 251 years, respectively, and would thus have begun about 2100 B.C. But Dynasty Sixteen seems to be an erroneous repetition, so that only Dynasty Fifteen with six (?) kings remains, and for these 250 years are certainly too much. Taking into consideration the recently discovered Sothic date for Dynasty Twelve, not much more than a century would remain for them, and therefore the invasion of the foreigners ought to be placed at about 1700 B.C. The reports of the cruelties and devastations, which, according to Egyptian tradition, accompanied the conquest, are untrustworthy. In one point, however, the traditional account has been confirmed; the invaders built a strong fortress on the northeastern frontier of the delta, in the

Sethroite nome, called Avaris (Egyptian, *Hat-waret*), and placed in it a strong garrison to secure the connection between the Syrian and Egyptian provinces. The conquerors soon adapted themselves to Egyptian manners, leaving probably the old administration untouched, and the Kings assumed Egyptian names. Three or four of these royal names have been found on the monuments. The six Kings of this dynasty were: Salatis or Saïtes; Beon (possibly Kheyân of the monuments); Apophis I. or Apachnan (hieroglyphic *Apopi a-qnan*); Apophis (*Apopi a-user-rê*), who seems to have been misplaced by Manetho and to belong to the end of the series, after Iannas and Archles (or Asses?). Perhaps these last two names are merely corrupt repetitions of the preceding. The second Apophis reigned for at least thirty-three years, as the mathematical papyrus of London written in his reign attests; for the other Kings we have only the corrupt Manethonian dates (nineteen, fourteen, thirty-nine years, etc.). These Kings resided in Memphis, Avaris, and Heliopolis (?), having the Delta under their direct administration, and leaving the country above Memphis to tributary princes of the old nobility. This proved fatal to their dominion, for the vassal Prince of Thebes soon felt strong enough to rebel against his sovereign. A popular tale (Papyrus Sallier I.) gives a fanciful narrative of the beginning of this war, but the mutilated condition of the manuscript renders it difficult to decide whether the foolish arrogance of Apopi or his exaggerated zeal for his god Set is represented as the cause of the struggle. The popular idea that the Hyk(us)os brought along their own native god of war, Sutekh, and tried to force his exclusive worship upon the Egyptians, is incorrect; this god was merely the Egyptian divinity Set (playfully written Sutekh), the local god of the capital, Avaris, who became, of course, the official patron of the Kings, but did not dispossess any other cults. The revolt against Apopi (II.?) was started by Sgenen-rê, the Prince of Thebes (which of the three princes of that name is doubtful), and lasted for long years, extending through the reigns of two short-lived Theban princes (Kames and Snekten-rê).

The princes of the nomes north of Thebes were annihilated in the war of independence, as they do not seem to have joined the national cause. When Amasis I. (Ahmose, c.1600 B.C.) ascended the throne, the Pharaohs of the foreign dynasty seem to have been almost completely expelled, but they sustained a long siege in their last stronghold, Avaris. This city fell in the third or fourth year of Amasis Ahmose and the surviving inhabitants were distributed as slaves. The strange statement in Manetho that Mischragmuthosis (i.e. Thutmosis III., c.1500 B.C.) took Avaris and allowed the remainder of the Hyk(us)os to retire to Syria, is, of course, erroneous. No remarkable buildings of the Hyk(us)os Kings have survived; only traces of temple restorations in Bubastis and the modern Gebelén. Possibly their constructions were destroyed after the expulsion. A considerable part of Syria seems to have been tributary to them, but the small stone lion bearing the name of Apopi (I.?), found at Bagdad on the Tigris, cannot be considered to prove that these monarchs ruled as far as Babylonia. The whole of this interesting portion of Egyptian history is very obscure. Consult: Koch, *De Regibus Pastoribus*

(Marburg, 1844); Chabas, *Les pasteurs en Egypte* (Amsterdam, 1868); W. M. Müller, in *Mitteilungen der vorderasiatischen Gesellschaft* (Berlin, 1898).

HYLA (Neo-Lat., from Gk. ἕλη, *hylê*, wood). The typical genus of the tree-frog family, Hylidæ; hence the word is often used as a name for tree-frogs in general, especially the common variable one (*Hyla versicolor*) of North America. See TREE-FROG.

HYLÆ'US (Lat., from Gk. Ἵλαιος, *Hylaios*, woodman). In Greek mythology, an Arcadian centaur who pursued Atalanta and was slain by her. In other legends he falls in the fight against the Lapithæ, or is slain by Hercules.

HYLAS, hi'las (Lat., from Gk. Ἵλος). In Greek legend, son of Theodamas or Theiomenes, favorite of Hercules, who took him on the Argonautic expedition. In Mysia, near the mouth of the Cios, while drawing water from a spring he was made captive by the nymph of the place. Hercules returned in sorrow to Greece, taking with him hostages of the Mysians, and requiring that they should continue the search for his beloved. The story was developed by the later Greek writers, and seems to have arisen from a Mysian religious festival, where a priest thrice called the name of Hylas. Consult Mannhardt, *Mythologische Forschungen* (Strassburg, 1884).

HYLLESTED, hul'le-stêd. AUGUST (1858—). A Swedish pianist and composer, born of Danish parents, at Stockholm, Sweden. He showed great musical precocity, playing in public when only five years old. He studied under Holger Dahl in Copenhagen, until 1869, and then, after making a concert tour in Scandinavia, entered the Royal Conservatory of Copenhagen. In 1876 he was appointed organist of the cathedral there, and director of the Nykjøbing Falster, a musical society. Three years later he studied with Kullak and Kiel in Berlin, leaving there to become a pupil of Liszt. He made many notable concert tours in Europe and America, and was the recipient of numerous honors. He was assistant director of the Chicago Music College (1886-91), and director of the piano department in the Gottschalk Lyric School (1891-94). In the latter year he went to Europe for an extended concert tour, and upon his return, in 1897, settled in Chicago. His compositions, the most popular of which are his songs and piano pieces, include: the symphonic poem, *Elizabeth*, for full orchestra and double chorus; *Suite romantique*; *Marche triomphale*, etc.

HYLLUS (Lat., from Gk. Ἵλλος). The son of Hercules and Deianira, married at his father's command to Iole. When Eurystheus was repulsed by the Heraclidæ with the aid of the Athenians, Hyllus slew him as he fled. Adopted by the Dorian Egimius in Thessaly, he gained the leadership of the Dorians for himself and his descendants. Having invaded the Peloponnesus in obedience to a command of the Delphic oracle to seize the Kingdom of Eurystheus 'after the third fruit,' he was unsuccessful and was killed in combat by King Echemus of Tegea. The oracle was fulfilled in the persons of his great-grandsons Temenus, Cresphontes, and Aristodemus, who after the third generation conquered the Peloponnesus.

HYLODIS. A genus of cystignathine frogs, about 50 species of which are known in tropical America, all small and like tree-frogs, with the fingers free and provided with undivided disks. A typical and familiar species of the West Indies (*Hylodes Martinicensis*) has some remarkable traits, described under COQUIL.

HYLOPHYTES (from Gk. ὕλη, *hylē*, forest, matter + φυτόν, *phyton*, plant). Plants which grow in the woods; forest plants. The hyliphytes are contrasted with the poöphytes, i. e. the plants of grasslands.

HYLOZOISM (from Gk. ὕλη, *hylē*, matter, wood + ζῷον, *zōon*, animal). The assumption that the principle of all change is to be found in material substance, and that all matter is instinct with life. The term is applied to the Ionic School (see GREEK PHILOSOPHY), which sought the explanation of the universè in terms of water, air, fire, etc., and thus assumed, without further investigation, that matter in one form or another had in it 'the promise and potency' of all change, including vital processes.

HYMANS, é'män', LOUIS (1829-84). A Belgian historian, poet, and publicist, born at Rotterdam. He was editor of various papers, and director of the *Echo du Parlement*, a liberal journal. He was elected a member of the Belgian Chamber of Representatives for the city of Brussels (1859), held that post for eleven years, and showed himself an upright and conscientious politician. He was the author of several novels, of *Lettres moscovites* (1857); *Histoire populaire de la Belgique* (18th ed. 1880); *Histoire populaire du règne de Léopold I.* (1864); *Histoire politique et parlementaire de la Belgique* (1869-70); *Notes et souvenirs* (1876); *Types et silhouettes* (1877), reminiscences; and *Bruezelles à travers les âges* (1883-89).—His brother, HENRI SIMON (1836—), an author and critic, was born at Antwerp. He was appointed conservator of the Royal Library of Brussels, and became a constant contributor to art journals. His best-known work is *Histoire de la gravure dans l'école de Rubens* (1879).

HY'MEN, or **HY'MENÆ'US** (Lat., from Gk. Ὑμήν). The Greek god of marriage, whose name survived in the refrain of the marriage song, though the original meaning ('begetter') was forgotten, and many legends devised to explain the occurrence in the hymn. The myths usually represent him as son of Apollo and a Muse, more rarely of Dionysus and Aphrodite. In art he is usually represented as a youth of delicate, almost feminine beauty, with a crown of flowers and a torch; more rarely with wings. Consult: Schmidt, *De Hymenæo et Talasio* (Kiel, 1886); Usener, *Götternamen* (Bonn, 1896).

HY'MENOCEPH'ALUS (Neo-Lat., from Gk. ὑμήν, *hymēn*, membrane + κεφαλή, *kephalē*, head). A genus of small pelagic fishes of the tropics, of the family Macruridæ (see GRENADIER), noted for the papery nature of the bones of the cranium. The only known species (*Hymenocephalus cavernæus*) is gray, with silvery tints on the sides, and was taken from deep water in the Gulf of Mexico. See Plate of CODFISH AND ALLIES.

HYMENOPHYLLITES, hī-mēn'ô-fil-li'tēz, AND **HY'MENOPHYLL'UM** (Neo-Lat. nom. pl., from Gk. ὑμήν, *hymēn*, membrane + φύλλον, *phyllo*, leaf).

A genus of ferns, comprising the film ferns and lace ferns, found growing parasitically on roots of trees and in other like situations, and characterized by their delicate membranaceous leaves with cup-shaped spore-cases situated at the ends of the veins, and their creeping rootstocks. The family containing them is one of the most primitive of the modern ferns, and also one of the earliest to appear in the geological records; for fossil leaves, called Hymenophyllites, very similar to those of the modern living genus Hymenophyllum, are found in the Devonian rocks of Europe. It is also known in the coal-measure flora of Carboniferous time, and in the Eocene flora. The fossil fern genus Sphenopteris is very similar in form to Hymenophyllites, and can with difficulty be distinguished from the latter. See FERN.

HY'MENOP'TERA (Lat. nom. pl., from Gk. ὑμενόπτερος, *hymenopteros*, membrane-winged, from ὑμήν, *hymēn*, membrane + πτερόν, *pteron*, wing). An order of insects, containing the ants, bees, wasps, ichneumon-flies, saw-flies, gall-flies, and related insects, elsewhere described under their names. The order includes a very great number of species, estimated at about one-fourth of the whole class, and of which some, as ants and bees, are singularly interesting and important. They have the mouth furnished with mandibles for cutting and tearing, but the other parts of the mouth are adapted for suction, and are generally narrow and elongated, often united into a kind of proboscis, as in bees. (See BEE.) The antennæ are generally slender, but often exhibit differences in the sexes of the same species. The wings are four in number, the first pair larger than the second, the wings of the same side united in flight by little hooks. The wings, when at rest, are laid over one another horizontally over the body. The wings are entirely membranous, not reticulated as in the Neuroptera, but with comparatively few nervures, the arrangement of which is so constant in the whole order that particular names have been given to them and to the space between them, and their diversities have been made use of in classification. The wings are wanting in the imperfectly developed females ('neuters') of some. Besides the ordinary eyes, all the Hymenoptera have three small, simple eyes (ocelli), on the top of the head. The abdomen is generally united to the thorax by a slender pedicel. The abdomen of the females is generally furnished with an organ capable of being protruded, but for different purposes in different sections of the order, it being in some of the groups an ovipositor or borer, and in others a sting.

The Hymenoptera in their perfect state generally feed on honey, but some of them prey on other insects, which are the food of the larvæ of a greater number; while the larvæ of some feed on various vegetable substances. The metamorphoses of the insects of this order are perfect; the larvæ are generally—although not in all the families—destitute of feet; the pupæ take no food. The Hymenoptera are remarkable for the dilatation of the tracheæ or air-tubes into vesicles, and the general perfection of the respiratory system. The instincts and even apparent intelligence displayed by some of them—particularly the social kinds, which live in communities—have excited admiration from the earliest times. See INSECT, paragraph *Social Insects*.

FOSSIL HYMENOPTERA. These appear in the Mesozoic formations in small numbers. Only about a dozen species are known, mainly from the Jurassic limestones of Solenhofen, Bavaria. The oldest hymenopterans are ancestral to the modern ants. In the Tertiary deposits are found representatives of all the important families in fossil forms very close to the modern species. In America the best examples are found at Florissant in Colorado, and in Europe the fresh-water shales of Aix, Eningen, and Radoboj, and best of all, the amber of the Baltic Provinces, are noted localities. Consult Scudder, "Systematic Review of Our Present Knowledge of Insects," in *United States Geological Survey Bulletin*, No. 31 (Washington, 1886).

CLASSIFICATION. The order Hymenoptera is divided into two suborders, each containing several superfamilies, as follows:

Suborder *Heterophaga*.—Superfamilies: Apoidea, true bees; Iphecoidea, solitary wasps; Proctotrypoidea, proctotrypoid parasites; Vespoidea, social wasps; Formicoidea, ants; Ichneumonidea, ichneumon-flies; Cynipoidea, gall-flies; Chalcidoidea, chalcis-flies.

Suborder *Phytophaga*.—Superfamilies: Siroidea, horntails; Tenthredinoidea, saw-flies.

(London, 1895).

HYMETTUS (Lat., from Gk. Ἠμηττός). A mountain range in Attica, about 3000 feet high, now called Trelo-Vuni, between four and five miles east of Athens, famous to-day, as well as anciently, for its honey of excellent flavor. There was also quarried at Hymettus a bluish-gray marble, much prized in antiquity.

HYMNOL'OGY (Gk. ἕμνολογία, *hymnologia*, from ᕐμνολόγος, *hymnologos*, singing hymns, from ᕐμνος, *hymnos*, hymn; connected with Skt. *syāman*, bond, Lat. *suere*, to sew, Gk. *κασ-σέειν*, *kas-syein*, to make shoes, OChurch Slav. *šiti*, to sew, Goth. *siujan*, OHG. *siuwan*, AS. *seowian*, Eng. *sew* + Gk. *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). The science of hymns, or the collective body of hymns used at a particular time or place. In the most general sense a hymn is a religious ode or poem; more specifically it is a metrical composition divided into stanzas or verses, intended to be used in worship. In some variety or form the hymn has been thus employed throughout the ages. Lenormant publishes an old Accadian hymn, sung to the moon-god Hurkis, that may have been used at Ur five thousand years ago. The Assyrian tablets furnish many specimens of the so-called penitential hymns. (Consult *Records of the Past*.) The religion of ancient Egypt produced hymns of beauty and power. (Consult Renouf, *Religion of Ancient Egypt*.) In India on anniversary days and in processions there are songs sung to the gods, but these are not of a high character. The Vedic hymns are many of them productions of worth. Buddhist hymns seem to be chiefly for recital or meditation, not for worship. Confucius made a collection of poetry, forty pieces of which are called 'praise songs' or 'songs of the temple

and altar.' The Mohammedans have no hymns; they have invocations and addresses. Greece was the land of song, and there was heard a song on every occasion by every class to celebrate every event. The so-called Homeric hymns consist of brief addresses to the gods. Callinus, the father of elegy (c. 700 B.C.), and Archilochus, a contemporary, wrote hymns, but none of them have reached us. Simonides, Tyrtaeus, Solon of Athens, Alcæus, and Sappho wrote lyric poetry. Roman worship was silent and reverential, but the priests used songs, and the poets wrote odes and lyrics. Of the hymns of the New World we know but little. Reville gives a sample of the hymns used in the time of the Incas in South America. The hymns, or rather incantations, of the North American Indians are inferior in quality, though not lacking in weirdness.

It is the Hebrew race which produced the highest development of worship poetry before the Christian Era, and it is generally conceded fact that the Hebrew Psalter has never been equaled as a whole. We get glimpses of the kindred arts, music and poetry, very early in the Hebrew Scriptures. Jubal was "the father of all such as handle the harp and organ" (Gen. iv. 21). And in the same connection we hear of the song of Lamech (Gen. iv. 23-24), perhaps the earliest song of Scripture. The song of Miriam (Ex. xv. 21) is the only one preserved of many possible improvisations that she may have produced. The Ninetieth Psalm has been attributed to Moses, and has been aptly described as the 'swan song of Moses.' In the Book of Numbers (xxi. 14) we find the mention of the "Book of the Wars of the Lord," which some suppose to be a collection of songs and ballads composed by the camp-fire. In the same chapter (xxi. 17-18) is given the song "Spring Up, O Well." One of the great songs of the Old Testament is that of Deborah and Barak (Judges v.). It is cast in a distinctly metrical form. The song of Hannah (I. Sam. ii.) reminds of the song of Mary (Luke i. 46-55) and it might be called the Magnificat of the Old Testament. The schools of the prophets knew of the soothing influence of music and used it in prophecy, and with it they may have used song also. With the founding of the Temple was founded the temple of Hebrew song. Scholars are not agreed as to the number of psalms composed by David. The estimate runs from ninety-five down to none. Solomon is said to have written 1005 songs, but only two Psalms (lxxii. and cxlii.) have his name prefixed to them. His other poetical productions are rather didactic than lyrical. The Psalms contain many of the poetical productions of exile and post-exilic times. Jonah ii., Isaiah xii., and Habakkuk iii. are also poetical productions. Robert Lowth was the discoverer of the metrical arrangement of Hebrew poetry, first publishing his discovery in 1753. Michaelis, Herder, Rosenmüller, De Wette, Gesenius, Rau, Hollmann, Gustav Bickel, and others have contributed something to the understanding of the subject.

In the New Testament the hymn note is changed. The centre is a person, not a race. The *Magnificat* of Mary (Luke i. 46-55) is a witness to her talent as a daughter of David, and her piety as a true Israelite. Her song has been much used by the Church, rarely, however, in metrical form. The best metrical version is that of W. J. Irons. The song of Elizabeth

(Luke i. 42-45), sometimes called the *lesser Benedictus*, and the song of Zacharias (Luke i. 68-79), the *Benedictus*, were in use in the Church as early as the time of Saint Augustine. The *Nunc Dimittis* of Simeon (Luke ii. 29-32) was used in Christian worship as early as the sixth century. The *Gloria in Excelsis* of the angels (Luke ii. 14) in its present form appears in the *Codex Alexandrinus* of the fourth century, thus proving its early use. The Epistles of Paul contain hymns. In Colossians iii. 16 we have a reference to the use of Psalms in public worship. Other hymns are found in Ephesians v. 14; I. Timothy iii. 16; vi. 15-16; II. Timothy ii. 11-13; the parallelism of this last passage is very marked. In the Apocalypse the language is naturally poetic, and there are several passages which might have been hymns; i. 4-8; v. 9-10, 12-14; xi. 15, 17, 18; xv. 3, 4; xxi. 10-14; xxii. 17.

One of the earliest references to be found in regard to the worship of the early Church is in the famous letter of Pliny to Trajan (A.D. 103) in these words: "They [the Christians] had been accustomed to come together on a fixed day before daylight, and to sing responsively a song to Christ as God." What this song was we do not know. Unfortunately, the first hymn-book of the Church is lost. This book was compiled and largely written by Justin Martyr. It was entitled *Psalmes*, and is mentioned by Eusebius, Jerome, and Gennadius. The Anti-Nicene Fathers bear testimony that hymns were used by the Church. We have one hymn entire appended to *The Instructor* of Clement of Alexandria (c.200 A.D.). It is the earliest Christian hymn extant, and may be Clement's, though by some supposed to be earlier than his time. It is entitled *A Hymn to Christ the Saviour*. The best translation is by Dean Plumtre, but the most common one is by Henry M. Dexter, beginning "Shepherd of tender youth." The next hymn is that mentioned by Saint Basil (c.330-379) in his treatise *On the Spirit*, and sometimes called the *Candle-light Hymn*, because sung in church at the lighting of the lamps. It begins "Joyful light of the holy glory." It has been translated many times. The best known translations are those of John Keble and Henry W. Longfellow. The chief Eastern liturgies contain the well-known *Cherubic Hymn*, beginning "Let us who mystically represent the Cherubim," dating from the time of Justinian (527-565). Methodius, who suffered martyrdom in the year 312, composed a hymn which is found in the *Banquet of the Ten Virgins* (*Discourse* xi. ch. 2), beginning "Up, maidens, the sound of the cry that raiseth the dead." The Gnostics composed many hymns to further the spread of their doctrines. Valentinus (d. 160) wrote many of the most profound. Bardesanes (d. 224) is said to have composed one hundred and fifty hymns. His son, Harmonius, was also a writer of hymns. They are sometimes called the fathers of Syrian hymnology. But that honor really belongs to Ephraem Syrus (d. 378), a poet of no mean order, who wrote to counteract the work of the Gnostics, as a little later Chrysostom (d. 407) did to counteract the work of Arius. With Ambrose (d. 397) begins a great uplift of the art of hymn-writing. To him is attributed the hymn *Te deum laudamus*, though probably written in part at least at a much later date. There are ninety-two of the hymns of the Ambrosian school yet in existence. Ambrose also reformed

the music of the Church, and his form of chant was used until the introduction by Gregory the Great (d. 604) of the Gregorian chant.

Both Greek and Latin hymnologists were active during the Middle Ages. In the Greek Church Saint Andrew of Crete (660-732), Saint John of Damascus (d.787), and his foster-brother Cosmas (d.760), were followed by the poets of the Studium, Saint Theodore (d.826), Saint Theophanes (c.800-850), and Saint Joseph (c.840), the most prolific of them all. The Church is greatly indebted to John Mason Neale (1818-66) for his translations from Greek sources, which however, were by no means close; indeed, he greatly improved upon his originals. In the Latin Church Aurelius Clemens Prudentius (d. c.413) was a prolific writer of hymns. Cælius Sedulius (fl. 450) was the next writer of note. Ennodius (c.473-521) composed a few hymns. Venantius Fortunatus (d. 609) was a writer of much power. He is best known to us by his passionate hymn *Vexilla regis prodeunt*, which in the translation of John Chandler, begins "The royal banner is unfurled." We are under obligation to Robert II., King of France (d. 1031), for *Veni, Sancte Spiritus* ("Come, Holy Spirit"), and three other hymns. The great hymn *Veni, Creator Spiritus* ("Come, Creator Spirit") is sometimes attributed to Charlemagne, to Ambrose, Gregory the Great, or Rabanus Maurus. The last named writer did compose hymns of merit, but this is not to be included. Saint Bernard of Clairvaux (d. 1153) is a name that belongs to the whole Church. He contributed a long poem on the "Name of Jesus." This contains several passages that have been used for hymns. Saint Bernard of Cluny (d. 1140) is not so well known personally, yet we can never sing of heaven in the highest strain without using John Mason Neale's translation of a part of his *De contemptu mundi*, which he called *Bernard's Rhythm on the Celestial Country*, especially the verses beginning "Jerusalem the golden." Thomas of Celano (fl. 1220), the friend of Saint Francis of Assisi, has given us the marvelous judgment hymn *Dies Iræ* ("Day of Wrath"). Saint Thomas Aquinas the Schoolman (q. 1274) wrote *Pange, lingua, gloriosi corporis mysterium* ("Sing, tongue, the mystery of the glorious body"). To Jacopone, the Italian Franciscan monk, we owe the *Stabat Mater* ("The Mother [i.e. the Virgin Mary] stood"). These hymns were the principal great hymns before the time of the Reformation.

One of the great results of the Reformation was the use of the vernacular in Church worship. Luther was the first hymn-writer of the German Church, enriching its worship with no less than thirty-seven hymns. The best-known is *Ein feste Burg ist unser Gott* ("A Mighty Fortress is our God"). The first evangelical hymn-book of 1524 contained eight hymns. Subsequent editions contained more and more until that of 1553 contains one hundred and thirty-one. Co-workers with Luther added much to the hymnology of the Church. Justus Jonas (1493-1555); Paul Eber (1511-1569); Erasmus Alber (d. 1553); Lazarus Spengler (1479-1534); Hans Sachs, the shoemaker poet of Nuremberg (1494-1576); Paul Speratus (1484-1551); and others among the early Reformers published hymns of value. The Bohemian Brethren, notably Michael Weisse (d. 1534), furnished a number of hymns in this period. Their hymns breathed a deep spiritual atmosphere. The French Reformation produced the

poetical translation of the Psalms by Clément Marot (d. 1544) and Theodore Beza (d. 1605); the German Reformed hymn-book of 1540 published at Zürich; and the Genevan Psalter of Calvin of 1562. In England the Reformers issued Miles Coverdale's *Goostly Psalmes and Spiritu-alle Songes* (London, 1539); Robert Crowley's versification of the Psalter and Litany (1549); and, last and most famous of all, the rendering of the Psalms by Thomas Sternhold and John Hopkins (1560).

The time of the Thirty Years' War was marked by the production of many fine German hymns of a more or less martial character. The principal composers were Martin Opitz (1597-1639); Johann Heermann (1585-1647); Johann Michael Altenburg (1584-1640), who composed part of the battle hymn of Gustavus Adolphus, "Fear not, O little flock, the foe;" Paul Fleming (1609-40), author of the *Pilgrim Hymn*, beginning "In all my deeds;" and Martin Rinkart (1586-1649), who composed the German Te Deum *Nun danket alle Gott* ("Now thank we all our God").

Germany continued to produce great hymns and hymn-writers after this period. Paul Gerhardt (1607-76) wrote one hundred and twenty-three hymns. Many have been translated into English, and some are in common use. Probably the most familiar is "O sacred head once wounded," translated by John Wesley. Johann Franck (1618-77), burgomaster of Guben, anticipated the Pietists in his mysticism as shown in his hymns. Johann Rist (1607-77) produced 610 hymns, a few having merit. Johann Scheffler, known as 'Angelus Silesius' (1624-77), was a writer of force, and some of his hymns are yet used. All the hymns of the period are somewhat mystical in their teachings.

Pietism was a reaction against Protestant Scholasticism, and swung to the other extreme of Mysticism. The leaders of the movement, Philipp Jacob Spener (1635-1705), and August Hermann Francke (1663-1727), wrote a few hymns. Christian Friedrich Richter (1676-1711) wrote thirty-three hymns. Johann Anastasius Freylinghausen (1670-1739) wrote a few hymns, and published the first hymn-book of the movement at Halle in 1704. Gottfried Arnold (1666-1714), the Church historian, wrote several hymns of value. Joachim Lange (1670-1744), a friend of Francke, wrote the morning hymn, *O Jesu, süßes Licht* ("O Jesus, sweet light"). Johann Friedrich Starck (1680-1756) of Frankfort wrote 939 hymns. Karl Heinrich Bogatzky (1690-1774) wrote hymns, as well as devotional works. Philipp Friedrich Hiller (1699-1769) of Württemberg wrote many hymns. The Moravian Church has produced many fine hymns, some of which have been translated by John Wesley, Miss Catherine Winkworth, and others. Count Nicolaus Ludwig Zinzendorf (1700-60) produced 2000 hymns. "Jesus, Thy blood and righteousness," and "I thirst, thou wounded lamb of God," have been favorite translations from his hymns. Bishop August Gottlieb Spangenberg (1704-92) wrote ten hymns. That on Christian simplicity, beginning "Holy simplicity, miracle of grace," written as a birthday hymn for his sister, is considered his best. Christian Gregor (1723-1801) compiled the Moravian hymn-book of 1778, published at Barby, still in use. To this he contributed several hymns. The inspiration of the hymnology of the Evangelical Revival in England can be

traced directly to the Moravian Brethren. To this period belong a few other hymn-writers of note, such as Joachim Neander (1650-80), sometimes called the 'Psalmist of the New Covenant,' and Friedrich Adolph Lampe (1683-1729), the author of thirty hymns. Gerhardt Tersteegen (1697-1769), a ribbon-weaver, produced one hundred and eleven hymns, some of which are worthy to be placed in the first rank. From the writers of this school we have the first introspective hymns of value.

The hymns of the Evangelical Revival are not by any means the first great hymns produced in England. The Elizabethan period produced the hymn by F. B. P. (the initials may stand for Francis Baker, pater, i.e. priest), "Jerusalem, my happy home," translated from the Latin; also the first English hymn-book. This was by George Wither, and was published in London in 1623. The Puritans produced as hymn-writers, Robert Herrick (1591-1674); John Milton (1608-74); Henry Vaughan (1622-95); and Jeremy Taylor (1613-67). In the Restoration period Samuel Crossman published *The Young Man's Meditation* (1664), which contains several hymns, a good specimen of which can be seen in Lord Selborne's (Sir Roundell Palmer) *Book of Praise* (1863). Henry More in his *Divine Dialogues* (1668) published seven long hymns on the festivals of the Church. But the greatest lyric poet of the period was Thomas Ken (1637-1711), the good Bishop of Bath and Wells. His evening, morning, and midnight hymns stand at the head of all worship poetry of the English language. The first two have never been surpassed, and hardly approached. Joseph Addison, his contemporary, furnished a few hymns of an exalted character. In 1683 John Mason published *Songs of Praise*, a hymn-book which went through many editions. Benjamin Keach published *Spiritual Melody* (1691), the first Baptist hymn-book. Among Independents the first hymn-book used was *A Collection of Divine Hymns* (1690). The metrical version of the Psalms by Sternhold and Hopkins was followed by that of Francis Rouse (1646), and that in turn by Nahum Tate and Nicholas Brady (1696), which exerted a great influence. The tendency, however, came to be less and less to base hymns on the Hebrew Psalter for a whole hymn-book. A preparation for the work of Isaac Watts (1674-1748), sometimes called the 'father of English hymnody,' was thus made. His hymns have been more widely sung than those of any other English writer, with the possible exception of Charles Wesley. His first work, *Horæ Lyricæ*, appeared in 1706; *Hymns and Spiritual Songs* in 1707. Besides these he published *Divine and Moral Songs for Children* (1720), long extremely popular. To the school of Watts belongs Philip Doddridge (1702-51). His hymns were almost all written to follow sermons, reënforcing the truth which had been preached. The Wesley family, and the men who gathered about them, both in and out of the Church of England, were prolific writers, and produced some of the best hymns in the history of the Church. Samuel Wesley (1662-1735) was no mean poet. His son, John (1703-91), translated several hymns, and mended many more. Samuel, Jr. (1691-1739), wrote some hymns. To Charles (1707-88), however, we must turn as the leader of the lyrical forces of the Evangelical Revival. He wrote over 6000 hymns. Out

of three hundred and twenty-five standard hymns James King assigns twenty-two to Charles Wesley, a larger number than ascribed to any other writer. At the present time not far from four hundred of his hymns are in common use. They include a wider range of subjects than those of any other writer of hymns. They chronicle the events of the time as well as the devotional experiences of the writer. Some were impromptu. Many have bits of personal history as a background. Around some hymns have grown beautiful stories, the historical data for which is exceedingly slight. The original hymn-books of the Wesleys were issued in thirteen volumes under the direction of George Osborn (London, 1868-72). Thomas Olivers (1725-99), John Cennick (1718-55), Edward Perronet (1721-92), and John Bakewell (born 1721), were of the Wesleyan party; while John Gambold, the Moravian (1711-71), Joseph Hart (c.1712-68), Miss Anne Steele (1717-78), John Newton (1725-1807), William Cowper (1731-1800), Robert Robinson (1735-90), John Fawcett (1740-1817), Augustus Montagu Toplady (1740-78), Joseph Swain (1761-96), William Williams (1717-91), and still others were more or less affected by the movement. The hymns of the movement are characterized by greater breadth of view than any previously issued. They include hymns of all kinds, but very few didactic hymns.

Hymns of modern days seem to have been produced by small groups of men representing some movement or belief. (a) The missionary movement produced James Montgomery (1771-1854) as its first hymn-writer and Reginald Heber (1783-1826) as its ablest. Both produced many hymns other than missionary. (b) The Oxford movement was characterized by its hymnological productions, as well as its works of devotion and argument. John Keble (1792-1866), with his *Christian Year*, Frederick William Faber (1814-1863), Edward Caswall (1814-78), John Henry Newman (1801-90), author of "Lead, kindly light," and Isaac Williams (1802-65) were the singers of this group. Their work evinced not only a deep piety, but an unsurpassed scholarly finish. (c) The Sunday-school movement has produced a great many hymns. Among the first publications was William Batchelder Bradbury's *Golden Chain* (New York, 1861). (d) The evangelistic movement of Messrs. Moody and Sankey brought into the Church a class of hymns entirely different from those produced by any other movement. Many were not of high order, in fact were a disgrace to the Church, but they were so widely used that this article would be incomplete without a notice of them. Beginning with *Select Hymns*, *The Gospel Hymns* in six numbers (1875-95) were followed by hymn-books whose name is legion and whose copies are millions. The most voluminous writer of this movement has been 'Fanny Crosby' (Mrs. Frances Jane [Crosby] Van Alstine). (e) The Salvation Army has not added much to the hymnology of the Church; it has, however, changed the class of music used, and not for the better.

In an article of this kind there must of necessity be many omissions. Only a few of the greatest hymn-writers can be mentioned. Four women have written hymns any one of which is worth a lifetime to produce. Mrs. Sarah Flower Adams (1805-48), "Nearer, My God, to Thee;" Miss Charlotte Elliot (1789-1871), "Just as I am

without one plea;" Miss Phæbe Cary (1824-71), "One sweetly solemn thought;" and Mrs. Phæbe H. Brown (1783-1861), "I Love to Steal Awhile Away." The Unitarians have produced some remarkable hymn-writers, such as John Pierpont (1785-1866), Henry Ware, Jr. (1794-1843), William Bourne Oliver Peabody (1744-1847), William Cullen Bryant (1794-1874), the Longfellow (Henry Wadsworth, 1807-82, and Samuel, 1819-92), Edmund Hamilton Sears (1810-76), Theodore Parker (1810-60), Stephen Greenleaf Bulfinch (1809-70), James Thomas Fields (1817-81), and Thomas Wentworth Higginson (1823—). The Protestant Episcopal Church has to offer the names of Bishop George Washington Doane (1799-1859), Bishop Phillips Brooks (1835-93), Bishop George Burgess (1819-66), and the Rev. Dr. William Augustus Muhlenberg (1796-1879). The Presbyterian Church has the names of Samuel Occam (1723-92), Samuel Davies (1723-61), Thomas Hastings (1784-1872), the Alexanders (James Waddell, 1894-59, Joseph Addison, 1809-60), Thomas Mackellar (1812—), Mrs. Elizabeth Prentiss (1818-78), and Charles Seymour Robinson (1829-99), the compiler of *Songs for the Sanctuary and Laudes Domini*. The Congregationalists have enrolled the names of Timothy Dwight (1752-1817), Joel Barlow (1755-1812), Nehemiah Adams (1806-78), Ray Palmer (1808-87), author of the immortal "My faith looks up to Thee," Henry Martin Dexter (1821-90), Jeremiah Eames Rankin (1828—), and Horatio Richmond Palmer (1834—). The Baptists furnish a long list with the names of Oliver Holden (1765-1844), Adoniram Judson (1788-1850), Mrs. Lydia Sigourney (1791-1865), Robert Lowrie (1826—), William Howard Doane (1831—), and Samuel Francis Smith (1808-95), author of "My country, 'tis of thee." The Methodists produced the first hymnologist of the American Church, David Creamer (born 1812). His *Methodist Hymnology* appeared in New York in 1848. Other Methodist hymn-writers are Miss Hannah Flagg Gould (1789-1865), Thomas Hewlings Stockton (1808-68), William Hunter (1811-1877), Thomas Osmond Summers (1812-82), Robert Arthur West (1809-66), President William Fairfield Warren (1833—), and Professor Caleb Thomas Winchester (1847—). Other American hymn-writers are John Greenleaf Whittier (1807-92), Hosea Ballou (1771-1852), Edwin Hubbell Chapin (1814-80), Charles Dexter Cleveland (1802-69), Miss Lucy Larcom (1826-93), Mrs. Emily Miller (1833—). The later writers of the Church of England include the names of Christopher Wordsworth (1807-85), Henry Alford (1810-71), John Samuel Bewley Monsell (1811-75), William Josiah Irons (1812-83), Arthur Penrhyn Stanley (1815-81), John Mason Neale (1818-66), Sir Henry Williams Baker (1821-77), Edward Hayes Plumptre (1821-91), John Ellerton (1826-93), William Walsham How (1823-97), and Samuel John Stone (1839—), and these are only a few of many. Other English writers of note are Horatius Bonar (1808-90), Frances Ridley Havergal (1836-79), James Drummond Burns (1823-64), Thomas Toke Lynch (1818-71), Norman Macleod (1812-72), Andrew Young (1807-89), John Burton (1803-77), Henry Francis Lyte (1793-1847), Sir Edward Denny (1796-1889), Josiah Conder (1789-1855), Henry Kirke White (1785-1806), Sir Robert Grant (1785-1838), Bernard Barton

(1784-1849), and Mrs. Felicia Dorothea Hemans (1793-1835).

Hymns, Ancient and Modern, originally compiled by a committee of which Sir H. W. Baker was secretary, and published in London in 1861, with supplemental hymns published in 1889; and *The Congregational Psalmist* (1858), edited by Henry Allon, and *Church Hymns* (1871), edited by Canon John Ellerton, are the greatest hymn-books of England. *Laudes Domini* (New York, 1884), edited by Charles Seymour Robinson; *The Plymouth Collection* (1855), by Henry Ward Beecher; *The Evangelical Hymnal* (1880), of Charles Cuthbert Hall and Sigismund Lasar; the Protestant Episcopal *Hymnal* (1871); the Baptist *Praise Book* (1871); and the *Methodist Hymnal* (1878) are noteworthy American hymnals.

BIBLIOGRAPHY. It has been estimated that there are at least 400,000 hymns in all languages, of which the greatest number are in German, and the next greatest number are in English. The literature on the subject is consequently becoming quite large. The great thesaurus of information is J. Julian's *Dictionary of Hymnology* (London and New York, 1892), the labor of many years and of many hymnologists. It covers the entire field and contains separate articles upon the hymnology of the different periods and lands. A. F. W. Fischer's *Kirchenlieder-Lexicon* (Gotha, 1878-79) is also very good. For the study of early Greek and Latin hymns the standard work is H. A. Daniel's *Thesaurus Hymnologicus* (Leipzig, 1855), which gives the text of many hymns; for the Latin mediæval hymns, a work of similar rank is F. J. Mone's *Lateinische Hymnen des Mittelalters* (Freiburg, 1853). For German Protestant hymnology to the seventeenth century the great work is P. Wackernagel, *Das deutsche Kirchenlied von der ältesten Zeit bis zu Anfang des xvii. Jahrhunderts* (Leipzig, 1864-77). J. M. Neale, by his *Mediæval Hymns and Sequences* (London, 1851), *Hymns of the Eastern Church* (London, 1862), and other similar works, contributed much to a knowledge of the hymnology of the Eastern and Western Churches of the Middle Ages. A fairly creditable book on Latin hymns is S. W. Duffield's *Latin Hymn-writers and Their Hymns* (New York, 1889).

The following books are recommended, but the list makes no pretension to completeness, only the greater books being named. On the general subject: Josiah Miller, *Singers and Songs of the Church* (New York, 1869); J. E. Prescott, *Christian Hymns and Hymn-writers* (London, 1883); W. G. Horder, *The Hymn Lover* (London, 1889); Duncan Morrison, *The Great Hymns of the Church: Their Origin and Authorship* (London, 1890); A. E. C., *Hymns and Their Stories* (New York, 1894); R. E. Welsh and F. G. Edwards, *Romances of Psalter and Hymnal* (New York, 1896); W. T. Stead, *Hymns that Have Helped* (New York, 1897); Duncan Campbell, *Hymns and Hymn-makers* (London, 1898). For the biography of a hymnologist, consult H. Housman, *John Ellerton: A Collection of His Writings on Hymnology; With a Sketch of His Life* (London, 1896). On German hymnology, consult: Winkworth, *Lyra Germanica* (London, 1855); and id., *Christian Singers of Germany* (ib., 1869); and for the hymns of Luther especially, Bacon, *Hymns of Martin Luther* (New York, 1883). There are several commentaries on hymns that

are very well done. Hyde, *Hymnal Sermon Pictures* (New York, 1899), does what is done nowhere else, and is most complete in the analysis of the hymns he discusses. Commentaries on denominational collections are: Biggs, *Hymns, Ancient and Modern* (London, 1867), giving annotations on the hymns of the Church of England; Nutter, *Hymn Studies* (New York, 1884, 3d ed. 1902), based on the American *Methodist Hymnal*; Burrage, *Baptist Hymn Writers and Their Hymns* (Portland, Maine, 1888); Tillet, *Our Hymns and Their Authors* (Nashville, Tenn., 1889); the annotated edition of the *Hymnal* of the Methodist Episcopal Church, South; Robinson, *Annotations upon Popular Hymns* (New York, 1893), based on his *Laudes Domini*; Stevenson, *The [British] Methodist Hymn-Book*, illustrated (London, 1883), from which S. W. Duffield drew many of the facts and anecdotes given in his *English Hymns* (New York, 1886), intended as a commentary on Robinson's *Laudes Domini*. The best anthologies of religious lyric poetry are: *The Book of Praise* (London, 1862; many subsequent editions), by Sir Roundell Palmer (Lord Selborne); and *The Treasury of Sacred Song* (London, 1889), by Francis Turner Palgrave.

HYMNS, NATIONAL. See NATIONAL HYMNS.

HYMN TUNES. The authentic history of hymn tunes begins with Hilary of Poitiers, who died in 368. His music was simpler than that of the ordinary jublations, each syllable of the text being given but one, or, at the most, two musical tones. Saint Ambrose (died 397) and, later, Pope Gregory the Great (died 604), introduced radical reforms in the style and singing of hymns (see AMBROSIAN CHANT; GREGORIAN CHANT), and the impetus given by them to the plain-chant (q.v.) carried that form along for centuries. It is noteworthy that, even so early, in many cases the author of the words also wrote the accompanying melodies. With the growth of polyphonic music these old chants were used as *canti fermi* upon which the more elaborate forms of masses and motets were constructed. Under Palestrina (q.v., died 1594) the polyphonic hymn reached its highest development. Around the historic plain-chants he embroidered a wealth of contrapuntal devices, yet preserving throughout their original smoothness and beauty. The difficulty of the music is the one objection against their more general use.

Meanwhile a reaction had arisen against the heavy, sombre music which had heretofore been the sole style of hymn tunes. Between the acts of Mystery Plays, and especially at those given at Christmas time, it was customary to sing songs whose general trend was religious, but whose music was light and popular. The Reformation was imminent and Luther appreciated and seized the opportunity for an innovation in Church music. He adapted some of these popular tunes to German translations of Latin hymns, wrote some original words, and the whole was set for four, five, or six voices by Johannes Walthers. Most important in this connection is the fact that for the first time in the history of hymn tunes the music was rhythmic. This was the beginning of the chorale (q.v.), which became immediately and widely popular. The next great period in Germany begins with Johann Sebastian Bach (1685-1750), who, while emphasizing the rhythmic element, at the same time de-

veloped the structural side of the music. After him the decline was rapid.

In France Clément Marot (died 1544) and Theodore Beza (died 1605) wrote metrical psalms which were set to popular music. Goudimel (1505-72), the earliest national composer, wrote many hymn tunes, but their difficulty rendered negative their excellence, and they were supplanted by the simpler arrangements of Claudin le Jeune (died 1600). Of the later French hymn-writers the most important was César Malan, of Geneva (1787-1864), who composed melodies to his own words. In England the history of hymn tunes follows much the same line as on the Continent. There were no hymns proper until the eighteenth century; before that time Tallis (died 1585), Byrd (died 1623), Parsons (died 1570), etc., set psalms to revised forms of old Continental tunes, and in 1621 "the Whole Booke of Psalmes" was published. The music of this edition was arranged largely by Thomas Ravenscroft, the tunes having been set by Bennet, Morley, Tallis, etc. With Orlando Gibbons (1583-1625) the polyphonic school in England came to an end, and the later compositions of Carey (died 1743), Wainwright (1792-1854), and their successors were poor in comparison. The reforms of the Commonwealth did nothing for Church music, and it was not until Purcell (1658-95), the greatest native English composer, that a lighter, more varied note was introduced into hymn tunes. The hymns of Watts (1674-1748) marked the beginning of the popular epoch, and those of Charles Wesley (1757-1834) its high-water mark. In recent years choral music and hymn tunes have drawn more closely together, to the immeasurable advantage of the latter. In England especially, Dykes (1823-76), Barnby (1838-96), Stainer (1840—), and others have all written excellent music. At the same time, however, many hymns have been written in England and the United States whose music depends wholly for its success on its catchy character. Most representative of this class are the hymns of Moody and Sankey. For a more detailed account of hymn tunes, consult: Dickinson, *Music in the History of the Western Church* (New York, 1902), which contains an exhaustive bibliography of the subject; Mees, *Choirs and Choral Music* (New York, 1901); also Butterworth, *Story of the Tunes* (New York, 1890); Love, *Scottish Church Music* (London, 1891); Curwen, *Studies in Worship Music* (London, 1894); Cowan and Love, *Music of the Church, Hymnary and Psalter in Metre, Its Sources and Composers* (London, 1901).

HYND'MAN, HENRY MAYERS (1842—). An English journalist and socialist leader, born in London. He graduated at Trinity College, Cambridge, and began to study law in 1863, but three years later, as correspondent for the *Pall Mall Gazette*, went to the war in progress between France and Italy, where he became the friend of Mazzini, Garibaldi, and other patriots. Between 1869 and 1871 he traveled in Australia, New Zealand, and Polynesia, and while in Melbourne wrote articles for the *Argus* in the cause of free education. He founded the Social Democratic Federation in 1881, and from that time was a conspicuous reform agitator. He was chairman at the International Socialist Congress held in London in 1896, and assisted at the formation of the new 'International' at Paris in 1900. He was

an Irish land-leaguer and a pro-Boer during the second Boer War. From 1874 he used his pen diligently in the socialistic cause. His books include: *A Commune for London* (1888); *Commercial Crisis of the Nineteenth Century* (1892); and *Economics of Socialism* (1896).

HYOID BONE (from Gk. ὑοειδής, *hyoeidēs*, shaped like the Greek letter upsilon, from ὑ, *y*, upsilon + εἶδος, *eidos*, shape). The tongue-bone, or V-shaped bone. It is sometimes spoken of as unimportant in man, compared with the so-called hyoid bone in many of the lower animals, in which, on account of its being a support for bronchial apparatus, it is often developed to a great size. But its importance is no less in man, because of its connection with many muscles; the perfection of its form and its exact location at the base of the tongue being a considerable element in the apparatus for the formation of articulate and musical sounds.

HYOLITHES, ἠϋλίθης (Neo-Lat. nom. pl., from Gk. ὑ, *y*, upsilon + λίθος, *lithos*, stone). An important and common fossil of the Cambrian rocks, and found also, though less commonly, in the higher rocks up to and including those of the Permian system. The shells of this mollusk are slender, conical tubes, often curved, and with triangular or flattened cross-sections. Some are provided with a lid to close the aperture. The old genus *Hyolithes* has been elevated to a family rank, and the numerous species have been distributed among several new genera. The *hyolithids* are very common in many of the lower Cambrian rocks, and they are indeed among the very oldest fossils known. They have been classed as pteropods, and more recently as worm-tubes, with the probabilities in favor of the latter relation. Some authors have also considered the *hyolithids* to represent quite nearly the most primitive form of gastropod. Consult: Novak, "Revision der Paläozoischen Hyolithiden Böhmens," in *Abhandlungen der Böhmisches Gesellschaft der Wissenschaften*, series 7, vol. iv. (Prague, 1891); Holm, "Sveriges Kambrisk-Siluriska Hyolithida och Conulariida," in *Afhandligar Sveriges Geologiska Undersökning*, series C, No. 112 (Stockholm, 1893); Walcott, "Fauna of the Lower Cambrian or Olenellus Zone," in *Annual Report of the United States Geological Survey*, vol. x. (Washington, 1893); Matthew, "Illustrations of the Fauna of the Saint John Group," in *Transactions of the Royal Society of Canada*, vols. i. to v. (Montreal, 1883-91).

HY'OSCY'AMUS. See HENBANE; BELLADONNA.

HYPATIA, ἠϋπάτεια (Lat. from Gk. Ὑπατία). Daughter of Theon, an astronomer and mathematician of Alexandria and head of the Neo-Platonic school in that city, early in the fifth century. She is famed alike for her beauty, her purity, her wisdom, and her tragic fate. Her father gave her the best training the philosophy of the time could furnish, and she succeeded him as lecturer at Alexandria; her fame drew students from all parts of the East, where the influence of Greek thought and knowledge was felt. The citizens of Alexandria were proud of her, and such reliance was placed upon her judgment and sagacity that the magistrates used to consult her on important cases. Among those who were most intimate with her was Orestes, prefect of

the city. At this time the Bishop of Alexandria was Cyril (q.v.), between whom and Orestes there had arisen a dissension on the question of jurisdiction. "It was commonly reported among the Christians," says Socrates, the Church historian, "that it was by her influence he [Orestes] was prevented from being reconciled with Cyril. Some of them, therefore, whose ringleader was a reader named Peter, hurried away by a fierce and bigoted zeal, entered into a conspiracy against her; and observing her as she returned home in a carriage, they dragged her from it and carried her to a church called Cæsareum, where they completely stripped her and then murdered her with shells. After tearing her body to pieces, they took her mangled limbs to a place called Cinaron, and there burned them." This occurred in March, 415. As at the time Synesius (q.v.) met her (about 395) she had been for twenty years a famous lecturer, and as she lived twenty years after that, she must have been at least sixty years old when murdered, but in legend and fiction she is represented as of unfaded physical charm. She is the heroine of Charles Kingsley's *Hypatia, or New Foes with an Old Face* (1853). Synesius has preserved a few of her letters. Consult Meyer, *Hypatia von Alexandria, ein Beitrag zur Geschichte des Neuplatonismus* (Heidelberg, 1886).

HYPÆRÆSTHĒSĪA (Neo-Lat., from Gk. ὑπερ, *hyper*, over + αἰσθησις, *æsthēsis*, sensibility, from αἰσθάνεσθαι, *aisthanesthai*, to perceive through the senses) and **HYPERALGESIA**. Hyperæsthesia is a term commonly though less correctly used to designate increased sensibility to pain, the proper term being hyperalgesia. It is believed that there is no increase of sensibility to touch or to heat and cold over the normal, though tactile and thermal sensibility may be diminished under various conditions. Unpleasant sensation or actual pain may be caused by a light touch on the surface, and is due to irritation of over-sensitive end-organs of common sensibility (that is, pain), and not to increased perception of touch. Hyperalgesia is due to peripheral, spinal, or cerebral irritation of sensory nerve-fibres. Increased cutaneous sensibility occurs in meningitis, cerebral or spinal; tetanus, hysteria, traumatic neuroses, hydrophobia, etc., as well as neuritis and multiple neuritis, and in some fevers. Local hyperalgesia occurs in inflamed areas, as around carbuncles, burns, gout, etc. See **ANÆSTHESIA**.

HYPÆR'BOLA (Gr. ὑπερβολή, *hyperbolē*, hyperbola, excess, from ὑπερβάλλειν, *hyperballein*, to exceed, from ὑπερ, *hyper*, over + βάλλειν, *ballein*, to throw). One of the conic sections (q.v.). Analytically, the hyperbola is the locus of a point which moves so that its distance from a fixed point, called the focus, bears a constant ratio greater than unity to its distance from a fixed straight line, called the directrix. In the figure, F is the focus and *d* the directrix for the branch on the right; F' is the focus and *d'* the directrix for the branch on the left; XX' is the transverse axis; YY' the conjugate axis; and *l* is the latus rectum. The equation of the hyperbola referred to the rectangular axes XX', YY' is $\frac{x^2}{a^2} - \frac{y^2}{a^2(1-e^2)} = 1$, in which *a* = OV, and *e* is the given ratio. Since *e* > 1, *a*²(1 - *e*²) is negative. Putting -*b*² for

this negative quantity, the standard form of the equation is $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$. The curve MN, PQ is the *conjugate hyperbola* with reference to the hyperbola AB, CD. (See **CONJUGATE**.) The

HYPERBOLA.

hyperbola is the only conic section having real asymptotes. These are the lines TT, T'T' in the figure. The equation of the hyperbola referred to its asymptotes is *xy* = *ab*. An hyperbola whose asymptotes are perpendicular to each other is called a *rectangular or equilateral hyperbola*. These asymptotes have the following remarkable property: If, starting from O, the asymptotes be divided in continued proportion, and from the points of section lines be drawn parallel to the other asymptote, the areas contained by two adjacent parallels and the corresponding parts of the asymptote and curve are equal.

HYPERBOLE, hi-pēr'bō-lē. The name given to a figure of rhetoric, by which expressions are employed that, taken literally, signify more than is really meant. The use of the figure is to arrest the attention. Hyperbole is the basis of many metaphors. Thus, we call Nero a 'monster'; Tamerlane, a 'tiger'; and so on. See **RHETORIC**, **FIGURES OF**.

HYPÆRBOLIC GEOMETRY. See **GEOMETRY**.

HYPÆRBOLIC LOG'ARITHMS. See **LOGARITHM**.

HYPÆRBO'REANS (Gk. ὑπερβόρειοι, *Hyperborcoi*, beyond the north wind, from ὑπερ, *hyper*, beyond + βορέας, *boreas*, north wind). A name given by the ancients to a mythical people dwelling in the distant north, beyond the Rhipæan Mountains, where it was everlasting day and perpetual spring, and where sorrow and old age were never found. The name was often applied to any people who lived in the far north. The Hyperboreans may have been originally those who brought to Apollo gifts and sacrifice. Consult Crusius, "Hyperboreer," in Roscher, *Lexikon* (Leipzig, 1884-97).

HYPÆRCALVINISM. That form of Calvinism which carries the system to its extreme logical conclusions, holding, for example, to a double predestination (to evil as well as good), and atonement only for the elect. The more moderate Calvinists seek to soften some of the results of their principles.

HYPÆRIDES (Lat., from Gk. ὑπεριδής, *Hypereidēs*). An Athenian orator of the fourth century B.C., one of the ten comprised in the Alexandrian canon. After studying philosophy

under Plato, and oratory under Isocrates, he began his public career as an advocate in the Athenian courts of justice, and joined the patriotic party, at that time led by Demosthenes and Lycurgus. He fitted out two triremes at his own expense for the Eubæan expedition of B.C. 358. In B.C. 338, when the disastrous fight of Chæronea laid Greece at the mercy of Philip, Hyperides proposed that the citizens should send their wives and children to places of security, and fight it out to the last. Though this desperate advice was not taken, its genuine patriotism was appreciated and rewarded by his countrymen. When the death of Philip revived the hopes of the anti-Macedonian faction, Hyperides promoted the alliance with Thebes, and after the destruction of that city by Alexander was one of the orators demanded of the Athenians by the Macedonian king. Alexander, however, did not press his demand, and Hyperides continued to oppose the Macedonian influence as strongly as ever. The arrival in Athens of Harpalus, the runaway treasurer of Alexander, then absent on his Eastern conquests, disturbed the friendly relation that had hitherto subsisted between Hyperides and Demosthenes, for in this celebrated case Hyperides, as one of the few anti-Macedonians who were above suspicion, was chosen to prosecute his friend. (See DEMOSTHENES.) In the Lamian War, which followed the death of Alexander, Hyperides took a leading part, and he spoke the funeral oration over his countrymen who had perished in battle. The year B.C. 322 saw the hopes of Athens finally crushed at the battle of Crannon. The chiefs of the patriotic party sought safety in flight. Hyperides was overtaken at Ægina and put to death. Tradition says that his tongue was torn out by his captors, or that he bit it out to avoid betraying his friends. As an orator Hyperides was ranked high by the ancients; it is said that some critics preferred him to Demosthenes. The 'grace' of his speeches was especially praised. The writer of the *Lives of the Ten Orators* enumerates 75 speeches, of which 52 were considered genuine. Until recently these were known only in scanty fragments, but late in the last century a number of papyri were discovered in Egypt which contain six speeches in a fairly complete state, including the famous funeral oration. This fully justifies the praise of the ancient critics, and may be ranked as one of the finest products of Greek oratory. A complete edition of the speeches and fragments has been published by Blass (Leipzig, 1894). The orations *Against Athenogenes* and *Against Philippides* have been edited, with an English translation, by Kenyon (London, 1893). Consult: Blass, *Attische Beredsamkeit*, iii (Leipzig, 1898); Jebb, *Attic Orators*, ii. (London, 1880).

HYPÉRION. See TITANS.

HYPÉRION. (1) A poetic fragment by John Keats. It deals with the overthrow of the old order of Saturn by the new one of Jupiter in Greek mythology, was begun in 1818, recast but by no means for the better in 1819, and finally published in 1820. (2) A romance by Longfellow, published in 1839. Its sale during the first twenty years approximated 15,000 copies. It narrates the wandering through Germany of Paul Flemming, the partly autobiographical hero, and contains much of German romance, introduced by translations of legends and poems.

HYPÉRIUS, ANDREAS GERHARD (1511-64). A Protestant theologian and reformer, born at Ypres, whence his learned name Hyperius, Gerhard being his family name. He was educated at the University of Paris, and traveled in the Netherlands and in Germany. Driven from England (where he lived four years with William Mountjoy, Erasmus's friend) by the persecutions of 1540, he went to Germany, was converted to Protestantism, and became professor of theology at Marburg. A deep scholar and a liberal theologian, he was accused of Zwinglian views on the Lord's Supper. He wrote: *Methodi Theologiae Libri III.* (1566); *De Formandis Concionibus Sacris* (1553); and *De Recte Formando Theologiae Studio* (1556), the first scientific dictionary of theology.

HYPÉRMET'AMORPHOSIS. See METAMORPHOSIS.

HYPÉRMETROPIA. See SIGHT, DEFECTS OF.

HYPÉRMNES'TRA (Lat., from Gk. Ὑπερμνήστρα). One of the Danaïds. She alone of the daughters of Danaüs disobeyed his command to slay her husband, Lynceus, but was eventually pardoned by her father.

HYPÉROPIA (from Gk. ὑπέρ, *hyper*, above + ὄψ, *ōps*, sight). A congenital or acquired error of refraction of the eye. Owing to too little convexity of the refracting surfaces, parallel rays of light do not converge to a focus on the retina, like in the normal eye, but to a point somewhere behind the same. It is usually called Hypermetropia, long-sightedness, and is the opposite of myopia.

HYPERSPACE. See GEOMETRY.

HYPÉRSTHENE (from Gk. ὑπέρ, *hyper*, over + σθένος, *sthénos*, strength). An iron-magnesium silicate. It crystallizes in the orthorhombic form, but is also found in granular masses. Associated with labradorite and other basic feldspars, it is an important constituent of certain eruptive rocks, such as gabbro and norite, and is widely distributed, especially in Sweden, Norway, Greenland, the Adirondacks, and Canada. When cherry-red in color it may be cut and polished, and used as an ornamental stone.

HYPÉRSTHENE GAB'BRO. See GABBRO.

HYPÉRTROPHY (from Gk. ὑπέρ, *hyper*, over + τροφή, *trophē*, nourishment, from τρέφειν, *trephein*, to nourish). The term applied in medicine to the abnormal and disproportionate enlargement of any part of the body. Examples of this change are seen in the muscular system, where it may occur altogether independently of disease. The huge bosses of flesh that stand prominently forward in the arm of a blacksmith or of a pugilist, and in the leg of a ballet-dancer, are illustrations of hypertrophy from increased use, where the general health may be perfect. In double organs, such as the kidneys and lungs, if the organ on one side degenerates through disease, the organ on the opposite side is often found to enlarge, and carry on double work. In these cases hypertrophy is an effect of disease, but is at the same time a preservative of life.

There are, however, cases in which the hypertrophy has a hurtful instead of a conservative effect, as, for example, hypertrophy of the thyroid gland, constituting the disease known as

goitre or bronchocele, hypertrophy of the prostate gland, of the spleen, etc. The following are the etiological factors of hypertrophy: (1) It may be congenital. (2) A local increase in the supply of blood to a part, whether due to increased exercise, or irritation by mechanical or chemical agents, etc. (3) It may be due to old age—the so-called senile hypertrophy, the commonest example of which is the enlargement of the prostate gland in old men, which is said to occur in about forty per cent. of all men after the age of fifty years. (4) Syphilis and chronic inflammations are also very common causes of hypertrophy. See **HEART, DISEASES OF THE.**

HYPHÆ (Neo-Lat. nom. pl., from Gk. ὑφή, *hyp̄hē*, web). An individual filament of the body of a fungus. A mass of organically related hyphæ constitutes a mycelium. See **FUNGI.**

HYPNAL (from Gk. ὑπναλός, *hypnalcos*, causing sleep, from ὕπνος, *hypnos*, sleep; connected with Lat. *somnus*, *sopor*, AS. *sucfen*, Skt. *svapna*, sleep, from *svap*, to sleep). A hypnotic of unquestionable value, combining as it does the effects of chloral hydrate and antipyrine, of which it is composed. Although it is recommended by some for insomnia accompanied by coughing, its chief use is found in cases of sleeplessness due to pain. Its only rivals in the latter field are opium, chloral hydrate, and Cannabis India. (See **HASHISH.**) The objections to using opium as a hypnotic in cases of persistent sleeplessness are well known; and the combination of the analgesic antipyrine with chloral hydrate gives great relief from pain, permitting the hypnotic action of the latter drug.

HYPNOS (Lat., from Gk. ὕπνος). The Greek god of sleep, the son of Erebus and Night, and twin brother of Death. He is represented as a youth with wings on his temples, bearing a poppy branch and the horn of slumber.

HYPNOSCOPE (from Gk. ὕπνος, *hypnos*, sleep + σκοπεῖν, *skopein*, to view). A magnet devised to measure hypnotic sensitiveness. The magnet is a slit tube 3.4 cm. in diameter by 5.5 in length, and weighs 169 grams. It is very powerful, lifting 25 times its own weight. The instrument is applied by removing the armature and inserting the forefinger of the person to be tested into the magnet so as to touch both poles at once. After two minutes sensitive or objective effects will be noticed in 30 per cent. of persons tested. It is not an instrument of any value whatever. Hypnotic influences cannot be measured by any known mode at the present time.

HYPNOTICS (from Lat. *hypnoticus*, Gk. ὑπνωτικός, *hypnotikos*, relating to sleep, from ὕπνος, *hypnos*, sleep). Agents which are used to induce sleep. During the state of slumber, especially if deep, the functional activity of the cerebral centres is largely suspended. Medullary centres remain active, but are less alert. The brain and spinal cord are anæmic, reflex action is diminished, and the senses are dulled. The ordinary precautions of one about to sleep—the recumbent position, the darkened and quiet room, the absence of previous excitement—are simply evidences of physiological necessity. Hypnotics act ordinarily by diminishing the functional activity of the brain, or by causing an anæmia of it, occasionally by both methods. They may

be divided into four classes: (A) *Mental*, acting by diminishing the functional activity of the cerebrum. This class includes the constant repetition of prayers, etc., the counting up into the hundreds or thousands, the counting imaginary sheep as they jump an imaginary wall, and many similar expedients. These are only of value in light grades of insomnia. (B) *Dietetic*. This class causes a congestion of the abdominal viscera by increasing their functional activity, and thus leads indirectly to cerebral anæmia. A light supper of crackers and cheese, or oysters, or soup, or beef tea, is often of great value for inducing sleep. Frequently the addition of a little alcohol as a weak toddy, or a bottle of beer, will help. (C) *Mechanical*, including: (1) *Hot water-bag or brick* to the feet, of value when the extremities are cold. It acts by indirectly causing cerebral anæmia. (2) *Moist warmth* to abdomen by a poultice or hot compress covered with oil-silk. This is frequently of value. It acts by dilating the abdominal vessels, and this causes cerebral anæmia. (3) *Hot bath*. This acts by dilating the cutaneous vessels, and thus causing cerebral anæmia. Certain precautions should be observed: The bed should be well warmed, and the room moderately cool. The bath should be hot, and the individual should stay in it for several minutes. He should be dried as quickly as possible, and in passing from the bath to the bed he should be well wrapped up and wear warm slippers. This method is often of great value when properly applied. It should be used with caution in cases of heart disease. (4) *Chapman's method*. This consists in the application of cold to the spine. It indirectly causes dilatation of the abdominal vessels, and thus cerebral anæmia. (5) *Massage*. This should be general and thorough, especially to the abdomen. It acts by dilating the vessels of the body, and also by lessening the irritability of the sensory cutaneous nerves. If the ordinary precautions of quiet and darkness are observed after the massage, this method frequently acts very well. All the preceding measures are of little value in case any acute disease is present. In such cases, and many others, we have to resort to drugs. These should not be used for ordinary insomnia until a thorough trial has been given to the dietetic and mechanical hypnotics. None should be given except under the advice of a physician who has examined the patient. They are, of course, grouped under the class (D) *Medicinal*. (1) *Opium* and its derivatives. As simple hypnotics these are all objectionable, for they produce other marked effects than sleep. The danger of a habit forming must also be considered. In acute diseases, especially when accompanied by pain or delirium, they are of great value. Codein is the least objectionable, but it is also the most expensive and the least efficacious. Heroin, dionin, and peronin, three new derivatives of morphine, can be utilized, but the danger of forming a habit is always present. (2) *Hyoscyamus* and its derivatives. These are not of as much value as are ordinary hypnotics, for they cause other marked effects. In cases of mania they are of great value. Hyoscyne hydrobromate has the most decided hypnotic action. (3) *Cannabis Indica*. Feeble in hypnotic power. The sleep produced by it is apt to be preceded by delusions often unpleasant. (4) *Chloral hydrate*. This is a very valuable hypnotic. It has some

objections. A very important one is the tendency to the formation of a habit. Another is the difference in susceptibility to its action. Chloral hydrate is a powerful cardiac depressant, and in cases of heart disease or heart weakness from any cause, it should be used with great caution, if at all. A small dose has caused death, although fifty and sixty grains have been given in other cases without harm. (5) *Bromides*. These are not very powerful hypnotics, but are often used as adjuvants to others. Potassium bromide is the most useful, but sodium bromide, though less active, is not as depressing to the circulation. (6) *Monobrated camphor*. A feeble hypnotic. (7) *Paraldehyde*, a polymeric modification of acetic aldehyde. This is an efficient hypnotic, producing sleep, as a rule, in half an hour. As regards its nervous effects, it is almost a pure hypnotic, and it causes but slight depression of the heart and respiration. It leaves no after effects except the odor of the breath, which is often very marked. It may cause nausea or vomiting if the stomach is very irritable. Like all hypnotics, it sometimes fails. (8) *Sulfonal*. This is an efficient but slow-acting hypnotic. The dose is given one or two hours before the expected sleeping-time. (9) (10) *Trional* and *Tetronal* are similar drugs, with more rapid and powerful action. The three last named may produce poisoning if used for any length of time or in too large doses. (11) Urethane, ethyl, $C_2H_5CO_2NH_2$, has a bitter, disagreeable taste. This is an efficient hypnotic, leaving no disagreeable after effects. In large doses it may cause vomiting, but is otherwise a pure hypnotic. It has no depressing action on the heart or respiration. (12) *Amylene hydrate*. A colorless fluid with a sharp taste and smell. This is an efficient hypnotic, causing sleep in fifteen to forty-five minutes. The sleep is natural, and there are no bad after effects. It has no depressing effects on the heart or respiration. It has caused in a few cases a delirium resembling that of alcoholic intoxication, but followed by refreshing sleep. (13) *Amylene chloral*, or *dormiol*, is similar in action. Most of the drugs named are considered in special articles under their names.

HYPNOTISM, or **HYPNOSIS** (from Gk. *ὑπνος*, *hypnos*, sleep). The general names for a group of abnormal phenomena, physical and psychological, which show a close outward resemblance to the phenomena of normal sleep and of sleep-walking. The symptoms of the hypnotic state differ considerably among different subjects, and the marking off of distinct stages within this state is rather a matter of theory than of actual observation. The artificial sleep is continuous and progressive, beginning with a languor and drowsiness not unlike those of a man suddenly waked from sound sleep, or arousing from a too protracted morning's nap after a disturbed night. As the state advances, the subject becomes partially anæsthetic, insensitive to pin-pricks, pinching of the skin, etc.; his sense-organs are closed to most of the impressions from his surroundings that would normally excite them; if awakened before the sleep has grown more profound, he remembers hazily what has occurred during hypnosis. He is extremely suggestible at the hands of those who, as he thinks, have induced the sleep, and will execute movements that the experimenter prescribes to him. The voluntary muscular system evinces a curious

rigidity and fixity; the subject will remain in any position in which he is placed. This feature has given the name of 'catalepsy' (seizure) to the stage in question. As the sleep is continued the subject becomes still more anæsthetic, until consciousness seems to lapse altogether; on waking, he has no memory whatsoever of the hypnotic period. The name of 'sommnambulism' is given to a stage of profound hypnosis in which illusions are produced at the experimenter's suggestion: the subject takes ink for wine, a pillow for a baby, steps carefully over an imaginary book, etc., etc.

These phenomena of sleep or trance, mixed with much that is simply charlatanry, have been discussed and exploited from time immemorial. The medicine-men of primitive and savage tribes, the magicians of Egypt and Chaldæa, the Hindu ascetics, the monks of Mount Athos, the quack physicians of all ages, have made use of hypnosis to enhance their personal prestige, to cure the sick, or to induce states of religious ecstasy. The modern history of hypnotism begins with F. A. Mesmer (1733-1815), a German physician who practiced hypnotic therapeutics at Paris from 1778, causing so great a stir in scientific circles that his pretensions were made a matter of inquiry by a royal commission (1785). The report of the commission was unfavorable; but 'mesmerism' still flourished. In England valuable works were published in the early forties by J. Braid, a Manchester surgeon (c. 1795-1860); but their sanity and importance have but recently been fully recognized. Braid coined the word 'neurohypnotism,' or nerve sleep, from which comes the modern word hypnotism. During the last third of the nineteenth century the facts of hypnosis were thoroughly investigated by physiologists and psychologists. Heidenhain and Preyer in Germany, Richet, Charcot, Liébault, and Bernheim in France, Delbœuf in Belgium, confirmed and extended Braid's results. The French investigators split into two distinct 'schools': that of Charcot and his followers at the Paris Hospital of the Salpêtrière, and that of Bernheim and his followers at Nancy. The Salpêtrière school maintains that hypnotism is a pathological phenomenon, akin to hysteria, and characterized by three well-marked stages; the school of Nancy asserts that it can be set up in the normal individual, that it is a unitary and progressive stage, and that the key to its understanding is given with the facts of suggestion. The latter views have found general acceptance; but the controversy undoubtedly hindered the advance of knowledge and threw discredit upon the whole subject. It need hardly be said that the doctrines known as animal magnetism, electro-biology, odism or odyism, mesmeric clairvoyance, etc., are one and all—save in so far as they cover the facts of hypnotism proper—fanciful and ungrounded hypotheses.

In considering the psychology of the hypnotic state, we have first to notice that its sole and essential condition is an exaggerated state of passive attention to some object or person. (See ATTENTION.) In popular phraseology there is a 'total surrender of the will' of the subject, either to a sense-impression or to the experimenter's personality. The condition of hypnosis thus lies—and this fact is of extreme importance—in the mind of the subject himself; the experimenter or 'operator' has no power, except as

the subject gives him power. The reason that the professional hypnotist and the physician are accredited with a special ability to induce hypnosis is, first, that they 'suggest' to the inquirer—whether consciously, by strongly worded advertisement, or unconsciously, by the mere authority of position—that such ability resides in them; and, secondly, that they acquire, in the course of their experience, a tact or insight concerning the best means of bringing the inquirer into the necessary attentive state. The subject comes to them prepared for hypnotization; and they make conditions easy for its attainment. Further than this the ability of the operator does not extend. It is, indeed, entirely possible to hypnotize one's self. (See AUTOSUGGESTION.) Most of us have, at times, 'let ourselves go' mentally, until we were on the verge of what seemed to be a kind of fascination or trance, at the brink of which we aroused ourselves with a start. If now we place ourselves under circumstances favorable to sleep, cutting off, so far as may be, external impressions, and attend concentratedly to the idea of hypnosis, we presently drop into a similar state of 'fascination' which soon becomes hypnosis proper, and later passes off as ordinary sleep.

We notice, secondly, as a corollary to what has just been said, that all persons of normal constitution are hypnotizable. Hypnosis is 'abnormal' only in the sense in which dreaming (q.v.) is abnormal; and as we are all liable, though in varying degree, to dreams, so are all normal minds liable to hypnotization. The strong-minded person who declares that So-and-so tried to hypnotize him, but could not on account of his vigorous resistance, makes a ludicrous misstatement. It is not So-and-so who is to hypnotize him, but he himself; and incapacity for hypnosis is not the mark of a strong, but of a weak mind. Hypnosis (and this is a difference between it and dreaming) is impossible in the case of idiots and of very young children, because they are scatter-brained, unable to attend fixedly and continuously; the more 'powerful the will,' the easier must hypnosis be. We see this, indeed, in the tendency of vigorous minds to 'brown study,' a state nearly related to hypnosis, and characterized by the same single-hearted absorption, and the same arrest of bodily movement. Whether or not animals can be hypnotized is a disputed question. In the emotion of extreme fear (when, if ever, the animal mind must be dominated by one sole idea, and so approach to the requisite degree of passive attention), we have a muscular rigidity, known as 'cataplexy' (cf. the popular word 'stroke'), which outwardly resembles the stage of cataplexy in man. Seize a frog firmly by a hind leg, and the animal will spread out, stiff and stark, making no effort to escape. Pigeons, fowls, guinea-pigs, etc., can all be readily 'hypnotized' by similar means. The trend of expert opinion seems, however, to be that the resemblance to hypnosis is rather external than real.

We turn now to some special questions of hypnosis, and first (1) to that of the *rapport*. This is a supposed subjective link or bond whereby the experimenter, in virtue of his will-power or personal magnetism, attaches the subject to himself. Now it is true that there are cases in which a subject can 'be hypnotized' only if a certain operator or experimenter allows or

commands it. But there is nothing mysterious, still less supernatural, in the matter. The subject in some way (perhaps by self-suggestion, perhaps at the explicit suggestion of a physician) acquires the insistent belief that hypnosis is impossible for him without the presence or assent of the experimenter; and the belief, once acquired, is effective. It is thus the subject, again, whose 'will' is concerned, not the operator. The *rapport* is sometimes suggested by physician to patient, in order to prevent interference by outsiders with the conduct of a case; and thus serves a useful purpose. (2) It may be suggested to a somnambulist subject that at such-and-such a time after waking from the hypnotic sleep he shall perform such-and-such an action. This is termed *post-hypnotic* or *terminal* suggestion. Its effectiveness depends upon the fact that the time idea is common both to the hypnotic and to the waking consciousnesses, and so forms a bridge between the abnormal and the normal states. "You will go into the kitchen and drink a glass of water at five o'clock." The subject is strongly impressed by the five-o'clock idea. When, therefore, five o'clock actually comes, its perception or idea is sufficient to throw him into the first stage of hypnosis; the suggestion recovers its hypnotic strength, and he goes, passively, to execute the prescribed act. (3) Although the somnambulist remembers nothing of the hypnotic state from which he is aroused, he may, if rehypnotized, recall what took place during his previous sleep. Memory is thus continued from one hypnotic consciousness to another, as it is from one waking consciousness to another; but there is no continuity of memory from sleep to waking, or vice versa. This fact has given occasion to various theories of double consciousness (q.v.): quite unnecessarily—for it is adequately explained by the known laws of memory. We remember only when we have a cue to memory, when our present circumstances 'suggest' the past. When eating a good dinner after a long walk we recall other good dinners eaten in like circumstances; we do not recall such dinners when there is nothing to remind us of them. But the waking state, with all the sudden inrush of stimulations that it involves, is entirely different from the hypnotic state; there is nothing in the one (apart from the terminal suggestions just discussed) to remind us of the other: whereas there is everything in a present hypnotic state to revive our memories of foregone like states. Dreams, in the same way, are not seldom continued from night to night, though we forget all about them in the daytime. (4) Lastly, as regards the *therapeutic value* of hypnosis, we may say that as a 'suggestion' in the waking life, may make us blush or cry, so may the indefinitely stronger suggestions of the hypnotic state bring about circulatory or secretory changes that are of benefit to the organism. But no command to get well can ever mend a broken bone, or cure a typhoid patient. Moreover, there is always the danger of setting up an 'hypnotic habit,' or of breaking down the subject's self-reliance; in which event the remedy is worse than the disease.

standpoint, Moll, *Hypnotism* (New York, 1893); Beruhelm, *Suggestive Therapeutics* (trans. New York, 1889); *Études nouvelles sur l'hypnotisme* (Paris, 1891); also in general, James, *Principles of Psychology*, vol. ii. (New York, 1890); Lehmann, *Die Hypnose* (Leipzig, 1890); Wundt, *Hypnotismus und Suggestion* (Leipzig, 1893); Dessoir, *Bibliographie* (Berlin, 1891); Jastrow, *Fact and Fable in Psychology* (Boston, 1900).

HYPOBOLE, hi-pōb'ō-lē (Gk. ὑποβολή, a throwing under, from ὑπό, *hypo*, under + βάλλειν, *ballein*, to throw). A figure of rhetoric, whereby each of several arguments that appear to favor the side of one's opponent is introduced only to be refuted in order. See RHETORIC, FIGURES OF.

HYP'OCAUST (Lat. *hypocaustum*, *hypocaustion*, from Gk. ὑπόκαυστον, vaulted room with furnace below, from ὑπό, *hypo*, under + καυστός, *kaustos*, burned, from καίειν, *kaiein*, to burn). The name for the subterranean hot-air chamber under the *calidarium* in Roman bathing establishments. The hot air was generated by a circular furnace which heated the water and gave out streams of hot air into the hypocaust, which consisted of a hollow double floor of concrete and tiles, between which were the pillar-like *suspensuræ* of tiles. The hot air was distributed throughout the building from the hypocaust by series of wall and floor flues, giving an even temperature. The system was invented shortly before Augustus, and was soon adopted not only in public baths, but in private houses. It is now coming again into use for heating the so-called 'Turkish baths.' It can be studied in all the details of its arrangement in the ruins of Roman houses and baths. See BATHS.

HYP'POCHLO'RITES. See HYPOCHLOROUS ACID.

HYP'POCHLO'ROUS ACID, HClO. An acid that may be assumed to be formed when chlorine monoxide (Cl₂O) is dissolved in water. Chlorine monoxide, which decomposes into chlorine and oxygen with explosive violence, may be obtained by the action of dry red oxide of mercury upon chlorine. In aqueous solution, chlorine monoxide is not explosive. The salts of hypochlorous acid are termed *hypochlorites*, and some of them are valuable bleaching agents. Ordinary bleaching-powder is supposed to contain the hypochlorite of calcium; Javelle water contains the hypochlorite of potassium; Labarraque's solution contains the hypochlorite of sodium. Bleaching-powder is made by the action of chlorine on lime; similarly, the hypochlorite of potassium may be obtained by the action of chlorine upon a cold solution of caustic potash. If solutions of hypochlorites are heated, the corresponding *chlorides* and *chlorates* are formed. See BLEACHING-POWDER.

HYPOCHERIS, hi'pō-kē'rīs (Neo-Lat., from Gk. ὑποχέρως, succory-plant). A genus of plants of the natural order Compositæ, of which one species, *Hypocheris radicata*, or long-rooted cat's-ear, is extremely common in meadows and pastures in Great Britain and other parts of Europe. Its leaves, which are all radical, and spread on the ground, resemble in form those of the dandelion, but are rough; the stem is branched, the flowers somewhat similar to those of the dandelion, but smaller. Cattle eat this plant readily,

and its abundance is not deemed injurious to pasture or fodder.

HYPOCHONDERS, hi'pō-kōn'dērz, or **HYPOCHONDRIA** (from Lat. *hypochondrium*, Gk. ὑποχόνδριον, soft part of the body below the cartilage and above the navel, from Gk. ὑπό, *hypo*, under + χόνδρος, *chondros*, cartilage). An old term for the two lateral and superior regions of the abdomen (q.v.) under the cartilages of the false ribs, and to the right and left of the epigastrium.

HYPOCHONDRIA, hi'pō-kōn'drī-ā. See HYPOCHONDERS; HYPOCHONDRIASIS.

HYPOCHONDRI'ASIS (Neo-Lat., from Lat. *hypochondrium*, Gk. ὑποχόνδριον, hypochondriac region; so called because of the supposed connection of the disease with this part of the body). A disease characterized by extreme increase of sensibility, palpitations, morbid feelings that simulate the greater part of diseases, exaggerated uneasiness, and anxiety, chiefly in what concerns the health, etc. In extreme cases it becomes a species of insanity. The disease is very frequently associated with disorder of the digestive functions. See INDIGESTION.

When sombreness of disposition and anxiety concerning personal comfort become exaggerated, and attention is directed chiefly to the state of the health, it amounts to common hypochondriasis. When it passes beyond the control of the will, when the whole mind is directed to the state of the system, or to particular organs, and exalts and misinterprets sensations, the condition is designated hypochondriacal insanity. The disease may be described as the engrossment of the attention by false impressions conveyed, or conceived to be conveyed, from internal organs. These sensations may, in many instances, be real, and proceed from actual alterations in the structure or functions of the parts supposed to be affected; but they may likewise consist of ordinary sensations, excited and intensified by the act of attention which makes them known to the patient. Neither the experience nor the sufferings of the victims are imaginary, however absurd their errors, and however groundless their apprehensions may be; the disease is real, and consists in the exaltation of sensibility and attention, and in the delusions which originate in that morbid state. A man lives in constant fear of death; he is firmly convinced that he labors under cancer, consumption, disease of the heart, etc. Hypochondriasis is often a precursor of melancholia, or other kinds of alienation; but it must likewise be regarded as a distinct and independent affection, traceable, generally, to disorder of the digestive and assimilative apparatus, to sexual excess or other debilitating influences. Such patients always should be watched, for many of them commit suicide while temporarily under the influence of an hallucination or a delusion. Diversion, camp life, hunting, fishing, and other occupations should engross the patient's attention during an outdoor life, or travel should be his resource, always in the society of a lively, healthy companion. Drugs alone produce little benefit. Consult: Falret, *De l'hypochondrie et du suicide* (Paris, 1822); Bucknill and Tuke, *Psychological Medicine* (London, 1879); Mercier, *Psychology, Normal and Morbid* (London, 1902).

HYPOCOTYL (abbreviation of *hypocotyledonous*, from Gk. ὑπό, *hyπο*, under + κοτυληδών, *kotylēdōn*, cotyledon, from κοτύλη, *kotylē*, socket). In seed-plants, the axis of the embryo below the cotyledons. This axis has been variously called 'radicle' and 'caulicle,' but since it has peculiar powers which do not belong to ordinary root and stem structures, it has received a distinctive name. See EMBRYO.

HYPOCRITE, THE. A play by Isaac Bickerstaffe, produced in 1768, and founded on Cibber's *Non-Juror*, which, in turn, was taken from the *Tartuffe* of Molière.

HYPOCYCLOID. See CYCLOID.

HYPODERMIC MEDICATION (from Gk. ὑπό, *hyπο*, under + δέρμα *derma*, skin). Introduction of medicines beneath the skin, with a hypodermic syringe. This method is often preferable to that of giving them by the mouth. The stomach is sometimes in a condition which will not bear the presence of drugs, particularly narcotics, and these are the agents which are most frequently administered hypodermically. A small graduated glass syringe attached to a slender hollow needle, cut off obliquely so that its sharpened extremity may easily be made to pierce the skin, is used. The medicine may be thrown in just beneath the skin, or the point of the syringe is thrust into the body of a muscle. The wounding of blood-vessels or nerves should be carefully avoided, and therefore the operation should not be undertaken except by a physician or a trained nurse. Local pains may generally be more successfully treated in this manner than by the common method. In some cases an anæsthetic may, however, be preferable. It is usual to make a special preparation of the drug which is to be introduced. The syringe must be completely filled when used, as the introduction of an air-bubble into a vein might be attended with danger. All instruments and drugs used should be thoroughly sterilized. The hypodermic syringe should be used with great caution, and never by the patient.

HYPODERMIS (Neo-Lat., from Gk. ὑποδερμίς, under-skin, from ὑπό, *hyπο*, under + δέρμα, *derma*, skin). In plants, a layer of cells beneath the epidermis. An archesporial cell is said to be hypodermal in origin when it arises immediately beneath the epidermis. Tissues bordering directly upon the epidermis are called *hypodermal*.

HYPOGYNY, hī-pōj'ī-nī (from Gk. ὑπό, *hyπο*, under + γυνή, *gynē*, woman). The condition in a flower in which the sepals, petals, and stamens arise from beneath the ovary. As a consequence, the ovary is seen inside of the flower, and is often spoken of as 'superior.' The contrasting term is 'epigyny' (q.v.). Hypogynous flowers are considered to be more primitive in character than epigynous flowers. See FLOWER.

HYPONASTY. (from Gk. ὑπό, *hyπο*, under + ναστός, *nastos*, close-pressed, from νάσσειν, *nassein*, to pack closely). A term applied by DeVries to the occurrence of greater growth upon the under side of a dorsiventral organ, which produces therefore an upward curvature. This may be due to internal or external causes. It is the common condition of young leaves and flower parts when they are in the bud. The correlative term is epinasty. See GROWTH.

HY'PONI'TRITES. See HYPONITROUS ACID.

HY'PONI'TROUS ACID, $H_2N_2O_2$. An acid which may be obtained in dilute aqueous solution, or in the form of its salts, but which has not been isolated in a concentrated state. Its salts are termed *hyponitrites*. It may be obtained by allowing sodium amalgam to act upon barium nitrite, neutralizing the resulting solution with acetic acid, precipitating with silver nitrate, and decomposing with hydrochloric acid the silver hyponitrite thus obtained. Silver hyponitrite, $Ag_2N_2O_2$, explodes if heated to a moderately high temperature. The solution of free hyponitrous acid decomposes, on heating, into nitrous oxide ('laughing gas') and water.

HY'POPHOS'PHITES. See HYPOPHOSPHOROUS ACID.

HY'POPHOS'PHOROUS ACID, H_3PO_2 . A crystalline compound that melts at about 17.5°C. and is readily transformed into ordinary phosphoric acid. It may be obtained by boiling caustic potash with phosphorus, subsequently adding sulphuric acid, concentrating the solution by evaporation and allowing it to crystallize in the cold. The salts of hypophosphorous acid are termed hypophosphites, those of iron, calcium, sodium, and potassium being extensively used in medicine, and often forming ingredients of patent medicines which are claimed to be valuable remedies for tuberculosis. Most such preparations are worthless, being mixtures of the hypophosphites of two or more metals. The several ingredients of which may counteract one another; and some such mixtures are positively harmful. On the other hand, if prescribed separately, in moderate doses, by a competent physician, the hypophosphites often constitute valuable therapeutic agents, inasmuch as they have the effect of improving nutrition and relieving some of the symptoms of phthisis. The hypophosphite of potassium may be used as an expectorant in chronic bronchitis. The official syrup of hypophosphites contains several hypophosphites, a considerable amount of free hypophosphorous acid, and often some iron.

HYPOS'TASIS (Neo-Lat., from Gk. ὑπόστασις, *hypostasis*, subsistence, from ὑπόστασις, *hypostatōs*, substantial, from ὑφίσταμαι, *hyphistanai*, to stand under, from ὑπό, *hyπο*, under + ἵσταναι *histanai*, to stand). A term of Greek theology, variously employed before the fourth century, but at last technically used to denote personal distinctions in the Godhead. The Council of Nicæa (325) did not clearly distinguish between *hypostasis* and *ousia* (substance and essence), and a controversy followed. (See HOMOUSSION.) The same uncertainty appears in the West as late as Augustine, who confesses that he does not understand the difference between the two Greek words (*De Trinitate*, v. 8, 10). But gradually the two words were differentiated, and *hypostasis* came to be used exclusively for the personality of Father, Son, or Holy Spirit. It was thus interpreted as being equivalent to *prosopon*, which the Latin rendered by *persona*, whence our word 'person.' The fully developed trinitarian dogma asserts one essence, or substance (*ousia*), and three persons (*hypostasis*) in the Godhead. This has remained the orthodox faith of the Church. Consult: the *Histories of Doctrine*, by Harnack, vol. iv. (London, 1898);

Loofs (Halle, 1893); and Fisher (New York, 1896). See TRINITY.

HYPOMATIC UNION. A term used to describe the union of Christ's human nature to the hypostasis or person of God the Word, in virtue whereof, while each nature is complete, even after union, yet there is but one undivided person of the God-man, to which all the actions, whether divine or human, are ascribed. This form of expression was devised for the purpose of excluding the doctrine of a mere moral union held by Nestorius. See MONOPHYTES; NESTORIANS; TRINITY.

HYPÓSULPHITES. See THIOSULPHURIC ACID.

HYPOTENUSE (Fr. *hypoténuse*, from Gk. ὑποτεινούσα, *hypoteinousa*, subtending, from ὑποτείνειν, *hypoteinein*, to subhend, from ὑπό, *hypo*, under + τείνειν, *teinein*, to stretch). That side of a right-angled triangle opposite to the right angle. The hypotenuse is the longest side of the triangle, and its mid-point is the centre of the circumscribed circle. According to the famous 47th proposition of the first book of Euclid's *Elements*: The square of the hypotenuse of a right-angled triangle equals the sum of the squares on the other two sides; the proof of this proposition is attributed to Pythagoras.

HYPOTHECATION (ML. *hypothecatio*, from *hypothecare*, to hypothecate, from Lat. *hypotheca*, from Gk. ὑποθήκη, *hypothēkē*, pledge, from ὑποτίθεναι, *hypotithenai*, to place under, from ὑπό, *hypo*, under + τίθεναι, *tithenai*, to place). At Roman law hypothec was the right to take and sell property belonging to another to satisfy a claim. Any balance (*hyperocha superfluum*) remaining after a creditor's claim was satisfied was restored to the former owner of the property. Hypothec might be established by the act of the owner (English mortgage), or it might be created by law (English lien). In either case the hypothecation might be of real property or of personal property, or of both. Many of the legal liens extended over the debtor's entire estate, real and personal. Hypothec was distinguished from pignus or pledge, in that it was established without delivery of possession. In modern civil law the term hypothec is commonly restricted to the mortgage or lien upon real property. At French law a lien upon movables or upon an entire estate is termed a 'privilege.' In Spanish law the term is restricted to the contractual mortgage of real property; all legal liens, whether upon realty or personalty, are 'preferences.' In Scotland, however, a legal lien upon personal property is called a hypothec. Consult the authorities referred to under CIVIL LAW.

HYPOTHESIS (Gk. ὑπόθεσις, *supposition*, from ὑποτίθεναι, *hypotithenai*, to place under, from ὑπό, *hypo*, under + τίθεναι, *tithenai*, to place). In scientific procedure, a conjecture as to the explanation of any phenomenon, made provisionally and used as a starting-point for further investigation and theory. Thus in studying the motion of the moon Newton made the hypothesis that its divergence from the straight line was due to the same cause that brings an apple to the ground when released from the stem. He then proceeded to find whether the rate of fall in the two cases was expressible by some single formula. After years it was discovered that this was the case. It is now quite

generally admitted that an hypothesis, to have any value, should be based on some known law, and should be the conjectural extension of that law to a new sphere under investigation. Thus Newton worked from the known law of gravitation on the surface of the earth. The hypothesis of a luminiferous ether is based on the known laws of the motion of fluids, etc. Such a known law is called a *vera causa*. Some logical purists insist not only that the point of departure must be a known law, but that the extension of this law to another sphere may not be legitimately made unless its extension is at least conceivably verifiable by sense-perception. Thus they claim that the existence of the luminiferous ether is not a rigidly logical hypothesis, because the ether is thought of as having no properties perceivable by our senses without the use of instruments that no one even supposes capable of construction. Such an interpretation of the *vera causa* is, however, not in accordance with actual scientific practice, nor is it theoretically justifiable. It would rule out the hypothesis of the prevalence of gravitation even within the solar system, as no one ever did or presumably ever will perceive with any of his senses the action of gravitation except as a *movement*, and this movement is the thing to be explained by the law of gravitation, and not its further perceptual justification. An hypothesis is a provisional attempt to think things together as instances of the prevalence of the same law; and all that is necessary to make an hypothesis valuable is that it should furnish some conception which shall at least provisionally unify experience by reducing it to law. A distinction is often made between theory and hypothesis. A theory is said to be a verified hypothesis. This distinction is one of degree, not of kind. Even an hypothesis which has been 'verified' may be overthrown by new facts; so that it is rather the fashion nowadays to speak of all the conceptions of natural science as 'working hypotheses,' and to say that they are accepted only tentatively as the basis for further investigations and for further theorizing on results. As to whether there is any unconditional element in scientific conceptions, see KNOWLEDGE, THEORY OF. For bibliography of the subject, see the works cited in the article LOGIC.

HYPOTHETICAL QUESTION. A legal term for the proper form of question to be asked an expert witness. See EXPERT EVIDENCE.

HYPOXANTHIN, hī'pō-zān'thīn (from Gk. ὑπόξανθος, *hypoxanthos*, yellowish-brown, from ὑπό, *hypo*, under + ξανθός *xanthos*, yellow), or SARKIN, C₈H₄N₂O. An organic substance chemically allied to xanthin, which it usually accompanies. If given to birds, hypoxanthin is excreted largely in the form of uric acid; it is not known by what organ this transformation is effected—probably not by the liver. See XANTHIN.

HYPISIPYLE, hīp-sīp'ī-lē (Lat., from Gk. Ἥψιπύλη), The daughter of Thoas of Lemnos, whom she saved when the women of the island killed all the other men in revenge for their neglect. When the Argonauts came to Lemnos, Hypsipyle became by Jason the mother of two sons, Euneus and Nephronus or Thoas. Having been driven out because she had spared her father, Hypsipyle became the nurse of Opheltus, son of the Arcadian King Lycurgus. When

Adrastus and the other heroes were on their way to the siege of Thebes, they met Hypsipyle in the Nemean forest and begged her to show them a spring, and during her absence the boy was killed by a serpent. For this neglect she was imprisoned, but was rescued by her sons. The funeral games instituted by the heroes for the dead Opheltes were the origin of the Nemean Games.

HYP'SISTA'RIANS (from Gk. Ἱψιστάρηοι *Hypsistarioi*, Hypsistarians, from ἵψιστος, *hyp-sistos*, most high, from ἕψι, *hypsi*, on high). A small sect which existed in the fourth century in Asia Minor. It seems to have been monotheistic and Jewish in some of its features, and in others Christian, debased by Sabean elements. Thus it taught the unity of the Deity, and His universal dominion; that sacrifices and other phenomena of external worship were to be given up; at the same time it enjoined Sabbath observance and the dietary laws of the Jews.

HYSOM'ETER (from Gk. ἕψι, *hypsi*, on high + μέτρον, *metron*, measure), or THERMO-BAROMETER. An instrument to determine the atmospheric pressure and altitude at a given point by ascertaining accurately with a thermometer the temperature at which water boils. The boiling-point of water diminishes with a decrease in the pressure of the atmosphere, and this always comes with an increase in elevation above the sea-level. With the barometer (q.v.) it is possible to measure heights with considerable exactness; consequently, by knowing the atmospheric pressure corresponding to the temperature at which water boils, we are able to find the altitude. The apparatus to determine the boiling-point was first used by Wollaston in 1816, and consisted of a metal vessel containing a delicate and carefully tested thermometer with graduations extending from 80° to 100° C., which could be read to .01 of a degree. There is a spirit lamp to boil the water, and the instrument is far more portable than a mercurial barometer. The relation between the boiling-point of water, the height of the barometer, and the altitude is shown in the following table, which is calculated for a mean temperature:

be measured, and by barometric observations and calculations. The second of these methods of measurement gives exact heights, but the other two methods give approximate heights only. To illustrate the application of the three methods of measurement a supposititious case will be assumed and each method applied to its solution. Let x represent the top of a mountain whose heights above the base s it is desired to measure by trigonometrical observation, and whose distance mi

from the point of observation is known. The instrument is set up at y and by it the vertical angle imx is measured. This gives the observer a triangle mix , of which the side mi , the angle imx , and the angle mx (90°) are known, and from these data he can readily calculate the length of the side ix . To this dimension in order to get the height of the mountain he must add the dimension io , which is the height of the instrument above the ground, and the dimension os , which is due to the curvature of the earth. The dimension io is easy to determine, but os has to be calculated. Now the curvature of the earth is 0.667 foot, or nearly 8 inches in one mile, and increases as the square of the distances, being thus 32 inches in two miles and 72 inches in three miles. If then the distance mi is one mile the dimension os is 0.667 foot. Owing to the refraction of the atmosphere, however, the point x always appears to the observer to be higher than it really is, and at an average this deceptive elevation amounts to one-seventh of the curvature of the earth, and, like the latter, varies with the square of the distance. For a distance mi

Bolling-point (Centigrade).	100°	99°	98°	97°	96°	95°	94°	93°	92°	91°	90°
Height of barometer (mm.).	760	732.2	707.1	681.9	657.4	633.7	610.6	588.3	566.7	545.8	525
Elevation (in meters).....	0	305	610	920	1225	1540	1850	2165	2485	2800	3120

From this table it will be seen that a variation of .1° in the boiling-point at sea-level corresponds to a decrease in the height of the barometer of 2.7 mm., at an elevation of 1000 meters 2.5 mm., at 2000 meters 2.2 mm., and at 3000 meters 2 mm. An approximate rule to determine the elevation of a place by this method, expressed in feet and Fahrenheit degrees, is to multiply the difference between the observed boiling-point and 212° by 550, if the height is less than half a mile, and by 560 if it is in excess of that amount, these factors representing the average amount of altitude corresponding to 1° at 70° Fahrenheit.

HYSOM'ETRY. The art of measuring heights on the earth's surface. Such measurements are performed by means of trigonometrical observations and calculations; by running a line of precise levels starting from mean sea-level and terminating at the point whose height is to

equal to one mile, then, the dimension os is 0.667 foot, due to curvature minus one-seventh of 0.667 foot due to refraction, which makes it 0.5714 foot. In careful geodetic work the calculations for refractions and curvature are made with much more precision than is done above and the instrument observations are made with exceeding care, but the general method is the same. At best such measurements are only approximate, since the determination of the refractions, which depends upon the atmospheric conditions, can be approximate only. To measure the height as by leveling, the observer starts from mean sea-level and runs a line of precise levels inland, which terminates at the point x , and establishes accurately its height above mean sea-level. The same result may be accomplished by starting the line of levels to x from a point on a line of levels previously run from mean sea-level. The method of running precise levels differs from ordinary spirit level-

ing (see LEVEL, LEVELING) only in the greater accuracy of the methods and instruments used.

For measuring heights by barometric observations the form of barometer known as the aneroid barometer is usually used. Mercury barometers may of course be used, but usually they are not, owing to the greater difficulty in transporting them and of keeping them in proper working order. The adaptability of the barometer as an instrument for measuring heights depends upon the facts that the mercury column falls as the atmospheric pressure decreases, and that the atmospheric pressure decreases gradually as we ascend above the sea-level. As a rough average it may be assumed that the barometer falls 1.10 inches for about 106 feet rise. To measure the height s , therefore, barometer readings are taken simultaneously at s and at x , and from them the difference in height of s and x may be found by the formula,

$$d = 6000 (\log. H - \log. h) \left(1 + \frac{T + t - 60}{900} \right)$$

in which d equals the difference in height; H and h are the two readings, and T and t are the temperature of the two stations in degrees Fahrenheit. In the most accurate barometric work various refinements of observation and calculation are introduced, but the general principle of the operation is the same as has been described. Barometrical measurements of heights are only approximate, since the moisture and dryness of the air, the wind, and various other atmospheric phenomena cause variations in the readings recorded, and no formula can possibly be devised that will embrace all these sources of error. Simultaneous observations, with barometers adjusted to the same standard, give the most reliable results. For a full discussion of the methods of measuring heights by trigonometrical leveling, precise leveling, and barometric observations, the reader may consult Johnson, *Theory and Practice of Surveying* (New York, 1900). See SURVEYING.

HYRACEUM (Neo-Lat., from Gk. *ὑραξ*, *hyrax*, mouse; connected with Lat. *sorex*, shrew-mouse). A peculiar substance found in the crevices of the rocks of Table Mountain, Cape of Good Hope. It is one or more of the excrements of the Cape hyrax (*Hyrax capensis*). Hyraceum is a blackish-brown viscid material, not unlike soft pitch, having a strong and offensive taste, not unlike castoreum, for which it has been used as a substitute in medicine, though now obsolete. At one time so large a quantity was found as to suggest the idea of its being used as a manure, but the supply was soon exhausted.

HYRACODON (Neo-Lat., from Gk. *ὑραξ*, *hyrax*, mouse + *ὀδόν*, *odous*, tooth). A primitive fossil rhinoceros found in the Miocene rocks of Western America and Europe. See RHINOCEROS.

HYRACOTHERIUM (Neo-Lat., from Gk. *ὑραξ*, *hyrax*, mouse + *θηρίον*, *thērion*, diminutive of *θήρ*, *thēr*, wild beast). An extinct four-toed ungulate mammal of the size of a fox, generally considered as an ancestral horse, remains of which are found in the Lower Eocene deposits of Europe and Western North America. See HORSE, FOSSIL.

HYRAX (Neo-Lat., from Gk. *ὑραξ*, mouse). A general name for a suborder (Hyracoidea) of small peculiar ungulate mammals comprised in a

single genus and family (Procavia, Procaviidæ), whose species are locally called 'conies,' 'damans,' and 'rock-rabbits.' Some fourteen species are known in Southwestern Asia, and in Eastern and Southern Africa. Although having the size and superficial appearance of rodents, and long so considered, Cuvier pointed out their essential agreement, in dentition and anatomical characters, with the ungulates. The molars are quite similar to those of the rhinoceros, but the upper jaw has two incisors curving downward, and during youth two very small canines, the lower jaw four incisors without canines. The skull, also, and other bones resemble those of the rhinoceros. The muzzle is short and pointed; the ears short and round. The ribs are more numerous than even in the rhinoceros—21 pairs, a number exceeded in no quadrupeds except the sloths, whereas no rodent has more than 15 pairs. The toes are united by the skin, as in the elephant and rhinoceros, and are round and soft, merely protected in front by a broad nail, which does not reach the ground. The legs are short. The tail is a mere tubercle. Their bodies are clothed with thick, uniformly dark-brown hair, except that it is discolored around a curious gland near the middle of the back, which is naked in several species.

The habits of all the conies (except the tree-hyraces) are much alike. The typical Abyssinian species live in rocky or stony places, in communities, like rabbits, and make their homes in holes under rocks or in a rocky watercourse. They seem to be mainly nocturnal and feed at night or in the early morning on leaves and young shoots of trees and bushes. In daytime they lie on rocks in the shade until toward noon, when they are likely to retire to their holes. They are very timid, and disappear when they are in the least danger. The only sound they seem to make is a shrill squeak when suddenly alarmed. This description will remind the reader of the closely similar behavior of the pikas (q.v.) of the Rocky Mountains, often called 'conies.' Mosely speaks of 'a short, hissing noise,' as the alarm cry of the Cape hyrax. All climb about smooth rocks with wonderful agility, which is explained by soft, almost suction-giving pads on the soles of their feet. (Consult Schweinfurth, *Heart of Africa*, vol. i., Leipzig, 1878.) The species longest known is the only Asiatic one (*Procavia Syrica*), which inhabits Arabia, Syria, and Palestine, and is the animal called 'cony' in the ordinary version of the Bible, for which the Syrian name is 'daman.' It was among those animals prohibited to the Israelites under the mistaken belief that they chewed the cud; but they are now eaten by the Arabs, though not regarded as very palatable by Europeans. Several species inhabit Abyssinia and East Africa, down to Mozambique; and Cape Colony and Natal are the home of a kind (*Procavia Capensis*) having very fine soft brown fur, with the spot on the back black, which is familiar to the English colonists under the names 'rock-badger' and 'rock-rabbit,' and to the Dutch as 'dasse.' They are often tamed as pets.

Three species of the genus Dendrohyrax, which live in East and West Equatorial Africa, differ decidedly from other conies by the habit of spending their lives and making their breeding nests in holes in trees. These three species agree in that the females have but a single pair of teats (other hyraces have three pairs), and the West Coast one

is remarkably large and furry, so that its skin is of much value as material for cloaks.

Consult for systematic revision of the order, Thomas, "On the Species of the Hyracoidea," in *Proceedings of the Zoological Society of London* (London, 1892).

HYRCA'NIA (Lat., from Gk. Ἵρκανία, *Hyrkania*). An ancient district of Asia, south of the Caspian Sea (anciently called *Hyrcaunum Mare*), bounded on the southeast by the Sariphi Mountains (now Elburz), which separated it from Parthia, and on the west by Media. It corresponded to the modern Mazanderan and Astrabad. The district is called *Vehrkāna* in the *Avesta*, a name which recalls the ancient name for wolf (*vahrka*). The region was wild and heavily wooded, and not generally fertile with the exception of the valleys among the hills, which produced corn, oil, and wine.

HYRCA'NUS (Lat., from Gk. Ἵρκανός, *Hyrkanos*). The name of two Jewish high priests and princes of the Asmonean family. (1) JOHN (Heb., Johanan) HYRCANUS, son of Simon Maccabæus, was, during the lifetime of his father, governor of the seacoast, with his seat in Gazara, and defeated Cendebeüs, the Syrian general. When Ptolemy succeeded in murdering Simon, an attempt was made also on Hyrcanus, but he escaped and obtained control of Judea (B.C. 135). At the beginning of his reign Antiochus Sidetes invaded the country, and Hyrcanus was compelled to sue for peace after having been shut up in Jerusalem. Antiochus showed himself inclined to be sparing and Jerusalem escaped destruction. Shortly afterwards Judea assisted Antiochus in a campaign against his brother, Demetrius Nicator, in which, however, Antiochus lost his life. Demetrius's short reign marked a period of internal dissensions in Syria, which enabled Hyrcanus to establish the independence of Judea. In this his alliance with Rome (a policy inaugurated by his uncle Judas and followed by his father Simon) was of material help. After the fall of Demetrius and his rival Alexander Zabina, Hyrcanus began (B.C. 123) the conquest of troublesome neighbors. First attacking Medaba in the Jordan district, he marched toward Schechem and succeeded in destroying the Samaritan temple on Mount Gerizim (c. 120 B.C.), though the Samaritans were not brought to submission till c. 109 B.C. Next the Idumæans were conquered and compelled to accept the Jewish faith. Even the trans-Jordanic peoples felt the power of Hyrcanus, and under his strong rule Judea reached the highest point of its power and equaled the Judea of Solomon's day. Coins were minted with the inscription, "Johanan High Priest and Chief of the Commonwealth of the Judeans." Like the Maccabees before him, Hyrcanus was a Pharisee, but because of an aspersion cast upon his mother, who had been a prisoner of war, he became a Sadducee, and the latter part of his reign was involved in this factional difficulty. He died in B.C. 105 and left five sons—Aristobulus, Antigonus, Alexander, Absalom, and another whose name is not known—two of whom, Aristobulus I. and Alexander Jannæus, governed with the title of king. (2) HYRCANUS II., son of Alexander, and grandson of the preceding. On the death of his father, B.C. 79 (or 78), he was appointed high priest by his mother, Salome Alexandra, who ruled Judea herself for several years. After her death (B.C. 69),

he became temporal ruler also; but his younger brother, Aristobulus, an abler and more energetic man, seized the government, and forced Hyrcanus to make an agreement by which Aristobulus was to rule and Hyrcanus be only high priest. Induced by the Idumean Antipater, he broke this agreement, and, aided by Aretas, King of Arabia Petraea, he endeavored to win back his dominions. Scæurus, the legate of Pompey, was bribed by Aristobulus, and Aretas had to abandon the siege of Jerusalem. By counter bribery on the part of Antipater, Hyrcanus obtained the control. Pompey took away the kingship from Hyrcanus, leaving him high priest, and proclaimed Antipater governor of the country. Aristobulus and his two sons, who had been carried away captives, tried at different times to wrest the power from Antipater, but failed. Finally, in B.C. 47, Cæsar made Hyrcanus tetrarch and high priest and Antipater was made procurator. Those around Hyrcanus and Hyrcanus himself began to suspect Antipater, and, while banqueting with Hyrcanus, Antipater was poisoned (B.C. 43), though Hyrcanus was not involved in this act. In B.C. 40 Antigonus, son of Aristobulus II., with the help of the Parthians, invaded the land, captured Hyrcanus by treachery, cut off his ears, and thus disqualified him for the office of high priest, and carried him off to Seleucia, on the Tigris. Some years later Herod, son of Antipater, obtained supreme power in Judea, and invited the aged Hyrcanus home to Jerusalem. For some time he lived in ease and comfort, but, falling under suspicion of intrigues against Herod, was put to death (B.C. 30). Consult Grätz, *Geschichte der Juden* (Berlin, 1854-75), vol. ii., chaps. i.-iii.

HYRIEUS, hî-rî'ê-üs or hir'î-üs (Lat., from Gk. Ἵριεύς, *Hyræus*, Οὐριεύς, *Ouriæus*). Son of Poseidon and King of Hyria in Beotia, for whom Agamedes and Trophonius built a treasure-house. In this, one stone was so arranged that it could be removed from the outside, thus enabling them to plunder the treasury at will. When Agamedes was finally caught in a trap set by the King, Trophonius cut off his brother's head to prevent discovery, and fled to Lebadea, where he was swallowed up by the earth. (See TROPHONIUS.) The story is that of Rhampsinitus in Herodotus, and is found as a folk-tale in many lands, and in many variations.

HYRTL, hêr't'l, JOSEPH (1810-94). An Austrian anatomist, born in Eisenstadt in Hungary. He was educated at the University of Vienna. He became professor of anatomy at Prague in 1837, and filled a similar position at Vienna from 1845 to 1874. His last years were spent in retirement and almost total blindness. Hyrtl endowed several charities in Vienna. His high rank in the scientific world was recognized before his death by the erection of a colossal marble statue in the arcade of the University of Vienna (1889). His researches dealt with comparative anatomy, especially that of fishes, the construction of the ear and of the testicles, and above all, with the subject of angiology, in which his great discoveries were made. Besides monographs on such subjects, including *Untersuchungen über das Gehörorgan des Menschen und der Säugetiere* (1845), *Vergleichende Angiologie* (1850), and *Die Blutgefässe der menschlichen Nachburt* (1870), he wrote on general anatomy, *Lehrbuch der Anatomie des Menschen* (1846; 20th ed. 1889), and a valuable and original *Handbuch der*

topographischen Anatomie (1847; 7th ed. 1882); and on the history of anatomical nomenclature, *Das Arabische und Hebräische in der Anatomie* (1879), *Onomatologia anatomica* (1880), and *Die alten deutschen Kunstworte der Anatomie* (1884). But his most important work was as a technical anatomist. He had great practical skill, devised special preparations for the dissection of various organs and a microscopical preparation to show capillary vascular network of the lesser organs, and wrote a *Handbuch der praktischen Zergliederungskunst* (1860).

HYSLOP, his'lop, JAMES (1798-1827). A Scottish poet, born and brought up on a farm in Kirkconnel Parish, Dumfriesshire. He was entirely self-taught, but while in the employ of a sheep-farmer in Muirkirk (1812-16), he became imbued with the Covenant associations of Airdsmoss, which inspired his best poem, "The Cameronian's Dream" (*Edinburgh Magazine*, 1821). Besides other poems, he published in the same periodical his accounts of a three years' voyage to South America, whither he was taken as tutor on a war-ship, having had previous experience of teaching in Greenock. After spending three years ashore, in teaching and journalism, Hyslop embarked again as tutor on H.M.S. *Tweed*, but within a month died of fever near the Cape Verde Islands, and was buried in the Atlantic. His poems, eighty-two in all, were published in Glasgow (1887), and two years afterwards his masterpiece was set to music by Hamish McCunn (q.v.).

HYSSOP (AS. *ysope*, from Lat. *hyssopus*, *hyssopus*, from Gk. ὕσσωπος, *hyssōpos*, ὕσσωπον, *hyssōpon*, hyssop, from Heb. ἔזֶב, sort of aromatic plant), *Hyssopus*. A genus of one species of the natural order Labiatae. The common hyssop (*Hyssopus officinalis*), a native of Southern Europe and the East, and naturalized in the United States, is a half-shrubby evergreen plant, about 1½ feet high, with beautiful blue flowers arranged in one-sided whorled racemes. It has long been cultivated for its aromatic leaves, young shoots, and seeds, which are sometimes used to season salads and soups, but more generally in a dried state as a stomachic and carminative. The virtues of hyssop depend on a volatile oil. A syrup made from the leaves is

HYSSOP.

sometimes used for colds, but the plant is less in favor than formerly. It has been supposed that the hyssop of the Bible is some species of Phytolacca, as *Phytolacca acinosa*, a native of the Himalayas; but the common caper has also been so considered. Hedge-hyssop is *Gratiola officinalis*.

HYSTASPES, his-tās'pēs (Lat., from Gk. Ὑστάσπης). A name found several times in Persian history. (1) It was the name of the father of King Darius I., and according to the Old Persian inscriptions he was Governor of Parthia, and his father's name is given as Arshāma, which agrees also with Herodotus. The name Hystaspes, or

Vishtaspa, of the inscriptions, is identical in form with Vishtaspa, the name of Zoroaster's patron, in the *Avesta*; but there is no historical ground for identifying the two personages, as has been erroneously done by some. The allusion to Hystaspes in Lactantius in the Church Fathers seems to have reference to Zoroaster's patron. Consult Jackson, *Zoroaster, the Prophet of Ancient Iran* (New York, 1898). (2) **HYSTASPES**, the son of Darius I. and Atossa, was a brother of Xerxes, and commanded a force of Bactrians and Sææ in the latter's army.

HYSTASPES. An ancient author, according to the testimony of several of the Church Fathers. He is supposed to have been a *magus* who wrote a book called *Vaticinia*. Of his life or date we are entirely ignorant. Two passages regarding his writings occur in Justin Martyr, one saying that he foretold the destruction of the world by fire, as the Sibyl did, and the other mentioning the book in connection with the Sibylline works and the prophetic books of the Old Testament as loathed by the evil demons. There is in the writing of Clement of Alexandria a reference of doubtful meaning, but usually construed to say that the work was in existence in the second century, and that it referred to the coming of the Messiah and to His kingdom; and another in Lactantius, where Hystaspes, like the Sibyl, is said to predict the destruction of Rome, and is quoted as describing the wickedness of the last time, its misery, and the final destruction of the unjust. The name points to Persian origin; but the possibility that it was merely the name of the work, as seems evident from the passage in Clement, when the choice would be due to the fame of the Magians, makes the origin of the work uncertain. Even its existence cannot be considered proved, much less that of an author called Hystaspes. Consult Kuhn, "Eine zoroastrische Prophezeiung in christlichem Gewande," in *Festgruss an Roth* (Stuttgart, 1893).

HYS'TERE'SIS (Neo-Lat., from Gk. ὑστέρησις, deficiency, from ὑστερεῖν, *hysterein*, to be behind, from ὑστέρος, *hysteros*, latter; connected with Skt. *ud*, AS. *ūt*, OHG. *ūz*, Ger. *aus*, Eng. *out*). The name given a phenomenon in the magnetization of magnetic substances, which was first observed by Warburg, in 1881, and later, in 1885, independently by Ewing, to whom the name is due. It is found that if a rod of iron—or any magnetic substance—is placed in a magnetizing helix, and the electric current through this gradually increased to a certain value, and then slowly decreased, the magnetic properties of the rod do not follow the same course when the magnetizing current is decreasing as they did when it was increasing. All the properties due to the magnetization—the induction, the change in length, the change in elasticity, etc.—lag behind the magnetizing force. That is, if these properties have certain values for a given magnetizing force when the current is increasing, they will not return to the same values, when, as the current is decreasing, the same magnetizing force is reached; but this force must be still further decreased, or even reversed, before these same values are again obtained. The amount of hysteresis varies greatly with different qualities of iron and steel, and with different substances. Its value is most important from a commercial

standpoint, because each time the magnetization of a piece of iron is reversed—as happens at each alternation of an alternating electric current—there is a definite amount of energy lost in heating the iron, and this amount depends on the hysteresis. There is another kind of hysteresis which is quite different. If a given magnetizing current is applied suddenly to a rod of iron, it may not attain its full magnetism instantly; and the fact that time is required to reach this is said to be due to 'viscous' hysteresis or 'magnetic lag.' For a full discussion of the importance of hysteresis, and of the molecular theory, which explains it, consult Ewing, *Magnetic Induction* (London, 1891). See MAGNETISM.

HYSTERIA (Lat., from Gk. *ἰστέρα*, *hysterā*, womb; connected with Lat. *uterus*, womb, Skt. *udara*, belly). A diseased state of the nervous system characterized by a great variety of symptoms denoting disordered nervous functions. It was formerly considered to be disease of the womb, and hence came its name; and it was at one time thought to be trifling and under the control of the will of the patient. Both these ideas are erroneous; for hysteria is frequently found among males, and is a disease of very serious nature, involving not only the brain and spinal cord, but also the peripheral nerves and the sympathetic system. While comparatively rare among Anglo-Saxons, it is said to be widespread among Latin nations and Scandinavians, being especially frequent among the French. Hysteria arises from predisposing causes of an hereditary nature, such as parental alcoholism, epilepsy, insanity, or hysteria, as well as injudicious training or education in youth, with depressing influences, as of surroundings. Exciting causes are overwork, worry, excessive responsibility, sexual excesses, profound or prolonged grief, and emotional or other mental shock, and lastly severe trauma, such as a railway accident, fall, or blow may produce. Hysteria is found among the working classes as well as among the idle, wealthy, and self-indulgent, who have never learned self-control or practiced self-denial. Two forms of hysteria are described, for reasons of convenience rather than for scientific reasons, as follows: (1) The form of the disease in which the patient is excitable, emotional, and perverse without cause and without intention, and has disturbances of sensation, motion, circulation, secretion, and excretion; usually falling into this condition after strain or stress, a disappointment, or great fatigue. (2) The form of the disease in which the patient has convulsive attacks, known by some as *hysteria major*, in contradistinction to the former variety, which is sometimes called *hysteria minor*. The patient may suddenly sink to the floor, become partly unconscious and rigid, and, either turning pale or remaining rosy, may breathe violently for a few minutes, and then recover perfect consciousness. Or the patient may sink to the floor after experiencing a sharp pain or an aura of some sort, uttering a little cry or calling for help, with pale or ashen face, and dilated pupils. Convulsions follow rigidity, resembling epileptic convulsions; there may be frothing at the mouth; after a short relaxation, during which the patient gasps, a repetition of the convulsions occurs, with absolute unconsciousness. Then the patient rolls, tossing the arms and legs about, and assum-

ing various rigid positions, occasionally bending the head forward, doubling up the body, clenching the fists, and folding the arms across the chest or the abdomen, or bending the head and feet backward in the pose called *opisthotonos*. After several repetitions of such actions, the patient remaining unconscious, relaxation occurs with a short period of repose, followed at once by attitudes of petition, depression, gayety, etc., the patient being delirious and talking of past events or imaginary encounters, not recognizing, though speaking with, those around her, and controlled by hallucinations of sight and hearing. In a varying time the delirium ceases and the patient becomes conscious, exhausted, and complaining of tenderness in some part of the body, passes a large quantity of pale, limpid urine, and generally resumes her occupation or goes about her house as if nothing had happened. The whole attack may last from 15 to 50 minutes. If these attacks are frequently repeated, the patient's strength is rapidly undermined, and she may be confined to her bed. The form of hysteria with convulsive seizures is often called *hystero-epilepsy* (q.v.)—an unfortunate and misleading term, which should not be used. It really means a combination of hysteria and epilepsy in the same person, which is possible, but rare.

Hyperalgesia confined to certain spots, circumscribed areas of anæsthesia, or anæsthesia of a half of the body, hysterical deafness, hysterical blindness, twitching of muscles, or contractures of groups of muscles, the '*globus hystericus*,' or feeling of a lump in the throat, spasmodic closure of the glottis with pseudo-asthma, retention of urine, paralysis (either hemiplegia or paraplegia), palpitations of the heart, flushing of face, neck, and scalp, with sweating, coldness of extremities or of the entire body, œdema of the extremities, menstrual irregularities, and vomiting of fluid, are among the symptoms of the disease. Mental changes are certain to occur, amounting only to lack of balance and of will power, or impairment of memory in some, in others also recurring melancholy, rapid emotional play, lack of power of application, impaired judgment, diminished regard for truth, and craving for sympathy. The last two symptoms are the basis for the peculiar actions of 'fasting girls;' self-mutilating martyrs; alleged sufferers who feign paralysis, pain, tumor, stone in the bladder, etc., and who eagerly submit to surgical operations.

Hysteria is not dangerous to life. Recovery is rare in prolonged cases, though proper treatment may be followed by cure in cases in which symptoms have reappeared upon provocation many times in the course of a year or two. Harshness used on the erroneous supposition that willfulness or perversity is at the foundation of hysteria always does harm, and is unjustifiably brutal. Relief of strain and of worry, change of environment, removal of the patient from home and from accustomed companions in the family, and treatment for indigestion, restoration of function, and nerve-building, form the principal features of remedial agencies. Will power must be systematically cultivated, and moral support be given to the patient. Massage, electricity, diet, baths, and sometimes a rest cure, are efficacious. See INSANITY; HYPNOTISM; TEMPERAMENT. Consult: Janet, *Etat mental*

des hystériques: les accidents mentaux (Paris, 1894); Richer, *Paralysies et contractures hystériques* (Paris, 1892).

HYSTERICS. See HYSTERIA.

HYSTERO-EPILEPSY. An improper, though frequently employed, term for a variety of hysteria, in which convulsive attacks occur, of an epileptoid nature. It is not a form of epilepsy, though not differentiated from that disease till Charcot, of Paris, gave an accurate and intelligent description of hysteria. See HYSTERIA. Consult: Feré, "Notes pour servir à l'histoire de l'hystéro-épilepsie," in *Archives de Neurologie* (Paris, 1882).

HYSTEROTOMY. See CÆSAREAN OPERATION.

HYTHE, hith (AS., haven). A market-town in Kent, England, 14 miles south of Canterbury. Hythe is a favorite seaside summer resort, and the seat of the national school of musketry (Map: England, H 5). It has an interesting church, partly Norman and partly Early English. Under the chancel is an extraordinary collection of human skulls and bones—many of the skulls having deep cuts in them; their age and origin are uncertain, but they are reputed to be the remains of Danes slain in a battle fought about 1000. Hythe owns its water-works. It is one of the Cinque Ports, but through the silting of its harbor has become removed half a mile from the coast. Population, in 1891, 4347; in 1901, 5600.

HYTU, ê-tō'. See ITU.

I

I The ninth letter in the alphabets of Western Europe. Its form in the Phœnician and early Greek alphabets, from which it is derived, somewhat resembled a narrow upright Z. (See ALPHABET.)

After various modifications this was straightened into its present shape. The Greek designation, *iota*, of the letter is an adaptation of its Phœnician name *yod*, 'a hand.' The dot over our small *i* did not come into use until the fourteenth century.

PHONETIC CHARACTER. The 'short i' in English is described as a high-front or palatal vowel, made by the blade of the tongue approximating the forward part of the palate or roof of the mouth—the sound heard in *it*. When approximated so far as to make a partial contact or closure, this passes over into a semi-vocalic or consonantal *y*, as in *you* (*iu*), although in English the *y* is often not written, e.g. *minion*, *million*; other variations may be noticed in *charity*, *bird*. The corresponding 'long i,' common in European languages, is found in *machine*, *police*, *pique*. This is sometimes known as the 'long e' sound in *receive*, *believe*, *seat*. The sound commonly called 'long i' in English, *wide*, *ice*, and the name of the letter itself (*i* pronounced *eye*), is really a diphthong, like *aisle*, made by premature opening of the lengthened vowel under stress-accent. This phonetic change from the older character of the sound was going on during the Middle Period of transition into the Modern English, so that it is now a phonetic rule that Anglo-Saxon or Old English *i* regularly calls for a diphthongal long *i* in modern English, e.g. OE. *wid*, *mil* = Mod. Eng. *wide*, *mile*. Historically the linguistic character of *i* is fairly stable, Indo-Germ. **uidhewā*, Skt. *vidhāvā*, 'widow,' Lat. *vidua*, OChurch Slav. *vidora*, AS. *widewe*, Eng. *widow*; or Gk. *oînos* (for *foînos*), 'wine,' Lat. *vinum*, A.S. *wîn*, Eng. *wine*. For the connection of I and J, see J.

As a *Symbol*.—I in the Roman notation stands for 1; in chemistry I = iodine; in logic I is the symbol of the partial affirmative proposition.

I'ABA'DU IN'SULA (Lat., translation of Gk. *Ἰαβαδίου νῆσος*, *Iabadiou nêsos*). According to Ptolemy (vii. 2), a large island in the Indian Ocean, southeast of the Golden Chersonese and southwest of the Isles of Satyrs; said to be very fertile and to contain much gold. The island meant was probably the modern Java, though Humboldt and others regard it as Sumatra.

The name, according to Ptolemy, signified *Island of Barley*. The capital was named *Argyre* (*Ἀργυρή*).

IACCHUS, *i-äk'kü's* (Lat., from Gk. *Ἰακχος*, *Iakchos*). A title used of Bacchus in the Eleusinian Mysteries, in which he was regarded as the son or husband of Demeter, or the son of Persephone. He was thus distinguished from Dionysus, the son of Zeus and Semele, but was sometimes called his son, and at times identified with him.

IACHIMO, *i-äk'i-mö*. In Shakespeare's *Cymbeline*, a Roman libertine who on a wager conceals himself in Imogen's room and carries away apparent evidence of her unchastity.

IAGO, *é-ä'gö*. A Spanish and Portuguese form of the name James, now occurring only in the combination *Santiago* (Saint James).

IAGO. In Shakespeare's *Othello*, a calculating and malignant character, the ancient of Othello, whom he secretly hates while retaining his confidence. In revenge for imagined wrongs he skillfully concocts evidence which convinces Othello of the unfaithfulness of his wife, Desdemona. Othello in jealousy murders Desdemona, and stabs Iago when the plot comes to light.

IALYSUS (Lat., from Gk. *Ἰάλυσος*). An ancient city on the island of Rhodes, possibly a Phœnician settlement, certainly an important place in the Mycænæan period. It was later colonized by Dorians from Argos, and formed with Lindus and Camirus the Rhodian tripolis. Even in the Homeric poems it is famed for its wealth. In B.C. 408 it united in the foundation of the city of Rhodes (q.v.). Some remains are still traceable near the modern village Ialiso. A necropolis at Ialysus has yielded many Mycænæan vases and other ornaments.

IAMBIC VERSE (Lat. *iambicus*, Gk. *ιαμβικός*, *iambikos*, from *ιαμβος*, *iambos*, iambus, from *ἰαπτειν*, *iaptein*, to assail with words). A term applied in classic prosody to verses consisting of the foot or metre called *iambus*, made up of two syllables, of which the first is short, and the second long (—). Archilochus (q.v.) is the reputed inventor of iambic verse. The term is also applied by analogy to English verse wherein stressed and unstressed syllables correspond to a long syllable followed by a short syllable in Latin or Greek verse. The English language runs more easily and naturally in this metre than in any other.

The stäg | at éve | had drñnk | his fill.

See METRE; VERSE.

IAMBlichus, í-ám'bli-kūs (Lat., from Gk. Ἰάμβλιχος). (1) A Greek writer of the second century A.D., a Syrian by birth, and the author of the earliest Greek romance of which considerable remains have survived. It was entitled *Babyloniaca*, and described in thirty-five books the remarkable adventures of two lovers, Rhodanes and Sinonis. The original romance has perished, but large extracts are preserved by Photius (chap. xciv.). (See PHOTIUS.) There is no great merit in the style, and the plot is full of magic.

(2) A Neo-Platonic philosopher, born at Chalcis, in Cœle-Syria, about A.D. 283. He lived mostly at Alexandria. He studied under the Neo-Platonists Anatolius and Porphyrius, and became deeply imbued with the teachings of Plotinus, which he expounded for many years to a large circle of hearers at Alexandria—but with a considerable admixture of his own peculiar views. He died at Alexandria, about A.D. 330. His doctrines were a mixture of Pythagorean and Platonic ideas, with much superstition and magic, and the supposed manifestation of God by ecstasies, and a communication with the spiritual world by means of ceremonies. He was a voluminous writer, but most of his writings are lost. Perhaps they were destroyed by the Emperor Constantine, who ordered the burning of the works of Porphyrius. Of his work, *Περὶ Πυθαγόρου Ἀρέσεως*, in ten books, we possess four complete sections, viz.: *On the Life of Pythagoras* (*Περὶ βίου Πυθαγορικοῦ*), edited by Nauck (Saint Petersburg, 1884); *Exhortation to Philosophy* (*Προρρητικὸς λόγος εἰς φιλοσοφίαν*), ed. by Pistelli (Leipzig, 1888); *On Mathematics* (*Περὶ μαθηματικῆς Ἐπιστήμης*), ed. by Festa (Leipzig, 1891); and an introduction to the *Arithmetic* of Nichomachus, ed. by Pistelli (Leipzig, 1894). There is also in existence a work on *Mysteries* (*Περὶ μυστηρίων λόγος*), which is attributed to Iamblichus; but the attribution has been questioned, perhaps, without reason. On Iamblichus and his philosophy, consult: Chaignet, *Histoire de la psychologie des Grecs*, vol. v. (Paris, 1893); and Zeller, *History of Greek Philosophy* (New York, 1889).

IANTHE, í-án'thê. (1) In Roman mythology, a girl to whom Iphis was betrothed (Ovid, *Met.*, ix. 12). (2) A character in Sir William Davenant's *The Siege of Rhodes*. (3) Lady Charlotte Harley, to whom, under the name of Ianthe, Byron dedicated his *Childe Harold*. (4) A character in Shelley's *Queen Mab*.

IAP'ETUS (Lat., from Gk. Ἰαπετός). One of the Titans, son of Uranus and Gæa, father in Hesiod of Atlas, Menœtus, Prometheus, and Epimetheus. Through Prometheus he is ancestor of Deucalion (q.v.), and so of the human race. Many scholars suppose his name to be identical with the biblical Japhet; others, like Maximilian Meyer, *Giganten und Titanen* (Berlin, 1887), deny any such connection.

IAPYGGIA, í-á-pij'í-á (Lat., from Gk. Ἰαπυγία). A name given to the southeastern district of Italy, forming the heel of the Peninsula; also called Messapia. The name Iapygia was familiar to the Greeks, but was not known to the Romans.

IBA, é'bá. The capital of the Province of Zambales, in Luzon, Philippines (Map: Luzon, D 4). It is situated 122 miles northwest of Manila, and has a post-office and telegraph station and a population (1898) of 3500.

IBADAN, é-bá'dán. The chief commercial city of Yoruba, in the interior of the English colony of Lagos, in Nigeria, Africa. It is a walled town, situated on a small river, the Odo-Ona, 30 miles south of Ojo, and about 85 miles northeast of Lagos, with which latter town it is connected by rail. Its population is estimated at 200,000, including the people outside the walls.

IBAGUE, é'bá-gá'. Capital of the Department of Tolima, Colombia, situated 60 miles west of Bogotá, on a fertile plain, at an altitude of over 4000 feet (Map: Colombia, B 3). It has a temperate and healthful climate, and is a prosperous and important town, with a number of sulphur and silver mines in its vicinity. Its population is estimated at 12,000. Ibague was founded in 1550, and was in 1854 the temporary capital of the Republic.

IBAJAY, é'bá-hí'. A town of Panay, in the Province of Capiz, Philippines, situated about 62 miles northwest of Capiz and near the Point of Poto, where the town formerly stood, and where much amber is collected (Map: Philippine Islands, G 8). Population, in 1898, 11,350.

IBALONE, é'bá-ló'ná. The ancient name of the Nicol tribe in the Philippine Islands (q.v.), especially on Albay Island.

IBANAG, é'bá-nág'. The speech of the Cagayane people in Luzon. See PHILIPPINE ISLANDS.

IBÁÑEZ DE IBÁÑEZ DE IBERO, é-bá'-nyáth dá é-bá'-nyáth dá é-bá'rō, CARLOS, Marquis of Mulhacén (1825-91). A Spanish military engineer and geodeticist, born in Barcelona. As a result of his work in geodesy and geography, he was given the title of Marquis of Mulhacén, and was elected to many scientific societies. His publications include: *Base central de la triangulación geodésica de España* (1865); *Descripción geodésica de las islas Baleares* (3 vols., 1871); and *Tableau géographique et statistique de l'Espagne* (1888).

IBARRA, é-bár'rá. The capital of the Department of Imbabura, Ecuador, situated at an altitude of over 7000 feet, 60 miles northeast of Quito (Map: Ecuador, B 3). It has some cotton and woolen mills, and a population of about 10,000. Once a considerable town with a population of about 16,000, Ibarra was almost wholly destroyed by the earthquake of 1868.

IBARRA, JOAQUIN (1725-85). A Spanish printer, born at Saragossa. He was appointed Court printer at Madrid. The following works from his press are among the masterpieces of the art of printing: A translation of Sallust by the Infante Don Gabriel (1772); an edition of Cervantes's *Don Quixote* (4 vols. quarto, 1780; 4 vols. octavo, 1782); the *Historia di Hispana* of Mariana (2 vols., 1780); and several fine editions of the Bible.

IBERCOURT, é'bár'kōōr', HENRY LOUIS D' (1771-1818). A Flemish traveler, born in Mons. His journeyings began in the West India Islands, and extended over a great part of South America. His narrations include: *L'Amérique dévoilée* (1811); *Voyage en Chili* (1812); and *Nouveau traité sur les légumineuses de l'Amérique du Sud* (1815). He also wrote a romance, *Un voyageur captif en Patagonie* (1814), and a pamphlet, *La constitution des Etats-Unis, est-elle applicable à l'Europe?* (1818), which so deeply offended the

Dutch Government that the author suffered a short term of imprisonment.

IBERIAN MADONNA. A wonder-working picture in the Kremlin, Moscow.

IBERIANS (Lat. *Iberes*, Gk. *Ἴβηρες*). A people anciently living at the mouth of the Iberus or Ebro River, in Eastern Spain. Later, the inhabitants of the entire Peninsula were so called. The term is now applied to the primitive Neolithic and Bronze-age men whose remains and relics are found in ancient graves, grottoes, and refuse heaps throughout Western Europe. Their ovoid and ellipsoid crania, called Pelasgic type by Sergi, resemble those of ancient Italy, Greece, Asia Minor, Egypt, Ethiopia, and North Africa, belonging to what he denominates the Mediterranean race. Keane also quotes Von der Gabelentz in the proof of identity between the Basque or Iberian and the Berber speech. This long-headed man, of low stature, has been traced as far as the British Isles, and is identified with the Piets and other groups. The term 'Iberian' is used by English ethnologists for the Mediterranean race, and Deniker's title for the same group is 'Ibero-Insular.' Keane subdivides the historical Iberian (Basque) as follows. The descendants from old extinct Iberian are:

Euscara (Spanish Basque)...	{	Guipuzean Biscayan, or Upper Navarrese North Upper Navarrese South
Bascunse (French Basque)...	{	Labordin Souletin, or Lower Navarrese East Lower Navarrese West

Consult: Keane, *Man: Past and Present* (Cambridge, 1899); Sergi, *Mediterranean Race* (London, 1901).

IBERIS. See CANDYTUFT.

IBERUS. The ancient name of the Ebro (q.v.).

IBERVILLE, é'bar'vêl', PIERRE LE MOYNE, Sieur d' (1661-1706). A French-Canadian soldier, naval commander, and explorer, founder of Louisiana. He was one of the ten famous sons of Charles le Moyne of Montreal. He studied seamanship in the French Navy, but his first exploits were inland—from the Ottawa north to James's Bay, with an expedition destined to gain possession of the English forts there (1686). He took part in the expedition for the destruction of Schenectady (1690). After capturing (1696) and demolishing the stone fort at Pemaquid, built to protect New England, Iberville thought of taking Boston, but sailed instead to Newfoundland, where he burned the village of Saint John's, laying waste all the British settlements on the island. Thence he steered for Hudson Bay, where he had a gallant victory over three English ships against his one, and destroyed the last remaining post of the Hudson's Bay Company. From the far North he went to the far South, sailing from France (1699) to the Gulf of Mexico in search of the mouth of the Mississippi, found it, and built a fort at Biloxi (q.v.), changing afterwards to Mobile, thus fulfilling La Salle's dream of planting a French colony on the Gulf. He left Canada in 1702, and died in France.

IBEX (Lat., chamois). The ancient name of the 'steinbock' of the Alps; and now designating a section or subgenus of goats having the horns

flat, and marked with prominent transverse knots in front, whereas those of the typical goats are compressed and keeled in front, and rounded behind. The group contains four species, all inhabitants of high mountainous regions, as described below. All are characterized by a nearly uniform coloration; but the hue varies with age and season, from gray, yellowish, or grizzled, to various degrees of brown, usually lighter on the throat, belly, and inside of the legs than elsewhere. The short summer coat is exchanged in winter for a longer, warmer one, mixed with an under wool. The pairing season of all is in midwinter, and the kids, usually two, are born in early summer. Compare GOAT; and see Plate of WILD GOATS.

The typical ibex (*Capra ibex*), called 'bouquetin' by the French, and 'steinbock' by the Germans, has long been exterminated as a wild animal, but is preserved by the Italian Government in a few valleys of the Piedmontese region. Formerly it seems to have roamed all over the Alps of Switzerland, Savoy, and the Tyrol, but always kept as high as possible, seeking its food, mainly by browsing bushes, at the edge of the snow, and not descending the valleys as does the chamois. Though larger and more powerful than the common goat, it is smaller than the other ibexes. The horns rarely exceed 30 inches in length and have the knobs not prominent, while the beard of the males is so small as to be hardly visible in the summer coat. This ibex is easily tamed when taken young, and interbreeds readily with domestic goats.

The Himalayan ibex (*Capra Sibirica*) is still numerous, and well known to sportsmen. A ram stands 40 inches high at the withers, has a heavy beard, and the roughly knobbed horns often measure more than 50 inches along the outside curve, and 11 to 12 inches in greatest girth. It inhabits all the mountain ranges of Central Asia from the borders of Persia eastward to the frontier of Tibet, and northward into Siberia; and is found not only on the summits, but on the open plateaus of the Pamir. Ordinarily, however, ibexes remain upon the crags as near as possible to the snow-line. They descend in winter only so far as is necessary to find uncovered pasturage, and often linger at that season at great altitudes where the wind sweeps steep slopes, and allows them to nibble a scanty subsistence from the withered herbage. The resistance to cold and hardness of constitution generally which this implies are characteristic of the race. They usually go about in small bands, led by old rams, but sometimes gather into herds of 100 or more. In the spring the males separate from the band and betake themselves to the highest crags, while the females seek retired places in which to bring forth their young. In spite of constant pursuit by hunters, the ravages of wild dogs, and destruction by avalanches, these animals seem to maintain their numbers (except near Kashmir), as they are prolific, and accustomed to wandering widely. Ibex-shooting is one of the most exciting and difficult feats offered to the sportsman, because of the nature of the country in which the animals live, and their extreme wariness and ability to escape down precipices and over crags which baffle their pursuers. The books of men like MacIntyre, Kinloch, Markham, Pollok, and other Anglo-Indian sportsmen are full of entertaining accounts of this adven-

turous hunting, and to these observers we owe most of our knowledge of the haunts and habits of these animals.

The Arabian ibex (*Capra Sinaitica*), or 'bed-en,' occupies the rough heights of the Sinaitic Peninsula, Arabia Petraea, Palestine as far as Lebanon, and Upper Egypt. It is rather smaller than the Himalayan, and the knobs on the front of the horns are less prominent and regular. An Abyssinian species, the 'walie' (*Capra walie*), also exists, and differs from the others in the curvature of its horns and a protuberance in the centre of the forehead.

IBILAO, ɛ̀bɛ̀-lä'ò. A head-hunting Malay-Negrito tribe in central Luzon. See PHILIPPINE ISLANDS.

IBIS (Lat. *ibis*, Gk. *ἰβίς*, of Egyptian origin). A stork-like bird of the family Ibiidae. The bill is long, slender, curved, thick at the base, the point rather obtuse, the upper mandible deeply grooved throughout its length. The face, and generally the greater part of the head, and sometimes even the neck, are destitute of feathers, at least in adult birds. The neck is long. The legs are rather long, naked above the tarsal joint, with three partially united toes in front, and one behind; the wings are moderately long; the tail is very short. The family is usually ranked with the storks in the same order as the herons, but there are important points in which the ibises approach the curlews. The sacred ibis, or Egyptian ibis (*Ibis Æthiopia*), is an African bird, 2½ feet in length, although the body is little larger than that of a common fowl. The glossy ibis (*Plegadis falcinellus*) is a smaller species, also African, but migrating northward into Continental Europe, and occasionally seen in Great Britain. It occurs in the tropical and subtropical parts of all the world, but is quite uncommon in North America. In the Southwestern United States it is replaced by the white-faced glossy ibis (*Plegadis guarana*), a species in which the adults have the region about the base of the bill white. The habits of both species resemble those of the sacred ibis. The color is black, varied with reddish brown, and exhibiting fine purple and green reflections. There are no loose pendent feathers. The white ibis (*Gama alba*), a species with pure white plumage, abounds on the coasts of Florida, and is locally abundant as far north as South Carolina and southern Illinois. Audubon saw multitudes on a low islet, and counted 47 nests on a single tree. (For its egg, see Colored Plate under Egg.) The scarlet ibis (*Ibis ruber*) is a tropical American species, remarkable for its brilliant plumage, which is scarlet, with the tips of a few outer primaries glossy black. The straw-necked ibis (*Carphibis spinicollis*) is a large Australian bird of fine plumage, remarkable for stiff, naked, yellow feather-shafts on the neck and throat, which look extraordinarily like bits of straw. The bird known in the Southern United States as 'wood-ibis' is not an ibis at all, but a stork (q.v.).

The sacred ibis, one of the birds worshiped by the ancient Egyptians, and called by them *hab* or *hib*, and by the modern Egyptians *abu-Hannes* (i.e. Father John), is a bird with long beak and legs, and is covered with black and white plumage. It was supposed, from the color of its feathers, to symbolize the light and shade of the moon, its

body to represent the heart; its legs described a triangle, and with its beak it performed a medical operation; from all which esoteric ideas it was the avatar of the god Thoth or Hermes (see HERMES), who escaped in that shape the pursuit of Typhon, as the hawk was that of Ra, or Horus, the sun. Its feathers were supposed to scare, and even kill, the crocodile. It appeared in Egypt at the rise, and disappeared at the inundation of the Nile, and was thought at that time to deliver Egypt from the winged and other serpents which came from Arabia in certain narrow passes. As it did not make its nest in Egypt, it was thought to be self-engendering, and to lay eggs for a lunar month. According to some, the basilisk was engendered by it. It was celebrated for its purity, and only drank from the purest water, and the most strict of the priesthood only drank of the pools where it had been seen; besides which, it was fabled to entertain the most invincible love of Egypt, and to die of self-starvation if transported elsewhere. Its flesh was thought to be incorruptible after death, and to kill it was punishable with death. Ibises were kept in the temples, and unmolested in the neighborhood of cities. After death they were mummied, and there is no animal of which so many remains have been found at Thebes, Memphis, Hermopolis Magna, or Eshmun, and at Ibiu or Ibeum, 14 miles north of the latter place. They are made up into a conical shape, the wings flat, the legs bent back to the breast, the head placed on the left side, and the beak under the tail. They were prepared as other mummies, and wrapped up in linen bandages, which are sometimes plaited in patterns externally. At Thebes they are found in linen bandages only; at Hermopolis, well preserved in wooden or stone boxes of oblong form, sometimes in form of the bird itself, or the god Thoth; at Memphis, in conical sugar-loaf-shaped red earthenware jars, the tail downward, the cover of convex form, cemented by lime. There appear to be two sorts of embalmed 'ibises'—a smaller one of the size of a rail, very black, and the other black and white. The former is not an ibis at all, but some smaller wading bird. The last is usually found with its eggs, and with its food in its stomach. By the Jews it was held to be an unclean bird. Consult: Wilkinson, *Manners and Customs of the Ancient Egyptians* (New York, 1879); Pettigrew, *History of Egyptian Mummies* (London, 1840).

IBLIS. One of the names of the Devil, in the Koran, who, however, is more often called *Shaitān* (Satan). Iblis is the chief of the fallen angels, who was once a good angel named Azazel, but having refused at God's command to render homage to Adam, was first condemned to death, but subsequently respited till the judgment day (Koran, vii. 13). The legend is borrowed from Jewish sources, and is embodied in the Midrashic exposition of Genesis, chapter iii. (consult Wünsche, *Midrash Bereshit Rabba*, p. 32 sqq., Leipzig, 1881). Both words for devil used by Mohammed appear to be of foreign origin, the form *Shaitān* coming close to the designation of Satan in Ethiopic—while *Iblis* may be a distortion of *diabolus*, modified in order to adapt it to a derivation from an Arabic stem *balasa* 'to confuse,' with which, however, it has really nothing to do. Of the two terms, the former is found in the Koran 87 times, the latter only 11 times. Moreover, the plural of

the former is used, whereas the latter occurs only in the singular, and was regarded by Mohammed as a name for a specific devil, the arch devil spirit; *Shaitān*, both in the Koran and the later literature, is used as a general designation for devils or evilly disposed demons. On the basis of the utterances in the Koran, the doctrine of the Devil is further developed in Mohammedan theology, influenced by the specifically Christian and Jewish conceptions current in the Orient whereby the Devil, as a single personage, usurps the powers and attributes of the numerous body of jinns (q.v.) of popular belief. The latter, however, as a survival of primitive religion, continue to hold sway among the people in general, so that in the folklore of the Arabs it is the jinns who are constantly introduced, both for good and evil purposes, whereas the mention of Iblis and of the Satans is largely confined to the body of theological writings. In the latter the contrast between the Devil and the angels is prominently put forward, and the view is expressed that each individual has a devil and an angel appointed as his companions, the former tempting him to evil deeds, the latter prompting him to good. The life of man passes in a constant struggle to be rid of the former and to keep close to the latter. Consult Weil, *Biblische Legenden der Muselmänner* (Frankfort, 1845).

IBN ABI USEIBIA, ib'n ä'bê ʿ-šā'bê-ä, MUWAFFAK AD-DIN (c.1195-1269). An Arabic physician and author. He was born in Cairo, of a family of physicians; lived in Egypt and Syria, and was educated at Damascus (1227-33). For two years he was head of a hospital at Damascus, then became court doctor to a Syrian emir. He is best known for his biographical lexicon of Mohammedan physicians, which has been edited by August Müller (Königsberg, 1884), and commented on by the same in *Ueber Ibn Abi und seine Geschichte der Aerzte* (Leyden, 1885). Consult: Wüstenfeld, *Geschichte der arabischen Aerzte und Naturforscher* (Göttingen, 1840); Leclerc, *Histoire de la médecine arabe* (Paris, 1876); *Travaux de la VIème session du Congrès international des Orientalistes à Leide*, vol. ii. (Leyden, 1884).

IBN AL-ATHIR, ib'n ä-l-ä-tär', IZZ-AD-DIN AL-JAZARI (1160-1230). An Arabic historian, who was born of good family in Mesopotamia, and lived in Mosul. He wrote *Kāmil*, a history of the world to the year 1231, edited by Tornberg under the title *Ibn-el-Athiri Chronicon quod Perfectissimum Inscrubitur* (1851-76); *Usd al-ghāba*, on the successors of Mohammed (1864); and a lexicon, edited by Seybold (Weimar, 1896). Excerpts from his other works may be found in Reinaud, *Historiens des croisades* (Paris, 1829).

IBN ARABSHAH, ib'n ä'rāb-shā', AHMED (1388-1450). An Arabic author, born at Damascus. He was carried captive with his family (1400) to Samarkand, after the invasion of Syria by Timur; took advantage of this opportunity to study Turkish and Persian; traveled through Mongolia and Astrakhan; and at Adrianople was employed by the Sultan to translate Arabian writings into Turkish and Persian. The most important of his works is the biography of Timur or Tamerlane (last ed., Calcutta, 1818). The book of anecdotes written by him has been

published by Freytag, with a Latin translation, under the title *Fructus Imperatorum et Jocatio Ingeniosorum* (Bonn, 1832-52).

IBN BADJA, ib'n bā'jā. See AVEMPACE.

IBN BATÛTA, ib'n bā-tū'tā, ABU ABDALLAH MOHAMMED (1304-77). An Arabic traveler. He was born at Tangier, Morocco, and spent many years in traversing Western and Central Asia, large portions of Africa, Russia, India, China, and Spain. For three and one-half years he acted as *cadi* at Delhi and in the Maldivé Islands. After his travels he settled in Morocco. His narrative of his journeys, replete with graphic and picturesque description, has been published in the French translation by Deffrémery and Sanguinetti (Paris, 2d ed. 1874-77). There is an English translation from an epitomized version by S. Lee (1829).

IBN DOREID, ib'n dō-rā'éd, MOHAMMED (838-933). An Arabic poet and scholar, born at Basra, and later resident in Oman, Persia, and Bagdad. His most famous poem is the elegy entitled *Alkasida-al-Makura*, dealing with the question of good luck and bad. Among his philological works may be mentioned an etymological and genealogical dictionary of Arabic proper names, edited by Wüstenfeld (1853-54), and two briefer studies in lexicography, edited by Thorbecke (1882).

IBN HISHAM, ib'n hē-shām', ABU MOHAMMED ABD AL-MALIK (c.760-833). An Arabic scholar of Basra. He is famed for his genealogical writings and his revision of the life of the Prophet Mohammed, written by Ibn Ishak (c.700-768). The biography was edited by Wüstenfeld (Göttingen, 1858-60), and translated into German by Weil as *Das Leben Mohammeds* (1864).

IBN JANACH, äb'n hä-nāch', ABULWALID MERWAN, or JONAH MARINUS. A Jewish grammarian of Spain. He was born near the end of the tenth century and died about the middle of the eleventh century, but the exact dates are unknown. He studied Hebrew at his birthplace, Cordova, and in Lucena, under Jewish teachers, and also took up the study of medicine. In 1012, in consequence of political disturbances, he was obliged, with many other Jews, to leave Cordova and settled in Saragossa, where he appears to have spent the rest of his days, and where, while continuing his practice of medicine, he devoted himself also to the investigation of Hebrew grammar, guided largely by the researches of his predecessor, Hayyuj (q.v.). Ibn Janach was enabled to advance the knowledge of Hebrew morphology far beyond the point that Hayyuj had reached. He did not hesitate to make slight changes in the biblical text where it seemed to be meaningless as it stood. His main work consists of two parts, the first dealing with grammar, *Kitāb-al-Luma*, published by J. Derenbourg (Paris, 1886); the second a lexicon, *Kitāb-al-'Usūl*, published by Neubauer (Oxford, 1873-75). The grammar, based on Arabic models, is the first systematic attempt to cover the entire field of Hebrew grammar. The dictionary is characterized by the same comprehensive knowledge and clear perception as the grammar, and, incidental to the explanation of words, furnishes valuable and elaborate discussion of grammatical points. Both the grammar and the dictionary were translated by Judah ben Saul Ion Tibbon (c.1120-1190),

the former having been published by B. Goldberg (Frankfort, 1856); the latter by W. Bacher (Leipzig, 1889). He also wrote several minor grammatical treatises (published by J. and H. Derenbourg, Paris, 1880), in which he defended his views and those of Hayyuj against attacks, and also amplified the grammatical treatises of the latter. Ibn Janach was also interested in philosophical questions, and strenuously opposed the speculations of Ibn Gebirol and other men of the day on the relation of God to the world, on the ground that they led to disbelief. Consult Bacher, *Leben und Werke des Abulwalid Merwan ibn Ganach* (Leipzig, 1885).

IBN KHALDUN, ib'n kâl-dōon', ABD AR-RAHMAN (1332-1406). An Arabic historian, born at Tunis, of a family from Seville. He early entered the public service, first in Tunis, then under the ruler of Fez. In 1362, under the Sultan of Granada, he carried on negotiations for peace with Pedro of Castile; in 1374 was imprisoned in Northern Africa, where he was intriguing, but returned home in 1378. Four years afterwards he set out for Mecca; on his way stayed three years in Egypt, whither he returned after the pilgrimage, and where he lived for a few years before he took service under Timur in Syria. His historical work is the first among the Arabs to leave the annalistic method, and the introduction especially is conceived in a philosophic manner. Besides this introduction, edited by Quatremère (Paris, 1858), and translated into French by De Slane (Paris, 1862-68), the work has two main divisions—the history of the eastern caliphate, partly edited, with Latin translation, *Ibn Khalduni Narratio de Expeditionibus Francorum*, by Tornberg (1840), and the account of the Berbers and the dynasties of North Africa, edited and translated into French by De Slane (Paris, 1862). Consult Kremer, *Ibn Khaldûn und seine Kulturgeschichte der islamischen Völker* (Vienna, 1879).

IBN KHALLIKAN, ib'n kâl'ê-kân', SHAMS AD-DIN AHMED (1211-82). An Arabic historian, born at Arbela, of the family of the Barmecides. He held important offices in Cairo and in Damascus, where he died. His most important work is a biographical dictionary, a very important source of knowledge of Arabian literature and its history from the eighth century to his own time. It is edited by Wüstenfeld (Göttingen, 1840-65), and translated into English by MacGuckin de Slane (London, 1842-71).

IBN KOTEIBA, ib'n kô-tâ'ê-bâ, ABDALLAH (828-c.889). An Arabic philologist and historian. He was born probably at Bagdad or Kufa, and for some time held high judicial offices at Dî-nâver. Later he was a teacher in Bagdad, and died there. Of his works, the most important are: *Adab al-Kâtib*, mainly philological, and of great value on literary style and on antiquities, of which Sproull published a part as *An Extract from Ibn Kotciba's Adab al-Kâtib* (1877), and which was edited by Grünert (1900); a collection of biographies of the Arabian poets, of which only the introduction has been published, by Rittershausen, with Dutch translation (1875); *Kâtib al-ma-Arif*, an outline of history for practical use, edited by Wüstenfeld (1850); and *Uyun al akhbâr*, a treatise upon government, war, nobility, character, science, friendship, food,

and other topics, edited by Brockelmann (Weimar, 1898).

IBN-ROSHD, ib'n rôsh't. See AVERROES.

IBN SAYID, ib'n sî-ég'. See AVEMPACE.

IBN SINA, ib'n sē'nâ. See AVICENNA.

IBN TOPHAIL, ib'n tô'fâ-êl. See ABU-BEKR MOHAMMED IBN TOPHAIL.

IBN ZOAR, ib'n zôr, or **IBN ZOHR**. See AVENZOAR.

IBOS, ê'bôz. Dominant negro people of the Niger Delta. Slaves from this region formerly were called 'Ibo.' Their language is akin to the Ewe and the Tshi.

IBRAHIM, ê'brâ-hēm' (1615-48). An Ottoman Sultan, third son of Ahmed I. On the death (1640) of his brother, Amurath IV., whose cruelty he had escaped by feigning madness, he came to the throne. His short reign was filled with excess, debauchery, and prodigality. In 1645 he attacked the island of Crete, which was then under the control of Venice, but did not live to finish this war, which was the result of an intrigue in his harem. His government was so cruel and the taxes so oppressive that in 1648 the Janizaries rebelled and dethroned him, and strangled him a few days later.

IBRAHIM, OU L'ILLUSTRE BASSA, ê'brâ'N' ôô lê'lus'tr' bâ'. A romance by Made-moiselle de Scudéry, originally published under the name of her brother (1641).

IBRAHIM PASHA, ê'brâ-hēm' pâ-shâ' (1789-1848). An Egyptian general. He was the adopted son of Mehemet Ali (q.v.), Governor and subsequently Viceroy of Egypt, and was born at Kavala, in the Province of Saloniki, in European Turkey. In 1816 he led an army into Arabia, and in the course of three years overthrew the Wahabi power in Western Arabia and in Nejd. During the War of Greek Independence he was dispatched at the head of a powerful fleet and a finely disciplined land force to the aid of the Turks in the Morea. In 1825 he stormed Navarino and Tripolitza, and in the following year took Missolonghi, after a long siege. The destruction of the Turkish-Egyptian fleet in the harbor of Navarino, October 20, 1827, and the landing of a French force, led to the evacuation of the Morea by Ibrahim in September of the following year. As the result of a dispute with the Pasha of Acre, an Egyptian army under Ibrahim invaded Syria in 1831, stormed Acre, May 27, 1832, and defeated the Turkish forces at Homes, Beylan, and Konieh. By the Treaty of Kutayah, May 14, 1833, Mehemet Ali received possession of Syria, while Ibrahim was made Governor of Cilicia. War with the Porte broke out again in 1839, and on June 24th of that year Ibrahim overwhelmed the Turkish army at Nisib, near the Euphrates. Only the interference of the Great Powers saved the Porte from the victorious armies of Mehemet Ali. Ibrahim was forced to evacuate Syria in 1840 and to return to Egypt, suffering the most severe hardships on his march through the desert. He died at Cairo, November 10, 1848, after acting for some months as Regent during the incapacity of Mehemet Ali. His son, Ismail Pasha (q.v.), subsequently became Khedive of Egypt.

IBRAIL, ê-brâ'êl. See BRAÏLA.

IBSAMBUL, êb-sâm'boól. A noted group of ruins on the Nubian Nile. See ABU-SIMBEL.

IBSEN, ip'sen, HENRIK (1828—). A Norwegian dramatist, born at Skien, March 20, 1828, whose influence is marked in German, French, English, and Italian literatures. His great-grandmother was Scotch, his grandmother and mother German, his grandfather's grandfather Danish. They were a family of ship-masters. His father, Knud Ibsen, a merchant, met with reverses in Henrik's boyhood, which compelled the youth to pass six years (1836-42) in great poverty. In the latter years of this period he attended a scientific school at Skien, and late in 1843 he became an apothecary's apprentice at Grimstad, where he remained till 1849 writing a *Catiline* in three acts (published 1850), and some poems. He now sought the University of Christiania to learn medicine, but in 1850 he was diverted by the successful production at Christiania of his *The Warrior's Mound* from academic studies to the drama. In 1851 he helped to found a short-lived weekly, *Man*, in which appeared his political satire, *Norma*. In November he was appointed stage manager at Bergen, with leave of absence for three months to study the art he was to practice. These he spent in Germany, writing the unsuccessful and unpublished *Saint John's Night*. In 1856 *The Banquet at Solhaug*, the first of his national dramas, was produced in the theatrical centres of Norway and Sweden. It won him enthusiastic applause and national renown. In 1857 he became director of the Norwegian Theatre at Christiania, but five years of his management reduced it to bankruptcy. Here were produced *Lady Inger of Ostraat*, a saga drama (1855); *The Vikings at Helgeland* (1859); and *Love's Comedy* (1862). In this period he wrote also the longest of his minor poems, *On the Mountain Plains* (1860). In 1862, after the bankruptcy of the theatre, Ibsen gladly accepted a position as æsthetic adviser in the other house. The Storting granted a pension to Björnson, but refused a petition in Ibsen's behalf. Full of bitterness, the poet left Norway in April, 1869, and went by way of Berlin and Trieste to Rome, whence he flung the satire *Brand* at the loose livers of Norway. In 1866 the Storting yielded. In 1868 Ibsen left Rome for Dresden, where he remained till 1874. After a voluntary exile of ten years, he went back to Norway. In 1891 Ibsen made Christiania his home. On his seventieth birthday the poet-dramatist received gifts and greetings from everywhere in the world. A bronze statue of him was set outside the new National Theatre in September, 1899. His influence is felt in Germany, France, Italy, and England.

Besides the dramas above named, Ibsen's works include: *The Pretenders* (1864), an historical drama; *Brand* (1866) and *Pear Gynt* (1867), dramatic poems; *The League of Youth*, a political comedy (1869); the bulky two-fold historical drama, *Emperor and Galilean* (1873); and, beginning with 1877, the yet better-known series of dramas that are more characteristic of what passes for Ibsenism: *The Pillars of Society* (1877); *A Doll's House* (1879); *Ghosts* (1881); *An Enemy of the People* (1882); *The Wild Duck* (1884); *Rosmersholm* (1886); *The Lady from the Sea* (1888); *Hedda Gabler* (1890); *Master Builder Solness* (1892); *Lille Eyolf* (1894);

John Gabriel Borkman (1896); *When We Dead Awaken* (1900). Ibsen's dramatic work had been at first romantic. This phase culminated in the *Banquet at Solhaug*. Then it was historic, but still romantic, up to the *Vikings at Helgeland*. Next the psychologic interest becomes prominent, and with it a tendency to social satire very marked in *Love's Comedy*, a masterpiece of swift action and of biting irony. The dramas from 1864 to 1867 are polemically national rather than social. *The League of Youth* marks the transition from political to social interests. From this time on Ibsen is a pathologist of social ills, dealing, as he does, with conditions universal to modern life, and thus winning an ever widening cosmopolitan audience. All these latter plays have been several times translated into English, best, so far as he goes, by William Archer (6 vols., 1890-92). Of comment there is cloud rather than illumination. By some Ibsen's work is assailed as immoral, cynical, pessimistic, unfit to be seen or read; by others it is hailed as a new gospel of truth and emancipation. It is not wholly either. The plays are studies in human responsibility under modern social conditions, which, in many points, Ibsen considers dangerously diseased and as threatening the whole body with a gangrene. So he has become the poet of protest, the unveiler of sophistries, the scourger of hypocries. He writes of vice, but it is with loathing. He lays bare the cause of evils and leaves it to others to prescribe the remedy.

But leaving the moral question aside, these social dramas mark a new stage in the evolution of dramatic art. It is a drama of descending, not ascending action, not of preludes, but of consequences. The plays are apt to begin with their climax. They are thoroughly realistic, absolutely unconventional. Their dialogues are so natural as to give the illusion of real though fascinating conversation which the playwright allows his audience to overhear. It would be hard to match them in any literature. Hence their power has been felt throughout the dramatic and literary world, while the realistic dramas of the French naturalistic school, of the Goncourts and Zola, have been regarded with languid curiosity as the products of artistic theory. For Ibsen's life, consult: Jaeger, *Henrik Ibsen: A Critical Biography* (Chicago, 1894); for summaries and comment on the dramas, Boyesen, *Commentary on the Writings of Henrik Ibsen* (New York, 1894); Shaw, *The Quintessence of Ibsenism* (London, 1893); Wicksteed, *Four Lectures on Ibsen* (ib., 1892); and Archer, "The Real Ibsen," in *International Monthly* (ib., 1901).

The German Ibsen literature native and translated is very extensive; among the more noteworthy and recent contributions to it are: Brahm, *H. Ibsen* (Berlin, 1887); Andreas-Salome, *Ibsen's Frauengestalten* (Berlin, 1892); Wörner, *Ibsen's Jugenddramen* (Munich, 1895), and *H. Ibsen* (Munich, 1899 seq.); Jäger, *H. Ibsen* (Swedish, Christiania, 1892; German, Dresden, 1897); Von Hausteim, *Ibsen als Idealist* (Leipzig, 1897); Garde (translated by Kühler), *Der Grundgedanke in Ibsen's Dichtung* (Leipzig, 1898); Brandes, *H. Ibsen* (Copenhagen, 1898); Reich, *Ibsen's Dramen* (Dresden, 1900); Litzmann, *Ibsen's Dramen* (Hamburg, 1901).

IBYCUS, ib't-kūs (Lat., from Gk. Ἰβυκος, *Ibykos*). A Greek lyric poet of the sixth century

B.C., born at Rhegium in Italy. He lived the life of a wandering minstrel, and passed some time at the Court of Polycrates, the tyrant of Samos. The story of his death near Corinth, and the detection of his murderers by means of a flock of cranes, which has been so beautifully told by Schiller in *Die Kraniche des Ibykus*, is based on a similarity between the name of the poet and the Greek ἰβυξ, 'a crane.' Of his poems, which were mostly of an erotic character, only fragments have been preserved. These are published by Schneidewin, *Ibyci Rhegini Carminum Reliquiæ* (Göttingen, 1833); and in Bergk, *Poetæ Lyrici Græci*, iii. (Leipzig, 1882).

ICA, ē'kā. A maritime department of Peru, bounded by the departments of Lima and Huanavelica on the north, Ayacucho on the east, Arequipa on the southeast, and the Pacific on the southwest (Map: Peru, B 6). Area, 8718 square miles. The surface is of varied formation. The eastern part is mountainous, the western is lower and traversed by ridges of low hills. The climate is hot and dry, and the soil, with the exception of the valleys, is thin. The vine and sugar-cane are cultivated extensively; corn, cotton, and indigo are also raised. The population was officially estimated, in 1896, at 90,962. Capital, Ica.

ICA. The capital of the Peruvian department of the same name, situated on the river Ica, 46 miles by rail from Pisco on the coast (Map: Peru, B 6). It manufactures wine and brandy. It was founded in 1563, and has suffered greatly from earthquakes. Population, estimated at 10,000.

ICA, ē-sā', or **PUTUMAYO**, pōō'tōō-mā'yō. An important tributary of the Amazon. It rises in the Colombian Andes, and flows southeasterly in a very tortuous course, joining the Amazon near San Antonio in the Brazilian State of Amazonas (Map: Brazil, D 4). Its total length is about 1000 miles, and it is navigable during the rainy season for nearly 900 miles. The region through which it flows is very sparsely inhabited and covered mostly with thick forests, so that at present the commercial value of the river is unimportant. The Ica was partly explored in 1878-79.

ICARIA, i-kā'ri-ā (Lat., from Gk. Ἰκαρία, *Icaria*). A deme of Attica, where excavations were carried on by the American School at Athens in 1888, when many interesting remains were found. Icaria is noted as the birthplace of Thespis, and as the spot to which legend assigns the introduction of wine-making and of the cult of Dionysus by the god himself.

ICARIA. An island of the Ægean. See **NICARIA**.

ICARIANS. Members of a communistic society, founded by Cabet (q.v.) to realize the ideals set forth in his romance *Voyage en Icarie*. During the years preceding the Revolution of 1848 communistic doctrines had a wide following in France; and when, in 1847, Cabet announced the acquisition of land in Texas, a large number of persons agreed to emigrate with him to found a settlement there. In 1848 sixty-nine persons set out for the colony, but were unable to endure the climate, and returned after a few months to New Orleans, where they were joined by Cabet with 400 more. Early the following

year Cabet, with about 300 followers, emigrated to Nauvoo, Ill., then recently deserted by the Mormons, where the colony was moderately prosperous for a few years, undertaking agriculture as well as trades and manufactures. Dissensions arose, and in 1856 Cabet was expelled together with those members of the community who supported him. In 1860 financial difficulties rendered it necessary for the remaining Icarians to abandon Nauvoo, and thirty-five of them founded a new settlement in western Iowa. For twenty years they grew in wealth and numbers; but in 1880 the community split into two factions, the Young and the Old Party. The former soon broke up; the latter existed until 1895, when it, too, was dissolved. In 1881 a few members of the Iowa community went to California, where they established Icaria Speranza, a society, however, more like a business corporation than a communistic settlement.

The organization of the Icarian communities was democratic. Directors were elected, but they could only execute the orders of the whole body. The members lived in little houses around a central hall where they took their meals in common. They were sociable in their habits, took great pains to educate their children, and were remarkable for their thrift, industry, and the good order they maintained. Excluding the purely religious communists, the Icarian settlements were by far the most successful of the communistic experiments of which the early nineteenth century was so prolific. Consult: Lux, *Etienne Cabet und der Ikarische Kommunismus* (Stuttgart, 1894); Shaw, *Icaria* (New York, 1884).

ICARIUS (Lat., from Gk. Ἰκάριος, *Ikarios*). (1) In Greek mythology, an Athenian to whom Dionysus taught the cultivation of the vine. (2) A Lacedæmonian, the father of Penelope, wife of Odysseus. When Odysseus declined to settle at Lacedæmon as desired by Icarus, and gave Penelope her choice of following him to Ithaca or of remaining with her father, the bride covered her face with her veil and chose her husband. Icarus then ceased his solicitations and raised a temple to Modesty on the spot.

IC'ARUS. See **DÆDALUS**.

ICAZBALCETA, ē'kāth-bāl-sā'tā, JOAQUIN GARCIA (1825—). A Mexican author. He was born in the City of Mexico, and began his historical and archaeological researches at an early age. His first literary work was done in the preparation of the *Diccionario universal de historia y geografía* (1885), and he afterwards published a *Colección de documentos para la historia de Méjico* (1858-66), and *Historia eclesiástica indiana, obra escrita á fines del siglo XVI. por Francisco Gerónimo Mendieta de la orden de San Francisco* (1870).

ICE (AS., OHG. *is*, Ger. *Eis*). Water in the solid state. It is crystallized in the hexagonal system. Ordinarily the crystalline structure of a block of ice is not apparent, owing to the close contact and perfectly regular arrangement of the crystals. But when a piece of ice is exposed to radiation from any luminous source, as the sun, a glowing fire, a gas or oil flame, disintegration gradually takes place, and by the use of a lens, numerous small crystals may be seen studying the interior of the block; as the heat continues, these crystals expand and finally assume

the shape of six-rayed stars of exquisite beauty. (See accompanying cut.) The freezing-point of pure water is marked 0° on the Centigrade and Réaumur scales, and 32° on the Fahrenheit scale. The influence of changes of pressure on the freezing-point is so slight that for all ordinary atmospheric pressures the freezing-point of pure water may be considered a constant quantity. Great pressures, however, have the effect of lowering the freezing-point very considerably, and by raising the pressure to many thousand pounds per square inch ice has been caused to melt at 0° F. By cooling pure and clear water cautiously, it may be 'undercooled,' i.e. it may, under ordinary pressure, be obtained in the liquid state at temperatures several degrees below its normal freezing-point. But this is quite different from the effect of high pressures; the state of 'undercooled' water is just as unstable as the state of a 'supersaturated' solution, and a slight disturbance may cause the whole mass to freeze very rapidly, just as it may cause rapid crystallization to take place in a supersaturated solution. The lowering of the freezing-point by pressure has furnished one of the theories explaining the motion of glaciers. This 'regelation theory' is illustrated by the following phenomenon: If a wire holding heavy weights at its ends is thrown over a block of ice, it gradually cuts its way through the block, and yet the latter remains entire. Along the line where the wire presses upon the block, the melting-point is lowered, and hence the ice melts and allows the wire to descend through a minute distance; the water immediately above the wire then freezes, because it is freed from pressure, and at the same time the ice immediately below the wire melts, allowing the wire to descend a little farther. Thus melting and almost immediate regelation proceed until the wire has cut through the block. The freezing-point of water, as that of any other liquid, is considerably lowered by dissolving in it substances of any kind, and seawater, on account of its salt, is found to freeze at -2.5° to -3.0° C. The solid separating out, under ordinary circumstances, from freezing seawater, is not a mixture of ice and salt, but pure ice, and this fact has been utilized in two ways: (1) for concentrating brine in the manufacture of salt; (2) for obtaining sweet drinking-water from the salt water of the sea.

Unlike most other substances, water, on passing from the liquid to the solid state, does not contract, but expands. Therefore ice, having a lower specific gravity than water, floats on its surface. The specific gravity of ice at its normal melting-point is 0.918. The specific heat of ice, i.e. the amount of heat required to raise its temperature 1° C., is much less than that of water in the liquid state; within 30° C. below the freezing-point it is very near one-half, and at lower temperatures it is even somewhat less than one-half, that of water. In the process of melting, ice absorbs more heat than any other solid (see FREEZING-MIXTURES), more than 80 calories being required to melt one gram of ice; the same amount of heat would raise the temperature of the gram of melted water to 80° C. (176° F.).

ICE-PACK, or PACK-ICE. A name given to the large sheets or pans of ice (*flocs*) which have united to form a *pack*, and which occupy the open surface of the sea. The ice is almost wholly the result of direct freezing of the superficial

stratum of the ocean, continued through a succession of years to a possible thickness of 16 to 20 feet, and of snow accumulations on this surface. Through 'shearing' and over-riding the ice-pack is frequently of greater thickness than would be brought about by freezing alone, and it is not rare to meet with 'hummocks' on the borders of the pack 30 to 40 feet in height, and more. The individual pans, sheets, or floes that help to build up the pack are of varying dimensions, ranging from small cakes to solid sheets many miles across, and a pack itself may measure a hundred miles, or even considerably more. Even where virtually unbroken, they may contain here and there pockets or 'lakes' of inclosed water, and penetrating water-ways (*leads*), connecting these lakes or wholly independent of them, are of common occurrence. The central part of the Arctic Basin is frequently assumed, but perhaps without sufficient reason, to be occupied by a stationary pack; along its southern border it is freely moving, sending down those vast sheets of ice which constitute the 'pack-drift.' The remarkable drift of the *Fram* has demonstrated that the northern pack was still moving close to the 86th parallel of north latitude, or within less than 300 miles of the Pole. The strong southerly drift of the pack-ice in the region about Greenland, Grinnell, and Grant Lands, jamming between the opposing land-masses, is that which has so largely baffled exploration along what is known as the 'American route' to the Pole. The great centrally located ice-mass which in Davis Strait and Baffin's Bay separates Greenland on the east from the disconnected lands of Arctic and sub-Arctic America on the West, is known by whalers and others as the 'Middle Pack.'

The Antarctic pack is less thoroughly known than the Arctic, although its extent appears to be very much greater, and during many years its front edge or that of the pack-drift has passed far beyond (northward of) the Antarctic Circle. Various names have been given by navigators to particular conditions of ice. The border of sea-ice which clings to the land, and is not affected by the movements of tides, is called the *ice-foot*. Ice that has been crushed into fragments by the impact of moving floes is called rubble. A piece of ice that floats with the upper surface just awash is called a *growler*. *Anchor-ice* or *ground-ice* is fresh-water ice that has frozen to the bottom of a lake or river. *Young ice* is ice new-formed, in distinction from ice of previous seasons. *Palæocrystic ice* is ice that has been formed during a number of seasons by floes overlaid one upon another, has been increased year by year by snowfall, and has been welded by sun and rain into a single mass. See ARCTIC REGION; ANTARCTIC REGION.

ICEBERG. Under this name is understood a detached fragment or section of a glacier, whose terminal foot has reached a body of water, whether fresh or salt, and there broken (calved) off. Fresh-water bergs are those of lakes, and are of comparatively rare occurrence, and never of large size. The oceanic bergs, on the other hand, are frequently of very great size; they may measure even miles in length, as those of parts of the Antarctic waters and even of Melville Bay, off the west coast of Greenland; and they not infrequently rise 250 or even 300 feet above the surface of the sea. In the case of the

flat-topped or even-formed bergs it can readily be inferred from the specific gravity of ice that they at times descend fully 1200 to 1500 feet, or more, into the abyss of the ocean; and it is a common condition to find the larger bergs 'stranded' or anchored at this depth to the floor of the sea. The pinnacled or fancy-shaped bergs are usually those which have undergone considerable weathering or beating up by the sea, and are thus necessarily of smaller size than those of even contour. It is a common statement that the Antarctic bergs differ from those of the Arctic by their larger and more generally tabular form; but these differences are not fundamental, and are hardly more than comparative. But it may be questioned whether all the larger detached masses of ice in the Antarctic Ocean are, indeed, true glacial bergs; many of them might well be only accumulated sea-ice, formed by accretional growth, independent of any assisting land-mass.

The source of practically all the icebergs of Arctic and sub-Arctic waters is Greenland, from whose ice-cap and névé radiate off hundreds of glaciers, the vast majority of which—at least, those of larger size—reach the sea, either directly or through the long fjords which extend 20 to 70 miles into the land. One or more of the glaciers of Melville Bay present ocean fronts of 25 or 30 miles, and there are a number of nearly equal size in Western, Southwestern, and Eastern Greenland.

Owing to the northward set of the West Greenland current, the bergs of this side are carried first to the north, and it is only at about the 74th or 75th parallel that they begin to make their way westward to come down on the 'American side.' Many of the East Greenland bergs follow in the trail of these, rounding the southern apex of the great insular land-mass. The lower point reached by the bergs in North-Atlantic waters is about 40° in the western half of the basin; eastward, the zone of distribution, following largely in the course of Gulf-Stream drift, rises sharply northward, and entirely clears the coast of Scandinavia.

Icebergs are apt to carry much debrital material with them, the remains or parts of the glacial moraines which were formed on land. These, on the melting of the ice, naturally find their way to the bottom of the sea, whether deep or shallow, and these help to build up a 'boulder-clay deposit,' somewhat similar to the basal till of glaciers. The stranding of bergs on rock-masses also tends to bring about grooving and polishing, again similar to what is produced by moving land-ice (glaciers). Consult Tyndall, *The Forms of Water in Clouds and Rivers, Ice, and Glaciers* (New York, 1872). See WATER; MELTING-POINT; FREEZING-POINT; GLACIER; REFRIGERATING MACHINES.

ICE, LAW OF. After ice has been harvested it is personality, and is subject to the rules of law governing that form of property. Before it is harvested it is deemed realty for most purposes, although some courts have held that a contract for the sale of all the ice on a certain pond is to be treated as a contract for the sale of a chattel, and not of an interest in real estate.

If the land beneath a particular body of water is subject to private ownership, the ice that forms on the water belongs to the owner of such land, and he has exclusive authority to gather or dispose of it. Hence a lease of the land or a con-

veyance of the fee carries to the tenant or to the grantee the ownership of the ice which forms during the term of the lease, or which exists at the date of the conveyance. It is in the nature of an accession to the land, being an increment arising from a formation over it, and is a part of the real estate under the rule that the ownership thereof extends indefinitely upward from the soil.

The landowner may grant to another the right to take ice from private waters, as a profit *à prendre*; that is, as a right to take the products or proceeds of land. Accordingly, the grant of a half-acre of land adjoining a mill-pond with the exclusive right to take the ice from the pond attaches this right as a profit *à prendre* to the half-acre, and it will pass to a second grantee of the half-acre as an appurtenance thereto. On the other hand, the landowner does not part with his right to ice which forms upon a mill-pond by granting to the mill-owner the privilege of flooding the land in question and maintaining a pond thereon. The ice attends the ownership of the soil, not the easement of covering it with water; and if the mill owner needlessly draws off the water for the sole purpose of destroying the ice or preventing its formation, he is liable in damages to the landowner. Again, the owner of land under a private stream is entitled to dam the stream and take ice therefrom, provided such use does not unreasonably interfere with the rights of riparian owners below him to the use of the water.

A riparian owner's right to ice on navigable rivers depends upon his ownership of the land under them. In States where the fee of such rivers is vested in the public the adjoining landowner has no title to the ice, and it belongs to the first appropriator. In other States, where riparian owners are accorded title to the land under navigable waters, they can maintain trespass against any one taking the ice without their consent. At times ice-covered streams or lakes are used as highways of travel, and the question has arisen whether the harvesting of ice upon such a thoroughfare amounts to a nuisance, as an unlawful obstruction to travel. The courts have given this answer: In the absence of legislation on the subject, the right of travel and the right of harvesting ice on navigable waters are public and are to be exercised reasonably. What is a reasonable use of either right depends upon the relative benefits to the community from its exercise. If the privilege of harvesting ice is of greater importance than that of traveling upon it, the latter cannot be set up to prevent or abridge the exercise of the former.

The right to harvest ice forming upon public waters is not private, but public or common. Any citizen may enter such ice fields and take what he pleases, so long as he does not unlawfully interfere with the like right of others. What acts amount to an appropriation of ice on public waters is a question upon which the courts are not agreed. One view is that an appropriation is made by marking and staking off a plot of ice, and preparing the surface for cutting. The other view is that a person does not gain any property rights in such a plot of ice until he has actually reduced it to possession. The subject is regulated in some States by statute. Consult: Gould, *The Law of Waters, Including Riparian Rights* (Chicago, 1900);

Coulson and Forbes, *The Law Relating to Waters* (London, 1902); and the statutes of the various States.

ICE AGE. See GLACIAL PERIOD; PLEISTOCENE PERIOD.

ICE-BEAR. The polar bear. See BEAR.

ICEBERG. See ICE.

ICE-BREAKING STEAMER. A vessel used for keeping open a navigable passage through ice. Such vessels are much used on the Great Lakes of the United States, where they are usually adapted for carrying cargoes or railway cars. They are very heavily built to stand the shock of ramming the ice or of running up on it at the bow and breaking it by reason of their weight. During the past few years the problem of constructing such vessels has been studied by Admiral Makaroff, of the Russian Navy, and several vessels have been built from his designs. The largest of these was built in England in 1898-99, and is called the *Yermak*. She is of 8000 tons displacement and has four screws, one under the overhanging bow to suck down the ice, so that the bow will ride over it, and, descending, crush it. This screw also creates a current which drives the broken ice astern. The stern is recessed to receive the bow of a vessel following her through the channel which she makes. Her length is 305 feet; beam, 71 feet; and draught, 25 feet. The coal capacity is very great—3000 tons—as it was intended to use her in Arctic exploration; she spent some months in the Arctic Ocean during the summer of 1900, and was very successful in breaking her way through ice-fields in harbors; but in 1901, against the heavy ice of the polar pack, she proved inefficient.

ICE-CAVE. Any natural formation of ice in a cave or crevice. The walls of caves often become cooled to such a point by the infiltration of cold air in winter or during the frosty nights of spring and autumn, that the percolating waters rapidly freeze. The ice usually disappears for a few weeks in September. The most celebrated ice-cave in the world is that of Dobschau (Dobsina), in Hungary, situated in the Carpathians, at an elevation of about 2700 feet. Consult Balch, *Glacières or Freezing Caverns* (Philadelphia, 1900).

ICE-COLUMNS. See FROST.

ICE-GULL. A name given to several gulls encountered by sailors in icy regions, most properly perhaps to Ross's gull. See GULL.

ICE INDUSTRY, THE. The ice industry is divided into two branches, in accordance with the origin of the ice itself. *Natural ice* is cut in winter from rivers, lakes, and ponds, stored in ice-houses, and distributed to consumers as needed. Manufactured ice, or, as it is more commonly called, *artificial ice*, is produced when and where required, and is generally distributed with comparatively little intervening storage. The collection and preservation of ice and snow, on a scale which was small indeed as compared with the operations of the present day, appear to have been practiced from early times by most civilized nations having the natural products within their reach. Where neither snow nor ice was provided by nature, various means of artificial production have been practiced in a small way for centuries; such as the exposure of water in porous receptacles, and packing common or

some other kind of salt about vessels containing water. But the modern ice industry began in the United States early in the nineteenth century, with the transportation of ice in sailing ships from cold northern to warm southern ports; and the production and sale of manufactured ice has, within the last twenty-five or thirty years, attained large proportions and made an ample and cheap ice-supply quite independent of local temperatures.

NATURAL ICE. It is said that both the Greeks and the Romans packed snow in deep underground pits, and that Nero established ice-houses in Rome. At the end of the seventeenth century dealers in ice and snow were quite common in France. In 1799 a cargo of ice, cut from a pond near Canal Street, in New York City, was shipped to Charleston, S. C. This may be considered as of little moment; but in the winter of 1805-06 Frederick Tudor, of Boston, Mass., entered the ice field in good earnest, and, after some heavy losses, succeeded in establishing an export trade in ice which was the beginning of the modern industry. Tudor's first ice cargo, of 130 tons, was shipped from Boston to Martinique in the winter of 1805-06, but though the ice reached its destination in safety, the venture resulted in a loss. Two years later a shipment of 240 tons to Havana, Cuba, also resulted in a loss to Tudor. A monopoly of the ice trade with the British West Indies was secured by Tudor about 1816, and a like privilege from Spain in 1815-16. From 1815 to 1820 the same merchant extended his ice trade to Charleston, S. C., Savannah, Ga., and New Orleans, La. Others followed his example, until in 1855 ice exports from the United States, according to statistics of the Treasury Department, amounted to 41,117 tons, valued at \$190,793. These exports increased to 68,802 tons, valued at \$267,702, in 1870, since which time, according to the authority already cited, there has been an almost constant decrease, until in 1900 the tonnage was only 13,720, and its value \$29,501. If the figures were available it would doubtless appear that the foreign ice trade was soon outstripped by the domestic commerce in what has long since changed from a luxury to a necessity. The *Ice Trade Journal* has published figures for the harvest of Maine and Hudson River ice for the years 1878 to 1900, inclusive, which show that those two sources alone produced yearly quantities ranging from 2,226,000 tons in 1880 to 5,626,430 tons in 1899. The capacity of Hudson River ice-houses in 1900 was placed at 4,216,000 tons. The combined Maine and Hudson River yield, enormous as it may seem, is estimated at only about half the commercial product of natural ice in the United States; but even if this be not too low for the total, it should be remembered that, in the aggregate, the additional harvest for private purposes is immense.

HARVESTING ICE is a comparatively simple operation, or series of operations, the main features of which are as follows: The snow, if any, lying on the ice is removed by scrapers. In case there is an upper layer of snow ice, it is loosened by field planes and then removed. Markers are next used to outline the blocks, which are followed by plows, which cut the grooves still deeper. The scrapers, planes, markers, and plows are drawn by horses or mules. The parallel grooves, it should be understood, are

first cut in one direction, then another series is cut at right angles to the first. The final grooves extend nearly through the ice, so that the

watery vapors above the stored ice. Railway sidings, or docks, or both, afford means for shipping the ice to distributing centres. Specially constructed cars, with lined sides and bottoms, are used where ice is to be shipped long distances, and in the South the cakes are carefully packed in addition.

FIG. 1. ICE TOOLS.

cakes may readily be pried apart by means of suitable tools. When the latter operation has been effected the cakes are floated to the shore through channels provided for the purpose, and there elevators, generally inclined, lift the ice to the ice-houses. The cakes are packed close

FIG. 2. ICE TOOLS.

together, with sawdust or other insulating material above the final layer, and between the ice and the outer walls of the ice-house. The ice-houses are generally tall structures, with outer walls composed of one to three compartments. Probably the most approved plan is to have an outer compartment in which the air is allowed to circulate; an inner or dead-air compartment; and a central space packed tightly with sawdust. The bottom of the ice-house must be well drained, and ample provision must be made for ventilation in order to prevent the accumulation of

FIG. 3. ICE TOOLS.

Besides the ice tools already named (snow-scraper, ice-plane, marker, and plow) the following may be mentioned: Augers and tapping-axes for inspecting the ice and for draining it of surface water; saws; forked and pronged and chisel and needle bars, for separating the cakes after the markers and plows have done their work; trimmer bars for squaring the cakes, and hooks, grapples, and forks, for pushing them to the elevator; chain scoop-nets and sieve shovels, for removing slush ice from the channels; hoisting, drag, and edging tongs, adzes and long-handled chisels for packing the ice in the houses; saws and bars for loosening the ice preparatory to shipment from the houses; and, finally, delivery wagons, tongs, saws, axes, shaves, and scales.

ARTIFICIAL ICE. A sketch of the development of ice-making apparatus and descriptions of the principles and practices involved will be found under REFRIGERATION. The following figures regarding the growth of the industry in this country are taken from the section on the Manufacture of Ice Industry in the Twelfth Census of the United States. The first ice factory of importance in this country was erected at New Orleans in 1866. In 1870 three other factories were included in the census returns. The number of establishments reported increased to 25 in 1880, 222 in 1890, and 787 in 1900. The total capital invested in these 787 plants was \$38,204,054, and the value of the products was \$13,874,513. These figures, like those previously given for natural ice, do not include the hundreds of plants making ice exclusively for their

own use, such as breweries and cold-storage houses. Of the 787 plants reported in 1900, 571 used the compressor, and 216 the absorption system. (See REFRIGERATION.) The total product of the 787 factories was 4,294,439 tons, of which 4,139,764 tons, or 96.4 per cent., was can ice, and only 154,675 tons plate ice. The Middle States produced more ice than any other group, the amount being 1,574,980 tons, as compared with 1,414,158 tons for the Southern States, and only 40,059 tons for the New England States. The average value of the ice at the plants, for the whole country, was \$3.11 per ton for can ice, and \$2.85 for plate ice. As a rule, the Southern States now depend wholly upon the manufactured product for their ice-supply, the few possible exceptions being some of the coast cities. As one goes farther North, natural ice comes more and more into competition with the manufactured article, until at the extreme North it actually, or practically, displaces the latter. But the use of manufactured ice has increased rapidly of late and is continually extending toward the North.

SANITARY ASPECTS. The sanitary quality of ice-supplies depends chiefly upon the presence or absence of disease germs, chiefly those of typhoid fever, in the original water, and upon the effect of freezing upon such germs. In addition there is the possibility that manufactured ice may become contaminated during the freezing process by sick or careless workmen, and that any ice may be fouled while it is being distributed to consumers. Proper washing of ice before domestic use, care not to bring ice in contact with food or water, and proper supervision of ice factories, would go far toward preventing danger from what may be termed incidental contamination. The water from which artificial ice is made is frequently distilled or filtered, or both. In general, it may be said that artificial ice should be made from none but naturally pure water or from that which has been purified, and that natural ice should not be harvested from polluted streams or lakes. It may be noted, however, that natural ice, when formed in fairly deep and quiet water, eliminates much of the impurities while freezing, and that recent bacterial studies show that after a few weeks practically all bacteria, and particularly the dangerous ones, disappear. Under anything like carefully guarded conditions, therefore, the chance of typhoid infection by means of ice is small. In the case of artificial ice, the freezing process, being from the outside in, concentrates the impurities at and near the centre of the cake.

BIBLIOGRAPHY. Consult Hile, *The Ice Crop* (New York, 1892); and for the sanitary aspects of the subject, consult: *Reports of the Massachusetts State Board of Health*, for 1889, 1892, and 1900; the *Report of the Boston Board of Health* for 1901; and Prudden, *Drinking Water and Ice Supplies* (New York, 1900).

ICELAND. An island and Danish colony in the North Atlantic, on the northern edge of the temperate zone. The Arctic Circle cuts the two most northern points of the island, which extends south to latitude 63° 35' N., and from longitude 13° 23' to 24° 35' W. (Map: Denmark, F 1). It is about 600 miles distant from Norway, and 250 from Greenland. Its area is 39,756 square miles, of which only about one-sixth is habitable. The southern coast has no indentations, but the west, north, and east coasts are

broken to a remarkable extent by numerous deep fiords, skirted by many small islands. In the south the coastal lands are low and sandy, but elsewhere the coasts are frowning and precipitous.

Iceland is a land of plateaus, built up of volcanic masses of old and recent origin; formations dating from before the Tertiary period are nowhere found. The average height of the land is from 1600 to 2000 feet. The few low grounds are small, and occupy only about one-fourteenth of the total area. Only these low grounds, the coasts, and some narrow valleys are inhabited, while the extensive highlands are quite unfit for settlement; the outer edges only are utilized as summer pastures for sheep. Basalt and volcanic breccia are the component rocks; the latter is found in the centre and extends down to the south, while the greater part of the west, north, and east coasts consists of basalt.

Above the elevated plains of the interior rise the broad domes of the ice-covered mountains; the largest of them rest on breccia, and where the glaciers descend almost to the sea, as on the south coast, there are no fiords or harbors, for these have been filled up by detritus. The basaltic regions, on the contrary, are intersected by numerous fiords, and contain many good harbors, often lying behind narrow tongues of land, which probably are old glacier moraines.

There are many lakes, but most of them are small. In the valleys of the basaltic tracts are deep lakes hollowed out of the solid rocks, as, for instance, the Lagarfljot, the surface of which lies 85 feet above sea-level, while its bottom is 275 feet below. In the highlands one finds several groups of moraine lakes, and in recent times large sheets of water have been formed by the damming up of glacier streams. Certain lakes fill hollows formed by the sinking of lava streams, while others are typical crater lakes. During a journey in 1889 Herr Thoroddsen discovered to the west of the great snow-field of Vatnajökull, a grand and beautiful group of crater lakes. This country is remarkable for its natural beauty; the whole surface is covered with colossal craters filled with water, and would resemble a landscape in the moon were it not for the greenish pools that show themselves everywhere among the coal-black lava, the brownish mounds of ashes, and the red heaps of scoriæ.

The glaciers of Iceland cover an area of 5200 square miles. The climate is peculiarly suited for the development of large glaciers, for the air is keen, cold, and damp. On the southeast coast the rainfall is considerable, and here lies the great Vatnajökull, 3100 square miles in area. The humidity on the coast is much greater than it is in the interior highlands, as is shown by the height of the snow-line. On the south side of Vatnajökull the snow-line descends to 1970 feet, while on the north side it is 4270 feet above the sea. The Breidamerkurjökull glacier advances on the south to 65 feet above the sea, while the lowest glacier on the north terminates at an altitude of 2500. Large areas (4300 to 4600 square miles) in the very centre of the island are covered with lava of recent origin. The higher lava-fields are almost entirely devoid of vegetation, and present a most dreary appearance. The most extensive lava desert is the Odadabraun, to the north of Vatnajökull, which covers an area of over 1540 square miles, and lies 2000 to 4000 feet above

the sea. Its volume is probably more than 51 cubic miles, and it has been formed by the ejections of 20 volcanoes. There are about 100 volcanoes, of which 20 have been in eruption in modern times. The best-known volcanoes are Hecla, Katla, and Askja. The crater of Askja is 16 square miles in area, and is covered with glaciers which melt in times of eruption, causing great inundations. There are many hot springs, and the geysers are famous for their intermittent eruptions of scalding water. About 75 severe earthquakes have occurred in the past century, many of which have done great damage to life and property. Several shocks in the closing years of the nineteenth century were severely felt in Reykjavik, the capital and chief town.

The climate is not very severe, considering the high latitude, as the island is open to the ameliorating influences of the Atlantic. In the highlands of the interior it is more severe and variable; here snow-storms often occur even in the middle of summer. The winter is long and damp, the summer short and cool. A journey can seldom be commenced before July, for in spring the soil is saturated with snow-water, and the mountains and elevated plateaus covered with snow. Grass first appears on elevated spots in July, while in the highlands of the interior the scattered patches of verdure seldom yield fodder for horses before the end of August. The greatest hindrance to exploration is this scarcity of grass. The lowlands and the valleys have a great depth of rich soil, and on the field slopes grasses of several kinds mingle with the scrubby mountain birch and stunted willow, and afford luxuriant herbage for the sheep. A few mountain ashes are the only trees worthy of the name, *Elymus arenarius*, a species of wild corn, is grown along the sandy coasts; and Iceland moss is a lucrative article of commerce.

The fauna embraces, in seven families, 34 species of mammals, 24 of which live in the water. Seals breed around the coasts, several varieties of whales, basking sharks, and over 60 species of fishes abound in the adjacent waters, and walrus are sometimes caught. White and blue foxes are numerous and are hunted for their fur. In 1770 reindeer were imported from Denmark, and are now found wild in the interior. Polar bears frequently arrive on ice-drifts from Greenland. The horse, the cow, the sheep, dog, and cat are the domestic animals. The dog resembles the Scotch collie and the Eskimo dog. Among indigenous birds are the falcon, ptarmigan, whistling swan, and several species of ducks. The eider-duck is especially valuable for its down, and is jealously protected.

AGRICULTURE AND OTHER INDUSTRIES. About five-sixths of the inhabitants live by horse, cattle, and sheep raising. A large part of the slopes and river valleys of the plateaus affords excellent pasture for sheep, and in the low-lying lands are extensive meadows, which, properly managed, could support twice the number of cattle that now graze on them. The island contains about 1,000,000 sheep and 20,000 cows. A great deal has been done latterly to improve the soil. Agricultural societies have been formed, and there are now four agricultural schools. At one time a little barley was grown, but it could not be made to pay, and therefore field cultivation has been abandoned. Horticulture, on the other hand,

makes great progress, potatoes, cabbages, and rhubarb thrive well, and some berries, such as currants, are cultivated. Woods have never existed since the glacial period, and the brushwood of birch is less extensive than formerly, owing to the sheep. The birch is seldom higher than a man, though in one place on the east side some specimens attain a height of over thirty feet. The mountain ash reaches the same height. The fishing grounds (cod, herring, flounders, whale, and seal) are frequented by English and French boats. The sea is very stormy, and therefore fishing is best pursued in large and strong vessels. The fishermen of Iceland have had to content themselves with small open boats. They brave the billows of the ocean in winter with the greatest boldness and contempt of danger, and every year many lose their lives. Want of capital has prevented them from acquiring large vessels, but considerable progress has been made in this direction, and the Icelanders now possess a fair fleet of fishing smacks. Manufacturing industries, with the exception of fish oil, are utterly absent. The simpler articles of dress and necessaries of life are usually supplied by every native for himself, and the number of artisans is very small. The mineral deposits are not sufficiently large to repay exploitation. Turf is the chief fuel, but some coal is imported.

The chief exports are dried fish, wool, live sheep and horses, eider-down, salted meat, oil, and whalebone. The annual value of the exports amounts at present to over \$2,000,000. The imports consist of textiles, cereals, and other food-stuffs, and have an annual value of between \$2,000,000 and \$2,500,000. Up to 1854 the trade of Iceland was a State monopoly of Denmark. Since then it has been free, and is now chiefly in the hands of Denmark and Great Britain. Iceland has regular steam communication every three weeks with Denmark via Leith, the port of Edinburgh. There are a number of trading stations on the island, and six commercial centres. There are few roads. In the settled districts the traveler follows bridle-paths worn by the hoofs of the small Iceland horses. But a few good roads have now been built, and some of the streams are being bridged. The people are sturdy, and have not allowed the hardships they have endured to crush them. As the farthest outpost of civilization they have always had to fight a hard battle with nature. They are of an earnest, quiet, and somewhat melancholy disposition, and as a rule very intelligent. Though the lower classes live in poor circumstances, they are very enlightened; perhaps in no other country of Europe are so many books, in proportion to the population, printed and sold as in Iceland. The island contains five printing establishments, from which issue ten newspapers and eight periodicals. During recent decades many Icelanders have emigrated to America, and have founded flourishing colonies in Manitoba. In all about 12,000 have crossed the Atlantic, but of late years the emigration has fallen off. Besides Reykjavik, the capital, with a population of about 4000, the chief settlements are Akreyri and Isaford.

GOVERNMENT. At the head of the administration is a Governor-General, appointed by the King of Denmark, and exercising his authority under the supervision of the Secretary for Iceland at Copenhagen. The Althing, or the Parliament of the colony, although in existence since

the Norwegian occupation, had not attained its full power before 1874, when the new Constitution granted by the King of Denmark endowed it with complete legislative authority. The Althing consists of 36 members, of whom 30 are elected by the people, and 6 appointed by the Crown. It is convened every two years, and is divided into two chambers, of which the upper is composed of six elected, and as many appointed members, and the lower one consists of 24 elected members. For purposes of administration the island is divided into three districts—the South, the West, and the North and East—administered by two officials having their seats at Reykjavik and Akreyri. The districts are subdivided into 20 smaller divisions known as *syssels*, and administered by sheriffs, who perform the functions of tax collectors, and judges of first instance. At Reykjavik there is a court of second instance from which appeals are made to the Supreme Court at Copenhagen. The revenue is derived from customs and tax on spirits, tobacco, coffee, and sugar. Elementary education is well provided for, and the number of illiterates is remarkably small. There are also a number of higher schools, a theological seminary, and a college at Reykjavik, with about 100 students. For religious purposes Iceland forms a separate bishopric in the Lutheran Church.

POPULATION. The population, estimated at over 46,000 at the beginning of the nineteenth century, was 72,422 in 1880; 70,927 in 1890. The birth-rate is large, but it is offset by the large infant mortality resulting from the severity of the climate. The Icelanders are of Scandinavian origin, and belong exclusively to the Lutheran Church. They live mostly on isolated farms, there being very few settlements.

HISTORY. Iceland was not visited by Europeans, as far as is known, until the end of the eighth century, when some Celts landed on the island, but its history really dates from about 870, when various Norsemen discovered it, chiefly by accident. One of these, Flóki Vilgertharson, gave it its present name. Soon thereafter the Scandinavians came in large numbers, owing to the despotism of Harold Haarfager (q.v.) at home, and permanent settlements were made, among them the present capital, Reykjavik. The settlements were all independent of one another, and for some time the only bond of union was furnished by their common religion, until finally in 927 one Ulfljotr was sent to Norway to prepare a code of laws. He did so, returning in 930. His Constitution provided for a yearly assembly, but all details are lacking to us. Many legal changes, however, had to take place before even a semblance of order prevailed in Iceland. In time, regular territorial divisions appeared, and a system of law very similar to that of Anglo-Saxon England. The most important event in the early history of Iceland was the conversion of its inhabitants to Christianity. The first missionary was Thorvaldr Kothranson, who came in 981, but after five years left the country, having failed utterly. More successful was the attempt made under the auspices of King Olaf Tryggvason of Norway (995-1000), who introduced Christianity, chiefly by force, in the year 1000. Under the influence of the new religion civilization gradually spread, and the laws became milder. Until 1103 Iceland belonged to the province of the Archbishop of Bremen, later to that

of Lund. Meanwhile the kings of Norway regarded Iceland with a jealous eye, for it was a place of refuge for all their rebellious subjects, but all attempts to conquer it failed for many years. The history of the island was mainly one of rivalries of different chiefs, and about the beginning of the twelfth century all the contests in the land were connected with those of the three sons of Sturle, the historian Snorri, Thord, and Sieghvat, the most powerful chiefs of their time. By marriage and other means, Sturle Thordson had become *godar*, or supreme magistrate, of several provinces, for these offices were hereditary in certain families. These offices he transmitted to his sons, who, however, were unable to agree. Finally, in 1262, Norway having been appealed to, King Hakon of that country induced Iceland to join its fortunes to that of Norway. The prosperity of the country from that time onward rapidly declined as strict navigation laws were enforced. In 1380 Iceland, joined together with Norway, came under the Crown of Denmark. Much of the subsequent history of the island is filled with the relation of physical evils which desolated the land, and effectually subdued the spirit of its inhabitants. Thus there were repeatedly severe volcanic eruptions, and between 1402 and 1404 the black death depopulated the island, sweeping away, it is said, two-thirds of the population. In 1540 Christian III, of Denmark began to introduce into Iceland the Reformation, which rapidly prevailed throughout the whole country. Its history since that time has been on the whole scarce in striking events. During the Napoleonic wars England captured it, but gave it back to Denmark by the Treaty of Vienna in 1815. The Althing or Legislative Assembly, which had existed since the earliest times, was now dissolved, but was reorganized in 1843. For many years constitutional conflicts with Denmark went on, which were finally amicably settled in 1874. Since then Iceland has had practically home rule.

ICELANDIC LANGUAGE. With the Norwegian popular dialects and Faroese, Icelandic forms the West Norse subdivision of the Scandi-

navian languages (q.v.), as opposed to the East Norse, made up of Swedish and Danish. The history of Icelandic begins with the settlement of Iceland by Norwegians, principally from Western Norway, at the end of the ninth century. After this time there was gradually developed in Iceland a particular West Norwegian dialect, which, however, at the outset differed but slightly from the parent Norwegian. Only after the introduction of Christianity, about the year 1000, is it possible to speak of languages instead of dialects in the whole Scandinavian north, and at this time Icelandic, too, ranged itself by the side of Norwegian, Swedish, and Danish as a separate language, with characteristic differences in sounds, inflection, and vocabulary.

In the history of Icelandic it is customary to distinguish two main periods—Old Icelandic, from the settlement of the island, in the ninth century, to the Reformation, at the middle of the sixteenth century, and New Icelandic, down to the present day. Old Icelandic is further subdivided into three periods, the first of which extends from 874 until about 1200; the second, the so-called classical period, during which the principal literary works were produced, from 1200 to about 1350; and the third, or transitional period, from 1350 to 1540. The language of the first period, at the beginning identical with that of Norway, at the end is distinguishable from it by but comparatively few differences. One of the most plainly discernible and characteristic distinctions between the two is the retention in Icelandic of initial *hl*, *hm*, *hr*, whose *h* early disappears in Norwegian, as it does in Swedish and Danish, but which has remained in Icelandic, alone of all the Germanic languages, to this very day. The language of the second period, on the other hand, exhibits many important changes along broad lines, in phonetic conditions and in inflectional forms, that from this time on sharply differentiate Icelandic and Norwegian. This forms an intermediary period which witnesses the gradual growth of those changes in the language whose consummation marks the beginning of the new period of Icelandic. During this whole time the language remained practically homogeneous throughout the island, and no sharply defined dialectic differences were developed. Manuscripts of the thirteenth and fourteenth centuries from the west of Iceland show, it is true, characteristic phonetic conditions in certain instances, and it is likely that others existed as between the north, west, and southeast, but none of them are important. From 983 to about 1400 Icelandic was also spoken in the settlements of Greenland, but to what extent this language deviated from that of Iceland cannot be determined from the few runic inscriptions which have come down to us.

Old Icelandic, both from the standpoint of the language itself and of the literature written in it, is by far the most important of the ancient Scandinavian languages. The sources of our knowledge of it are an almost unparalleled literature in prose and verse, written after the early part of the twelfth century, but often of far more ancient ultimate origin. The alphabet used is the usual Latin script of the end of the Middle Ages, introduced by way of England and modified to fit the special conditions of the language. The few runic inscriptions that exist in Iceland are

unimportant from a linguistic point of view, in that they are all more recent than the oldest manuscripts written in Latin letters. The oldest conditions, however, are in many cases not to be found in the oldest manuscripts, but in poems contained in manuscripts of the thirteenth century, which, as a consequence of their metrical construction, have kept forms as old, in some instances, as the ninth century, from which early time they had been transmitted orally from generation to generation. The oldest manuscript that has been preserved is an inventory of the church at Reykjaholt, in Iceland, the most ancient part of which was probably written between 1178 and 1193. The principal manuscript of the Elder Edda, the so-called Codex Regius, dates from the end of the thirteenth century; the principal manuscript of the Snorri Edda, the so-called Codex Upsaliensis, is of the same period. The best manuscripts are all written before the middle of the fourteenth century. Icelandic manuscripts are both parchment and paper. The former medium was used from the beginning of writing, at the end of the twelfth century, down into the sixteenth century; the latter from the fifteenth century almost to the present day. Old Icelandic manuscripts are preserved principally in four large collections—viz. the Arnarnagæran collection, so called from the Icelanders Arni Magnusson, who collected and gave it to the University Library in Copenhagen; the collection in the Royal Library in Copenhagen; the so-called Delagardic collection, in the University Library in Upsala, Sweden; and the collection in the Royal Library in Stockholm. Besides these, there are a few manuscripts in the University Library in Christiania, Norway; in the British Museum, in London; the Bodleian Library, in Oxford; the Advocates' Library, in Edinburgh; in Germany, in Wolfenbüttel, in Tübingen; in Utrecht, Holland; in Vienna and Paris. No manuscripts of importance whatever have been left in Iceland, with the exception of the Reykjaholt inventory, which is a single quarto leaf of parchment preserved in the public archives in Reykjavik.

The most predominant characteristics of Old Icelandic as a Scandinavian language are, in the main, the following: To an extent unknown to the other members of the Germanic group, Icelandic exhibits a consistent and widely developed process of assimilation in consonants and vowels; under this head falls the extraordinary extension of umlaut, which is here not merely a process of palatalization, as elsewhere in the Germanic languages, but of labialization as well. There is besides this a characteristic preference for suffixes, as exhibited in the use of the suffixed definite article with substantives, masc. *-nn*, fem. *-n*, neut. *-t*; the formation of an entirely new medio-passive conjugation by the suffixal use of the reflexive pronoun; and the expression of negation by an added *-gi*, *-a*, or *-at*. Other important characteristics are the universal shortening of the vowels of inflection and of derivation; the disappearance of final *n* in the so-called weak inflection of substantives and adjectives, and in the infinitive of verbs, whose accompanying preposition, furthermore, is *at*, instead of *du* (*zu*), as in the other Germanic languages, and the use of the consonantal case ending *-r*, elsewhere retained only in Gothic as *-s*, in masculine and feminine substantives. There are, in addition, many

other minor peculiarities in sounds, inflections, and syntax. Contrasted with Old Swedish and Old Danish, whose earliest documentary remains date from 1281 and 1329 respectively, Old Icelandic possesses, as a whole, as is to be expected, a much more ancient character in sounds and in inflectional forms. It is, however, by no means invariably the most conservative. The far greater extension of the process of umlaut, for instance, in Old Icelandic, results in a large number of forms that are more recent than the corresponding ones in the other Scandinavian languages in their oldest period. The notably wide vocabulary of Old Icelandic shows some admixture of foreign elements. These are Latin words, introduced mainly through the Church after the Christianization of Iceland in the year 1000; Celtic words, introduced in considerable number as a result of the contact of Celtic-speaking people in the British Islands with the Norwegian settlers of Iceland, many of whom came by the way of Scotland, Ireland, the Orkneys, the Hebrides, and the Shetlands, where they had previously lived for longer or shorter periods; Anglo-Saxon words, which came in as a consequence of the close contact of Icelanders in England with the people, their language, and their culture; and finally, a few French and German words, due to the use in literature of foreign material, derived either directly or remotely from these sources.

The history of New Icelandic, or the present period of the language, begins with the Reformation, although the conditions that characterize it can already be observed in process of development in the transitional period at the end of Old Icelandic. The earliest literary monument of New Icelandic is the first Icelandic printed book, the New Testament, translated by Odd Gottskalksson, and printed at Roeskilde, in Denmark, in 1540. In general, Icelandic has still retained, to the present time, along broad lines, in inflections and vocabulary, its archaic characteristics, so that to-day it is on the whole the most ancient in appearance of the Germanic tongues. Since the beginning of the period the language has, however, in reality undergone a continual internal development. This is particularly true of the sounds, which have been very materially changed in pronunciation, although frequently the conservative retention of the old orthography gives no clue to it. What has helped Icelandic to retain its early conditions is, more than anything else, its relative isolation and the consequent minimum contact with other languages, on the one side, and the fact of its unbroken use in literature on the other. The production of literature in Iceland, although it dwindles in value and amount after the classical period until it is awakened to new life by the Reformation, has never wholly ceased since its very beginning. All this, with the continuous culture of the old literature, which has in some form or other never been forgotten, has tended to keep the language phenomenally pure and homogeneous throughout the island. After 1380, when Iceland, which since the end of the Republic in 1262 had belonged to Norway, fell with that country under the sovereignty of Denmark, a Danish influence was exerted upon the language which has continued, with varying effect, down to the present time. This influence was particularly active in the two centuries immediately following the Reformation,

when, as a consequence of the reawakened literary activity, which brought with it many translations of foreign, and especially of Danish books, it made itself felt in vocabulary and orthography to such an extent that the language seemed on the way to lose forever its characteristic purity. It was an appeal to the old literature which furnished the missing norm, and not only checked the further introduction of Danicisms, but set on foot a reactionary tendency toward the forms and orthography of the classical period of the language. This puristic movement began toward the end of the eighteenth century, but was particularly furthered by the formation of the Icelandic Literary Society by the Danish philologist Rask in 1816. Since that time an influence has been carefully and intelligently exerted, both to eliminate foreign elements from the vocabulary, and either to rehabilitate old forms or to set in their place new forms made out of the old elements of the language, and to reform the orthography from the standpoint of etymology. A printed page of Icelandic at the present day has as a consequence a much more primitive character than the facts of its pronunciation actually warrant. In comparison with the other Germanic languages, changes have, nevertheless, been relatively few, and Icelandic, not only apparently, but in reality, as it is in use to-day, is inherently the best preserved of this entire group.

The present territory of Icelandic, aside from small settlements in the United States and in British America, is the island of Iceland, where it is the spoken and written language of the 70,000 inhabitants. The literary language of the present time is to all intents and purposes the spoken speech, not of any particular region or of any separate class, but of the people of the whole country, with the reservation that in the capital and the trading places along the coast much Danish is in use, and the spoken language is no longer as pure as elsewhere. As in the old period, there are no dialects in modern Icelandic, although there are still, as then, minor differences that give the language of certain parts of the country a local color.

BIBLIOGRAPHY. The standard grammar in German is Noreen's *Altisländische und altnorwegische Grammatik* (2d ed., Halle, 1892). A briefer treatment of Icelandic alone was published by the same author in 1896. Kahle's *Altisländisches Elementarbuch* (Heidelberg, 1896), and Holthausen's *Lchrbuch der altisländischen Sprache* (Weimar, 1895), are both excellent. The best treatment of the inflections in Danish is Wimmer's *Oldnordisk Formlære* (5th ed., Copenhagen, 1897). The earliest grammar in English is Dasent's translation of Rask's work (London, 1845). The most convenient grammar in English is Sweet's *An Icelandic Primer* (Oxford, 1886). Reference may also be made to Vigfusson and Powell's *An Icelandic Prose Reader* (Oxford, 1879). The whole subject of Old Northern grammar is treated scientifically by Noreen in Paul's *Grundriss der germanischen Philologie*, vol. i. (Strassburg, 1901). A very careful treatment of modern Icelandic pronunciation will be found in Sweet's *A Handbook of Phonetics* (Oxford, 1877). The modern language is discussed in Carpenter's *Grundriss der neuisländischen Grammatik* (Halle, 1881). The only lexicon with English renderings is Vigfusson's *An Icelandic-English Dictionary*, etc. (Oxford, 1874), valuable for

its references, but marred by careless etymologies. For the poetical language the standard work is still Sveinbjörn Egilsson's *Lexicon Poeticum Antiquæ Lingvæ Septentrionalis* (Copenhagen, 1860). The best recent dictionary is Fritznér's *Ordbog over det gamle norske Sprog* (2d ed., Christiania, 1883-96), with renderings in Danish. Larsson's *Ordförrådet i de äldsta isländska handskrifterna* (Lund, 1891) contains an exact reference to each occurrence of every word in the oldest Icelandic manuscripts. Gering's *Glossar zu den Liedern der Edda* (2d ed., Paderborn, 1896), and Möbius's *Allnordisches Glossar* (Leipzig, 1866) are valuable special dictionaries. Thorkelsson's *Supplement til isländske Ordbøger* (Reykjavik, 1876-85) contains words not found in previous dictionaries, including Icelandic through the seventeenth century.

ICELANDIC LITERATURE. In order to understand the remarkable brilliancy of the classical Icelandic literature of the twelfth and thirteenth centuries, it is necessary to bear in mind the fact that the early settlers were among the cream of the Norwegian people. In spite of the political difficulties that had induced these hardy Norsemen to seek a home almost in the ocean itself, intercourse between Iceland and the Scandinavian Peninsula continued to be very close, especially as a result of the frequent visits made to Norway by young Icelanders of rank. Another reason for the literary supremacy of the early Icelanders is closely connected with one of the principal natural drawbacks of the island, its severe climate, and the consequent isolation of the people during the greater part of the year. Persons in Iceland were thus greatly thrown upon their own resources. As a result, the art of story-telling was resorted to for passing away the monotony of the dark winter days. The periodical meetings in summer were used for an interchange of news and of stories and poems, and to this day the Icelanders are probably the greatest lovers of oral literature. The Icelandic classics still form the most popular reading matter of the masses of the people. This vitality of the Icelandic literature is again closely connected with social conditions. The Icelanders are a homogeneous people, and in reading the accounts of the early heroes of Iceland they read the stories of their own ancestors, whose names have been familiar to them from early childhood. For them the long genealogies, which the most patient foreign reader finds tiresome, are full of interest as family records of the remote past, and the most insignificant detail is fraught with the vividness of personal association.

Turning to the literature itself, we find, as is the case with the other literatures of the world, that the earliest monuments are in verse form. The earliest monument of Icelandic literature, furthermore, the so-called *Older Edda*, is, like our own *Beowulf*, the most important and interesting work produced, and claims, more than any other single work, the attention of Icelandic scholars. The *Older Edda* is not a poem, in the strict sense of the word, but a collection of more or less closely connected poems of varying length and character, which were preserved for a long time by oral tradition, suffering inevitable changes in the process of transmission. For many centuries the manuscript containing the poems was forgotten, and on its discovery in 1643 it was attributed to the classical writer

Sæmund, called the Wise, who lived in the last half of the eleventh and the first half of the twelfth century. It has since been proved conclusively that it was redacted by an unknown Icelander. A curious error is also frequently repeated with regard to the etymology of the word *Edda* itself, which is explained as meaning great-grandmother. As a matter of fact the name was improperly extended from a prose work, the so-called *Younger Edda*, the work of Snorri Sturluson (q.v.). The age of the *Older Edda* has been greatly exaggerated, the oldest portions probably belonging in their present form to the tenth century. (For an account of the poems, see *EDDA*.) The *Younger*, or *Prose Edda*, is of great value, because of the information it gives of Icelandic mythology and the language of the early skalds. It is a sort of *ars poetica*, and was compiled for the guidance of young poets. Its style is admirable, its tales of the gods and goddesses being related with a due attention to effect. The style of most of the early Icelandic poetry is in marked contrast to the simplicity and directness of the classical prose. The most complicated figures and the most obscure references are freely used. The form is alliteration combined with assonance, or the agreement of medial vowels. Most of the poems of the skalds are short, eight verses each, but some few longer poems occur. The most striking of the latter are the three poems by Egil Skallagrímsson, the hero of the Egils Saga. They are much simpler than the short poems by the same author, and are full of feeling and dignity. Egil's elegy on his son may be ranked among the great poems of the world. To the eleventh and twelfth centuries belong poems composed in imitation of the ancient works, consisting of moral and didactic maxims, the former conceived from an assumed heathen, the latter from a Christian point of view. In the thirteenth century the skaldic art declined and gave place to an inferior literature based upon biblical stories and legends of the saints. Two centuries later appeared the *ríma*, or ballad, which closely resembles in form and subject matter the ballad as found on the Continent. These continued in popularity until the seventeenth century. Frequently the classical sagas were paraphrased in these *rímas*.

The earliest Icelandic prose belongs to the beginning of the twelfth century; when Ari the Wise (1067-1148) composed a history of his native island and its population in the *Islendingabók* (The Book of the Icelanders), which is a revision of an earlier work by Ari. The value of this work is historical rather than literary, for its facts, while detailed and reliable, are not presented in an interesting style. It has been edited, with a German introduction and notes (Halle, 1891). The *Landnáma-bók* (Landtaking Book), also by Ari, is based upon the earlier *Islendingabók*. It describes the discovery and settlement of Iceland, and contains detailed accounts of 3000 persons and 1700 places. It was continued by others. There is an English translation by T. Ellwood (London, 1898). These works entered largely into the composition of the annals of the early kings of Norway, composed a century later by Snorri Sturluson (q.v.), under the title of the *Heimskringla* (Circuit of the World), the opening word of the work. This work deserves special notice as being the most important historical contribution of the Middle Ages.

It is characterized by a vivid style, and so strongly does it appeal to the Icelandic consciousness that it is still the most popular book after the Bible in Iceland. A new translation into Dano-Norwegian has been made (1900) by G. Storm, and published with a subvention by the Norwegian Parliament. The best edition in the original is that edited by F. Jónsson (1893-1901). A continuation of the *Heimskringla* was composed by several authors. It has twice been translated into English, by David Laing (London, 1844 and 1889), and by W. Morris and E. Magnússon (London, 1895). Other histories belonging to a later period are *Flateyrbók*, containing a rather confused selection of sagas, the *Færeyingasaga*, which tells of the introduction of Christianity into the Faroe Islands (translated by F. York Powell, 1896), and the *Orkneyingasaga*, relating the history of the earls of the Orkneys. The parts of the *Flateyrbók* relating to the discovery of America have been edited by A. M. Reeves in *The Finding of Wineland the Good* (London, 1890). The compilation of the laws of the island attracted the attention of the Icelanders at an early period, and in 1118 a complete code, known as the *Grágás* (gray goose), which had been derived from the ancient Norse law, was submitted to the *Althing*, or popular assembly, and in 1123 the canons of the Church, or the *Kristinrettr*, were settled and reduced to writing. A collection of these enactments in the ancient and subsequent codes has been made by Stephensen and Sigurdsson (Copenhagen, 1853), under the title of *Lagasafn handa Islandiæ*.

Of hardly inferior interest to the *Edda* and the *Heimskringla* are the sagas (q.v.). This term in its broadest sense includes all Icelandic prose works of a narrative character. Thus, strictly speaking, Ari's works cited above are sagas, as is also the *Heimskringla*. But as generally used the term saga is applied to shorter narratives, the interest of which centres in one person. The scene of the saga may be laid either wholly or in part in Iceland, or occasionally altogether outside of Iceland. Sagas are divided into several classes, the first of which is the mythic-heroic. The representatives of this class often give a later version of some well-known story which appears in other literatures. This is notably the case with the most interesting representative, the *Völsunga Saga*, earlier traces of which appear in the *Eddas*, and a later version in the *Nibelungenlied* (q.v.). It has been translated by W. Morris and E. Magnússon (London, 1870). The *Vilkina Saga*, treating of Dietrich of Bern, is later, and shows German influence. The *Fridthiofs Saga* is of special interest as being the earliest version of the story made famous by the Swedish poet Tegnér (q.v.). A number of legendary stories were translated into Icelandic prose, the most important of which is the *Saga of Barlaam and Josaphat* (q.v.). The second and most characteristic class of sagas are the family sagas, accounts of individual men and their families. These biographies, as they would now be called, deal with the earliest settlers of the island, and extend to about 1050. They are marked by great simplicity of style, with frequent highly dramatic passages, extreme detail, especially in connection with genealogies and chronologies, and keen characterization. A striking feature of all the sagas is the introduction of

verses supposed to be the work of the characters. This is particularly noticeable in the *Kormaks Saga*, which contains an average of over one poem to each page. The family sagas are subdivided into two classes, the larger sagas and the smaller sagas. To the first belong the *Njáls*, the *Egils*, the *Laxdæla*, and the *Eyrbyggja*. Of these, the first has been admirably translated by G. Webbe Dasent (2 vols., Edinburgh, 1861), and the last was translated in a condensed form by Sir Walter Scott. The *Egils Saga* has been edited with a German introduction and notes by Finnur Jónsson (Halle, 1894), and in the same series the *Laxdæla Saga* has appeared, edited by Kr. Kaalund (1896). Among the smaller sagas, the most interesting are the *Kormaks Saga* and the *Saga of Gunnlaug Serpent Tongue*, both of which are love tales. Apart from their literary qualities, the Icelandic sagas are of great value in throwing light upon many Old Norse customs—religious, legal, and social—that would otherwise be entirely unknown. This is especially true of the *Eyrbyggja*. For the English reader, the introduction to Dasent's translation of the *Egils Saga* is of interest in connection with the general subject of sagas.

Modern Icelandic literature begins with the introduction of printing (1530) by the last Roman Catholic Bishop of Iceland. The first Icelandic translation of the New Testament was made in 1540. During the seventeenth century many learned works were written, the leader in this movement being Arngrim Jónsson (1568-1648). Many manuscripts were collected and copied, and communication between Icelandic and Danish and Swedish scholars was close. Grammars and dictionaries were compiled, and many antiquarian works were published. Among the principal scholars of this period were Thormod Torfæus (1636-1719) and Arni Magnússon (q.v.). During this same period, and without interruption down to the present day, Iceland has produced a surprisingly large number of poets—the largest number, indeed, in proportion to the population, of any country in Europe. Among these poets may be mentioned Hallgrímur Pjetursson (1614-74), the leading Icelandic psalm-writer; Stefan Olafsson (1620-88); Eggert Olafsson (1726-67); and Jon Thorklaksson (1744-1819). The latter made an excellent translation of *Paradise Lost* and Klepstock's *Messias*. Among nineteenth-century poets may be noted Bjárna Thórarson (1786-1841), who is probably the most popular recent Icelandic poet; Jónas Hallgrímsson (1807-45), who introduced several foreign verse forms, notably the hexameter. Of the younger poets we may mention Gestur Pálsson (1852-91); Matthias Jochumsson (1835—), one of the most productive Icelandic poets and author of one of the few successful dramas; Thorsteinn Erlingsson (1858—); and Hannes Hafsteinn (1861—). The principal Icelandic novels are Jón Thordarson's *Piltur ok Stulka* (The Boy and the Girl) and *Mathur ok Kona* (Man and Wife).

BIBLIOGRAPHY. The standard history of Old Norse literature is Finnur Jónsson's *Den Oldnorske og Oldislandske Litteraturs Historie* (3 vols., Copenhagen, 1893-1900). The only treatment of the whole subject in English is Winkel Horn. *History of the Literature of the Scandinavian North*, translated by Anderson (Chicago, 1884). This contains a useful bibliography. The

Prolegomena to Vigfússon's edition of the *Sturlunga Saga* (Oxford, 1878) discusses the classical literature, and the same author's *Corpus Poeticum Boreale* (ib., 1883) contains a complete collection of the poetry down to the thirteenth century, with English translations, notes, etc. The value of this work is impaired by the arbitrary arrangement of many of the poems, especially those of the *Older Edda*. Extracts from the literature will be found in Vigfusson and Powell, *Icelandic Prose Reader* (London, 1868), and in other similar works. Consult also the introductions to the translations of individual sagas in the *Saga Library*, edited by Morris and Magnússon (London, 1884).

ICELAND MOSS (*Cetraria Islandica*). A lichen found in cold climates, especially in Iceland and Norway, in which places it forms an important article of commerce. It is also met with on the higher mountains to the south, but is neglected. It is largely used as a food by the Icelanders and the Laplanders, who either powder the dried plant and make it into bread, or boil it with milk. As food also it has been used in other countries to which it is exported. Before it becomes edible, however, it must be steeped in water to remove a bitter principle. Other uses are in the manufacture of sizing-paper and in dressing the warp in weaving. Formerly it was used as a remedy in pulmonary troubles, but is now regarded as a bland mucilaginous diet in such cases.

ICELAND SPAR. A transparent variety of calcite that is found chiefly in Iceland. Owing to its transparency and double refracting property, it is used for polarizing prisms and in other optical instruments. See CALCITE.

ICE-NEEDLES. See FROST.

ICE'NI. A tribe of ancient Britain, occupying, as is supposed, the present counties of Norfolk and Suffolk. The Icenii joined the ranks of Aulus Plautius in A.D. 43, and secured the defeat of the sons of Cymbeline (q.v.). Some years later (A.D. 61), when the Romans endeavored to establish their authority more firmly in the country, the Icenii rebelled under their Queen, Boadicea, but were subdued. See BOADICEA.

ICE-PACK. See ICE.

ICE-PETREL. A brown and white petrel (*Puffinus gelidus*) of the Antarctic seas.

ICE-PLANT (*Mesembryanthemum crystallinum*). A tender greenhouse annual herb native of Africa and of the south of Europe, remarkable for the glistening bladder-shaped hairs with which its whole surface is covered, and which sparkle in the sun like granules of ice. The seeds are used for food in the Madeira Islands. The ashes supply barilla, which is extensively used as a source of carbonate of soda in soap and glass making, and for which the plant is burned in countries where it abounds. There are in all about four hundred species of this genus, most of which are natives of the south of Africa. The ice-plant is introduced and spreading in southern California. *Mesembryanthemum aquilaterale*, a trailing plant, is also common in California, where its purple flowers, one and a half inches across, are very striking. *Mesembryanthemum edule* bears edible fruits called Hottentot figs.

ICE POLO. A game on skates, which should not be confounded with ice hockey, nor with the equestrian game of polo, though it is related to both these games. Whether ice polo is derived directly from them is uncertain, and of little consequence. It is sufficient to point out the main differences in these two games. The words hockey and polo have been loosely applied to a number of games, but there should be little difficulty in placing them properly. While ice polo is similar in object to ice hockey, it is very different in methods of play. A ball is used instead of a puck, the construction of the stick and the method of handling it are different, and there is a more open manner of play. This open play is brought about through the permission to indulge, in an ice-polo game, in what would in ice hockey be off-side play, that is, getting between the ball and the opponents' goal. Five men make up a team, two less than in ice hockey. There are two rushers, one centre, one halfback, and one goal-tend. The goals are four feet wide and the distance from goal to goal is 150 feet. There are two playing periods of twenty minutes each, with ten minutes' interval. A goal counts three points. The game never had much vogue outside of New England. See HOCKEY.

ICE-PLANT.

ICE YACHTING. Excepting Russia, no country in the world shares with America the sport of ice yachting, and Russia is only a sharer in the sense that a few of its boats, such as those of 'the Russian River Club,' are sailed over a portion of the Gulf of Finland, near Saint Petersburg. As early as the year 1790 there were ice boats, and contests at Poughkeepsie on the Hudson, the runners of one of the boats being still preserved. It was built by Oliver Booth, and was little more than a square box on three runner skates: one on each side of the box, and the rudder one set in an oak post with an oar-tiller. It was sailed with a small flat-headed spritsail. More than half a century passed before there was much improvement in this primitive design. The first real innovation was that of Allaire of Red Bank, N. J., on the Shrewsbury River, who in 1856 mounted his three runners on a triangular frame,

a pattern that was at once seen to give advantage over the previous method. From this the Hudson River boats were gradually developed, the side bars forming with the body a bridge or runner plank (at right angles with the body of the yacht) projecting on each side, and carrying at each end one runner or skate. The mast was stepped at the junction of the runner plank with the main beam; and they had low sails with large jibs, short non-peaked gaffs, and booms extending many feet out from the stern. This style reached its limit in 1869 in the old *Iceicle*. The stepping of the mast over the runner plank placed the centre of effort so far aft that the boats would run away with their occupants, and throw them out, sometimes to their great peril. In 1879 this class was practically superseded by the *Robert Scott* type of a single backbone, with an elliptical steering-box. Then the mast was stepped forward of the intersecting runner-plank, and the jibs and boom shortened. Improvements have continued, but mainly in construction, which has aimed at strength combined with lightness in backbone and masts, and springiness in the cross or runner plank: a very desirable condition, for if a runner under an ice yacht weighing 2000 pounds, and going at 45 miles an hour, strikes a hummock of ice, and has no give or spring in it, the consequence may be a shock that will reduce the craft to pieces. In the year 1866 the lateen sail was adopted, both on the Hudson and Shrewsbury rivers. *Scud*, with the largest lateen ever rigged, was sent from the Shrewsbury to Poughkeepsie on the Hudson, and entered for the pennant several years. She, as well as *Ariel* and *Blizzard*, were exceedingly fast, but, without apparent reason, they would spin round on their heels like tops, or bolt, and in spite of its admittedly many good qualities, and undoubted speed, the rig lost supporters. Theoretically any sailing craft should do its best with all its canvas in one piece. *Flying Scud* modified the lateen by spreading its 615 feet of sail, or cat-boat fashion, by supplementing it with a small jib, and *Vixen* and *Ranger* had other developments of the lateen. The lateen sail has still some staunch friends. The *Georgie* of the Shrewsbury River fleet, and Colonel Higginson's *Cold Wave*, with the Mohegan cat-rig, are two examples of it.

The latest design in runners is that of H. Percy Ashley, known as the rocker type. These have a curve fore and aft. They are especially useful on rough ice. The elongated tiller, too, is of the utmost importance on occasions, because it allows the sailor to lie head forward in the steering-box and guide the yacht with his feet while yet tending sheet with his hands.

The usual course in races is a triangle of one mile on each leg, of which only one can be before the wind, and five times around the triangle constitutes a heat. This necessitates ten sharp turns. The time made by boats over such a course necessarily varies very much on each leg, and still more from day to day, according to the condition of the ice, and the force and direction of the wind. The fastest time made in the pennant championship over the regulation course was by *Iceicle* in 1897 in 46 minutes 19 seconds. Much faster time has been made on a straight-away course in a favorable wind: it is not an uncommon incident under those circumstances for a boat to pick a race alongside the railroad

on the Hudson's banks, and outsail an express train.

The principal original locations for ice yachting were the Hudson River above Poughkeepsie, Newburgh, and Orange Lake, N. Y., and the Shrewsbury River in New Jersey. From these the sport spread westward in the sixties to Lake Minnetonka, Minn., where it was introduced by Theodore Wetmore, and much fine sport has been had by yachtsmen from Saint Paul and Minneapolis. Lake Winnebago, Wis., has also a half-dozen clubs on its borders. Lake Pepin, about 40 miles south of Saint Paul, is the centre for the boats of several towns. At Bar Harbor Lake in Maine there is excellent sport, as well as at Burlington, Vt., on Lake Champlain. In Canada ice yachting is very popular, and on Lake Ontario there is much racing of boats from clubs, both in the Canadian and American ports. So there is in the Bay of Quinte, and on the Saint Lawrence River. No favorable conditions are allowed to pass either at Montreal or Quebec, and on many other of the large inland lakes followers of the sport test their skill.

There are many prizes annually competed for; but as ice yachts are by their nature difficult to move from watershed to watershed, they are mostly local.

ICHABOD, ik'á-böd. A poem by Whittier, intended as a rebuke to Daniel Webster for his change of attitude toward the question of slavery.

I-CHANG, ē'chäng', **Ī CHANG**. A *fu* or departmental city of the Province of Hu-peh, China, situated on the left bank of the river Yang-tse, about 1100 miles from the sea, and about 15 miles below the entrance to the great Yang-tse Gorges (Map: China, D 5). It stands in the centre of a hilly country rich in rice, cotton, wheat, barley, and wood-oil trees (the *T'uug-shu* or *Aleurites cordata*), and many kinds of fruit grown in the sheltered valleys near by. The climate is dry, with warm summers and pleasant winters.

The place is of great commercial importance. It is for the present the limit of up-stream steam navigation, the few attempts that have been made to mount the rapids of the Upper Yang-tse having resulted in disaster. Hence all cargoes destined up-stream are here transhipped to craft specially constructed for the navigation of the river above I-Chang, and most of the down-stream cargoes from Sze-chuen are also transhipped. The city is one of four opened in 1877 to foreign residence and trade, in accordance with the convention signed at Chi-fu in 1876, and a few foreign business houses have agents here. Great godowns or warehouses have been built to accommodate this transit trade, and a foreign settlement has been laid out just below the native city. In 1900 the total trade of the port amounted to 23,143,617 Haikwan or custom-house taels. The total imports of foreign goods amounted to 10,995,273 taels, and of this goods to the value of 10,479,156 taels were reshipped by native craft to Chung-king in Sze-chuen. The value of the Sze-chuen produce reshipped to ports down-stream was 7,154,970 taels. I-Chang has no direct trade with foreign countries.

The steamer traffic is entirely in the hands of the British and the Chinese. About 15,000 native craft of all sizes (the largest probably about 60 tons) pass this port or call at it, in

the course of the year, the river being practically the only way of reaching the great province of Sze-chuen (where the richest coal-fields in the world are situated), and the northern parts of Kwei-chow and Yun-nan. The population of I-Chang is 35,000, including a score or more of foreigners.

ICH DIEN, ik dën (Ger., I serve). The motto of the Prince of Wales, which, surmounted by three ostrich-feathers (originally one), forms his official crest. According to the theory of its derivation Edward I. on presenting his new-born son, Edward of Carnarvon, to the Welsh, who had demanded a native-born prince, used the expression in its Welsh signification—*Eich dyn*, "Behold your man." Another view, not historically verified, attributes it to the occasion of the killing of John, King of Bohemia, by the English at Crécy, and asserts that the Black Prince found the motto under the plume worn by the dead King, and assumed it to imply that 'he served under the King, his father.'

ICHNEUMON, ik-nū'mōn (Lat., from Gk. *ιχνεύμων*, *ichneumōn*, tracker, from *ιχνεύειν*, *ichneuein*, to track, from *ιχνηος*, *ichnios*, track). An old name for the civets of the genus *Herpestes*, now generally called mungoses. (See MUNGOOSE.) The name belongs specifically to the Egyptian mungoose, or Pharaoh's rat' (*Herpestes ichneumon*).

ICHNEUMON-FLY. An insect of a group of parasitic Hymenoptera, forming the family Ichneumonidæ. More than 1100 genera of ichneumon-flies have been described, and many thousands of species. Economically considered they are among the most important groups of insects, since without exception they are parasitic upon or within other insects, and in the very great majority of instances they destroy injurious species. As a rule the ichneumon-fly lays her eggs beneath the skin of the host insect. The egg hatches, and the young footless grub feeds upon the fat and blood and lymph of the host, piercing the fatty tissue with a pair of sharp-pointed jaws. It re-

A LARGE ICHNEUMON-FLY.

Male (b) and female (a) of *thalassa lunator*, in relative size, the latter in the act of forcing her ovipositor into a log. spect the viscera and vital organs of the host up to the last limit, and only sacrifices them toward the completion of its growth. Its skin is very delicate, and it breathes by absorbing oxygen through this skin from the blood of the host insect, and not, as the older writers supposed, by placing itself in communication with the tracheæ of the host. The digestive tube has a very large stomach which is closed behind, and remains closed until the larva is full grown. When this time is reached, and the larva transforms to

pupa, a rectal opening is formed, and the excrement is voided. That such an economy as this is necessary to the life of the parasitic larva is at once seen when we consider that if the excrement were voided daily it would cause speedy inflammation and the death of the host insect before the parasite could become mature. It was formerly supposed that for this same reason the parasitic larva did not cast its skin, but Seurat has recently shown that some of them do occasionally molt.

Some ichneumon-flies lay their eggs on the skin of the insects they attack, and others near the host insect, so that the parasitic larva, after hatching, finds its way to its prey. When the host insect is an internal feeder, like a wood-borer or a gall-insect, the ichneumon larva lives upon instead of within the host. There is no uniformity in the degree of rapidity with which they develop, and they may pass the winter months either as larvæ, pupæ, or adults. As a rule they are long-bodied, slender insects, varying much in size. Many of them have long, sting-like ovipositors—in some instances, as in *Rhyssa*, more than twice as long as the body.

Both the scientific and popular names of this group of insects were derived from the Egyptian ichneumon or 'Pharaoh's rat,' which devours the eggs and young of the crocodile.

Consult: Sharp, *Cambridge Natural History*, vol. v. (London, 1895); Comstock, *Manual for the Study of Insects* (Ithaca, 1885); Ashmead, "Classification of the Ichneumon-Flies," in *Proceedings of the United States National Museum* (Washington, 1900). See Colored Plate of INSECTS.

ICHTHOLOGY, ik-nōl'ō-jī (from Gk. *ιχνηος*, *ichnos*, trace + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). The study of fossil footprints, tracks, trails, and impressions found in the rocks of various geological ages. The most prolific sources of such footprints and impressions in North America are the Jura-Trias sandstones of Massachusetts, Connecticut, and New Jersey. Prof. Edward Hitchcock gathered a great collection of them from the New England localities and placed it in the Amherst College Museum. This collection contains over 8000 tracks, and it furnished the material for Hitchcock's *Ichnology of New England: A Report on the Sandstone of the Connecticut Valley, Especially Its Fossil Footmarks*. Many of the tracks therein described were first supposed to have been made by birds, but they are now known to be the footprints of ornithopod dinosaurs like *Anchisaurus* (q.v.). Still others were made by heavy five-toed animals of unknown nature. Some of the smaller tracks were made by insect larvæ which are found in the same series of deposits. (See MORMOLUCOIDES.) For an entertaining account of fossil footprints, see the chapter on "Impressions of the Past," in Lucas, *Animals of the Past* (New York, 1901). See FOSSIL; JURASSIC SYSTEM; TRIASSIC SYSTEM.

ICHTHYODORULITES (Neo-Lat. nom. pl., from Gk. *ιχθύς*, *ichthys*, fish + *δῶρον*, *dory*, spear + *λίθος*, *lithos*, stone). The fossil spines of sharks, which are often found isolated in the ancient rocks. Many of them are of large size, and because of their hardness and phosphatic nature have been preserved with a considerable degree of perfection. Some of them are well

known under the names of *Ctenacanthus*, *Macæracanthus*, *Pleuracanthus*, *Cyracanthus*, etc. Some of these spines have been found in their original positions at the front edges of the fins of fossil sharks. See FOSSIL; and SHARK.

ICHTHYOL, ik'thi-ól (from Gk. *ιχθύς*, *ichthys*, fish), or **AMMONIUM ICHTHYOL SULPHONATE**. A dark-red oily liquid obtained from a bituminous quartz rich in fossil fish, found in the Tyrol. To prepare the drug, the mineral is distilled with strong sulphuric acid, a saturated aqueous solution of common salt is added to the distillate, and the ichthyol-sulphonic acid which separates out is neutralized with ammonia. The ichthyol thus obtained has a somewhat disagreeable bituminous odor and taste, and is soluble in water, in glycerin, and in various oils. It is an antiseptic, mild irritant, and somewhat of a styptic. It is absorbed with ease by the skin when applied externally, and by the intestinal mucous membrane when administered internally. It is one of the best-known remedies for erysipelas, in which disease it is applied externally in the form of an ointment made up with lanolin. The same preparation is highly recommended for cases of acute articular rheumatism, as affording prompt relief by reducing the pain and the swelling. Unna has declared it to be the remedy par excellence in acne. He applies it externally in the form of a 15 per cent. ointment, and gives it internally in doses of from 2 to 10 grains in pills or in capsules; he also recommends the free use of ichthyol soap. Ichthyol is extensively employed in the treatment of various skin diseases, and is said to be particularly efficacious in eczema, chronic urticaria, and simple sycosis. It is frequently prescribed, with success, as a local application in chronic nasal catarrh, especially in the form known as ulcerative rhinitis.

ICHTHYOLOGY, ik'thi-ól'ó-jí (Gk. *ιχθύς*, *ichthys*, a fish + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). That branch of natural history which treats of fishes. See FISH.

ICHTHYOPHAGI, ik'thi-óp'á-jí (Lat. nom. pl., from Gk. *ἰχθυοφάγος*, *Ichthyophagos*, fish-eater, from *ιχθύς*, *ichthys*, fish + *φαγεῖν*, *phagein*, to eat). Among the ancient Greeks, a name for various tribes of coast dwellers on the southern seas; in Asia, on the coast of Southern China, Gedrosia, and Northeastern Arabia; in Africa, on the west coast of the Arabian Gulf and in Senegambia.

ICHTHYOPSIDA, ik'thi-óp'sí-dá (Neo-Lat., from Gk. *ιχθύς*, *ichthys*, fish + *opsis*, *opsis*, appearance). A division of the Vertebrata, including all such forms as have no amnion and alantoid, but which have, either persistently or temporarily, gills as their respiratory organs. The group includes the Amphibia (q.v.) and the fish-like forms. This division was introduced by Huxley.

ICHTHYORNIS, ik'thi-ór'nís (Neo-Lat., from *ιχθύς*, *ichthys*, fish + *ornis*, *ornis*, bird). A genus of toothed birds of the Cretaceous age, found fossil numerously in western Kansas,

along with remains of *Hesperornis*, *Aptornis*, and the like. These two genera represent the division *Odontotormæ* of the toothed birds (see *ODONTORNITHES*), characterized by having the teeth, with which the mandibles were plentifully furnished, set each in a separate alveolar socket. The various species were birds not greater than a pigeon in size, and resembling terns in general appearance and probably in habits. They were sea-birds of powerful flight, and the structure of their wings, legs, and carinate sternum much

SKULL OF ICHTHYORNIS.
a, Cranium and upper mandible of *Ichthyornis regalis*; b, lower mandible of the larger *Ichthyornis victor*.

resembles that of modern birds. The skull, however, retains many reptilian features besides the teeth, such as the diminutive elongated space for the brain, the single-headed quadrate bone, and the union of the lower jaws in front by a ligament. The vertebrae, also, differ from those of *Hesperornis* and all modern birds, in being biconcave. This form of vertebra is seen in a few recent and many extinct reptiles, but is especially characteristic of fishes; the presence of this character alone would indicate the very antique origin of the group. These birds doubtless lived and fed as do modern gulls, seizing living fishes, and going ashore only to breed and roost at night. They were doubtless well feathered, and seem to have flourished until the end of the Cretaceous era. Most of the fossil remains thus far obtained are in the museums of Yale University and of the University of Kansas. See *HESPERORNIS*; and consult the authorities there referred to.

ICHTHYOSAURUS, ik'thi-ó-sq'rús (Neo-Lat., from Gk. *ιχθύς*, *ichthys*, fish + *σαῦρος*, *sauros*, lizard). An extinct genus of fish-like reptiles found in the Mesozoic rocks of Europe and North America. The ichthyosaurs among reptiles are analogous to the whales among mammals, and they have many points of resemblance to these. Their bodies were round and tapering, heads large, with long snouts and very short necks, limbs reduced to paddles, and they had a broad, vertical fin on the tail and a triangular fin at the middle of the back. The body was covered with thin, smooth skin and no traces of dermal plates have been discovered. The jaws were armed with a large number of sharp, conical teeth that have a complicated internal structure similar to that of the teeth of Labyrinthodonts or Stegocephalia. The eyes are surrounded by circles of sclerotic bones, and there is a large pineal foramen on top of the skull between the eyes. The vertebrae are biconcave, and the pelvic

arch is separated from the vertebral column, for there is no sacrum. In size they ranged from 4 to 40 feet, and they must have swarmed in immense numbers in some portions of the European seas, especially during Liassic time, for their remains have been found in abundance in deposits of that age at Lyme Regis, England, and in Württemberg, Germany. That they were predaceous animals and fed largely on fish, is evidenced by the fish fragments found within their coprolites and also within the abdominal cavity of some skeletons. Some ichthyosaurs were viviparous, for specimens obtained in the Württemberg quarries show several small embryonic skeletons contained in the abdominal cavities of the adults. About thirty-five species of Ichthyosaurus are known, and they have been found in the Mesozoic deposits of Europe, the East Indies, Australia, New Zealand, and South America. Allied genera are Mixosaurus, of small size from the Trias, and Ophthalmosaurus, a toothless ichthyosaur from the Upper Jurassic and Lower Cretaceous. A single representative, Baptanodon, is found in the North American Jurassic, and is very close to Ophthalmosaurus. The ichthyosaurs and their allies, together with the Sauropterygia, comprising the plesiosaurs and allied forms, were formerly included in an order Enaliosauria, which is not now recognized.

(Edinburgh and London, 1889). See REPTILIA.

ICHTHYOSIS, ik'thī-sīs (Neo-Lat., from Gk. *ἰχθυόσις*, from *ἰχθύς*, *ichthys*, fish), or FISH-SKIN DISEASE. A disease characterized by a hardened, thickened, rough, and almost horny state of the epidermis, which breaks into small, irregular, scale-like pieces, which do not readily exfoliate, but which if removed are speedily reproduced. In the localities less profoundly altered by the ichthyotic condition, there is hypersecretion of sweat; in the hardened and thickened places, many sudoriparous glands are suppressed and the surface is dry. The disease may affect almost the whole surface or may be confined to a single part; and is most frequently, but not always, congenital. It is attended with no constitutional disturbance. The disease is extremely obstinate, and when congenital may be considered as incurable. The treatment consists in the frequent use of the warm or vapor bath, so as to soften the thickened epidermis and to facilitate its removal, and friction by means of a piece of flannel may be conjoined with the bath. The internal administration of tar, cod-liver oil, etc., sometimes gives relief.

ICHTHYS, ik'thīs (Gk. *ἰχθύς*, *ichthys*, fish). An early Christian symbol. It was discovered that the Greek word for fish consisted of the first letters of the common ascriptive title to Christ: Jesus Christ, the Son of God, the Saviour, or in Greek Ἰησοῦς Χριστὸς Θεοῦ Υἱὸς Σωτήρ. A fish thus became the symbol of Christ, and to make the sign of a fish was to give to the initiated the plainest indication of being a Christian. Accordingly, it entered into the freemasonry of early

Christianity. The acrostic appears upon the monuments, and the figure of a fish likewise.

ICICA, is'ī-kā. See PROTIUM.

ICIL'IUS. The name of a plebeian family in Rome, which produced some of the most zealous defenders of the plebeian interest against the patricians. The name of one of them, betrothed to the unfortunate Virginia, is associated with one of the most touching incidents in the legendary history of Rome. See APPIUS CLAUDIUS CRASSUS.

ICKELSAMER, ik'el-sā'mēr, VALENTIN (c.1500-c.1537). A German grammarian. Nothing definite is known of his life. He was born at Rothenburg-an-der-Tauber, it is conjectured, as about 1525 he was schoolmaster there, and from the title-page of one of his works we may gather that he lived for a time, possibly as schoolmaster, at Karlstadt. Afterwards he lived at Erfurt and at Augsburg. His two principal works were: *Rechte Weis auff's kürztzist lesen zu lernen* (c.1527), the foundation of the German phonetic method; and *Teutsche Grammatica* (c.1534), one of the earliest German grammars. Both these books are reprinted in Müller, *Quellen-schriften und Geschichte des dewtschsprachlichen Unterrichts* (Gotha, 1882).

ICKNIELD STREET, or **WAY**. An ancient road running from Cornwall to Norfolk in England. The name is connected with the Icenī.

ICOD, or **ICOD DE LOS VINOS**, ê-kōd' dā lōs vē'nōs. A small town on the northwest coast of Teneriffe, one of the Canaries (q.v.) (Map: Spain, F 5). Population, in 1900, 7282.

ICOLMKILL, i'kōm-kil. See IONA.

ICON BASILIKE, i'kōn bā-sil'ī-kē. See EIKON BASILIKE.

ICO'NIUM. A town of Asia Minor. See KONIEH.

ICON'OCCLASM (from Gk. *εἰκών*, *eikōn*, image + *κλάω*, *klān*, to break). The name given to any movement against the religious use of images, but especially to the crusade against their use which excited the whole Eastern Church in the eighth century, dating in its definite character from a decree of the Emperor Leo, the Isaurian, which enjoined the destruction of such images. The question was settled by ecclesiastical authority at the second Council of Nicæa (787), but several succeeding emperors confirmed and attempted to enforce the edict against much popular opposition. The course of the Reformation in Western Europe was marked by wholesale destruction of sacred statues, and many of the English cathedrals still bear traces of the iconoclasm of Cromwell and his soldiers.

ICON'OCLAST. The nom-de-plume of Charles Bradlaugh.

ICONOCLAST EMPERORS. The Byzantine Emperors by whom the contest against iconolatry in the Eastern Church was waged: Leo III., the Isaurian, Constantine V., Leo IV., Leo V., the Armenian, and Theophilus.

ICONOGR'APHY. A term originally used, in its etymological sense, to signify the science of antique portraiture, i.e. the discussion, enumeration, and history of the portraits of prominent persons in statues, busts, paintings, coins, gems, etc. This science was first resurrected by

Michelangelo and Fulvius Ursinus, and further developed by Canini, in his *Iconografia* (Rome, 1669). The term 'iconography' is occasionally applied to the portraits or images of mythological personages and objects of antiquity—a subject generally treated in the article MYTHOLOGY. Its chief use, however, is in reference to the attributes, emblems, and symbols with which Christian deities, saints, and conceptions are represented in art.

CHRISTIAN ICONOGRAPHY. In the early Christian centuries the representations were few in number and quite simple, leaving much freedom to the artist. They embraced subjects like the "Good Shepherd" and the emblems of faith, familiar to all. In the fourth and fifth centuries iconography became more complicated. The clergy began to use it as a factor of systematic religious instruction, controlling the representations which were now executed in strict accordance with formulas. Christ, as King of Heaven, was by far the favorite subject from the fourth to the seventh century, while from the eighth to the twelfth, the 'Last Judgment' and scenes from the Revelation were in vogue. There were two schools: the Eastern or Byzantine and the Western or Latino-German. The former was by far the most original and important, dominating not only the East, but Europe during the Carolingian period, and remaining supreme in Italy until late in the Gothic age. It found its expression in mosaics, frescoes, and illuminated manuscripts, sculpture being excluded as a result of the Iconoclastic conflict. (See BYZANTINE ART.) The iconography of the Romanesque (q.v.) period was meagre and unsystematic, but during the Gothic age an independent Western system originated in France, spreading throughout Europe. In the North it found its chief expression in the sculptures of the great cathedrals, and endeavored to represent the encyclopædic conceptions of the scholastics. (See GOTHIC ART.) In Italy it manifested itself chiefly in painting. Iconography remained under clerical control until, with the Renaissance, the human element superseded the divine, the old subjects being used as a means for the expression of human feeling and artistic ability. The old subjects from biblical history, especially those illustrating the plans of salvation and those from the lives of the saints, continued to be used, the most popular subject being the Madonna with the Christ Child, represented as an earthly mother or in more divine attitudes. The more important subjects of Christian iconography are treated under separate titles, like CHRIST IN ART; HOLY FAMILY; VIRGIN IN ART. For the important part played by emblems and symbols in iconography, see the articles on these subjects, and such special articles as AUREOLE; NIMBUS, etc.

BIBLIOGRAPHY. The foundations of the modern science of Christian iconography were laid by Didron, *Iconographie chrétienne, grecque et latine* (Paris, 1845; English translation in Bohn's Library), and Anton Springer (q.v.).

See also Durand, *Histoire de Dieu, iconographie des personnes divines* (Paris, 1844); Wessely, *Iconographie Gottes und der Heiligen* (Leipzig, 1875). The best modern works are: Barbier de Montault, *Traité d'iconographie chrétienne* (Paris, 1890), and Detzel, *Die christliche Ikonographie* (Freiburg, 1895). There is no good work on the subject in English, the writings of Mrs.

Jameson being unscientific. For iconography in the sense of classical portraiture, consult the monumental works of Visconti: *Iconographie grecque* (3 vols., Paris, 1808); *Iconographie romaine* (3 vols., ib., 1818-20); Bernouilli, *Römische Ikonographie* (Stuttgart, 1882-91); *Griechische Ikonographie* (Munich, 1901).

ICTEROHÆMATURIA, ik'tēr-ō-hēm'ā-tū'rī-ā (Neo-Lat., from Gk. ἰκτερος, *ikteros*, jaundice + αἷμα, *haima*, blood + οὐρον, *ouron*, urine). A malignant disease of sheep, due to the action of a blood parasite similar to that of Texas fever. In Europe it is known as carceag. The micro-organism of the disease is found in the blood, urine, spleen, liver, and kidneys. The chief symptoms are fever, bloody urine, and jaundice of the eyelids, nostrils, and sometimes of the skin. Dropsical swellings occur on the head and neck, and the animal assumes a crouching position. During the progress of the disease there is a decrease in the number of red blood-corpuses and an increase in the number of white corpuses. Post-mortem examinations reveal an enlargement of the kidneys and a yellow color in the adipose tissue. The disease occurs in restricted localities, where it causes serious losses of sheep. It appears to be safe, however, to raise goats on such infected areas.

ICTINUS (Lat., from Gk. Ἰκτινός). The chief architect of the age of Pericles, designer of the Parthenon at Athens, the great hall for the mysteries (Telesterion) at Eleusis, and the Temple of Apollo Epicurius at Phigalia in Arcadia. He is said to have written an architectural treatise on the Parthenon.

IDA (Lat., from Gk. Ἰδῆ, *Idē*, Ἰδα, *Ida*). A mountain range of Asia Minor, extending through Phrygia and Mysia; now known as Kaz-Dagh. The Granicus, the Simois, the Scamander, and other streams famous in ancient story, flowed from its sides. The highest peak was Mount Gargarus, 5748 feet, near the plain of Troy. Ida was an ancient seat of the worship of Cybele, who was hence called *Idæa Mater*. There was another Ida, almost equally famous, in Crete. This is now called Psiloriti. It rises to a height of about 8000 feet above sea-level. Zeus is said to have been nurtured in a cave in this mountain.

IDA. The princess, in Tennyson's poem of that name.

IDÆI DACTYLI (Lat., from Gk. Ἰδαίων Δάκτυλοι, *Idaioi Daktyloi*). Like the Corybantes and Curetes, attendants upon Cybele, who were originally connected with Mount Ida in Phrygia, whence they were transferred to Mount Ida in Crete, where they watched the infant Zeus. They are supernatural metal-workers, and seem to derive their name from their ready fingers (δάκτυλος, *daktylos*, finger). The number is given as five or ten, or sometimes even 100. In Greece they appear only at Olympia, where they seem to have been brought from Crete, and were identified with Hercules and four brothers, who first competed in the foot-race.

IDA GROVE. A town and the county-seat of Ida County, Iowa, 80 miles east by south of Sioux City, on the Maple River, and on the Chicago and Northwestern Railroad (Map: Iowa, B 2). It is the commercial centre of a fertile agricultural and stock-raising district, and has grain-elevators and flouring-mills, a broom-fac-

tory, etc. A municipal heating plant is in successful operation. Population, in 1890, 1563; in 1900, 1967.

IDAHO, *í'dá-hō* (North American Indian, gem of the mountains). One of the Western States of the American Union, lying between latitudes 42° and 49° N., and longitudes 111° and 117° W. It is bounded on the north by British Columbia, on the east by Montana and Wyoming, on the south by Utah and Nevada, and on the west by Oregon and Washington. The extreme length from north to south along the western boundary is 485 miles. The width varies from about 50 miles in the north to nearly 300 miles in the south. Its area is 84,800 square miles, including 510 square miles covered by lakes.

TOPOGRAPHY. The surface of Idaho is elevated and mostly mountainous. Lying between the main axis of the Rocky Mountains on the east and the Cascades on the west, the State embraces a portion of the Great Basin, a plateau lying 2000 to 5000 feet above the sea, while the northern and eastern parts are traversed by mountain ranges whose loftier summits rise above the snow-line. The principal ranges, the Salmon River and Bitter Root, attain their maximum development near the eastern border, but they send out spurs which extend nearly across the whole width of the State. Northward from the Bitter Root Mountains the system of elevations is continued by the *Cœur d'Alène* and Cabinet ranges to the Canadian frontier. In the extreme southeast are the Bear, Blackfoot, and Snake River ranges, offshoots from the main Rocky Mountain system in Wyoming. Nearly the whole area of Idaho is drained into the Columbia by the Kootenai, Clark Fork, Spokane, and Snake rivers. The Snake, or Lewis Fork, is much the largest, its basin within the State covering more than 60,000 square miles, and its course being about 850 miles. It receives important tributaries in the Boise, Payette, Weiser, Owyhee, Salmon, and Clearwater, but its waters are usually shallow. In its course from east to west it passes over three falls, the American, the Shoshone, and the Salmon. The Shoshone Falls have a perpendicular descent of nearly 200 feet. Below the Salmon Falls the river is navigable for light-draught boats to the mouth of the Powder River. In the northern part of the State there are several lake basins, including Pend Oreille, Kaniksu, and *Cœur d'Alène*, and in the southeast on the Utah boundary, Bear Lake drains through the Bear River into Great Salt Lake.

CLIMATE AND SOIL. The climate in the more elevated parts is severe, with heavy snowfall in winter; the plains and valleys have a milder climate, free from great extremes, as the summer heat is moderated by mountain breezes. The rainfall in the south is very light, increasing toward the north and east, where the elevated ranges arrest the moist winds. Agriculture is thus limited to the mountain valleys and to the basins of the large rivers, such as the Salmon, Clearwater, Payette, and Boise, where irrigation can be practiced. These basins have a rich alluvial soil that produces excellent crops of cereals and fruits. The uplands have a moderately fertile soil of sands and clays, and are best adapted to grazing.

FLORA AND FAUNA. See paragraphs on these respective topics under **ROCKY MOUNTAINS** and **UNITED STATES**.

GEOLOGY AND MINERAL RESOURCES. Geologically Idaho exhibits the general features characteristic of the Rocky Mountain States. Strata of Paleozoic, Mesozoic, and later ages alternate with eruptive and metamorphic rocks. Along the Snake River there is a vast lava-bed forming a desert nearly 400 miles long and 40 to 60 miles wide, the eastern end of a volcanic belt that extends to the Pacific. The fissures from which the molten rock poured out during the late Tertiary period are generally concealed beneath the thick sheets, although their position may be indicated by the lines of flow. The surface of this region is a level plain, almost destitute of vegetation.

MINING. The mineral resources of the State, including deposits of gold, silver, lead, iron, coal, and salt, are of great importance. Gold is obtained from both placer and quartz mines in nearly every county. The first discoveries were made about 1860, and the total output up to 1901 amounted to more than \$100,000,000. There has been a decrease in production in late years, owing to the exhaustion of the placer deposits; but with the opening of new fields for quartz mining, such as that at Thunder Mountain, the industry may regain its former prominence. Dredging operations for the recovery of gold from the bed of the Snake River have been carried on successfully for several years. The *Cœur d'Alène* lead-silver district in Shoshone County is one of the richest in the United States. The metallic output of Idaho in 1900 was as follows: Gold, \$1,727,700; silver, 6,429,100 ounces, valued at \$3,986,042; lead, 85,444 short tons; copper, 290,162 pounds.

FORESTS AND FORESTRY. There are in the State 7,000,000 acres of timber land, the exploitation of which has just begun. Almost the whole of the forest area is in the northern part of the State, where the valleys are covered with an exceedingly dense growth. The larger part (3,456,000 acres) of the Bitter Root Timber Reserve is in Idaho. The higher elevation is known as the alpine fir region, constituting nearly three-fourths of the total reserve, the timber in this part being of little value. In the lower zone the yellow pine occupies the drier regions, and the red fir the more moist regions. The Idaho forests have suffered great losses from forest fires.

AGRICULTURE. A very large part of the State is arid and irreclaimable land. In the north the rainfall is greater, and supplies sufficient moisture for grain crops. Three-fourths of the total area is yet public land. This, however, is being rapidly taken up. The great development of the mining industry has created a home market for farm produce, and justifies incurring the heavy expense of irrigation. The channels of the main streams—the Snake and Clearwater—are generally deep, making irrigation impossible or highly expensive. But numerous smaller streams offer excellent irrigation facilities. This is especially true of the head-water region of the Snake River and of the large district, in the western part of the State, lying north of the Snake River and watered by the Boise River and other streams. The Bear Lake region in the southeast corner is also said to be adaptable to irrigation purposes. In 1900, 602,568 acres, or 42.6 per cent. of the improved land, were irrigated. Five and nine-tenths per cent. of the total area, or 3,204,903 acres, were reported for the same year

as contained in farms, the average size of which was 183.4 acres. As is common with irrigated lands, intensive farming is the rule, and the soil being very fertile when sufficiently watered, the yield of all crops is very abundant. Hay and forage is the most extensive and valuable crop, the annual acreage for which increased over two and a half times in the last decade of the nineteenth century. Over a third is alfalfa. In the same period the acreage devoted to cereals increased over threefold. Wheat constituted 72 per cent. of the cereal crop for 1899. Oats, barley, and flaxseed are of less importance, and corn is scarcely raised at all. The western part of Idaho, particularly the Boise Basin, is becoming noted for its fruits and vegetables. Apples and prunes are the chief varieties of orchard fruits.

STOCK-RAISING. Thus far, however, it has been the grazing rather than the farming facilities which have been most extensively utilized. There are 25,000,000 acres of pasture land in the State. In the northern and the mountainous parts of Idaho considerable expense is incurred in stock-raising, owing to the shortness of the summers and the depth of the winter snow. Herders and packers who use mules and horses in the northern mountains through the summer season withdraw to the valley of the Snake River to winter their stock. Along the Snake River, on both sides, there are numerous valleys where winters are not severe enough to prevent cattle and horses from picking up a living for themselves. In the decade ending with 1900 large gains were made in every variety of domestic animals. Sheep are the most important, having produced wool to the value of \$2,210,790 in 1899. The following tables show the relative importance and increase of the different varieties of crops and domestic animals:

	Hay and forage, acres	Wheat, acres	Oats, acres	Barley, acres	Corn, acres	Potatoes (Irish), acres
1900.....	513,656	266,305	64,739	32,798	4,582	9,313
1890.....	190,501	63,704	21,997	10,004	1,362	3,721

	Dairy cows	Meat cattle	Horses	Mules and asses	Sheep	Swine
1900.....	51,929	311,605	170,120	2,155	1,965,467	114,080
1890.....	27,278	192,153	84,135	1,012	857,712	32,188

MANUFACTURES. The manufacturing industry, though not large, is making a vigorous growth. The value of products increased 283 per cent. during the last decade (1890-1900). Flour-milling is of some importance; but the sawing of lumber is the principal industry. The census for 1900 gives the following figures: Number of establishments, 591; capital, \$2,941,524; wage-earners, 1477; wages, \$862,088; value of products, \$4,020,532.

TRANSPORTATION. The Union Pacific, passing through the southern part of the State, offers good railroad facilities to the Snake River Valley. The northern portion of the State is also well provided for by the Great Northern and the Northern Pacific lines. But the great central portion of the State is without railroads. The development of mines within this section has stimulated the construction of wagon roads and trails, but these are altogether inadequate to the

needs of the district. The total railway mileage of the State was 1271 miles in 1899.

BANKS. October 31, 1900, there were 15 national banks, 10 of which were in operation. Capital stock, \$575,000; outstanding circulation, \$218,976. Deposits, September 5, 1900, \$3,937,423; reserve held, \$1,643,497. On June 30, 1900, there were 8 State banks, with a capital aggregating \$185,500; deposits, \$537,902; resources, \$781,465. There were also 6 private banks with resources aggregating \$329,320; capital, \$81,665; and deposits, \$210,693.

GOVERNMENT. Idaho became a State under its present Constitution, adopted by a convention held August 6, 1889. An amendment may be proposed in either branch of the Legislature, and if agreed to by two-thirds of all the members of each House is submitted to the people, and becomes a part of the Constitution if approved by a majority of the electors. If demanded by two-thirds of the members of each House, the question of calling a constitutional convention is submitted to the people, where it is decided by a majority of the electors voting. Suffrage is granted to both male and female citizens who have resided in the State six months, in the county thirty days, and are registered. There are various offenses which cause disqualification for the right of suffrage, among which are plural marriage, or in any manner teaching . . . or encouraging any person to enter into plural marriage, or membership in any organization which encourages it.

LEGISLATIVE. The number of State Senators cannot exceed 24, nor the Representatives 60, both being elected from counties or districts composed of contiguous undivided counties for the term of two years. The Legislature meets on the first Monday after the first day of January of even years, and at other times when con-

vened by the Governor. Bills for raising revenue must originate in the Lower House. Members receive \$5 per day and mileage, but the per diem allowance cannot exceed \$300 for any one session.

EXECUTIVE. The Governor, Lieutenant-Governor, Secretary of State, Auditor, Treasurer, Attorney-General, and Superintendent of Public Instruction are elected for two years at the time and places of voting for members of the Legislature. The Governor, Secretary of State, and Attorney-General constitute a board of pardons. A vetoed bill or item of an appropriation bill is carried over the Governor's head by a two-thirds vote of the members present in each House.

JUDICIAL. The Senate constitutes a court for the trial of impeachments, the Lower House having the sole power of impeachment. The Supreme Court consists of three justices, elected by the State at large for a term of six years. The

State is divided into judicial districts, in each of which a judge is elected for a term of four years, and there is a district court in each county at least twice a year. A clerk of the district court is elected for each county, holding office four years. A prosecuting attorney is elected for each organized county for the term of two years. There are also probate courts, justices of the peace, and such other courts as may be established by law. Three-fourths of a jury may render a verdict in a civil action, or five-sixths of a jury in a criminal action for a misdemeanor.

LOCAL GOVERNMENT. The Legislature maintains a uniform system of county government, and by general laws provides for township and precinct organizations, and for the incorporation, organization, and classification of cities and towns. Each county biennially elects county commissioners, a sheriff, treasurer, probate judge, county superintendent of public instruction, assessor, coroner, and surveyor.

FINANCE. The bonded indebtedness of the State on January 1, 1901, was \$443,500. Much of this was incurred in the construction of wagon roads. The outstanding State warrants for the same date were \$124,766.

MILITIA. Able-bodied male residents between the ages of eighteen and forty-five are liable to military duty, except persons having conscientious scruples against bearing arms. These may be exempted from such duty in time of peace. In 1899 the State had an organized militia of 566 officers and men.

POPULATION. The development of the mineral and other resources of the State has induced a rapid growth in the population—almost doubling in the decade 1890-1900. The population consists predominantly of native-born Americans, only about one-sixth being foreign born. As in other mining and grazing States, the male sex is much in excess. The population, by decades, is as follows: in 1870, 14,999; in 1880, 32,610; in 1890, 84,385; in 1900, 161,772. In 1900, Boise, the capital, contained a population of 5957, and Pocatello, 4046.

INDIANS. According to the last census there were 4226 Indians in the State. There are four reservations, viz. the Fort Hall, Lenhi, Cœur d'Alène, and Nez Percé. The Indians in the two last-named reservations have made much progress and are practically self-supporting. The others are still dependent upon the Government, receiving about 30 per cent. of their subsistence from Government rations.

RELIGION. In religion, Idaho is, like Utah, strongly Mormon. The Catholics are the next strongest, and the Methodists, Baptists, and Presbyterians follow in the order named.

EDUCATION. The school officers of the State consist of a superintendent of public instruction, a superintendent of each county, and a board of three trustees in each district. Schools cannot be supported from the public-school fund if any political or sectarian doctrines be taught therein; and the distribution of books, tracts, or documents of this character in them is forbidden by law. The public schools are sustained from the income of a general school fund, also from a county tax, from moneys arising from legal fines and forfeitures, and from fees paid by teachers for certificates of qualification. The basis for

distribution of the school money is the number of individuals of school age (five to twenty-one years). Districts may levy special taxes for building or repairing school-houses, and; when the cost of repairs does not exceed \$25, the trustees may levy a rate bill, to be collected from such patrons of the school as are able to pay. In 1900 only 4.6 per cent. of the population ten years of age and over were unable to read and write, which was smaller than the corresponding number for the whole country. The State institutions comprise the University of Idaho at Moscow; normal schools at Albion and Lewiston; and an agricultural and mechanical college at Idaho Falls. There are also the College of Idaho (Presbyterian) at Caldwell; Episcopal school at Lewiston; Saint Aloysius Academy at Lewiston; Saint Teresa's Academy at Boise; and an industrial school for Cœur d'Alène Indian girls at Desmet.

CHARITABLE AND PENAL. Defectives are temporarily sent for purposes of education to Colorado institutions. In 1900 the State insane asylum at Blackfoot contained 118 male and 74 female inmates. In the same year the State prison at Boise contained an average daily enrollment of 150 prisoners.

HISTORY. The first white explorers of Idaho were Lewis and Clarke in the first decade of the nineteenth century. A mission is reported to have been established at Cœur d'Alène in 1842, but for many years after that the region was visited only by hunters and prospectors. It was organized as a Territory on March 3, 1863, but with an area more than three times as large as at present, since it included the whole of Montana and nearly all of Wyoming. In May, 1864, a part was set off to Montana, and in 1868 Wyoming was organized. The discovery of gold in 1882 at Cœur d'Alène in the northern part of the State was followed by a large immigration. In 1889 a new constitution was adopted, and the University of Idaho was established at Moscow. On July 3, 1890, Idaho was admitted to the Union. The presence of a large number of Mormons in the southern part of the State excited great alarm, and as early as 1883 led to hostile action on the part of the Legislature. A law depriving professed polygamists of the right to vote was carried to the United States Supreme Court, and there sustained. In 1893, however, the heads of the Mormon Church rejected polygamy as an essential element of their creed, the anti-Mormon restrictions were removed, and all single-wived Latter Day Saints were admitted to the ballot-box. From May to September, 1892, a miners' strike at Cœur d'Alène was marked by a number of bloody conflicts between union and non-union workers. Federal troops were dispatched to the scene of disturbance, and military law was proclaimed. The strike failed, but dissatisfaction persisted among the mine workers, and in April, 1899, blazed out in renewed strikes and riots. Martial law was once more proclaimed, and nearly one thousand miners were seized and imprisoned by the United States troops till the strike was crushed out.

In national elections Idaho has been carried by the Democrats, or the Democrats and Populists in fusion, since 1892. The Governors since its organization as a Territory have been as follows:

Consult: Onderdonk, *Idaho, Facts and Statistics Concerning Its Mining, Farming, and Industries* (San Francisco, 1885); Bancroft, *Washington, Idaho, and Montana* (San Francisco, 1890).

IDAHO, UNIVERSITY OF. A State educational institution situated at Moscow, Idaho. It was founded in 1889, but was not opened for the reception of students until 1892. It is under the control of five regents, and offers free instruction to students of both sexes. It comprises a course of letters and science, schools of agriculture and applied science, and a preparatory school. It maintains an agricultural experiment station, and has organized farmers' institutes throughout the State. Military drill is required of preparatory students, and of freshmen and sophomores in the university. The degrees of B.A., B.S., B.M., B.E.M., B.E.E., and B.C.E. are conferred. The total attendance averages 350, of whom about 150 are collegiate students. The library contains about 8000 volumes and 10,000 pamphlets. The endowment consists of 286,000 acres of land. The grounds and buildings are valued at \$275,000, and the income is approximately \$65,000.

IDAHO SPRINGS. A town in Clear Creek County, Colo., 37 miles west of Denver; on the Colorado and Southern Railroad (Map: Colorado, E 2). Picturesquely situated in the famous Clear Creek Cañon, at an elevation of 7543 feet, and having cold and hot soda springs, it is one of the noted summer resorts of the State. In 1859 gold was first discovered in Colorado, at Jackson's Bar, within the present city limits. Up to 1902 the mineral production of the district was over \$200,000,000. The town has a number of concentrating mills, machine-shops, lumber-yards, etc., and is famed for its mining tunnels. There is a public library. Population, in 1890, 1338; in 1900, 2502.

IDALIUM (Lat., from Gk. Ἰδάλιον, *Idalion*). A town in Cyprus, adjoining which was a forest sacred to Aphrodite, who was hence sometimes called *Idalia*. The site is the modern Dalin.

IDDESLEIGH, Ἰδζ'λι, first Earl of. See **NORTHCOTE.**

ID'DINGS, JOSEPH PAXSON (1857—). An American geologist, born in Baltimore, Md. He graduated at the Sheffield Scientific School of Yale in 1877, was a graduate student and assistant in mechanical drawing and surveying there until 1878, and continued his studies in

geology and microscopic petrography at Columbia University and Heidelberg. From 1880 until 1892 he was in the service of the United States Geological Survey, to which he returned in 1895. In 1892 he became assistant professor, and in 1895 professor, of petrology at the University of Chicago. His Government explorations were described in many reports and contributions to scientific journals. Among his more important writings are: *The Nature and Origin of Lithophysæ and the Lamination of Acid Lavas* (1887), reprinted from the *American Journal of Science*; *On the Development of Crystallization in the Igneous Rocks of Washoe, Nev.* (1885), with Arnold Hague; and *The Origin of Igneous Rocks* (1892), in the *Bulletin of the Washington Philosophical Society*.

IDE (Norweg., Swed. *id*, roach). A fish (*Leuciscus idus*), closely allied to the roach. It inhabits the lakes of the northern parts of Europe, and ascends rivers in April and May to spawn. It is excellent for the table. A gold-colored variety, called 'orfe,' is bred in Germany, and is sold extensively for ornamental aquariums.

IDEA (Lat., from Gk. *idéa*, form, from *ideîn*, *idein*, to see; connected with Lat. *videre*, to see, Skt. *vid*, AS. *witan*, Eng. *wit*, to know). The term 'idea' has undergone a radical change of meaning in the history of psychology. "Employed by Plato to express the real form of the intelligible world, in lofty contrast to the unreal images of the sensible, it was lowered by Descartes, who extended it to the objects of our consciousness in general" (Hamilton). In modern philosophy the word has a distinctly empirical flavor. Locke (q.v.) defines idea as "whatsoever is the object of the understanding when a man thinks," "that which the mind is applied about whilst thinking," and the intellectualistic tendencies of the English Associationist school (see **ASSOCIATION OF IDEAS**) made 'idea' almost equivalent to what is now termed 'mental process' (q.v.). In current psychological usage the word is either taken in a wide sense to denote the "conscious representation of some object or process of the external world" (Wundt), thus covering perception (q.v.), ideas of memory, and ideas of imagination; or it is restricted to the two latter categories, and opposed to perception, as a strictly re-presentative to a presentative process. Since there is no essential psychological difference between 'representation' and 'presentation,' the first and wider application of the term is preferable.

An idea which has been formed, after the manner of a composite photograph, from many ideas of similar character, and which has thus lost definiteness of detail, while it is liable to associative arousal at the hands of a large number of other ideas, is termed an 'abstract' idea. (See **ABSTRACTION**.) When the abstract idea is symbolic, and not pictorial—when, e.g., it is a word—it is named a 'concept.' Ideational masses of complex but vague contents, which require the operation of active attention to bring their constituents to separate recognition—such as our idea of the sentence that we are about to utter, or (on a still larger scale) our idea of self—are called 'aggregate' ideas. For ideas of memory and imagination, see those titles.

Consult: Sully, *The Human Mind*, vol. i. (London, 1892); Ladd, *Psychology, Descriptive and Explanatory* (New York, 1894); James, *Prin-*

ciples of Psychology (ib., 1890); Titchener, *Outline of Psychology* (New York, 1899).

IDEALISM. In philosophy, the theory that no reality is independent of consciousness. Its ordinary antithesis is realism, or the theory that the reality of things is not dependent upon their relation to consciousness. The *motif* of idealism can best be understood by contrasting idealism with agnosticism or skepticism (q.v.), which admits the existence or at least the possibility of reality in independence of consciousness, but denies the possibility of knowing such reality. A typical skeptic, such as Hume, admits that we do know the contents of our own consciousness. Most skeptics, among them Hume, go to the extent of formulating laws in accordance with which these contents appear and vary. But all this knowledge, satisfactory as it is in its own sphere, is knowledge only of phenomena, or of ideas in the Lockean sense of the word. Skepticism is thus idealistic in its epistemology or theory of knowledge, while anti-idealistic or non-committal in its ontology (q.v.). The idealist escapes skepticism by refusing to take into consideration the possibility of the existence of a non-ideal reality. The realist asserts the existence of the non-ideal reality which the skeptic either admits or doubts without denying, but usually the realist also asserts the possibility of knowing that reality. Thus the idealist and the realist are antagonistic, both in epistemology and ontology, while the skeptic sides with the idealist in epistemology and yet refuses to take sides against the realist in ontology. Idealism has taken numerous forms. Among these may be mentioned subjective idealism, which assigns only subordinate reality to the content of consciousness and ultimate reality only to the conscious subject (Berkeley and Fichte); objective idealism, which interprets nature as reason made an object to itself (Schelling); absolute idealism, which assigns ultimate reality only to the unity consisting of both object (contents) and consciousness in indissoluble correlation (Hegel); and transcendental idealism, which regards the world of experience as dependent for its order upon the action of a conscious subject working in accordance with laws of thought, but which at the same time denies that ultimate reality is dependent upon such action (Kant). For a criticism of idealism, see KNOWLEDGE, THEORY OF; and see also PLATO; PLOTINUS; NEO-PLATONISM; BERKELEY; KANT; FICHTE; SCHELLING; HEGEL; LOTZE; GREEN, THOMAS HILL. Consult: Willmann, *Geschichte des Idealismus* (Brunswick, 1894-97), and the authorities referred to under KNOWLEDGE, THEORY OF; METAPHYSICS; ONTOLOGY.

For the question of idealism in literature, see ROMANTICISM; REALISM.

IDEAS, ASSOCIATION OF. See ASSOCIATION OF IDEAS.

IDELER, ɛ'de-lër, CHRISTIAN LUDWIG (1766-1846). A German astronomer and chronologist, born at Gross-Brese, near Perleberg, in Prussia. After holding various offices he received a professorship at the University of Berlin in 1821, and in 1829 he was made a foreign member of the Institute of France. Ideler's most important works are: *Handbuch der mathematischen und Vochnischen Chronologie* (2 vols., 1825-26; 2d ed. 1833), which was the first work that presented a clear view of the reckoning of time

among the ancients; and *Die Zeitrechnung der Chinesen* (1839), a supplement to the *Handbuch*. He also wrote, in conjunction with Nolte, handbooks of the French and English languages and literatures, which passed through numerous editions.

IDEN, ɪ'den, ALEXANDER. A Kentish squire in Shakespeare's 2 *Henry VI.*, the slayer of Jack Cade.

IDENTITY (ML. *identitas*, sameness, from *identicus*, same, from Lat. *idem*, same), THE LAW OF. The principle that in any train of thought, such as a syllogism, there must be running through all the differences of contents a oneness of meaning, in which is found the consistency of the phrase of thought. This definition leads to the consideration of the dispute about the meaning of identity. Some have maintained that it is undifferentiated sameness, and that the differences which are found among similar things are accretions of unlikenesses around the core of sameness. Others have maintained that no two objects of consciousness are exactly alike, and that identity is not undifferentiated likeness, but a likeness in difference or a differentiated likeness. The debate centres around the conception of philosophical atomism. It is possible by abstraction to obtain an idea of some quality which is the element of likeness between several objects, and which can be thought as itself undifferentiated. Take color, for instance. In all the different colors, such as red, green, and yellow, can we find by abstraction some one element which is undifferentiatedly alike? Suppose we say that it is that quality of the visual sensation which is due to the stimulus of (relatively) homogeneous light vibrations. (See COLOR.) Even the answer does not secure undifferentiated likeness. That quality thus produced is not one quality, but it is "at least 160 spectral color qualities" (Titchener), each irreducible to any other. But even these are not sharply defined against each other. Although we cannot distinguish all the differences, there is every reason to suppose that there are differences which, though they affect our experience, we are not attentively aware of. There is a continuum of color. (See CONTINUITY, LAW OF.) If so, there is no undifferential sameness of color, although there is a sameness which we recognized in the differences. There is a oneness in all the reds, which oneness we cannot isolate, although we can recognize. So there is a oneness in all color, unisolable but distinguishable and recognizable. What is true of color is true of everything else. Atomistic explanation of color is false to fact. Undifferentiated sameness is not offered by experience. Hence an identity might be defined as an unisolable but distinguishable oneness of attributes in objects which at the same time might present a multiplicity within the same attributes. For the atomistic views of identity, consult James, *Principles of Psychology* (New York, 1893); for the opposite view, Bradley, *Principles of Logic*, books i., ii. (London, 1883); also the discussion between James and Bradley in *Mind*, new series, vol. ii. (London, 1893); Bradley, *Appearance and Reality* (see index for pertinent passages) (London, 1897); Bosanquet, *Logic* (see index for pertinent passages) (London, 1888); Fullerton, *Sameness and Identity* (Philadelphia, 1890); also the authorities referred to under LOGIC; KNOWLEDGE, THEORY OF.

IDEOGRAPHY (from Gk. *idéa*, *idea*, *idea* + *-γραφία*, *-graphia*, a writing, from *γράφειν*, *graphein*, to write). The art of representing ideas by graphic signs, as may be seen in the hieroglyphics (q.v.) found on the monumental relics of Egypt.

IDES. See under **KALENDS.**

IDIOCY (from Gk. *ιδιωτεία*, *idioteia*, uncouthness, from *ιδιώτης*, *idiotēs*, private citizen, from *ιδίος*, *idios*; connected ultimately with Lat. *suus*, Skt. *sva*, own). A condition of arrest of development of the brain, and, in consequence, of the intellectual faculties, of the infant or child. If the non-development is such that the child is capable of feeding himself and of appreciating enough of his surroundings to avoid injury, the condition is usually termed *imbecility*. If there is no such evidence of mental capacity, *idiocy* is the term usually employed. *Feeble-mindedness* occupies an intermediate position between normality and imbecility. The defect or disease of the brain which interferes with normal evolution may be congenital or acquired; the cerebral functions may be all more or less involved. Ribot and also Sollier maintain that the slow development of the cerebral faculties is due to want of attention; that spontaneous attention is caused by affective states brought into action by sensations, and that those young children are the most attentive whose nervous systems are most easily stimulated. Hence the faculty of attention is closely related to the activity of the sensations. The greater the power of attention, the more intelligent does the individual become. In idiocy, owing to the diminution or loss of the power of attention, the perceptions aroused by sensations are more or less indefinite, and the resultant idea likewise ill-defined. Sensations become more numerous as the organism develops, and the lack of ideas and recognitions becomes more noticeable. Frederick Peterson, whose translation of Sollier we quote, sounds a warning that there are other faculties of mind, such as will and memory, which are absolutely necessary to all subsequent mental activity, and adds that lack of the power of attention, while common in idiocy, cannot be taken in any way as distinguishing this condition of mind from other forms of mental impairment. Frequently somatic and especially cranial and facial characteristics are noticeable upon the birth of the idiot, though idiocy exists also when physical evidence is wanting. An idiot may not take the breast, may cry without motive and with different notes from normal children. Deafness or blindness may be congenital. The senses of smell and of taste may be undeveloped. The movements of the eyes may be irregular. The idiot may be slow in responding to the stimulus of touch; he may not laugh; thermic sensibility is diminished; a constant rhythmic, automatic motion may be present; he may not learn to walk, and all voluntary movements may be acquired late in youth, and imperfectly. Organic sensations are blunted, including hunger, thirst, desire for defecation or urination. Lack of the faculty of attention exists, owing to defective senses which convey feeble impressions to the brain, as well as to a lack of the affective state; the internal form of attention (reflection of Ribot) is absent or deficient in the idiot. He is practically incapable of preoccupation. His instincts are defective, whether of hunger or of self-preservation;

while the instinct of irritation is very strong; and the sexual instinct is seldom normal, being exaggerated, impaired, absent, or perverted. Occasionally remarkable special aptitudes are seen in idiots in the direction of music, mathematics, mechanical arts, drawing, painting, memory for facts or dates, playing certain games, and a low order of wit or drollery. It is said that the Court fools and jesters of ancient times were idiots of high grade or imbeciles, until others, seeing the emolument to be obtained, studied and practiced the art. Ribot says that Sikorski is authority for the statement that the activity and attention of normal children are mainly developed through play. Idiots for the greater part manifest little tendency to play, clinging to the simplest games of infancy and preferring solitary pastimes. Others of higher grade prefer noisy, destructive sports, and traits of brutality, selfishness, and quarrelsomeness are apparent. Civility and politeness are rarely acquired. Destructiveness, evidenced in their play, may develop into a vicious satisfaction in inflicting injury, commission of arson, or of homicide, or of self-mutilation. Sentiments and sensation are rudimentary or absent: the absence of ideas of right and wrong, the varying respect for authority, the absence of religious feeling, and the absence of veracity being especially noticeable.

It has been said that idiot children sometimes show facial characteristics at birth. They are always ungracious, uncouth, or ugly in figure, face, attitudes, or movements. Very common among them are misshapen or unsymmetrical heads, dwarfishness, lack of proportion of the limbs, stooping and slovenly postures, deformities of the hands or feet, and awkward gait (Peterson). The expression of the face varies from apathy to constant laughing, leering, or scowling; the mental characteristics being evident also. There may be deformities of the iris, cornea, or the lids of the eyes, as well as malformation of the nose, ears, and chin. Microcephalus, hydrocephalus, and cretinism are found in some idiots. There are speech defects. Sollier finds two kinds of mutism in idiots, a motor and a sensory aphasia (q.v.). In the first the idiot cannot talk, though he understands; in the second he understands nothing which is said. Language is developed late in the idiots who talk. As stated, when infants, their notes are not normal, but meaningless and monotonous cries take the place of the usual crowing of a baby. Speech disturbances are common, as regards both absence of words to express ideas, or imperfections of grammar, and also excessive and infinite loquacity. Reading is impossible in idiots who suffer from defects of the visual centres or the visual apparatus. The writing centre is the latest part of the linguistic cerebral equipment to be developed, together with its association tracts. They learn to reproduce letters, though never to write well, and they exhibit a tendency to write with the left hand, and also to write from right to left. They execute drawing only by copying, without perspective, or produce scrawls of fantastic nature.

From preceding statements it has been gathered that the intelligence of the idiot varies from the normal in different degrees. He has fewer ideas than the imbecile. Imitation does not furnish ideas for him: it simply centres on mechanism, except in the idiots of higher grade, in whom

the idea, assimilated by the intelligence, unfortunately is not retained, but lost. Sollier reminds us that memory is hereditary, organic, or acquired. (See MEMORY.) Hereditary memory exists often in idiots. Organic memory, or unconscious memory (as of walking and other associated movements), though sometimes completely absent in idiots, owing to defective nerve-centres and lack of attention, is nevertheless better developed than either hereditary or acquired memory. Attention being an absolute requisite for acquired memory, idiots are rarely possessed of this power. Memory fixed by repetition of sensation, without emotional basis, is found in educable idiots; as, e.g. memory of the location of the dining-room, of the bed, etc. The phenomenon of specialized memories, such as those for musical airs, or dates, for example, is inexplicable. Association of ideas, occurring, as it does, by resemblance, contrast, and contiguity, hardly exists in idiots. They experience an association of sensations. Judgment and reason also are very faulty. Volitions do not exist in the lowest order of idiots. Voluntary control of the sphincters occurs in idiots who walk only after they have learned to do so. In higher idiots the will is manifested by more complex movements than actions accomplished for the satisfaction of natural needs and appetites; but even these complex movements may become secondarily automatic. Self-respect, to which one may appeal in an imbecile, is little developed in the idiot.

As to the psychological development of an idiot points are reached in every case at which education ceases, and further mental progress is impossible. Peterson places the limits as follows: In the inferior types intellectual progress ceases at the age of six or seven, and sentiments and senses continue their development to eighteen or twenty; while in the superior grades the improvement of senses, sentiments, and intellect may all cease about puberty. Retrogression may occur, following the same law as dementia, to wit, enfeeblement of will, intelligence, sentiments, and sensations in this order. The causes of idiocy are various. Its elements are in many instances hereditary, that is to say, a course of conduct in a parent which tends to degeneration, such as excessive alcoholic indulgence of any kind, will tend to induce arrested normal healthy development in offspring. Other causes are injuries received during childbirth, acute disease of the brain or its coverings in early infancy, or even while intra-uterine. Injury to the brain may result in idiocy. Chronic disease of the brain-coverings, tuberculosis, tumors within the brain, hydrocephalus, are other causes. A peculiar type of idiocy is due to mal-development of the thyroid gland. This is called cretinism or myxedematous idiocy. The attempt to educate idiots commenced in the seventeenth century with an experiment of Saint Vincent de Paul at the Priory of Saint Lazarus. His efforts to teach idiots, though continued for many years, were not successful. In 1799 the celebrated Itard took a wild boy found in the forests of Aveyron and attempted to teach him; and although the success in this particular case was slight, he believed that he had discovered methods and facts which would be of use in other cases. These he communicated to his pupil, Dr. Edouard Seguin, who, in 1838, opened a school for idiots in the Hospital for Incurables in Paris. He met with success

enough to have the idiots at the Bicêtre sent to the hospital to be instructed, and in the course of three years he received the approval of the French Academy. Dr. Seguin adopted a system involving the theory that idiocy was prolonged infancy. His practice, founded upon this, was to excite and continue the process of development. Of course a variable success attended the experiment. The art of effecting such development requires much knowledge, tact, and patience. Different kinds of idiots need different stimulants, physical and mental. Pure air, good nutritious food, exercise; in short, any treatment which is calculated to increase the bodily and mental functions will improve the idiot. Wherever his interest can be awakened there will be a mental stimulus, and as the tendency of development is toward a normal standard, more or less improvement must follow. Dr. Seguin removed to New York City, where he established a school for idiots and feeble-minded children, which was very successful. Other similar institutions exist in various parts of the country. Statistics are unreliable, as confusion is apt to be caused by the inclusion of epileptics and insane people with the feeble-minded and imbecile. In 1890 it was stated that there were 95,500 'feeble-minded or idiotic' persons in the United States.

Consult: Sollier, *Psychologie de l'Idiot et de l'imbecile* (Paris, 1891); Preyer, *The Mind of the Child*, trans. by H. W. Brown (New York, 1893); Ribot, *The Psychology of Attention* (Chicago, 1894); Bourneville, *Assistance, traitement et éducation des enfants idiots et dégénérés* (Paris, 1895); Peterson, "The Psychology of the Idiot," in *American Journal of Insanity* (Utica, New York, 1896).

IDIOCY (in law). A total lack of reasoning powers, or of those intellectual faculties by which man is peculiarly distinguished. Its legal consequences, so far as contract and tort obligations as well as criminal responsibility are concerned, are the same as those of insanity (q.v.). The term is ordinarily limited to those who have had no understanding from birth, although some courts have declared that it is properly applicable to those who have become totally imbecile from sickness or other causes, as well as to congenital fools. In case of one who has never possessed a glimmer of reason, the law presumes that he will never attain any. Hence the custody of his person and of his lands formerly vested in the lord of the fee or of the manor. Because of the abuse of this power, Parliament transferred the wardship of idiots to the King, by statute of 17 Ed. II., c. 9. In this country the care of their persons and property is provided for by statute or safeguarded by constitutional provisions. For example, the present Constitution of New York vests the care of idiots in the State Board of Charities, and not in the Commission of Lunacy. It was laid down by ancient English writers upon law that a man who is born blind, deaf, and dumb can have no understanding, and hence cannot make a valid contract, gift, or grant. This doctrine had its origin in a misconception of certain texts of the civil law, which declared that one who was deaf or dumb could not be a party to a *stipulatio*, that is, a contract which was entered into by an oral question and answer, in certain formal words. It is quite clear that a dumb person could not

be a party to this formal contract, for he could not ask the question nor speak the response. Deafness also incapacitated one for such a contract, by preventing his hearing the question or the answer. But the civil law never countenanced the presumption that a deaf and dumb person was mentally incapable of entering into a consensual contract. In modern English law the presumption is only *prima facie*, and may be repelled by evidence, that the particular person whose competency is brought into question does possess sufficient intelligence to rank as one of sound mind. Consult: the *Commentaries* of Blackstone and Kent; Holmes, *Misunderstandings of the Civil Law*, 6 Am. Law Rev., 37; and the authorities referred to under MEDICAL JURISPRUDENCE and INSANITY.

IDIOM (Lat. *idioma*, Gk. ἰδιῶμα, *idiōma*, peculiarity, from ἰδιοῦσθαι, *idiousthai*, to make one's own, from ἴδιος, *idios*, one's own, peculiar). A term used to denote a phrase or form of words approved by the general usage of a language, while in many cases it will admit of neither grammatical nor logical analysis. In a broader sense, it denotes the genius or peculiar cast of a language; hence it is often applied to a peculiar form or variation of a language, a dialect.

ID'OP'ATHY (from Gk. ἰδιοπάθεια, *idiopatheia*, peculiar feeling, from ἰδιοπαθής, *idiopathēs*, affected peculiarly, from ἴδιος, *idios*, peculiar + πάθος, *pathos*, feeling). Idiosyncrasy (q.v.); peculiar susceptibility. The term is also used of the quality of being idiopathic. A disease is called idiopathic as distinguished from one resulting from a wound, traumatic. An idiopathic disease is therefore an idiopathy.

ID'IOSYN'CRASY (Gk. ἰδιοσυγκρασία, *idiosynkrasia*, peculiar temperament, from ἴδιος, *idios*, peculiar + σύγκρασις, *synkrasis*, mixture, from συγκεραννύναι, *synkerannynai*, to mix together, from σύν, *syn*, together + κεραννύναι, *kerannynai*, to mix, from κράσις, *krasis*, mixture). An individual trait or constitutional peculiarity. Thus, there are persons who have a great dislike to particular kinds of food, smells, sounds, etc., which to most persons are agreeable; and, on the other hand, a desire is sometimes manifested for things generally disliked. In particular individuals an eruption of the skin will be caused by eating strawberries, or fainting by the smell of a rose, when the person is unaware of the cause. Idiosyncrasies also occur in consequence of which certain medicines become inoperative, or certain poisons harmless. Idiosyncrasies are either permanent or temporary, sometimes arising from mere morbid conditions, and disappearing along with them. The term is also employed to denote *mental*, as well as *physical* peculiarities, which are often signs of insanity, such as baseless antipathies to certain persons, bizarre arrangement of articles in one's room, permanent dread of passing certain objects, etc.

IDLE LAKE. In Spenser's *Faerie Queene*, the lake on which Phadria sailed.

IDLER, THE. The title of a series of papers by Dr. Johnson, published in Payne's *Universal Chronicle* (1758-60).

IDOL (OF. *idole*, Lat. *idolum*, from Gk. εἶδωλον, *eidōlon*, image, from εἶδεναι, *eidēnai*, Skt.

vid, to know, Lat. *videre*, to see). An image intended to represent a deity, and to be adored as such. The act of such adoration is idolatry. Through theological usage, the term idolatry has come to mean in a general sense any worship or obeisance paid to any other than the Supreme Being as conceived by Judaism, Christianity, or Islam. Confining ourselves to the more restricted usage, the worship of idols appears to be a phase of religious evolution that is natural to man at a certain stage of culture. It arises from the desire to furnish some tangible evidence of the presence of the powers upon whom man feels himself to be dependent. In this sense idolatry is to be distinguished from the attribution of divine force to a sacred stone, river, or other object. The sanctity is inherent, for one reason or the other, in such objects themselves, whereas the sanctity of an idol is due to its being a symbol. It becomes evident, therefore, that while the direct worship of objects is a link in leading to a symbolical image-worship, the latter belongs to a phase of religious thought transcending the more primitive manifestations of the religious instinct. This thesis finds an illustration in the religious history of the Semites, as well as in that of the Greeks and Romans. The localization of nature deities, such as the sun, moon, and certain planets, led in the case of the Babylonians and Egyptians to representation of the gods of a more or less fanciful character, and the development of the art instinct acts as a powerful factor in promoting and maintaining the worship of these gods under the form of images of men or animals, or of a combination of the two. The influence exerted by Babylonian and Egyptian culture led the nations of Palestine—notably the Phœnicians—to replace poles and stones by symbolical representations of the gods, and the Hebrews likewise after they had advanced to the agricultural stage fell a prey to these same influences until, through the reaction brought about by the teachings of the prophets, an emphatic protest against all manner of idolatry is embodied in the religious system and cult of post-exilic Judaism. The rise of Christianity helped to spread the doctrine throughout the ancient world, though even within the sphere of Christianity image-worship (q.v.) could not be entirely rooted out. Islam struck at the root of the evil by forbidding the making of any representation of any living thing, whether intended to be worshiped or not (cf. Ex. xx. 4). To give life was felt to be the exclusive prerogative of God, and to attempt to reproduce even the external form of a living thing was regarded as impiety. As a consequence wherever Islam secured a foothold idolatry was doomed. Zoroastrianism at least did not encourage idolatry, but it is noticeable that in the extreme East—India, China, and Japan—idolatry was not only reconciled with the remarkable development of religious thought that took place in those regions, but its hold seemed to grow stronger with each new phase in this evolution.

IDOM'ENEUS (Lat., from Gk. Ἰδομενεός). The grandson of Minos, and son of Deucalion of Crete. As ruler of Cnosus and Crete, he led 80 ships to Troy. In the *Iliad* he is described as one of the mightiest of the heroes, and in the battle at the ships he plays a leading part. The early history makes him return to his home in

safety, and receive there in due time an honorable burial. In later writers he was represented as vowing during a storm to sacrifice to Poseidon the first living thing that met him on a safe return to Crete. The victim was his son, and his subjects drove him forth. He wandered to Calabria, where he built a temple to Athena, and later from Italy to Asia Minor, where he established a shrine of Apollo, near Colophon. Here he died and was buried.

IDRAC, ἰδράκ', ANTOINE (1849-84). A French sculptor, born at Toulouse. He studied under Guillaume, Cavelier, and Falguière, and at twenty-four won the Prix de Rome. He displayed especial mastery of the nude and was rapidly rising in his profession when he died, aged thirty-five. Idrac's works are: "Cupid Stung by a Bee," a theme of the Greek anthology (1878), bought by the French Government; "Mercury Discovering the Caduceus," a marble figure which won the first medal and is now in the Luxembourg Museum; and a "Salambo" (1882), which showed his ability to represent the supple nude form, won him the French Legion of Honor and received a first prize at the Munich Exposition of 1883.

IDRIA, ἰδρέ-ἄ. An important mining town in the Austrian Crownland of Carniola, situated in a deep caldron-shaped valley on the Idriza, 22 miles west-southwest of Laibach (Map: Austria, C 3). Idria is famous for its quicksilver-mines, believed to be the richest in Europe. They were discovered in 1497, and have been operated by the State since 1580, employing altogether about 1500 persons, and yielding over 500 tons of quicksilver annually. Population, in 1890, 5084; in 1900, 5772.

IDRISITES. A dynasty of Arab rulers in the northwest of Africa. The founder of the line was Idris of the race of Ali, who about 785 united a number of the native Berber tribes into a kingdom under his sway. His son Idris II. founded Fez and greatly increased his possessions by conquest, but on his death the kingdom was divided among his sons, and, thus weakened, it fell an easy prey to the power of the Fatimites in the third decade of the tenth century.

ID'UMÆ'A. See EDOM.

IDUN, ἰδῶον (Icel. *Ipunn*; connected with *p*, energy, *ipenn*, energetic, OHG. *ila*, energy). The name of a goddess of Scandinavian mythology. She was the daughter of the dwarf Ivald; but being received among the Æsir, she became the wife of Bragi. Idun possessed a box of apples, by the use of which the gods preserved their perpetual youth. She was carried off by the giant Thiassi, with the assistance of Loki. But the gods, beginning to grow old and gray without their apples, sent Loki after her, and, changing himself into a falcon and Idun into a nut, he returned with her to Asgard. In this myth Idun represents spring, and Thiassi winter. According to Sophus Bugge, the main story may be closely connected with the Greek myth of the golden apples of the Hesperides in an Irish version. The introduction of edible apples at a time when this fruit was unknown in the North seems to imply a foreign source.

ID'YA. A poetical name of Britannia.

I'DYL, or **I'DYLL** (from Fr. *idylle*, Lat. *idyllium*, from Gk. *εἰδύλιον*, *eidyllion*, short poem, from *εἶδος*, *eidos*, form, scene). A term

generally used to designate a species of poems representing scenes of pastoral or out-of-door life. It is, however, an error to suppose that the idyl is exclusively pastoral; certainly, there is no warrant for such a notion in either ancient or modern usage. Of the thirty-one idyls attributed to Theocritus, only ten are bucolic.

IDYLLS OF THE KING. Twelve poems by Tennyson, published between 1842 and 1885, based on the Arthurian romances. The titles are: "The Coming of Arthur," "Gareth and Lynette," "The Marriage of Geraint," "Geraint and Enid," "Balin and Balan," "Merlin and Vivien," "Lancelot and Elaine," "The Holy Grail," "Pelleas and Ettarre," "The Last Tournament," "Guinevere," "The Passing of Arthur."

IDZŪ, ἰδζῶ. One of the fifteen provinces of Japan which make up the Tōkaidō or 'East Sea Circuit,' and through which the highway called the Tōkaidō runs. It is a mountainous peninsula, with numerous bays and promontories, 32 miles long and 16 wide, lying between the bays of Sagami on the east and Suruga on the west. Geologically and orographically it forms part of the volcanic range of mountains with which the name Hakone is associated. Its most important river is the Kanōgawa, which flows north into Suruga Bay, and its highest peak is Amagi-san, with a height of about 4800 feet. Its chief towns are Mishima, on the Tōkaidō, and the small but beautiful port of Shimoda, on the southeast coast. The rearing of silkworms and the reeling of silk form the principal industry of the peninsula. It abounds in hot springs and watering-places, the chief of which is Atami, about 45 miles from Yokohama. To Idzu belong, both geologically and politically, the 'Seven Volcanic Islands,' of which Oshima or Vries Island, 38 miles from the mainland, is the chief, and further south Hachi-joshima, long used as a place of banishment. See Rein, *Japan* (London, 1884); and Satow and Hawes, *Handbook for Travellers in Central and Northern Japan* (Yokohama, 1881).

IERNE, ἰ-ἔρ'νῆ. An ancient Greek name for Ireland.

IF, ἰφ. A rocky island about two miles west of Marseilles, with a castle, the Château d'If, built in 1529, and later used as a State prison. In it Mirabeau, Philippe Egalité, and others were confined. The castle is most widely known through Dumas's *Count of Monte Cristo*.

IFFLAND, ἰφ'λάντ, AUGUST WILHELM (1759-1814). A German actor and dramatist. He was born at Hanover and was intended for the Church, but before he was nineteen the stage had become his choice. He went to Gotha, where he studied under Gotter, Beck, Beil, and Ekhof, and thence in 1779 to Mannheim, where he first became famous. Differences with his manager induced Iffland in 1796 to accept the post of director in the Berlin National Theatre. Fifteen years afterwards he was made superintendent of all the royal theatres, and under his management the Berlin stage reached its highest point. But he was not merely an able manager. As an actor he showed himself artistic, painstaking, and minute, strong in comedy of every-day life. Voice and figure unfitted him for tragedy. For the stage he translated and wrote himself, for the most part, plays of over-great sentiment, and too

strongly urged didactic purpose. But in them he displayed much literary talent and great practical knowledge of the stage. *Die Jäger, Dienstpflicht, Der Spieler, and Die Mündel* kept the stage for a century. Iffland's dramatic criticism is to be found in his *Almanach für Theater und Theaterfreunde* (1806-11), and *Theorie der Schauspielkunst* (1815). Consult the autobiography, *Meine theatralische Laufbahn* (ed. by Holstein, Heilbronn, 1886); Duncker, *Iffland in seinen Schriften* (Berlin, 1859); and Genée, *Ifflands Berliner Theaterleitung* (Berlin, 1896).

IFNI, éf'nè. A seaport town of Africa, situated on the western coast of Morocco, opposite the Canary Islands. It was ceded by Morocco to Spain in 1883. Population, about 6000.

IFUGAO, é'fō-gā'ò. A head-hunting Malay-people in Nueva Vizcaya and Isabella provinces, Luzon. Their speech is distinct with many subdivisions. See PHILIPPINE ISLANDS.

IGBARA, ég'bá-rá, or **IGBIRA**, ég'bí-rá. A negro people of the Sudan living at Nupé on the right bank of the Niger and southward to Yoruba. They are said to be industrious and commercial. Their language belongs to the same linguistic group with Nupé, Ewe, and Tshi. Half a century ago the Kingdom of Nupé was subdued by the Hamitic Fulas, and the Igaras, together with other kindred tribes, were brought under Moslem influence, though many are still pagan. The ruins of Fende or Panda, the capital of this once powerful dominion, are still to be seen. They are governed by a Fulah Emir, but are within the British Protectorate. See FULAH.

IGERNA, I-gēr'ná, **IGERNE**, i-gēr'n', **IGRAINE**, i-grán', or **YGNERNE**, ig-nèrn'. In the Arthurian romance, the wife of Gorlois, Duke of Cornwall. She was loved by Uther, King of Britain, and by him became the mother of Arthur.

IGLAU, é'glou. An ancient and, next to Brünn, the largest town of the Austrian Crownland of Moravia, situated on the Iglawa and on the Bohemian frontier (Map: Austria, D 2). It has a fine market-place; a number of interesting churches, including one dating from the eighth century; a Rathaus; barracks (formerly a Dominican monastery); and a cloth hall. In the Middle Ages Iglau was an important mining centre, but since the Thirty Years' War mining has been practically extinct, and the manufacturing of cloth is now the foremost industry. There are numerous weaving, spinning, and dyeing establishments, a cigar-factory employing over 2500 hands, potteries, and flour-mills. There is also a considerable trade in agricultural products, cloths, and lumber. Population, in 1890, 23,716; in 1900, 24,387, chiefly German Catholics, and including over 4000 Czechs. Iglau is a town of great antiquity, its silver-mines having been worked as early as the eighth century. By the Treaty of Iglau, in 1436, a settlement was effected between the Hussites and Sigismund, who was acknowledged King of Bohemia. The town suffered heavily from a fire in 1523, and was thrice captured by the Swedes during the Thirty Years' War.

IGLESIAS, é-glá'sé-ás, JOSÉ MARIA (1823—). A Mexican statesman and author. He was born in the City of Mexico, studied law in the university there, and later became professor of jurisprudence

in that institution. He early entered politics, and speedily attracted attention by his natural ability. Political preferment rewarded his loyalty to the Government, and in 1857 he became Secretary of Justice, and a little later Secretary of the Treasury. From 1853 to 1867 he was again Secretary of Justice. In 1868 he was a member of the General Congress, and the same year was appointed Minister of the Interior by Juarez, to whose fluctuating fortunes he had clung with unwavering fidelity. In 1873 he became president of the Supreme Court, and by virtue of that office assumed the Presidency of the Republic when Lerdo de Tejada was overthrown in 1876, but was soon compelled to give up the position to Diaz. After 1878 he applied himself to journalism, and published several works on Mexican history.

IGLESIAS DE LA CASA, dá lá ká'sá, JOSÉ (1748-91). A Spanish poet, born at Salamanca. His earliest writings were satires in the form of epigrams and *letrillas* directed against contemporary society. After entering the Church he wrote works of a graver nature, and later his verses were merely rhymed theological discussions. His style has much clearness and animation, but lacks originality. The first edition of his works is that of Salamanca (1798). The idyls and romances included in this edition are not so well known as his poetry, and are of less value.

IGNACIO, ég-ná'thé-ó, JOSE DE JESU MARIA (1721-80). A German Jesuit, whose secular name was Herman Loessing. He was born in Paderborn, and began his clerical career as professor of rhetoric and philosophy in the College of Old Mexico. While there he became interested in the antiquities of the country, and spent about ten years in collecting them. Returning to the fatherland with his spoils, he became librarian to the Archbishop of Cologne (1768), and published *De Arte Hieroglyphum Mexicanorum* (1774), *Historia Novæ Hispaniæ* (1777), *Reisen in Neu-Spanien* (1778), *Historia Regni Aztecorum* (1780), and *Cosmographia* (1780). He became blind before his death, and after it his notes were incorporated into two works by Chastelard.

IGNA'RO (Lat., I do not know). A character in Spenser's *Faerie Queene*, who answered all questions with "I cannot tell."

IGNATIEFF, ig-ná'tyef, NIKOLAI PAVLOVITCH, Count (1832—). A Russian general and diplomat, born in Saint Petersburg, January 29, 1832. He was the son of a favorite officer of the Emperor Nicholas, and was commissioned in the Guards in 1849; he served in the Crimean War, and was made a colonel in 1856, and a major-general in 1858. In the latter year he was made diplomatic attaché to General Muravieff, Governor of East Siberia, and in this capacity negotiated with China the Treaty of Aigun (May 28, 1858), by which Russia came into possession of the region of the Amur. He was subsequently sent on a special mission to Khiva and Bokhara, and as Plenipotentiary to Peking in 1860. He was made Adjutant-General of the Czar in 1863, and was placed at the head of the Asiatic department of the Ministry of Foreign Affairs. In the following year he was sent to Constantinople to represent the Czar at the Court of the Sultan, and he remained in this important

post until the outbreak of the Russo-Turkish war in 1877. He was an active agent in the events of this exciting and critical period, encouraging the restlessness of the Christian peoples of the Balkans, while endeavoring to maintain the Russian influence over the Sultan. In the pursuit of his ends Ignatieff did not hesitate to resort to duplicity and the basest kind of intrigue, and succeeded in gaining the sobriquet of 'Liar Pasha.' Through such means he was quite successful in maintaining the Russian influence during the life of Abdul Aziz, but after the latter's violent death and the deposition of Amurath V. (1876), the anti-Russian influence became predominant with Abdul Hamid, and events moved rapidly toward war. After the conference at Constantinople during the winter of 1876-77, Ignatieff hastened to Berlin, Vienna, and London on diplomatic business. At the close of the war he participated in the negotiations of Adrianople, and was mainly responsible for the Treaty of San Stefano. On account of disagreements with Gortchakoff, he retired from office, but on the accession of Alexander III. (1881) he was recalled and made Minister of the Imperial Domains, and then of the Interior. While holding this office he attained prominence as a persecutor of the Jews. This, as well as his opposition to M. de Giers, led to his retirement a second time, June 21, 1882. He subsequently participated in public affairs only as member of the Council of the Empire and of the Senate. He is a prominent figure in the Pan-Slavic or Nationalist Party.

IGNATIUS, Ig-nā'shi-ūs, SAINT (c.790-878). A patriarch of Constantinople, youngest son of the Emperor Michael I. In 813 the Armenian usurper Leo V. forced him to enter a cloister. From the position of abbot the Empress Theodora raised him to that of Patriarch of Constantinople (847). He had no sympathy with the iconoclasts, and so was in favor with the Empress. On the other hand, he excommunicated her brother Bardas, who made him one of his first victims when he took the reins of government for the young Michael III. (857). Ignatius refused to abdicate, until forced to do so in 866. He was reinstated on the accession of the Emperor Basil in 867. He is still a favorite saint in the Greek Church.

IGNATIUS OF ANTIOCH, SAINT. Bishop of Antioch in the reign of Trajan, and author of seven Greek letters which are included among the works of the Apostolic Fathers (q.v.). Little is known of Ignatius's life. He was born probably not far from the middle of the first century. Syria appears to have been his home. Tradition says that he was a disciple of the Apostle John, which is not impossible. Much less likely is the tradition which makes him the child whom Jesus took in His arms and blessed. There is no reasonable ground for doubting that Ignatius was Bishop of Antioch, but we do not know how long he held that office. The statement of Origen and Eusebius that he was the second Bishop may be accepted. This leaves Peter out of account, and makes Ignatius the successor of Evodius. Respecting the close of his life, we have more definite information. He was condemned to be killed by wild beasts in the arena, and for that purpose was taken to Rome, under guard of ten Roman soldiers. They passed through Asia Minor, stopping here and there, and

being received with Christian hospitality by the churches along their route. At Smyrna Ignatius wrote letters to the churches of Ephesus, Magnesia, Tralles, and Rome. Further on, at Troas, he wrote to the Philadelphians, the Smyrnæans, and to Polycarp, Bishop of Smyrna. He then was led to Rome, where he suffered martyrdom, probably at some time between 107 and 117 A.D. The most definite early statements point to the tenth year of Trajan, which would be 107-108. It was believed, at a considerably later time, that his remains were carried to Antioch for burial.

The extant *Martyr Acts* of Ignatius are not authentic. Long and bitter controversy has raged over the epistles which bear his name. They are extant in several different versions, especially three: (1) *The longer Greek*, containing thirteen epistles; (2) *the shorter Greek*, containing seven epistles; (3) *the Syriac*, containing only three epistles. The critical question is, Which form, if any, is the genuine one? Opinions have varied widely. It has been held (a) that all the recensions are spurious; (b) that the shorter Greek form alone is genuine; (c) that the Syriac alone is genuine; (d) that, of the shorter Greek form, all the epistles except Romans are genuine; and (e) that Romans only is a genuine epistle. The best modern criticism holds to the authenticity of the seven epistles in the shorter Greek form. There is almost contemporary witness borne to the Ignatian letters in the Epistle of Polycarp to the Philippians (see POLYCARP).

Accepting these seven as genuine letters of Ignatius, we learn to know their author as a fervent, enthusiastic Christian bishop, of intense zeal for martyrdom. He constantly insists on maintaining allegiance and obedience to the bishop, who is the centre of unity. It is evident that the monarchical episcopate, i.e. the system of having one bishop over each church, had already been developed in Syria and other portions of the East, whatever may have been the case elsewhere. The heresy against which Ignatius warns is chiefly docetism (q.v.), for he declares that Christ suffered in fact, not merely in appearance. He also warns against Judaizing heresies. From the doctrinal point of view, Ignatius is highly important, standing as he does in the line of catholic development which passes from Paul and John, through Ignatius and Irenæus, to the full-grown Nicene theology. It is in his letter to the Christians of Smyrna that we meet for the first time with the phrase 'the Catholic Church.' It does not, however, bear its later, technical sense of the exclusive orthodox Church, but its earlier, etymological meaning of 'the universal Church.' We owe to Ignatius the application of the term 'eucharist' to the Lord's Supper. But above all else, his epistles bear witness to the earnest, devoted spirit of early second-century Christianity, and to the vitality of faith in the age succeeding that of the Apostles.

For the best edition of Ignatius, consult: Lightfoot, *The Apostolic Fathers: Part II., S. Ignatius and S. Polycarp* (London, 1889), with English translation. Text and translation are also found in the small edition of Lightfoot, *Apostolic Fathers*, by Harmer (London, 1893); English translation alone in the *Ante-Nicene Fathers*, edited by Roberts and Donaldson, vol. i. (Buffalo, 1886). In general, consult: Crutt-

well, *Literary History of Early Christianity* (London, 1893); Harnack, *Chronologie der altchristlichen Litteratur* (Leipzig, 1897); Von der Goltz, *Ignatius von Antiochien* (Leipzig, 1894); Smith and Wace, *Dictionary of Christian Biography*, article "Saint Ignatius."

IGNATIUS OF LOYOLA, Ió-y'ólá, SAINT (1491 or 1495-1556). The founder of the Jesuits. Iñigo Lopez de Recalde was the youngest of thirteen children, of a noble family. Until recently he was said to have been born on Christmas night, 1491, but the Bollandists and Polanco are authority for the change to 1495. He was born in the ancestral Castle of Loyola, near Azpeitza, in the Basque Provinces, not far from the French frontier. At fourteen, after a scanty education, he became a page at the Court of Ferdinand the Catholic. Court life grew distasteful after some years, however, and he became a soldier under his relative, the Duke of Najera, in 1517. He fought bravely against the Navarrese, the Moors, the Portuguese, and the French. He had reached the rank of captain when, while directing the defense of Pamplona against the French in the war between Francis I. and Charles V., he was wounded severely, May 20, 1521. He was taken prisoner and conveyed to the Castle of Loyola. As a result of the wound, one leg was badly deformed. This would have been very unsightly in the fashionable hose of the day, and he bade the surgeon reduce the deformity at any cost. The leg was rebroken and he bore the operation and consequent suffering without complaint. His convalescence was prolonged, and time hung heavily on his hands. He asked for some romances of knight-errantry then popular, but there were none in the castle. Instead they brought him a translation of Ludolf of Saxony's life of Christ, and some lives of the Saints. Ignatius's life as a soldier had been far from a model. Polanco says: "Up to the age of twenty-six his life had been divided between the love of women and sports, and quarrels over points of honor." For want of anything better to do, however, he read and reread these pious books. The spiritual achievements of Saint Francis and Saint Dominic came to replace the deeds of his knightly heroes in his imagination. As soon as he was able, in the garb of a beggar he went to the shrine of the Virgin at Montserrat, where after a confession of his whole life on the vigil of the Annunciation, March 24, 1522, he hung up his arms as a votive offering and a symbol of his renunciation of his military career and of his entire devotion henceforth to the spiritual warfare. Then, barefoot, he went to the neighboring town of Manresa and served the sick and poor in the hospital. He lived in a cave, and his austerity finally impaired his health, though it was at this time that his *Spiritual Exercises*, from which he drew great spiritual strength, took form in his mind. After this he went on a pilgrimage to the Holy Land, and would have stayed at Jerusalem to spread the gospel among the infidels, but was discouraged by the local authorities. He returned to Barcelona in 1524. Realizing now that to do good he must have more knowledge, he began, at the age of thirty-three, the rudiments of grammar in a public school beside boys. After two years he went to the new University of Alcalá and later to Salamanca. Because of public religious teaching with what was thought insufficient education,

he incurred the censure of ecclesiastical authorities at both places. In 1528 he repaired to Paris to continue his studies. He was robbed by a companion and had to lodge in a hospital, where he did menial work for his support while attending the university. During his summer vacations he visited Spanish merchants in Antwerp, Bruges, and London so as to obtain money to continue his studies. During his student years he had no resources but the charity of the faithful. At Paris he formed, with chosen companions, a pious confraternity, out of which developed later the Society of Jesus. (See **JESUITS**.) Ignatius's genius for knowing men can be inferred from the fact that of his earliest companions chosen thus at the University of Paris, one became later the great Apostle of the Indies, Francis Xavier, and three, Lainez, Salmeron, and Lejay, became the leading theological advisers to the Council of Trent. One of the others, Faber, received the honors of beatification from the Church. In the crypt of the Church of the Martyrs, on Montmartre, on the Feast of the Assumption, August 15, 1534, the little band took their vows as Jesuits. At first their intention was to evangelize Palestine. They made their way to Venice for this purpose, but the war between the Christians and the Turks closed the way to the Holy Land, so they resolved to offer themselves to the Pope for any service he might assign. Paul III. received them with great kindness. The pulpits of various churches were assigned to them, and their burning discourses and saintly lives soon attracted attention. No other of them was so effective as Ignatius himself, who spoke as the plain, blunt, but intensely earnest, soldier. In 1539 Ignatius asked for Papal approbation of his Order. In spite of opposition to the erection of another religious Order in the Church, the Pope read the draft of the Constitutions, and said: "The finger of God is here." While occupied with his constantly growing society, Ignatius found much to do besides its direction and the writings of the Constitutions. Though a Spaniard, he devoted himself to the care of the Jewish converts, and secured the correction of many abuses in the treatment of those who wished to remain orthodox Jews. He founded a house for fallen women, and was not ashamed to be seen conducting them to it through the streets. He tried to prevent the occasions of their fall by providing a home for friendless girls. He established orphan asylums for boys and girls. The influence he acquired can be understood from the fact that he was able to end a dispute between the Pope and John III. of Portugal that threatened serious harm to religion at the moment, and another between the citizens of Tivoli and their ruler, Margaret of Austria.

His writings consist only of the Constitutions and rules of the Society of Jesus, his Letters, and the *Exercitia Spiritualia*. This last little book of scarcely a hundred duodecimo pages has proved one of the most influential works ever written. From the very beginning it formed the basis of the spiritual training of the Jesuits themselves, and the mold in which their retreats and missions to the people were cast. It has come to be the acknowledged model after which the missions and retreats given by most of the other religious Orders of the Roman Catholic Church are conducted. Three things

are treated of particularly in the book: the service of Jesus Christ, placed above all that the kings of the earth can offer; the discernment of spirits; and finally the choice of a state of life. It was this book that accomplished the reforms the Jesuits effected. The Constitutions of the Jesuits are entirely the expressions of Ignatius's ideas. They have been but slightly modified, never in any essential, by successive General Congregations. Great writers have called them one of the world's works of genius. It is often said that Ignatius founded the Jesuits to counteract the effects of the German Reformation, but there is good authority for believing that when Ignatius conceived the idea of his Order he had not even heard the name of Luther. Even more than a decade later, he seems to have paid little heed to the religious movements in Europe, especially in Germany. One year before his death in 1555 the society comprised eight provinces, divided as follows: Italy, two; Spain, three; Portugal, one; Brazil, one; India and Japan, one. In Germany there were but two residences—Cologne and Vienna. He died in Rome, July 31, 1556. He was beatified in 1609 and canonized in 1622.

Consult: Ribadeneira, *Vita Ignatii Loiolæ Soc. Jesu Fundatoris* (Naples, 1572; best recent edition, Barcelona, 1885), translated into most modern languages. For Ignatius's life as General of the Jesuits, his letters, *Cartas de San Ignacio de Loyola* (Madrid, 1874), are the authoritative sources of information. Ignatius dictated some autobiographical notes called the *Acta*, which must form the basis of an appreciation of the man himself. There are several English editions of this: *Autobiography of St. Ignatius* (ed. O'Connor, S. J., New York, 1900), and Rix, *The Testament of Ignatius Loyola* (Saint Louis, 1900). Of recent lives the most authoritative are: Clair, *La vie de Saint Ignace de Loyola* (Paris, 1891); in English, Stewart Rose (the Duchess of Buccleuch), *St. Ignatius of Loyola and the Early Jesuits* (New York, 1891); an excellent study of Ignatius the man, Joly, *Saint Ignatius of Loyola* (New York, 1899). In the *Monumenta Historica Societatis Jesu* (Madrid, 1894) there is a hitherto unissued life of Ignatius by Polanco, who was a close personal friend. Consult, also, Hughes, *Loyola and the Educational System of the Jesuits* (Great Educators Series, New York, 1892).

IGNATIUS'S BEAN, SAINT. See SAINT IGNATIUS'S BEAN.

IGNEOUS ROCKS (Lat. *igneus*, fiery, from *ignis*, Skt. *agni*, fire). Rocks produced as the result of solidification from a molten condition. Such rocks include lavas which have been poured out upon the earth's surface; the fillings of the fissures, pipes, and other passages in the earth's crust through which molten material was conducted during its rise to or toward the surface; and the larger masses which consolidated at great depths. The agents of decomposition and disintegration of rock material and those of transportation and degradation necessarily expose to view these several types of igneous rocks, each of which possesses certain general and distinguishing characteristics. The most noteworthy general characteristic of the igneous rocks, when unmetamorphosed, is a massive structure without lamination or bedding, such as is characteris-

tic of the sedimentary or clastic rocks on the one hand; or schistose structure, such as is developed in the metamorphic rocks. Inasmuch, however, as it has been shown that many *metamorphic rocks* (q.v.) have been formed from igneous rocks, it is clear that no sharp line can be drawn to separate these classes on the basis of structure, although in the main the above distinction applies.

Prominent among the textures characteristic of the igneous rocks are the granitic, the porphyritic, and the vitreous or glassy. The granitic texture is crystalline throughout and consists of an interlocking mosaic of the different mineral constituents, the nearly uniform size of the grains indicating that the process of consolidation was essentially an uninterrupted one, and that practically the same conditions obtained during all stages of the process. In this mosaic the mineral constituents which first separated from the magma have more or less perfect crystal outlines, whereas those of later separation have irregular boundaries because sufficient space was not available in which to build out their crystal faces. The porphyritic texture, which is the next most common among the igneous rocks, has crystals of one or more of the mineral constituents of the rock imbedded in a base or ground mass of smaller crystals, or of rock glass. The crystals imbedded in the ground mass are known as porphyritic crystals or phenocrysts. It is generally supposed that the phenocrysts were crystallized out of the magma in a stage of the process of consolidation earlier than that which produced the ground mass of the rock, and as most igneous rocks of porphyritic texture have been formed either at the surface of the earth or at quite moderate depths below it, it is supposed that the phenocrysts were formed at considerable depths before the magma rose to or near the surface. In the lavas that flow from Vesuvius, or from most other volcanoes, the phenocrysts may be picked out of the still molten lava as it flows from the volcano. The vitreous or glassy texture is one of comparatively infrequent occurrence, but is represented by obsidian (q.v.) and pitchstone. It is now generally recognized that many igneous rocks which have an entirely crystalline texture were once largely composed of rock glass, which has devitrified through processes of chemical alteration and crystallization.

In addition to the above textures characteristic of igneous rocks and dependent upon the state of crystallization of the rock substance, there are many others. One of the most common observed in lava (q.v.) is a peculiar crumpled lamination of the rock caused by the arrangement of mineral constituents of unequal dimensions with their longer axes parallel to the crumpled lines of the texture. This fluxion texture is conditioned by the flow of the lava, the crumpled lines indicating the direction of flow. Other textures, as the amygdaloidal, scoriaceous, and pumiceous, which indicate different grades of cellular or porous texture, are conditioned by the steam once held in the lava and the opportunities for expansion and escape of this steam as the lava approached the surface of the earth.

In chemical composition the igneous rocks show wide variation, though limits are set by the laws of formation of magmas. No such limits are set for the clastic rocks. By processes of alteration the igneous rocks change into the metamorphic

IGNATIUS LOYOLA
AFTER A PAINTING BY RUBENS

rocks (as do also the clastic rocks), so that no sharp line can be drawn to separate these great divisions.

Great difficulties arise in the systematic classification of igneous rocks, by reason of the many ways in which it is possible to describe them, and the varying importance which is attached to each method; hence great difference of opinion exists among petrographers as to the best scheme to be adopted. On the Continent of Europe, and especially in Germany, the manner of occurrence of a rock, whether as a boss or batholite (q.v.), as a dike (q.v.), or as a sheet or flow, is given the first importance; and the age of the rock, once considered paramount, still retains its importance in the secondary classification. In America opinion seems to favor as bases of classification the chemical composition, the texture, and the mineral composition; but the future must be awaited before any classification free from serious objections is likely to be adopted. The almost hopeless confusion of the schemes now in use is generally recognized. The reader is referred to the following works, in which are given detailed descriptions of igneous rocks. Consult: Kemp, *Handbook of Rocks* (New York, 1896); Rosenbusch, *Mikroskopische Physiographie der Mineralien und Gesteine* (Stuttgart, 1896); Zirkel, *Lehrbuch der Petrographie* (Leipzig, 1894); Teall, *British Petrography* (London, 1888). See GEOLOGY.

IGNIS FATUUS, fāt'ū-ūs (Lat., vain fire). A luminous appearance frequently seen in marshy places, in churchyards, and over stagnant pools. It generally appears a little after sunset as a pale, bluish-colored flame, varying in size and shape; sometimes it shines steadily till morning, at other times disappears, and reappears within about half-hourly intervals. It floats in air at about two feet from the ground, is sometimes fixed, and sometimes travels with great rapidity. Many efforts have been made to discover its cause; but so varied are its appearances and so void of any common principle, that these attempts have totally failed. Two of the various explanations offered may be mentioned here. The first is that the ignis fatuus is due to phosphureted hydrogen gas (PH_3), which possesses the property of igniting when it comes in contact with dry atmospheric air; the gas would be generated by the decomposition of animal matter present in a marshy soil. The second is that it is due to the combustion of methane, or marsh-gas, CH_4 , produced by the decomposition of vegetable matter; but though this supposition satisfactorily accounts for many appearances connected with the ignis fatuus, the gas itself is not spontaneously combustible, and an additional supposition requires to be made to account for its ignition. The probable conclusion is that a number of phenomena, apparently similar, but arising from different causes, are aggregated under the term ignis fatuus.

The appearance of ignis fatuus is not a common phenomenon, and many distinguished naturalists who desired to investigate it have never succeeded in finding it; but it is not unfrequently seen in the north of Germany, the swamp and moorland districts in the south and northwest of England, and in the lowlands of Scotland. It is seen in the above places from the middle of autumn till the beginning of November. In former times the ignis fatuus, under the names

of Will-o'-the-Wisp, Jack-a-lantern, Spunkie, etc., was an object of superstition among the inhabitants of the districts where it appears, and was believed to be due to the agency of evil spirits attempting to lure travelers to their destruction.

IGNORANCE OF THE LAW. One of the important maxims of the common law is *ignorance of the law excuses no one*. It is not, however, an aphorism of universal application, nor is it to be pressed into the service of injustice; neither does it warrant the presumption that every one knows the law. There is no such presumption. It would be contrary to common sense and reason. Yet the rule that ignorance of law shall not serve as an excuse for illegal acts or omissions is common to all systems of law, and is not only expedient, but necessary.

The maxim is of prime importance in criminal law, yet here it has real or apparent exceptions. If a person is indicted for larceny he may show that he honestly believed the property to be his own, although it appeared that this belief was due to his ignorance of a rule of law which vested the property in another. This results, however, from the fact that he does not commit the crime of larceny unless he intended to appropriate another person's property to his own use. Had the indicted person been sued for conversion by the true owner, his ignorance of the law would have been no excuse. In the civil action for conversion his motive, or intention, or belief in taking would be immaterial. One who takes and uses property as his own acts at his peril. So if a person enters into an honest and fair contract he cannot, except in certain cases of fraud or deceit (q.v.), absolve himself from its obligation by showing that he would not thus have contracted had he known the rule of law applicable to the transaction.

In general it may also be said that a person who has paid money in ignorance of the law cannot recover it in a quasi-contract action. This means that no man will be permitted to exempt himself from a duty, or shelter himself from the consequences of infringing a prohibition imposed by law, or acquire an advantage in opposition to the legal rights and interests of another by pretending error or ignorance of law. See MISTAKE; QUASI-CONTRACT; and the authorities there cited.

IGNORANTINES (from Lat. *ignorare*, to be ignorant). A religious congregation of men in the Roman Catholic Church, associated for the gratuitous instruction of poor children in sacred as well as secular learning. See SCHOOLS, BROTHERS OF CHRISTIAN.

IGORROTE, ē'gōr-rō'tā. A warlike people of mixed Malay-Mongoloid blood, speaking several dialects; chiefly in Benguet Province, Luzon. Also any wild Filipinos of Malay blood. Variants, Y'golot, Y'gulut, etc. See PHILIPPINE ISLANDS.

IGOR'S (ē'gōrz) BAND, SONG OF (Russ. *Slovo o polku Igorevčē*). The only Russian poetic monument, dating from the twelfth century. It recites the unfortunate outcome of the expedition (1185) of Igor, Prince of Novgorod-Syeversk, into the country of the Polovtsy in Southern Russia. The Prince was defeated and taken prisoner, but later he escaped with the help of a slave. The poetic gems of the song are the lyric passages depicting the grief of Nature over the Prince's capture; the lament of Yaroslavna, his

consort, on hearing of his fate; and the escape of Igor. The original manuscript, discovered by Musin-Pushkin and published in 1800, was destroyed in the Moscow fire of 1812. The editing was very poor, and another copy found in 1864 among Catharine II.'s papers is hardly more satisfactory. It has been an object of bitter controversy, and a vast literature on the subject has grown up. A translation by Wolfsohn in *Schönwissenschaftliche Litteratur der Russen* (Leipzig, 1843), and one with introduction and notes by Paucker (Berlin, 1884), are very good.

IGRAINE, ê-grân'. See IGERNA.

IGUALADA, ê'gwá-lá'dá. A city in the Province of Barcelona, Spain, situated on the river Noya, in a mountainous but fertile district, 46 miles by rail northwest of Barcelona (Map: Spain, F 2). It was formerly a fortified town, but its walls are now in ruins. It has manufactures of cotton, linen, and other textiles. Population, in 1900, 10,476.

IGUANA, íg-wá'ná (Sp., from the Haitian name, *igoana*, *huana*, *yuana*). A genus of tropical American lizards, representing the family Iguanidæ, of which there are about 55 genera and

TEETH OF AN IGUANA.

235 or more species. In external and internal structure iguanas closely resemble the Agamidæ of the Old World and are distinguished mainly by the pleurodont dentition. The tongue is thick and villous. All the North American forms possess femoral pores, but few of the South American species have them. In habits also the Iguanidæ closely resemble the Agamidæ, save that there are no flying forms to correspond with the flying dragon of the Agamidæ, while in America some of the iguanas, such as *Anolis*, have digital expansions, and others are semi-marine, neither of which conditions is met with in the Old World family. The family contains several of the largest lizards. Most of the species are arboreal, but some of them live on the surface of the sand and stones of the desert, and have a depressed form. Several species live wholly, or almost wholly, on vegetable food—the blossoms and leaves of plants. For this reason the flesh of several of them, especially of the genus *Iguana*, is very palatable, is sought by the natives of Central and South America as food, and is sold in their markets in considerable quantity. One of the species most eaten is *Iguana tuberculata*, a repulsive looking lizard, with a high, dorsal, fringed ridge, and a large dewlap (see Plate). It basks on the limbs of trees during the warm hours, and while thus situated seems rather indifferent to the approach of man. It is fond of music, and of having the body stroked. The natives take advantage of these facts, and whistle a lively tune as they approach, and when near enough stroke the sides of the iguana with a stick until they succeed in getting a noose over its head. (Consult Belt, *Naturalist in Nicaragua*, London, 1888.) The natives also dig them out of their burrows or chase them into trees with dogs trained for the purpose. On the Galapagos

Islands there is a semi-aquatic genus, *Amblyrhynchus*, whose species feed on seaweeds along shore. This lizard is described in detail by Darwin, in chapter 5 of his *Naturalist's Voyage* (London, 1860). There are other species of the same genus that live for months without water by feeding on the succulent cactus. The great iguana of Jamaica, with the prominent serrate crest, is *Cyclura lophoma*. In the Southwestern United States, from western Kansas to southern California and Mexico, dwell several genera of green, dark gray, or brown iguanid lizards, such as *Uta*, *Holbrookia* (q.v.), *Ctenosaura*, and *Crotaphytus*. (See COLLARED LIZARD.) The large genus *Sceloporus* (see ALLIGATOR LIZARD) ranges not only over the western and central part of the United States, but in all the Eastern and Gulf States as far north as New Jersey and Indiana. Another widely distributed genus, *Anolis*, has two representatives in the South Atlantic States, popularly called 'chameleons.' (See ANOLIS.) These lizards possess mimicry of color in a remarkable degree, and have a considerable power of changing their color. They are insectivorous, and the wanton destruction of them is much to be deplored, for in their native habitats they are of considerable economic importance to agriculture. To this family belongs also the basilisk of Central and South America, so named on account of its fancied resemblance to the creature of fable. (See BASILISK.) It is a large, harmless lizard, found no further north than Southern Mexico. The family also includes those peculiar, spiny, short-tailed, flattened lizards, known as 'horned toads' (q.v.).

Consult: Boulenger, *Catalogue of Lizards of the British Museum* (London, 1885); Cope, *Crocodylians, Lizards, and Snakes* (Smithsonian Institution, Washington, 1900); Stejneger, *Death Valley Expedition* (Department of Agriculture, Washington, 1893); Kingsley (editor), *Standard Natural History*, vol. iii. (Boston, 1885); Gadow, *Amphibia and Reptiles* (New York, 1901). See LIZARD.

IGUANODON, íg-wán'ô-dôn (Neo-Lat., from Eng. *iguana* + Gk. *ὀδός*, *odous*, tooth). A genus of ornithomimid dinosaurs, found fossil in Jurassic and Lower Cretaceous rocks of Europe. *Iguanodon* is perhaps the first dinosaur brought to light, for it was described by Mantell in 1825 from specimens found in Kent, England. The animal was 15 to 25 feet long; the head was large and narrow, the jaws heavy and furnished with numerous teeth of peculiar form that resemble those of the modern American lizard *iguana*. The anterior portions of the jaws are provided with strong, horny beaks like those of turtles. The fore limbs have four toes and a 'spur,' and are much shorter than the heavy three-toed hind limbs. The pelvis is elongated, and the tail heavy, and there is a ridge of strong vertebral spines extending along the dorsal surface from the neck to the middle of the tail. All the bones are hollow. *Iguanodon* was a herbivorous dinosaur that walked on its hind legs, and sat on a tripod formed by the hind legs and tail, after the manner of the kangaroo. It lived in great numbers in the swampy regions of England and Belgium, and other parts of Europe during Jurassic time, as indicated by the mode of occurrence of its fossil skeletons, twenty-nine of which were found at one time in Upper Jurassic sandstones of the coal regions at Bernissart, Belgium.

IGUANAS AND OTHER AMERICAN LIZARDS

1. IGUANA (*Iguana tuberculata*).
2. GREEN LIZARD (*Anolis principalis*).
3. NORTHERN HORNED TOAD (*Phrynosoma Douglassi*);
top of head and profile.
4. CHUCKWALLA (*Sauromalus ater*).

5. LEOPARD LIZARD (*Crotaphytus wislizeni*).
6. DESERT LIZARD (*Callisaurus draconoides*); head and
hind limb.
7. GILA MONSTER (*Heloderma horridum*).
8. COMMON HORNED TOAD (*Phrynosoma cornutum*).

Iguanodon has not been found in the Mesozoics of America, where it is represented by similar genera *Camptosaurus*, *Laosaurus*, and *Tespesius*. A very instructive account of the discovery and early history of Iguanodon, illustrating the method by which fragmentary material has after careful work yielded valuable results, is to be found in Mantell's *Petrifactions and Their Teachings* (London, 1851). See also Woodward, *Outlines of Vertebrate Palæontology for Students of Zoology* (Cambridge, 1898). See CAMPTOSAURUS; DINOSAURIA.

IHLANG-IHLANG, ê-läng'ê-läng' (Malay, flower of flowers). A strong and rich perfume from a Malayan tree (*Cananga odorata*) of the custard-apple family (*Anonacæ*). The perfume is distilled from a volatile oil yielded by the flowers.

I. H. N. CLUBS. See LEND-A-HAND CLUBS.

IHNE, ê'ne, WILHELM (1821-1902). A German historian, born at Fürth, and educated at Bonn (1839-43). He was private tutor in England (1843-47), and returned to Liverpool, where he had charge of a school (1849-63), after two years' teaching at Elberfeld. In 1863 he went to Heidelberg, where he was made professor in 1873. He wrote: *Questiones Terentianæ* (1843); *Researches into the History of the Roman Constitution* (1853); *Plea for the Emperor Tiberius* (1856); a *History of Rome* (1871-82), of which the German edition was published later, and is partly the work of Zumpt, and *Early Rome* (1876).

IHRE, ê're, JOHAN (1707-80). A Swedish scholar of Scottish extraction. He was born at Lund, and educated at the University of Upsala, where he acquired a great reputation, and carried off the highest honors. He subsequently traveled in France and England, was appointed under-librarian to the Academy of Sciences on his return to Sweden, and rose through a variety of offices to be professor of belles-lettres and political economy (1748). Ihre's principal work is his *Glossarium Suiogothicum* (1769), which may be regarded as the foundation of Swedish philology. It was published at the cost of the State, which gave Ihre \$10,000 to execute it. His numerous academical disputations, amounting to upward of 450, are still valuable, especially those on the Mæso-Gothic version of the Gospels by Ulfilas.

I. H. S. See ABBREVIATIONS.

II KAMON NO KAMI, ê-ê kâ'môn nō kâ'mê, or Ii NAOSUKÊ, Baron (1815-61). The Japanese statesman whose wise and vigorous statesmanship led to the opening of Japan to foreign nations, and the establishment of friendly relations with them. He was the fourteenth son of Baron Ii, of Hikone on Lake Biwa, and was born of a line of ancestors known honorably in the tenth century. At twenty-one, Ii went to Yedo, and had his mansion within the inclosure of Yedo Castle at Sakurada, or Cherry Field. In 1850 he was made heir to the baronetcy, assuming the highly honorable title of Kamon no Kami, which gave him standing at the Mikado's court. In 1853 the question of foreign intercourse, precipitated by Commodore Perry, divided the opinions of the daimios. Although he shared with many a feeling of hatred toward foreigners, Ii drew a line of distinction between personal feelings and national interests, and declared himself to be in favor of intercourse with foreigners, and of a re-

vival of the military spirit for national defense. The Shogun Iyetsada being childless and in poor health, the question of appointing an heir added to the complication of the period. Pressed by Townsend Harris (q.v.) to sign the treaty which he had negotiated, and which the Court in Kioto opposed, the Shogun had to face a crisis which admitted of no delay. On June 4, 1858, two days after the Mikado's refusal to approve the treaty, the Shogun appointed Ii to be Tairo or Regent, and on the 5th he was publicly installed, as the virtual ruler of Japan, but acting in the name of the Shogun. The Shogun Iyetsada died suddenly August 15th, leaving no heirs. Carrying out his master's wishes, Ii appointed Kikuchiyo, who subsequently took the name of Iyémochi, the Prince of Kishiu, then a child of twelve, to be his successor, and, taking the responsibility, in view of the rapid approach of the squadrons of the Russians, British, and French after their victorious campaign in China, he signed the liberal treaty drawn up by the United States Minister. The treaty with Great Britain followed on August 26th and that with France on October 9th.

The great daimios of Mito, Owari, and Echizen, however, opposed his nominee to the shogunate, the two former daimios wishing also to have Echizen made regent. On the outbreak of the long-gathering storm of opposition, Ii crushed his enemies with a strong hand, and dispatched an embassy to the United States to ratify the treaty. Among other triumphs he had the Princess Kazu, aunt of the present Emperor, betrothed in marriage to the young Shogun, and they were married in Yedo in 1861. Before this, on the 23d of March, a snowy day, while on his way in his palanquin with a large following of bodyguards to the palace in Yedo, they were attacked by a band of eighteen assassins, seventeen from Mito, one from Satsuma, all of them Ronins (q.v.). In the fight which ensued Baron Ii himself was stabbed, and his head cut off and carried away to the castle town of Mito, and there exposed on a pole. For years the name Ii rested under a cloud, but it has been cleansed by Shimada Saburo in his book *Kai Koku Shimatsū* ("Opening of the Country. Beginning and End"), which has been translated into English under the title of *Agitated Japan* (1896). The man and the episode of his assassination have given rise to a considerable body of native literature, and the episode is treated in fiction by A. C. Maclay in *Mito Yashiki* (3d ed., 1899).

IIWI, ê-ê'vê. The English spelling by many voyagers of the name of a Hawaiian bird, otherwise known as 'mamo' (q.v.), whose scarlet plumage was used for the native feather cloaks.

IKAO, ê-kâ'ô. A famous summer resort of Japan, situated in the Province of Katsuke, about 20 miles by rail from Takasaki, and 88 miles from Tokio. It is built on the slopes of the Haruna Mountain, and is celebrated for the picturesqueness of its situation as much as for its two hot springs and rich vegetation. The mineral springs have a temperature of 113° F., and contain iron and sulphate of soda.

IK MAR'VEL. See MITCHELL, DONALD GRANT.

IKUNO, ê-kûn'ô. A mining town of Japan, situated at an altitude of 1200 feet, in the prefecture of Hiogo, about 35 miles northwest of Kobe, and 31 miles by rail from Himeji. Its

silver-mines, the second largest in Japan, are run by the Government. Over 1500 persons are employed, and the mines are worked day and night. Besides silver they also yield gold. Population, estimated at 3000.

ILAGAN, ê-lâ'gân. The capital of the Province of Isabela in Luzon, Philippines (Map: Luzon, F 2). It is situated in the centre of the province at the confluence of several streams, about 330 miles northeast of Manila, and is one of the principal centres of the tobacco industry. Population, in 1898, over 13,800.

ILLANO, ê-lâ'nô, or **ILLANO**. A Moro tribe on Illano Bay, Southern Mindanao. See PHILIPPINE ISLANDS.

ILCHI, êl'chê'. A city of the Chinese Empire. See KHOTAN.

ÎLE-DE-FRANCE, êl-de-frâns. The former name of Mauritius (q.v.), an island in the Indian Ocean.

ÎLE-DE-FRANCE. One of the old provinces of France, having Paris as its capital, and now mostly comprised in the departments of Seine, Seine-et-Oise, Seine-et-Marne, Aisne, and Oise. During the last century of the Carolingian dynasty, the Ile-de-France was possessed by a race of powerful nobles who took the title of Dukes of France. One of the ablest of these was Hugo or Hugues, surnamed Le Blanc, or Le Grand, who for twenty years previous to his death (956) virtually wielded the sovereign power under the Carolingian kings Louis IV. and Lothair. His son Hugh Capet eventually became the actual sovereign. See CAPETIAN DYNASTY.

ILEO-CÆCAL (îl'ê-ô-sê'kal) **VALVE**. A valvular constriction that guards the passage between the large and the small intestine, at the opening of the cæcum. It consists of a double fold of mucous membrane, and is present in all mammals except certain carnivores.

IL'ËUM. See INTESTINE.

IL'ËUS (Neo-Lat., from Lat. *ileos*, Gk. *εἰλεός*, *eileos*, *ἰλεός*, *ileos*, severe colic, from *εἰλεῖν*, *eilein*, to roll up; connected with Lat. *volvère*, to roll, Eng. *wallow*). A severe colic, due to intestinal obstruction. Its symptoms are pain, nausea, and vomiting—which latter may contain feculent matter—rapid and feeble heart, and collapse. The obstruction may relieve itself, or if of mechanical origin, it may require operative interference to save life.

I'LEX (Lat., holm-oak). A tree often named in the Latin classics, the evergreen oak or holm-oak (*Quercus Ilex*). It is a native of most parts of the south of Europe, and of the north of Africa, and often attains large dimensions. Its leaves are ovate-oblong, acute, leathery, hoary beneath; but they vary much in some respects, from the size of a sloe-leaf to that of a beech, and from being very spiny at the edge to perfect evenness. Its wood is very hard and heavy, tough, durable, and useful, particularly for axles, pulleys, screws, and whatever is to be subjected to much friction. The acorns are of various quality, sometimes bitter, and sometimes sweet and eatable. In modern botany *Ilex* is the generic name of the holly (q.v.).

ILFORD, il'fêrd. A town in Essex, England, five miles southwest of Romford (Map: London, D 9). Its modern growth and importance are

due to the photographic industry, the establishment of dry-plate works, and a paper-mill. The erection also of the London County Council's Claybury Hall Lunatic Asylum, holding 2000 persons, has been instrumental in adding to the population. The twelfth-century chapel of a mediæval hospital is of archaeological interest. The British Museum contains fossil remains of mammoths discovered here. Population, in 1891, 10,900; in 1901, 41,250.

ILFRACOMBE, il'frâ-kôöm. A market-town, seaport, and watering-place on the north coast of Devon, England, finely situated amid picturesque irregular hills, on an inlet of the British Channel, 11 miles northwest of Barnstaple (Map: England, B 5). The harbor is formed by ramparts of rock, and furnished with a lighthouse and a pier. It has excellent bathing facilities which, with its fine air, make it a popular summer resort. Fishing and an active coasting trade are carried on. It is an old town, and in the fourteenth century was of considerable commercial importance. Population, in 1891, 7692; in 1901, 8600.

ILGEN, êl'gen, KARL DAVID (1763-1834). A German philologist and educator, born at Burg-holzhausen in Saxony, and educated at Leipzig. In 1789 he became rector of the gymnasium at Naumburg; in 1794 professor of Oriental languages at Jena; and in 1802 rector of the Landesschule at Pforta, where he labored with conspicuous success for nearly thirty years. His main works are: *De Jobi Natura atque Virtutibus* (1788); *Urkunden des ersten Buches Moses in ihrer Urgestalt* (1798); *Die Geschichte Tobis nach drei verschiedenen Originalen übersetzt* (1800); *Hymni Homerici* (1796); *Scolia Græcorum* (1798); *Opuscula Varia Philologica* (1797); and *Animadversiones ad Vergilii Copiam* (1820). Consult Naumann, *Ilgiana* (Leipzig, 1853).

ILI, ê'lê'. A river which rises, under the name of Tekes, in the Thian-Shan Mountains, on the borders of the Russian and Chinese empires, not far from Lake Issyk-kul, flows at first in a north-easterly and then in a westerly direction, passing the town of Kuldja, and falls into Lake Balkhash in the Russian Central Asiatic Province of Semirietchensk (Map: Asia, G 4). It is about 800 miles long, and is navigable from Kuldja.

ILIAC ARTERIES. The two arteries formed by the bifurcation of the abdominal aorta. The aorta (q.v.) divides at its lowest point—which is usually on the left side of the body of the fourth lumbar vertebra—into the two common iliac arteries, which pass downward and outward on each side to the margin of the pelvis for about two and one-half inches, and then divide into the external and internal iliac artery of either side. The external iliac passes obliquely downward and outward to the femoral arch, when it enters the thigh and becomes the femoral artery. The internal iliac is a short vessel, about an inch and a half in length, which divides into an anterior and a posterior trunk. The anterior trunk divides into several branches, which supply the bladder, the rectum, the generative organs, and muscles both within and on the outside of the pelvis, with arterial blood; while the branches of the posterior trunk mainly supply muscles within and on the outside of the pelvis. The importance of the internal iliac artery

in carrying on the circulation in uterine life is noticed in the article FÆTUS.

IL/IAD. See HOMER.

ILLIAD OF FRANCE, THE. A name sometimes given to the *Roman de la Rose*.

ILLION, il'ī-ōn. A village in Herkimer County, N. Y., 12 miles east-southeast of Utica; on the Mohawk River, the Erie Canal, and the New York Central and Hudson River and the West Shore railroads (Map: New York, E 2). It has a fine public library, with about 11,000 volumes. The manufactures include firearms, typewriters, bicycles, knit goods, and cabinet and filing cases. The water-works and electric-light plants are owned by the municipality. One or two families seem to have moved to the site of Ilion about 1816, but there was properly no village here until about 1828. It was incorporated in 1852. Population, in 1890, 4057; in 1900, 5138.

IL'IONA (Lat., from Gk. Ἰλιόνη, *Ilionē*). In Greek mythology the wife of Polymnestor, King of Thrace. She was the daughter of Priam and Hecuba, and according to one legend brought up her brother Polydorus, who had been committed to the care of Polymnestor. When the latter, instigated by the Greeks, who wished to exterminate the race of Priam, designed the murder of Polydorus, Iliona substituted his own son, Deipilus, who was put to death instead.

ILI'ONEUS (Lat., from Gk. Ἰλιονεύς). The son of Niobe, killed with all her other children. He was praying, and Apollo would have saved him if the arrow had not already been sent.

ILITHYIA, il'i-thi'yā (Lat., from Gk. Εἰλεΐθυια, *Eileithyia*). The Greek goddess who presided over childbirth. The plural form *Ilithyia* is used in the *Iliad*, but elsewhere only one goddess of the name is mentioned.

IL/IUM. See TROY.

ILIUM (Lat., flank). A portion of one of the bones of the pelvis, the os innominatum. In the undeveloped child it is a distinct portion, which afterwards becomes united to the pubis in front and to the ischium behind and below. It is the hip-bone or haunch-bone. See PELVIS.

ILKESTON, il'kēs-ton. A market-town in Derbyshire, England, 10 miles northeast of Derby, on an eminence in the valley of Erewash (Map: England, E 4). There are manufactures of hosiery and lace, and coal and iron works in the vicinity. The town possesses a valuable medicinal mineral spring and baths. It was known in 1084 as Tilehestune. It obtained a grant for a market and fair in 1251, but was not incorporated before 1887. It owns its gas, water, markets,

and cemetery, and maintains a sewage farm. Population, in 1891, 19,744; in 1901, 25,400.

ILKHANDS, el-kānz'. See MONGOL DYNASTIES.

ILLÆ'NUS (Neo-Lat., from Gk. εἰλεῖν, *eilein*, to roll closely). A fossil trilobite with smooth-surfaced elliptical or rounded carapace, found in the Ordovician and Silurian rocks of most parts of the world. See TRILOBITA.

ILLAMPU, el'lyām'pōo. A mountain of the Andes. See SORATA.

ILLA-TICSI, el'yā tēk'sē (Quichua, Eternal Light). A name given to the supreme god of the Peruvians, Uiracocha.

ILLE-ET-VILAINE, el'ā'vā'lān'. A maritime department in the northwest of France, a portion of the old Province of Brittany, lying between the English Channel and the Department of Loire-Inférieure (Map: France, E 3). Area, 2699 square miles. Population, in 1896, 622,039; in 1901, 613,567. It is watered chiefly by the rivers from which it derives its name—the Vilaine, and its tributary, the Ille. The usual grain crops are raised in sufficient quantity to meet the wants of the population. Flax and hemp are extensively produced, and the cider of this district is esteemed the best produced in the country. Cattle are reared in great numbers, iron-mines are worked, and great varieties of linen and woolen fabrics are manufactured. Rennes is the capital, and Saint-Malo the principal seaport.

ILLEGITIMACY (from Lat. *in-*, not + *legitimus*, legal, from *lex*, law). According to the civil and statute law as found in many States, the status of children born out of wedlock. In England, children born out of wedlock have been held as illegitimate even upon subsequent intermarriage of the parents; also children of the deceased wife's sister have long been considered illegitimate. In Italy, much confusion has arisen as to legitimacy, owing to the strife between Church and State. It has been held that children resulting from marriages which had been solemnized by the Church only were illegitimate, a civil marriage being necessary to give legitimacy to offspring.

In New York the children of a man and woman cohabiting professedly as husband and wife have been held to be legitimate. In France, where informal unions are common, the same rule does not hold. Children of such a union are considered illegitimate. A great variety exists as to theory and practice in different lands, and reference must be made to special treatises on the subject. Illegitimacy has been much discussed from three distinct points of view—the moral, the economic, and the legal.

For the student of morals and social reformer the causes and effects of illegitimacy form the leading points of observation. That the number of illegitimates justifies consideration, the preceding statistics on the general situation may give sufficient evidence.*

Of all subjects for statistical investigation, illegitimacy presents perhaps the most difficulties, owing to the lack of agreement among different legal authorities as to what constitutes illegitimacy, and to the fact that it is a phenomenon naturally subject to concealment. Complete figures up to date cannot be secured; it appears, however, that in civilized lands children born out of wedlock vary from 3 per cent. to 12 per cent. of all births. In most cases figures on illegitimacy exclude still-births. Of the latter the number equals about one-third of the illegitimates.

Attempts have been made to demonstrate statistically the causes of illegitimacy, but with little success. The study, for instance, of the fecundity of women throws very little light upon it. In Russia, in 1896, the number of births to 10 marriages was 65, while the number of illegitimates was only 31 to 1000 births. During the same period in France there were only 27 births to 10 marriages, with 88 illegitimate births per 1000. In Austria there were 44 births to 10 marriages, and 145 illegitimates per 1000 births, and England showed about 36 births to 10 marriages and 42 illegitimates to 1000. It seems evident that the apparent strong tendency to child-bearing cannot explain the phenomenon.

Equally uncertain is evidence gathered to show that climatic conditions have any large part to play. The following table (for 1896) presents some figures bearing upon the geographic distribution of illegitimacy. The division of cities is roughly made, those in the first column being north of latitude 52° N. and those in the second column south of latitude 49°:

ILLEGITIMATES PER 1000 BIRTHS

NORTHERN		SOUTHERN	
Rotterdam.....	70	Naples.....	86
Hamburg.....	138	Venice.....	189
Berlin.....	154	Milan.....	204
Saint Petersburg...	276	Paris.....	268
Copenhagen.....	279	Rome.....	194
Stockholm.....	396	Vienna.....	449

As is seen by the table, the difference is scarcely worth considering. It certainly does not corroborate the view that the southern cities are less moral than the northern.

That the degree of illiteracy must exert some influence on the rate of illegitimate births can, perhaps, not be wholly denied. That its influence has been much overestimated seems equally certain. Along with any such general cause must be placed many other factors which complicate the problem. The table in the next column will illustrate this point.

It has long been believed that the moral conditions of the cities are lower than those of rural districts. Increased knowledge of rural conditions has tended to qualify this view. In general, it may be said that the rate of illegitimacy is higher in cities than in the country. This is

due to a variety of causes. There is in the city less social restraint, less danger of detection of paternity, and a greater degree of abandonment on the part of the females. In some instances,

COUNTRY	Per cent. of literates in population	Illegitimates to 1000
England.....	96	40
Scotland.....	97	65
Ireland.....	85	27
France.....	95	88
Germany.....	99	89
Scandinavia.....	99	{ Sweden 107 Norway 71
Belgium.....	87	87
Russia.....	38	31
Austria.....	76	145
Italy.....	62	77

however, as in Bavaria and in some other Continental countries, the greater freedom of marriage laws and better industrial opportunities in the city render family life more convenient and irregular relations less common than in country districts, where the conditions of holdings hinder marriages. The high degree of illegitimacy is often an indication of certain laws which affect the situation, as, for example, was the case in Bavaria. In former times the laws were extremely unfavorable to marriage, and a high rate of illegitimacy resulted. The rate of illegitimacy was as follows: 1865-69, 20.59 per cent.; 1871-80, 12.86 per cent.; 1887-91, 14.01 per cent. With the passing of more liberal marriage laws and the use of greater industrial freedom the number of marriages rapidly rose, and a corresponding fall in the number of illegitimates took place. The number of marriages increased in the period from 1840-70 from 65 per 10,000 population to 81 per 10,000 population; at the same time the rate of illegitimacy fell from 20.59 per 100 births to 12.86 per 100.

Laws instituting an inquiry as to parentage have so far had little effect in checking illegitimacy. The following table will serve to illustrate this feature of the case:

RATE PER 1000 CHILDREN BORN, PERIOD 1878-82. STILL-BIRTHS EXCLUDED

Countries where inquiry as to paternity is refused	Rate per 1000 births	Countries where inquiry is allowed	Rate per 1000 births
Belgium.....	77	Austria.....	144
France.....	74	Saxony.....	127
Italy.....	73	Bavaria.....	132
Holland.....	30	Sweden.....	101
Russia.....	28	Denmark.....	101
		Scotland.....	84
		England and Wales.....	48
		Switzerland.....	47
		Ireland.....	25

The presence in society of illegitimate children might be expected to involve serious economic and moral evils, since they are frequently deserted by their natural protectors, and since by heredity and environment they would naturally tend toward pauperism and crime. The greater death-rate among this class of children diminishes these social and economic effects. The following table shows the death-rate among infants under one year in each class, in the countries named:

* As the United States keeps no official record of births, no authentic statistics for that country can be given.

COUNTRY	Per cent. deaths among legitimates	Per cent. deaths among illegitimates
Austria.....	24.5	33.3
France.....	15.5	30.0
Belgium.....	16.1	26.2
Norway.....	9.9	12.16
Prussia.....	19.3	34.8
Bavaria.....	29.3	38.6
Württemberg.....	29.6	36.4
Berlin.....	25.0	32.8

It will be seen that the average rate of infant mortality is 25 per cent. higher among illegitimates than among legitimates. Even more difference is shown by the tables of François. According to these tables the death-rate is twice as high in Spain, Hungary, Sweden, and Denmark. Investigations undertaken to show the physical and moral development of illegitimates are inconclusive in results. This question has been studied in Germany, and more experiments seem to show that illegitimates do not differ greatly from the normal. For example, of 277 illegitimates examined for military service in Berlin in 1870, there were 90 accepted; of the same number of legitimates, 95 were accepted. Among criminals investigations have shown that the illegitimates furnish a large number of those arrested for theft and for begging.

An important question from the standpoint of the economist and public financier is the burden imposed by illegitimacy upon the public. It may work against the welfare of the State by unduly increasing the population, because it removes the feeling of responsibility felt by those who know they must support those whom they bring into the world. The more practical and immediate aspect of the problem, however, is the expense the State must meet in caring for the illegitimates. The importance of this item depends on three conditions: First, the actual number of those thrown on the public; second, the share of this burden borne by private charity; third, the degree of responsibility placed on the reputed parents as to the support of the illegitimate children. This leads to a detailed study of charity work, however, for which reference must be made to that head.

As to the support of illegitimates, the common-law rule is that the putative father of a bastard child is not liable for its support, this obligation falling legally on the mother.

By statute law, both in England and most of the United States, upon complaint of the mother or of certain designated public officers, an inquiry may be had as to the identity of the putative father, and upon sufficient proof an order of affiliation made whereby the father is adjudged to pay for the support of the child. Consult Lappingwell, *Illegitimacy* (New York and London, 1892).

Under common law, an illegitimate child can neither inherit nor transmit property. The exception to this rule is that to his own offspring he may will property of his own accumulation. Laws of the United States have modified this condition, and as a rule, allow inheritance and transmission of property through the mother.

The legitimation of children born out of wedlock by statute law in most of the States follows upon the intermarriage of the parents and acknowledgment of the children. The legitimation of illegitimates secures them, in general, all the

privileges of children born in wedlock. It therefore carries with it the right of property and inheritance and the name of the father. In England the intermarriage of the parents at any time before the birth of the child legitimates the child. English law recognizes the status of the child in the place where the parents were domiciled. In the civil and canon law, the intermarriage of parents has always made the child legitimate. This is the law of Scotland, Holland, Germany, and France.

ILLICIUM, il-līsh'ūm (Neo-Lat., from Lat. *illicere*, to allure, from *in*, in + *lacere*, to entice). A genus of trees of the natural order Magnoliaceæ, the members of which have flowers with three or six petal-like sepals, numerous petals arranged in several rows, many stamens and pistils, capsules arranged in a star-like form, opening upward, and each containing a single seed. The species are few, but very widely distributed. The most important is *Illicium anisatum*, star or Chinese anise, the fruit of which is used in medicine and as a condiment. This tree is held in high esteem by the Japanese, and is planted near their temples. The star anise of commerce is now derived principally from Anam. Among the other species is *Illicium floridanum*, a shrub with pendent clusters of dark purple flowers, native of Florida and Louisiana, of which the leaves and capsules smell like anise, though more faintly than those of the Chinese tree. Similar in fragrance is *Illicium parviflorum*, another Floridian species. See ANISE.

ILLIGEN, ēl'lē'zhän', ANDRÉ (1638-70). A French buccaneer, native of Ixelles, near Brussels. From the merchant service of the Netherlands, he passed into that of the French filibuster Montbars, who had saved him from the Spaniards, and together they sacked cities and ships of the enemy. Illigen afterwards worked with the famous Welsh pirate Sir Henry Morgan, with whom he coöperated during some of the latter's noted expeditions against the possessions of Spain in the West Indies and South America.

ILLIMANI, ēl'yē-mā'nē. A volcano in the Bolivian Andes, South America, situated about 25 miles southeast of the city of La Paz (Map: Bolivia, D 7). It is surmounted by four peaks, of which one, Condor Blanco, is over 20,800 feet high. It is covered with perpetual snow above 15,000 feet, whence its name, signifying 'snow mountain.' There is a lake in the mountain mass 15,900 feet above the sea, and glaciers on the north side at an altitude of 16,350 feet. The first ascent to the summit of the central peak was made in 1877 by Wiener, Grumbhow, and Ocampo.

ILLINOIS, il'lī-noi' or -noi' (American Indian, *Illini*, men). A group of North American Indian tribes belonging to the great Algonquian linguistic family (see ALGONQUIAN STOCK) and originally occupying the State that received their name. La Salle speaks of Lake Michigan as Lac des Illinois. Some of the separate tribes in this group were the Cahokias, after whom the gigantic pyramidal mound opposite Saint Louis was named, Kaskaskia, Michigami, Moingwena, Peoria, and Tamaroa. Most of them have left the record of their existence in place names here and there about the State.

A point of interest relating to the Illinois and other Algonquian tribes in the Ohio Valley is

the question of their connection with the people who erected the great truncated pyramidal earth mounds in the Mississippi bottoms, in the western part of the State.

The Illinois came early into relations with La Salle (1670-82) and the French traders. Through the influence of the Trappist monks these tribes were held loyal to the French in their wars with the neighboring tribes and afterwards with the English.

At the close of the Revolution the United States had great difficulty in subduing the Indians of this area. They now number 172, and are situated on a reservation in the Indian Territory.

ILLINOIS. 'The Prairie State.' A north-central State of the United States, lying between latitudes 36° 59' and 42° 30' N., and longitudes 87° 35' and 91° 40' W. It is bounded on the north by Wisconsin, on the northeast by Lake Michigan, on the east by Indiana, on the south by the Ohio River, separating it from Kentucky, and on the west by the Mississippi, flowing between it and Missouri and Iowa. Its greatest length is 385 miles; extreme width, 218 miles. Area, 56,650 square miles, of which 650 miles are water.

TOPOGRAPHY. The whole State lies within the great prairie region, and has the physical appearance of a broad plain sloping slightly toward the south and southwest. After Louisiana and Delaware, it is the most level State in the Union. The surface of the plain, however, is not so monotonous as it appears on the map, being broken by minor undulations in a series of low hills and broad hollows. In the extreme northwest there are hills rising to an altitude of more than 800 feet, but the average elevations range from 600 feet in the north to 300 feet in the south. The elevation of Chicago is 582 feet. With the Ohio, Mississippi, and Lake Michigan on its borders, the State is well favored as to navigable waterways. The minor streams, with the exception of a few in the northeastern part, flow into the Wabash, Ohio, and Mississippi. The largest of these, the Illinois, has a course of nearly 500 miles, and can be ascended by small boats for a distance of 250 miles from its mouth. It drains central Illinois, receiving as affluents the Kankakee, Des Plaines, Fox, Vermilion, Mackinaw, Spoon, and Sangamon. Among the other important rivers are Rock River in the north, and the Kaskaskia, Big Muddy, Little Wabash, and Embarras in the south. Lake Peoria, in the central part of the State, is formed by a widening of the Illinois River.

FLORA AND FAUNA. See paragraphs on these topics under UNITED STATES.

CLIMATE AND SOIL. The climate is typically temperate, the mean annual temperature ranging from 47° to 54° F. The winters are somewhat severe owing to the northerly winds, which have an unobstructed sweep over the prairies. Vegetation starts in April, and frosts occur about the middle of September. The average annual rainfall is thirty-eight inches. The soil consists of a rich, warm loam almost free from pebbles, and is mostly of glacial origin. An underlying stratum of hard clay prevents the seepage of moisture. On the river bluffs in the western part a fine, sandy deposit, called loess, occurs quite commonly, while the bottom lands have a surface of alluvial silt. The soils are remark-

ably fertile and require little artificial preparation to fit them for the growth of cereals.

GEOLOGY AND MINERAL RESOURCES. During the Glacial period the area of Illinois was overrun by the northern ice sheet, which spread out a mantle of drift over the surface, burying the preëxistent topography. Only where the rivers have eroded their channels through this glacial material do the underlying formations outcrop. Silurian strata predominate in the northern part, and Devonian and Carboniferous in the central and southern parts. The coal-fields cover an area of 37,000 square miles; the number of seams varies from 7 to 12, with a thickness of 2 to 8 feet. The coal is bituminous, of Carboniferous age, and is best adapted for steaming. The most productive mines are located in Sangamon, Saint Clair, Vermilion, Macoupin, La Salle, Grundy, Williamson, and Bureau counties.

MINING. This industry is of little importance when compared with agriculture and manufacturing. Nevertheless, the production of bituminous coal has assumed enormous proportions. Illinois ranks second among the States in the amount of coal mined, and the output amounts to nearly 10 per cent. of the total for the country. The value of the annual output has increased from \$10,000,000 in 1886 to \$28,163,937 in 1901. Limestone is extensively quarried, the product being used for building and road-making purposes. The value of the annual output for the last decade has averaged about \$2,000,000. Both of the above products are procured from a number of widely scattered points. The discovery and the mining of lead in the northwest corner of the State played an important part in the early settlement of the commonwealth. It is still mined to a limited extent. Some zinc is also mined in the northern part of the State. Fine clay and other commercial clays are mined, and the manufacturing of lime and of cement are well-established industries. The mineral waters of the State are also of considerable commercial value.

FISHERIES. Many of the streams of the State abound in fish, which, though of little importance compared with the total food-supply, are yet worthy of consideration. German carp and buffalo-fish are commercially of most importance. Twenty shipping points on the Illinois River report the total value of fish caught for the year 1899 as \$362,000. The protection and fostering of the fishing resources of the State are placed under the supervision of a State board of fish commissioners.

AGRICULTURE. For several years following 1870 Illinois exceeded all other States in the per cent. of its farm area, in the per cent. of farm land improved, and the acreage in crops, and at the end of the century was exceeded in these respects by only one State—Iowa. According to the census of 1900, 91.5 per cent. of the land area was included in farms, of which 84.5 per cent. was improved, each of these per cents. being the largest given in any Illinois census. In the greater part of the State the soil is a black loam of great fertility. The average size of farms decreased gradually until 1880; since then it has remained almost constant, being 124 acres in 1900. The per cent. of tenant-operated farms is rapidly increasing, amounting in 1900 to 39 per cent. of the total number. The share system of renting is most common. The products raised are of great variety, but corn has always

been predominant, the number of acres devoted to its cultivation being twice that of any other crop. For a long time Illinois was the foremost corn State, but in recent years that place has been surrendered to Iowa, while Kansas and Nebraska have each in occasional years had a greater acreage. A very high point in the corn production in Illinois was reached in the late seventies, followed by a gradual falling off of more than one-third; it revived, however, in the decade 1890-1900, the figure for the latter year being the highest reached. In 1880 3,200,000 acres under wheat exceeded that for any other State; but for the last decade of the century it has averaged only a little over half that amount,

sales, \$14,477,813 being received from the sale of milk. Other cattle during the last decade of the century have averaged a little less than 2,000,000 head, being less in the preceding decade, but now giving the State about fifth rank. For two decades hogs have exceeded 5,000,000 head, Iowa being the only successful rival. Less attention has been given to sheep, which have decreased in number more than half since 1870. The State ranks next to Missouri in number of domestic fowls. The following tables, taken from the census returns for 1890 and 1900, show the relative importance of the different crops and varieties of farm animals, and the changes which have occurred during the decade:

YEAR	Corn (acres)	Oats (acres)	Wheat (acres)	Rye (acres)	Barley (acres)	Hay (acres)	Potatoes (acres)
1900.....	10,266,335	4,570,034	1,826,143	78,869	21,375	3,343,910	136,464
1890.....	7,863,025	3,870,702	2,240,932	165,598	41,390	3,522,884	170,726

YEAR	Dairy cows	Other neat cattle	Horses	Mules and asses	Sheep	Swine
1900.....	1,007,664	2,096,346	1,350,219	127,173	629,150	5,915,468
1890.....	1,087,886	1,975,233	1,335,289	107,875	922,631	5,924,818

giving the State a low rank. Oats show just the opposite tendency, the crop prior to 1880 having an annual acreage of less than 2,000,000 acres, but since 1885 averaging 3,500,000 acres, the State ranking next to Iowa. Hay, which for the decade 1880-90 had an annual acreage of over 3,000,000 acres, dropped below that figure in the succeeding ten-year period. Illinois is one of the most important potato-producing States with an average acreage of over 150,000 acres. All these crops are grown throughout the State, but the northern part is found especially adapted to hay, the north and central to corn, the eastern to oats, and the southwestern to wheat. Rye and barley are most extensively raised in the northern portion of the State, sorghum, tobacco, and castor beans in the southern, and broom-corn is grown in the central. In the production of the last, the State exceeds all others. Peaches and pears are raised chiefly in the southern part, while apples, grapes, and other fruits are common throughout the State. In 1900 the apple-trees numbered 13,430,000, or 74 per cent. of the total fruit-trees, having nearly doubled in number during the decade ending with that year. The per cent., however, of increase for all other varieties of fruit-trees was much greater than for apple-trees. In the vicinity of Chicago large quantities of small fruits and other products are grown for the Chicago markets. In most parts of Illinois expensive farm drainage systems need to be maintained.

STOCK-RAISING. There being an enormous production of corn and other kinds of stock feed, stock-raising naturally assumes great prominence. For many years the number of horses exceeded 1,000,000, giving the State first rank until 1900, when it was exceeded by Iowa. Large numbers of mules are also raised. The milch cows number about 1,000,000, only Iowa and New York exceeding this figure. Dairy products—milk and butter—constitute one of the leading sources of wealth, and are exceeded in importance in but two other States. In 1899 the dairy product was valued at \$29,638,619. Of that sum 64.3 per cent. was actually realized from

MANUFACTURES. Illinois is the most important manufacturing State west of the Alleghany Mountains, and is outranked by only two of the Atlantic Coast States—New York and Pennsylvania. It is a natural collecting and distributing centre for a very large and prosperous area. To Chicago (q.v.) is accredited 70 per cent. of the total manufactured product for the State. From its beginning the city was an important stock market, and it soon far outclassed all other places as a slaughtering and meat-packing centre. From the table appended it will be seen that the value of the products of this industry constitutes over one-third of the total for the twenty-four leading industries of the State, and the greater part of this (\$256,537,000) was in 1900 accredited to Chicago. The entire slaughtered animal is utilized, and this gives rise to a large number of subsidiary industries, some of which attain a large magnitude in themselves. Thus the value of soap and candles manufactured exceeds \$9,000,000, and the products of the tanning, currying, and finishing of leather are almost as important. The forests to the north and the iron-mines of the Lake Superior region together afford the raw products for a large number of important industries. The manufactures of iron are only possible where an abundant supply of fuel is attainable, and the extensive coal-mining industry of the State abundantly meets this requirement. Only two States exceed Illinois in the manufacture of iron and steel. Chicago is the largest producer of these products among all the lake cities. Joliet has become another important centre for the production of iron and steel. The value of the product for Chicago and Joliet in 1900 was respectively \$31,461,000 and \$13,380,000. The manufactures of foundry and machine-shop products are even greater in value than is the product of iron and steel. Over two-thirds of the total product is accredited to Chicago. The value of agricultural implements manufactured is more than three times that of any other State, and Pennsylvania alone exceeds Illinois in the production of cars and other railroad supplies. The manufacture of carriages and wagons is also

of great importance; but it is interesting to note that while the production of these vehicles scarcely increased at all during the decade, the production of bicycles and tricycles increased 82.3 per cent. during that decade, and has become almost as important. The production of bicycles and tricycles in 1900 was about double that of any other State. Of the manufactures dependent more wholly upon wood, the most important is furniture, confined almost exclusively to Chicago, while planing-mill products and other lumber and timber products are more generally distributed throughout the State. There are important manufactures depending largely upon agriculture for raw materials. The most important of these are manufactures of liquor, flouring and grist-mill products, glucose, cheese, butter, and condensed milk. About two-thirds of the total manufactures of liquors represent distilled liquors. Peoria leads in the industry, and is the largest producer of fine high wines in the United States. The glucose plants of the State

make thirty-five distinct products directly from corn, and consume 20 per cent. of the corn crop of the State. Chicago has become an important centre for the manufacture of men's and women's factory-made clothing as well as of boots and shoes, and has a very large printing and publishing business. The manufacture of electrical apparatus and supplies, although almost wholly the development of the last decade, has become an industry of first rank. The manufacture of musical instruments also experienced a very significant gain during the decade. The greatest absolute increase in the manufactures of the State was made in the decade 1880-90. During the last census (1900), however, the percentage of the entire population engaged as wage-earners in the industry was greater than in any previous census, being 8.2 per cent., or 395,110 persons. It will be seen from the table that the per cent. of increase for the number of establishments is greater than the per cent. of increase for the value of products; but in a number of the more important in-

dustries a very decided tendency toward centralization is evident. The accompanying table shows the relative importance of the leading industries, and the changes which have occurred in the last census period.

TRANSPORTATION AND COMMERCE. The State has water communication with the Mississippi Valley and a southern outlet to the Atlantic. Lake Michigan, which touches the State at the northeast corner, gives water communication with Canada and the Lake States, and an eastern outlet to the Atlantic. The Illinois and Michigan Canal, constructed from the lake to the head of navigation on the Illinois River, connects the two water systems. The railroads are more numerous and have a greater extent of track than those of any other State. This is owing in part to the favorable situation for commerce and travel, and partly to the almost level surface of the land, which reduces the cost of construction to the lowest point. Chicago and Saint Louis are the two focal points for the railroads of the State; indeed, most of the grand trunk lines of the continent converge at the former place. The Illinois Central, through the encouragement of extensive land grants by the Government, was constructed in 1850-56, and was the first line in the State. The line still pays into the State treasury 7 per cent. of its gross earnings, being otherwise exempt from taxation. The railway mileage by decades is as follows: 1860, 2790; 1870, 4283; 1880, 10,165; 1900, 10,814. There are about 20 miles for every 100 square miles of territory, and about 23 miles for every 10,000 inhabitants. In 1900 there were 116 railroad corporations having lines within the State. The number of passengers carried during the year mentioned was 42,153,000, the average distance being 24.12 miles. The tons of freight hauled amounted to 88,307,000, the average distance being 116.65 miles. Thus the great natural resources of the State, together with its admirable land and water facilities for transportation, and its central location, give it a high rank in commercial importance. Chicago is the great collecting and distributing centre of the Middle West. Recent improvement in the navigation of the Saint Lawrence makes it possible for the smaller ocean vessels to reach the Chicago port, and though this is not yet considered commercially practicable, it is confidently expected that further improvements will result in the development of a large foreign traffic directly with the Chicago port. See CHICAGO.

BANKS. In 1902 there were 276 national banks in the State with a capital stock of \$44,930,000; deposits, \$238,459,000; cash, etc., \$53,537,000; and loans, \$282,007,000. The State banks numbered 190, with a capital of \$29,840,000; deposits, \$232,723,525; cash, etc., \$30,534,988; and loans, \$171,201,512. The savings banks had deposits of \$80,251,287, the average deposit being \$309.95. In 1902 the private banks numbered 178, with loans (approximately), \$12,386,236; cash, \$1,231,918; capital, \$3,407,825; and deposits, \$23,174,163.

FINANCE. On October 1, 1900, the outstanding bonded debt of the State was only \$18,500. The balance of all funds in the State treasury amounted to \$2,617,900. Constitutional limitations prevent the State and the local governmental units from appropriating money to aid railroads and canals. There are also other rigid constitutional

provisions intended to prohibit the loan of the State's credit, and to limit the ordinary debt-contracting power to a maximum of \$250,000, unless permission to exceed this amount has been given by a vote of the people. The local governments are limited in their debt-contracting power to 5 per cent. of the value of taxable property.

CONSTITUTION AND GOVERNMENT. The present Constitution, which is the third for the State, was ratified by a vote of the people in July, 1870. To secure either an amendment or a constitutional convention requires a two-thirds vote of each House and a majority of the votes cast at a popular election, while the Constitution drawn up in convention must again be submitted to a popular vote of the people. Voters must have resided in the State one year, in the county ninety days, and in the election district thirty days next preceding an election. The General Assembly is given power to exclude from the right of suffrage persons convicted of infamous crimes.

LEGISLATIVE. The Senate of 51 members is elected for four years, the House of Representatives for two years. Three Representatives are elected from each of the 51 Senatorial districts, and each voter is allowed three ballots, which, if he sees fit, may be cast for one man, or one and a half votes for each of two men, or one vote for each of three candidates. The three candidates having the highest number of votes are elected. This works to the advantage of the minority. Legislators receive \$5 per day mileage, and \$50 for incidental expenses. The legislative session begins on the first Wednesday after the first Monday in January of odd years. The capital of the State is Springfield.

EXECUTIVE. A Governor, Lieutenant-Governor, Secretary, Auditor, Superintendent of Instruction, and an Attorney-General are elected for terms of four years each. A Treasurer is elected for two years, and cannot be reelected for the next succeeding term. The Governor exercises the usual pardoning power, subject to legal regulations. Any bill or item of an appropriation bill may be vetoed by the Governor, but a two-thirds vote of each House may override the veto. The Lieutenant-Governor, President of the Senate, and Speaker of the House are in line of succession to the Governorship in case of vacancy.

JUDICIAL. The State is divided into seven districts, in each of which a judge of the Supreme Court is elected who serves for nine years. Inferior appellate courts are also established by law. Circuit Court judges are elected for terms of six years, and two or more terms of the Circuit Court must be held each year in each county. A county judge and a clerk of court and a State's attorney are elected for four years in each county. Probate courts may be established in counties exceeding 50,000 inhabitants. Justices of the peace, police magistrates, and constables are elected as provided by law.

LOCAL GOVERNMENT. Each county elects three (Cook County 15) county commissioners, who serve for three years. A county sheriff, treasurer, coroner, are elected for four years, but the sheriff and treasurer are not eligible to reelection for the next succeeding term.

The State has 25 Representatives in the National House of Representatives.

MILITIA. In 1900 there were 1,091,472 males of militia age. In 1898 the National Guard of the State aggregated 8,490 men and officers.

POPULATION. The Territory of Illinois in 1810 had 12,282 inhabitants. The population of the State by decades is as follows: In 1820, 55,211; 1830, 157,445; 1840, 476,183; 1850, 851,470; 1860, 1,711,951; 1870, 2,539,891; 1880, 3,077,871; 1890, 3,816,351; 1900, 4,821,550. The rank of the State advanced from eleventh in 1850 to fourth in 1860 and third in 1890, which position it still holds. In 1890 it surpassed Ohio for the first time, and became the most populous State west of the Alleghany Mountains. The greatest absolute gain was made in the last decade of the century, the per cent. of increase being 26.0, as compared with 20.7 for the United States. The earlier movements of population into the State were largely composed of Southerners, who crossed the Ohio River into southern Illinois, or were attracted up the Mississippi River to the lead-mining districts in the northwestern part of the State. These, however, were soon greatly outnumbered by immigrants from the Eastern States. Some of the public lands were still unoccupied when the great German migration to America began, and consequently a large number of Germans found homes within the State, and Chicago has continued to be a German centre. The German born are considerably more than twice as numerous as any other foreign nationality, and constitute over one-third of the total foreign-born population. The Scandinavians came a little later, yet in time to secure a firm foothold in the northern part of the State. The Irish element is much less prominent than in the Atlantic Coast States, but is about equal to the Scandinavians in numbers. The more recent immigrants include a large number who are of the Slav or Latin race. The total foreign-born population in 1900 numbered 966,747. The colored population numbered 86,677, of whom 1503 were Chinese. The urban population equals half the total for the State, and the gain during the last decade has been wholly in the towns and cities, the per cent. of gain in these being 53.2. Sixty-six places exceed 4000 in number of inhabitants. The density of population is 86 per square mile, or more than three times that of the nation as a whole. The male sex outnumbers the females by 125,000.

CITIES. According to the census of 1900, the cities having a population exceeding 25,000 are as follows: Chicago, 1,698,575; Peoria, 56,100; Quincy, 36,252; Springfield, 34,159; Rockford, 31,051; East Saint Louis, 29,655; Joliet, 29,353.

RELIGION. Estimated upon the reported number of church communicants, the Methodists about equal the Catholics in their adherents. The Baptists, Disciples of Christ, Presbyterians, German Evangelicals, Congregationalists, Lutherans (General Council), and Protestant Episcopalians follow in importance in the order named.

EDUCATION. In 1900 only 4.2 per cent. of the population over ten years of age were illiterate, as compared with 10.7 for the whole country. The free-school system dates from 1855. Rapid progress has been made in perfecting the system, especially in lengthening the school year, the average for recent years having exceeded 150 days. The power of the county superintendent has been increased so that he can supervise the schools without restriction by the county boards. Great inequalities, however, exist throughout the State, due to the inadequacy of local taxes in many of the rural communities, and to lack of

centralization. Over 350 schools enroll fewer than 10 pupils each. Lack of funds necessitates short terms and leads to the employment of mediocre teachers. More than one-third of the pupils of the State are enrolled in ungraded schools. The lack of high schools in the rural communities, or any provision for the payment of their tuition in schools outside their district, prevents many from securing the advantages of a secondary education. In 1900 there were 1,588,000 persons between the ages of six and twenty-one. Of these, 958,900 were enrolled in the public schools, the average attendance being 737,576. The per cent. of the children in daily attendance increased from 61 in 1880 to 76.9 in 1900; and the average number of days attendance increased during the period from 91.9 to 123.3. There were also 142,496 children enrolled in 965 private schools. The private secondary schools numbered 65, and the public high schools 321. The public-school teachers numbered 26,303, of whom 6950 were male. The average monthly salary of the male teacher was \$60.34, and of the female teacher \$52.45.

The total cost to the State of the public schools and educational institutions was, in 1900, \$19,919,000. The income from the township school funds amounted to \$900,000, while that from the county and State funds approximated \$100,000. The average cost per enrolled child was \$18.94. The total permanent school fund now amounts to \$17,429,000. The largest items are, first, school lands unsold and other lands of an estimated value of \$9,571,000, and, second, the township funds, being the net proceeds of the sale of the sixteenth section in each Congressional township, amounting to \$5,923,000. The State educational system comprehends higher institutions of learning, of which there are five normal schools, located respectively at Charleston, De Kalb, Macomb, Carbondale, and Normal; an agriculture and mechanic-arts school at Urbana; and a university also at Urbana. In few States has private initiative been more active in establishing higher schools of learning. Thirty-one institutions have assumed the name of 'college' or 'university.' Besides these there are a large number of professional and technical institutions, more modest in name, but equally well known. Cook County Normal School is one of the best known in the whole country, and the University of Chicago (q.v.) has attracted wide attention by its original features and the eminence of the scholars who have been called to fill its chairs. Among the best known of the other institutions are the Northwestern University, the Armour Institute of Technology, and the Rush Medical College, situated at Chicago; Knox College, at Galesburg; and Illinois Wesleyan University, at Bloomington. Most of the higher institutions are coeducational.

CHARITABLE AND PENAL INSTITUTIONS. The following is a list of the correctional and charitable institutions of the State, with their situations.

<i>Correctional</i>	<i>Situation</i>
Penitentiary (Northern).....	Joliet
Penitentiary (Southern).....	Chester
State Reformatory.....	Pontiac
State Home for Juvenile Female Offenders.....	Geneva
<i>Charitable</i>	
Institution for the Education of the Deaf and Dumb.....	Jacksonville
Institution for the Education of the Blind.....	Jacksonville
Central Hospital for the Insane.....	Jacksonville

The average number of inmates in the charitable institutions for the two years ending in June, 1900, was 9615. The ordinary expense to the State for the last year was \$1,416,000, being an average per capita cost (gross) of \$158.71. The above charitable institutions, together with the county jails and almshouses, and every association receiving dependent, neglected, and delinquent children, are subject to inspection by the State Board of Charities, consisting of five unsalaried members. While the board exercises a great influence its power is merely advisory, and not executive. The paupers in the almshouses of the State in 1900 numbered nearly 9000. Of these, 3100 were insane. The county system of outdoor relief is in vogue, and as a result the township officer distributes alms with rather more generosity than judgment, making an average county expenditure of 20 cents per capita, while in several counties the combined outdoor and indoor relief consumes half the total county tax. In some respects the State has been exceptionally progressive. Especially noteworthy is the establishment of a juvenile court in counties exceeding 500,000 population, and a system of unsalaried parole officers, the working of which has resulted in a large number of children being cared for outside of prisons or institutions to which they would otherwise have been doomed. Reform methods have also been introduced in the penal institutions, supplemented by a wise parole system.

HISTORY. In 1673 Father Marquette ascended the Illinois River, and two years later established a Jesuit mission at the Indian village of Kaskaskia. La Salle entered the river in 1679, named it Illinois from the tribes inhabiting the region, and built Fort Crèvecoeur at the foot of what is now called Lake Peoria. His explorations were continued by Tonty, whom he left behind in 1680 when he returned to Canada. Fort Saint Louis on Starved Rock was built in 1682, and between 1683 and 1690 French traders established themselves at Kaskaskia, Cahokia, and other Indian villages, though the actual settlement of Kaskaskia, the oldest town in Illinois, probably did not occur before 1700. By 1751 there were six important settlements within the present limits of the State. The French showed a remarkable aptitude for controlling the Indians and adapting themselves to their mode of life. Intermarriage between French and Indians was common, and ties of friendship were established which lasted after the power of France had passed away. Pontiac's rising prevented the English for two years from taking possession of the Illinois country ceded to them in 1763. In general, conditions remained unaltered after the English occupation, but many prominent French settlers fled from English rule to Saint Louis, Natchez, and other towns in the valley of the Mississippi. In 1778-79 a force of Virginians under George Rogers Clark (q.v.) captured Kaskaskia and subdued the province. Virginia ceded its claims to the southern part

of the region in 1784, Massachusetts and Connecticut gave up their rights in the following year, and in 1787 the region became a part of the Northwest Territory. Ohio was set off in 1800, Indiana in 1802, and Michigan in 1805; what remained was organized as Illinois Territory on February 3, 1809. The hostility of the Indians prevented rapid settlement in the north. On August 15, 1812, the garrison at Fort Dearborn (Chicago) was massacred. On August 18, 1818, the first Constitution was adopted. On December 3 Illinois was admitted into the Union with boundaries so extended to the north as to include the port of Chicago. By 1805 most of the Indian titles to land within the Territory had been extinguished. There ensued a period of wild land speculation, marked by stupendous frauds. The early immigrants, who came chiefly from the South, brought with them a decided predilection for slavery. The first Legislature passed stringent laws to protect the few slaveholders in the State, and from 1818 to 1865 a harsh code of anti-negro laws, known as the 'Black Laws,' was in force. In 1824 an attempt was made to call a convention for the purpose of legalizing slavery in spite of the ordinance of 1787, but the project was quickly and definitely defeated. The murder of Elijah P. Lovejoy (q.v.), at Alton, in 1837, however, showed the persistence of a strong pro-slavery sentiment. After 1820 the people were hurried into an unhealthy state of precarious prosperity. Banks were established at Edwardsville and Shawneetown, entirely on paper credit, and an elaborate system of internal improvements was begun. As the northern part of the State, after the Black Hawk War (q.v.), commenced to fill up with immigrants from New England and the Middle States, the process of economic development was accelerated. The Illinois and Michigan Canal was begun in 1834, and was built with the proceeds of the sale of public lands granted by Congress. The inception of other public improvements was followed by a panic in 1842, when the State bank suspended specie payments. The people, however, recovered quickly, and in 1850 Congress made an extensive cession of public lands to aid in the construction of the Illinois Central Railroad, an enterprise which contributed greatly to the development of the State. In 1840 the Mormons, who had immigrated from Missouri and founded Nauvoo, began to figure in the politics of Illinois. Welcomed at first, they became in the course of a very few years obnoxious to the mass of the inhabitants. Acting as a unit, under autocratic direction, they succeeded in obtaining exclusive privileges from the Legislature. Their religious practices jarred with the feelings of their neighbors; they were inclined to look upon Gentiles with superciliousness; they were prosperous. Bitter feelings led to hostile action in 1844, when Joseph Smith, founder of the sect, while in prison at Carthage on the charge of treason, was murdered by a mob. In the following year the Mormons left Illinois. In 1858 occurred the great contest for the United States Senatorship between Abraham Lincoln and Stephen A. Douglas. At the outbreak of the Civil War Illinois was in an extremely prosperous condition. It produced three-fifths of all the grain exported to Europe, and was the second State in the Union in railway mileage. During the war the State readily furnished its quota of troops, sending

260,000 men into the field. In peace, its prosperous development continued. In 1865 Chicago had become the leading stock market of the world, and a great grain centre. Legislation between 1865 and 1885 was largely concerned with corporations, and especially with the railroad companies. The Constitution of 1870, replacing the one adopted in 1849, forbade the creation of corporations by special law. A State board of railroad commissioners was created to protect the interests of the State against the railway companies, and the Legislature frequently attempted to fix a maximum for transportation, and to prevent discrimination in rates. Between 1872 and 1875 the farmers of Illinois participated in the widespread Granger movement of the time. (See GRANGE.) On October 8-10, 1871, a fire laid waste a large part of Chicago and rendered 100,000 people homeless. The loss to the city was estimated at nearly \$300,000,000. The action of the Mayor in calling in the Federal troops to preserve order during the excitement following the calamity occasioned a bitter dispute between that official and the Governor of the State, who showed himself jealous for the honor of the civil authority. A general feeling of unrest found expression in 1885 and 1886 in bitter strikes and bloody riots; in Chicago an Anarchist crowd attacked the police with pistols and dynamite. In 1893 the Columbian Exposition was held in Chicago. In 1894 a strike of the employees of the Pullman Palace Car Company developed into a general strike of railway men. Traffic in Illinois was almost suspended, and in June lawlessness broke out. Interference with the United States mails led to the intervention of the Federal Government. Chicago was occupied by the Federal troops; the leaders of the strikers were arrested on civil process, and sentenced to short terms of imprisonment for contempt of court. The backbone of the strike was thus broken. In national politics Illinois was Democratic before 1860. In that year it cast its vote for Lincoln, and since that time it has been consistently Republican with the exception of the year 1892, when it voted for Grover Cleveland. In State politics the year 1857 is the line of demarcation between Democratic and Republican ascendancy.

ILLINOIS, UNIVERSITY OF. The State University of Illinois, occupying a site of 600 acres, between the cities of Urbana and Champaign. It was chartered in 1867 as the Illinois Industrial University, and assumed its present name in 1885. In 1870 women were admitted as students, and now form about one-sixth of the whole attendance. The university is divided into six colleges: Literature and arts, science, engineering, agriculture, law and medicine, including schools of library and science, art and design, music, military science, and pedagogy, and preparatory and graduate departments. The State laboratory of natural history and the United States agricultural experiment station for Illinois are departments of the university, but have separate financial support. The schools of pharmacy, medicine, and dentistry are situated in Chicago. The university owns valuable collections in zoölogy, geology, and other departments, an art gallery, and an excellent collection of historical portraits. The library contains about 60,000 volumes, exclusive of special departmental libraries. The university holds a summer session of nine weeks designed primarily for teachers. It maintains close relations with the high schools of the State through a careful system of inspection and accrediting. It has developed rapidly, and is constantly engaged in scientific investigations bearing upon the interests of the State. In 1902 it had 21 buildings, 300 instructors, and over 3200 students, of whom about 1000 were in attendance at the undergraduate college. At the same time its endowment amounted to \$645,000, its buildings and grounds were valued at \$1,175,000, and its annual income, mainly derived from legislative appropriations, was \$780,000.

ILLINOIS AND MICHIGAN CANAL. See CANAL.

ILLINOIS COLLEGE. The oldest collegiate institution of Illinois, founded in 1829 at Jacksonville, Ill., in part through the efforts of the Eastern organization known as the 'Yale Band.' The curriculum is arranged on the group system, with elective courses after the freshman year, and leads to the bachelor's and master's degrees. The college had, in 1902, 65 collegiate and 42 preparatory students and 18 instructors. At the same time the value of its grounds and buildings was \$150,000, and its endowment \$155,000. The college library contains about 11,000 volumes, supplemented by about 4000 volumes in the libraries of the literary societies.

ILLINOIS RIVER. An important tributary of the Mississippi, traversing the State of Illinois (Map: Illinois, C 3). It is formed by the junction of the Des Plaines and the Kankakee, 45 miles southwest of Chicago. It flows generally southwest, joining the Mississippi near the mouth of the Missouri. Its length is 500 miles, and it is broad and deep, and navigable for steamers 250 miles to La Salle, whence a ship-

canal connects it with the south branch of the Chicago River (q.v.), thus affording uninterrupted water communication between the Great Lakes and the Mississippi. The chief cities on the river are Ottawa and Peoria.

ILLINOIS WESLEYAN UNIVERSITY.

A Methodist Episcopal college at Bloomington, Ill. It was founded in 1850, and comprises a preparatory school, a college of letters, with four parallel courses, embodying the elective system, and schools of law, music, and oratory. The degrees conferred in course are B.A., B.S., Ph.B., LL.B., M.A., Ph.D., and the honorary degrees of D.D. and LL.D. The total number of students enrolled in the university in 1902 was 1407, of whom 141 were collegiate and 478 non-resident students. At the same time the faculty numbered 36 instructors. The library contains some 10,000 volumes. The university has an endowment of \$200,000, an income of \$36,000, and grounds and buildings valued at \$150,000.

ILLITERACY (from Lat. *illiteratus*, uneducated, from *in-*, not + *litteratus*, educated, from *littera*, *littera*, letter). The condition of one who cannot read and write his own language. As used in the United States Census, the term includes also those who can read but not write.

There are several methods of determining the percentage of illiterates, and unfortunately the various nations follow different plans. Some statisticians prefer to base their estimates on the number of applicants for marriage licenses who cannot sign their names. Most of the European countries find the percentage from the examinations of the recruits for the army and navy, thus confining the test to men of a certain age. In the United States the census makes inquiry of each person, and takes his or her word, there being no test of any sort. In all countries, children under a certain age are not included, as it is not expected that they should know how to read and write. The age taken naturally affects the percentage. The United States does not count children under ten; Italy fixes the age at six. Naturally, the country which best enforces compulsory school attendance will show the lowest percentage.

The report of the United States Commissioner of Education for 1900 contains the following table for the different countries:

	Percent.		Percent.
Germany.....	0.11	Hungary.....	28.10
Switzerland.....	0.30	Greece.....	30.00
Scotland.....	3.57	Italy.....	38.30
Holland.....	4.00	Russia.....	61.70
France.....	4.90	Spain.....	68.10
England.....	5.80	Portugal.....	79.00
Belgium.....	12.80	Servia.....	86.00
Ireland.....	17.00	Rumania.....	89.00
Austria.....	23.80		

It is a matter of regret that the United States cannot stand at the head of this list, but the census gives the percentage as 10.7, thus placing the country between England and Belgium. The situation, however, is improving. The census of 1900 says: "Not only has there been an absolute decrease in the number of illiterates since 1880, although a much larger Indian population is comprehended by the figures of the present census than heretofore, but the illiterate population now represents less than one-ninth of the entire population considered as compared with a little more than one-sixth in 1880." That much remains to be done is evident from the fact that

10.9 per cent. of the voters are illiterate. Of the total number of illiterates, 15.5 per cent. could read, but not write. The illiteracy of the whites was 6.2 per cent., as compared with 44.5 per cent. of the negroes. The native whites have a percentage of 6.2, as against 12.9 per cent. of the foreign-born whites. It may seem curious that whites of native parents show a percentage of 5.7 to 1.6 for whites born of foreign parents, but the explanation is that a very large proportion of the native born are living in country districts, while whites of foreign parents are largely in the towns and cities and have better school facilities. This fact suggests a comparison of city and country. The rate of illiteracy among white males over twenty-one years of age in cities of 25,000 and over, and for those outside the cities, is shown for various parts of the country by the following table:

	In cities of 25,000 and over	Outside the cities
North Atlantic division.....	5.8	7.3
South Atlantic division.....	3.0	12.8
South Central division.....	3.4	12.6
North Central division.....	3.3	4.6
Western division.....	1.7	5.0

The high average in the Southern States is to be explained by the lack of proper school facilities in the rural districts. The illiteracy of the negroes is very large, but is steadily decreasing. The Indians show a percentage of 56.2.

Within the various States there is also great divergency in the percentages, showing unequal conditions. Taking one State from each division of the country and showing the average illiteracy of the white males of voting age, and also the highest percentage in any county in the State, gives the following:

Average outside cities of 25,000		Given county showing highest percentage	
Massachusetts.....	6.6%	Dukes County.....	8.8%
Delaware.....	10.8%	Sussex County.....	15.2%
Alabama.....	14.1%	Cleburne County.....	22.5%
Iowa.....	2.6%	Mills County.....	4.1%
Montana.....	3.5%	Missoula County.....	8.5%

Comparing the sexes, the males constitute 48.7 per cent. of the illiterates, the females 51.3 per cent. Consult: *Census of the United States, 1900*, vol. ii.; *Annual Reports of the Commissioner of Education* (Washington); *Reports of Ministers and Departments of Education* of various European countries.

ILLUMINATED DOCTOR, THE (Lat. *Doctor Illuminatus*). A title given to Raymond Lully and to Johann Tauler (qq.v.).

ILLUMINATI (Lat. nom. pl., enlightened). A name which has been borne by four different societies. (1) The earliest was that of the *Alombrados* in Spain, followers of a seductive mysticism, curiously compounded of Gnosticism, Lutheranism, and Buddhism. It spread rapidly through Spain about the middle of the sixteenth century, though vigorously combated by the apostle of Andalusia, John of Avila, and by Ignatius Loyola. It was finally suppressed by the Inquisition, though it lingered until the middle of the seventeenth century, and had a few scattered followers even at the beginning of the eighteenth. Consult Pelayo, *Historia de los*

heterodoxos españoles (Madrid, 1880). (2) A group of enthusiasts and visionaries, known as *Guérinets*, in France about 1684. (3) An association of mystics in Belgium in the latter half of the eighteenth century. (4) A society to which the name is now most commonly applied, the *Order of the Illuminati*, which was founded at Ingolstadt on May 1, 1776, and soon spread over almost all the Roman Catholic parts of Germany. Its founder at first called it the 'Order of the Perfectibilists.' It owed its existence to Adam Weishaupt, professor of canon law at Ingolstadt, a man of superior abilities and much benevolence, but deficient in practical knowledge of mankind. Impatient of restraints imposed on the human mind, he conceived the idea of forming an association which should consist of the choicest spirits, labor for the establishment of the dominion of reason, and promote religious and political enlightenment and emancipation. Religious dogmas and forms of worship were to be rejected, a system of deism was to be propagated together with republican opinions. The accession of Baron von Knigge to the new Order, and the support which it received from the Freemasons, led to its rapid extension. Weishaupt's knowledge of the Order of the Jesuits, whose pupil he had been, led him to borrow some of their methods for the accomplishment of what he regarded as the most opposite ends; and the Illuminati were soon involved in a system of mutual espionage, confession, and the like, essentially inconsistent with true freedom, but calculated to place the threads all in one hand by

on June 22, 1784, an edict was issued by the Elector of Bavaria for its suppression, which was followed by others March 2, 1785, of a more drastic character, and under the prosecution ensuing the Order was suppressed. Weishaupt was removed from his professorship. He returned to Gotha, where he was received and died as Court Councilor, in 1830, at the age of 82. Various other members were severely punished, and the form of justice was not strictly observed in the proceedings against them. Great importance was at one time attached to the Order of the Illuminati, whose secret influence was regarded as a principal cause of many of the political events of the time of the French Revolution. Consult Kloss, *Bibliographie der Freimaurerei und der mit ihr in Verbindung gesetzten geheimen Gesellschaften* (Frankfort, 1844).

ILLUMINATING. See MANUSCRIPTS, ILLUMINATED.

ILLUPI, il'lü-pi (East Indian name), **ILLUPIE**, **ELLOOPA** (*Bassia longifolia*). An East Indian evergreen tree. The bark is prescribed in cases of itch; the gummy juice is employed as a remedy for rheumatism; the leaves and the milky juice of the immature fruit are also used in medicine; the flowers, roasted or boiled, furnish an article of food, and the seeds yield a greenish fixed oil, known as illupi-oil.

ILLUSION (from Lat. *illusio*, mockery, from *illudere*, to mock, from *in*, in + *ludere*, to play). In general, a distorted or abnormal perception (q.v.). The word is used in English psychology

FIG. 1. ILLUSIONS OF REVERSIBLE PERSPECTIVE (from Titchener, *Experimental Psychology*).

Notice that even while you look at the figures, without changing the position of the book, the tops of the figures appear now away from and now toward you.

which the holy legion was to be led on, as it was imagined, to the benefaction of mankind. But, from this cause, the dissolution of the Order soon ensued. Weishaupt and Knigge, its two leaders, quarreled with one another. The Order began to be openly denounced as dangerous, and

in two principal senses: (1) As the counterpart of hallucination (q.v.), "an assimilation of an hallucinatory character" (Wundt), a distortion or misinterpretation of the contents of perception, due to an abnormal irritability of the sensory centres of the brain-cortex. The distortion

may take the form of subjective enhancement of the intensity of stimulus, as when a gentle knocking at the door is taken for the growl of thunder; it may involve a qualitative alteration of the stimulus, as when the monotonous sighing of the wind is heard as angelic music; or it may consist in a fantastic modeling and grouping of the forms of perceived objects, as when a dimly

FIG. 2. SCHROEDER'S REVERSIBLE STAIR FIGURE.

The figure fluctuates as you look at it. If at first you seem to be looking at the top of the treads, the appearance soon changes, so that you seem to see the under side of the stairs.

seen stone or tree-stump is regarded as a ghost. Sane persons of imaginative disposition are liable to illusion, more especially at times of mental stress or overwork; and, indeed, the readiness with which we can find faces in the fire and monsters in the clouds shows how short is the path from normal to abnormal assimilation. We reach the stage of unquestioned abnormality with patients who interpret the half-heard conversation of passers-by as threats directed against their life, and see on the face of every stranger an expression of disgust or contempt or menace.

(2) In its second meaning, illusion is a perversion of the contents of perception due to structural or functional peculiarities of the

FIG. 4. THE ARROW-HEAD AND FEATHER ILLUSION (from Sanford, *Course in Experimental Psychology*).

In the first row, the distances between the points of the angles are equal, and the 1st, 2d, 4th, 6th, 8th, and 10th to 11th and 12th vertical lines are all equal in length to the distance between the points of the arrows, though they do not appear so. In the second row of figures the top and bottom lines are all equal; in the third and fourth rows the horizontal, in the fifth row the vertical, and in the sixth and seventh rows the horizontal lines are all equal in length. In the last row the parts of the horizontal lines marked off by the points of the angles are all equal.

because they are of a character different from that which our previous knowledge of the stimuli, or our experience under other conditions, would lead us to expect. For instance, we know that all four sides of a square are equal. We expect, therefore, that a square will look as high as it is broad. As a matter of fact, the perfect square always looks like a rectangle whose vertical dimension is somewhat greater than the horizontal. Again, we are extremely familiar with the appearance of the circle, which we have seen in all sorts of figures and under the most varied conditions. When, then, we inscribe a square in a given circle, we do not expect that the appearance

FIG. 3. VARIABLE ILLUSIONS OF EXTENT (from Sanford, *Course in Experimental Psychology*).

In A the space covered by the 8 dots at the left seems greater than that between the 8 and the one at the extreme right. In B the quadrants with inscribed radii appear greater than those that are empty. The figures C and D (Helmholtz's Squares) have a slightly oblong appearance. Figure E is a variant of A, the illusion being the reverse of that in A.

sense-organs. So far from being abnormal, this form of illusion is both natural and necessary. We speak of the perceptions as 'illusory' simply

of circularity will be affected. In actual fact, the circle seems to be pinched in, at the points where its circumference is touched by

the angles of the square, so that we perceive which should include the square. No one whose vision is normal can escape these illusions; their occurrence is, as we shall see, intrinsic to the

FIG. 5. CONSTANT ILLUSIONS OF EXTENT (from Titchener, *Experimental Psychology*).
The vertical dimensions appear to be greater than the horizontal dimensions of all the figures.

FIG. 6. VARIABLE ILLUSIONS OF DIRECTION (A the Hering figure, B Wundt's figure).
The parallel lines ab and cd in A seem to be nearer together at the ends than in the middle. In B the opposite is the case.

A

B

FIG. 7. VARIABLE ILLUSIONS OF DIRECTIONS (Zöllner's Figures).

In A the vertical lines and in B the diagonal lines in the square do not appear parallel, though they are.

working of the eye as a 'space organ'; the perceptions are illusory only in the sense that they conflict with our other knowledge, i.e. with the verdict of the 'mathematical' or 'measuring' eye. The most important of these 'normal' illusions

later investigators; the one by Wundt (q.v.), who seeks, so far as possible, to account for the illusions in physiological terms (fixation and eye-movement); the other by Lipps (q.v.), who offers a 'mechanical aesthetic' principle of explanation. Lipps's theory is, in brief, that we read into the lines and figures in question forces and counterforces, strivings and resistances, akin to those which we experience in ourselves; so that the column 'seeks' or 'strives' to rise, the horizontal line to stretch itself, the circle to 'hold itself together,' etc. We shall here give Wundt's classification and explanation, on the ground that, in matters of perception, physiological conditions must always have the priority over psychological.

FIG. 8. CONSTANT ILLUSION OF DIRECTION (Von Recklinghausen).

Look at the centre of the figure with one eye, and the lines will appear to be perpendicular to each other and make squares.

are the spatial illusions of touch and sight. The latter, which were first demonstrated by J. Oppe (1815-94) in certain simple geometrical figures, have been termed collectively, the *geometrical optical illusions*. They are exceedingly numerous, and explanations have been almost as plentiful as illusions. Two attempts at systematic treatment have, however, been made by

the point of fixation is the point nearer the observer, and movement of the eye toward a given point brings that, in its turn, to the front of the figure. (b) Next follow the illusions of extent, variable and constant. A dotted line looks longer than a drawn line of equal objective length, for the reason that it offers more halting places as the eye moves along it. Draw an outline square;

then a group of horizontal lines, filling the same area as the square; and then a similar group of vertical lines. The horizontal group looks

with oblique lines of the same length directed outward (arrow feathers); the latter appears considerably the longer of the two. Wundt's explanation is that the inward-going obliques offer a check to the passage of the eye along the principal line, while the outward-going obliques favor a continuance of eye-movement. The constant illusions of extent (due to asymmetries of muscular action about the eyeball) are summed up in a right-angled and equal-armed cross. The vertical line in this figure seems to be longer than the horizontal; the upper vertical arm longer than the lower; and, in monocular vision, the outer horizontal arm looks longer than the inner. (c) Thirdly, we have variable and constant illusions of direction. Draw a large outline square, marking in one of the diagonals, and three or four lines parallel to the diagonal, at equal distances on either side of it. Now proceed to cross-hatch the oblique lines, cutting the diagonal with short vertical pieces, the two adjoining obliques with short horizontal pieces, the two oblique lines next beyond these with verticals again, the two next with horizontals, and so forth. Notice that the parallel obliques no longer look parallel, but appear to converge and diverge alternately. The explanation of this and similar illusions is that small angles are overestimated, and large angles relatively underestimated; and the reason for such overestimation, again, is that it takes more muscular effort and energy to start a movement of the eye than it does to continue a movement already begun. The constant illusion of direction is that, under certain conditions of fixation, hyperbolas are perceived as straight lines, owing to the concavity of the retina. (d) There remains a group of illusions which Wundt classes as 'associative,' i.e. as psychological, not physiological, in origin.

FIG. 9. ASSOCIATIVE ILLUSIONS (from Sanford, *Course in Experimental Psychology*).

For A and B see text. C and D show the same angle differently estimated. E and F are the same kind of illusion as A and B. In G the circle surrounded by small circles is the same in size as that surrounded by large circles, though it appears larger.

higher, the vertical group broader, than the objectively equal square, for the reason, again, that the grouped lines offer more obstacles to the passage of the eye over the area of the figure. One of the most disputed figures of this class is the illusion of Müller-Lyer, or the arrow-head and feather illusion. Draw two vertical or horizontal lines of equal length. Tip the two ends

FIG. 10. THE STROBOSCOPE OR ZOÉTROPE.

Looking at the figures through the slits in the rim, you get, when the instrument is rotated, an effect similar to and depending on the same causes as that of the kinetoscope.

of the one with oblique lines directed inward (arrow-heads), and the two ends of the other

FIG. 11. AN ILLUSION OF MOVEMENT.

Move the figure around in a circle in its own plane, and observe the apparent motion of the six outer disks and the central cog-wheel. (From Sanford, *Course in Experimental Psychology*.)

If equal short horizontal lines are drawn, some grouped closely together, and some widely spaced, the latter appear longer than the former; the length of the line is 'assimilated' to the size of the interspaces. In the same way, if two broad

FIG. 12. MIXED ILLUSIONS (from Titchener, *Experimental Psychology*).

In 1 compare the size of left-hand circle with inner circle in middle figure, also outer circle of middle figure with right-hand circle. In 2 the half of the altitude of an equilateral triangle that is nearer the vertex looks shorter than the other half. In 3 the shorter parallel lines seem farther apart than the longer parallels do (Wundt). In 4 "the dots are really at the level of the lower line, but seem a little too high, especially when the figure is held so as to make the lines oblique" (Sanford). In 5 the middle sections of the five broken lines are all parallel, though they appear to be otherwise.

and two narrow rectangles are drawn, of equal height and separated by equal spaces, the space between the larger rectangles will look smaller than the space between the narrower; the interspaces are differently estimated by 'contrast' with the adjacent figures. (See CONTRAST.) (e) Finally, we may, of course, have figures in which several of the above-mentioned motives, physiological and psychological, cooperate to produce the illusion.

We may further include under the general heading of optical illusions: (1) the physical illusions produced by mirrors, lenses, prisms, etc. (see MIRAGE; REFLECTION; REFRACTION); (2) the physiological illusions of color (see AFTER-IMAGE; CONTRAST); (3) illusions of movement, such as, e.g. the apparent movement of the moon when viewed through drifting clouds; and (4) illusions of distance. Under the latter category falls the apparent enlargement of sun and moon when seen near the horizon. The distance between the observing eye and the horizon seems to be longer (owing to the haziness of the air, the number of intervening objects, etc.) than the distance between the eye and the zenith. But if two objects subtend the same

visual angle (give the same retinal image) at different distances, the one which is farther off must be larger than the other.

Touch, no less than sight, is subject to spatial illusion. (a) If two compass points are set down upon the skin, first on an area of greater and then on an area of less sensitivity, the distance between them will seem to be greater in the former case than in the latter. Give the points, e.g. a separation that enables them to be clearly perceived as distinct impressions when they are set crosswise upon the skin of the upper arm. Now draw the compasses down the inner surface of the arm, to forearm, wrist, and fingertips. The two parallel lines which they describe will appear to converge and diverge upon the regions of less and greater sensitivity. Or set the points down, vertically, upon the upper and lower lips, and draw the compasses outward, toward the ear. The points seem to converge as they travel over the skin. (b) Cross the tip of the second over that of the third finger, and place a marble or other small object between the crossed tips. Since the two surfaces now stimulated are never affected, in ordinary life, by one and the same object, but only by two different

objects, the single marble is 'felt' as two. This illusion of localization is described by Aristotle, in his tract *On Dreams*. (c) Draw a given length of coarse thread between the finger and thumb, at first slowly, and then more quickly. The thread appears to be much longer in the former case; the separate pressure sensations have a longer time in which to run their course undisturbed by subsequent pressures, and fullness of sensation is interpreted as length of thread. (d) If a point be moved over the skin at a uniform rate, it will seem to travel more quickly as it crosses areas of greater sensitivity, and to become slow again as it enters regions of less sensitivity.

A striking illusion of temperature is described by the English philosopher Locke (q.v.). Hold the one hand in a bowl of heated, the other in a bowl of cold water. After a short time, plunge both hands into a bowl of lukewarm water. This will appear hot to the cooled, and cold to the heated hand. The illusion is due to the preceding adaptation of the temperature-organs of the skin. (See CUTANEOUS SENSATION.) An equally striking illusion in the sphere of kinæsthetic sensation is afforded by the fact that a small weight always appears heavier than a larger weight* of the same objective heaviness. The smaller weight stimulates intensively a limited cutaneous area, with its underlying tissues; the larger weight stimulates lightly a large area of skin, and leaves the underlying tissues practically unaffected. These instances, which could be multiplied almost indefinitely, show clearly that the term 'illusion' implies nothing more than a discrepancy between perception and objective measurement.

ILLUSION COMIQUE, è'lu'zyón' kò'mèk', L' (Fr., the comic illusion). A complicated and improbable play by Corneille (1636) embracing a comedy and a tragedy.

ILLUSIONS, OPTICAL. See ILLUSION.

ILLUSIONS PERDUES, è'lu'zyón' pàr'dy', LES (Fr., The Lost Illusions). A work in three parts by Balzac (1837-43), which earned the hostility of the press by reason of its picture of the feuilletonists.

ILLUSTRATED LONDON NEWS. The oldest illustrated weekly, founded in 1842, by Herbert Ingram.

ILLUSTRATION. A term generally used in reference to the pictorial decoration and illustration of books. In the more usual sense, book illustration is the addition to a book of pictures (and indirectly of maps and plans) which may aid in the right understanding of the text. This service they may render in a serious and almost scientific way by giving views of buildings, accurate drawings or other reproductions of dress, portraits of individuals, copies of works

of art named, and the like, these being things which are impossible to describe in words, and of which a clear presentation to the reader is desired. On the other hand, the illustrations may also be merely extensions of the text; thus, when Cruikshank or Leech illustrates *Oliver Twist* or *Mr. Jorrocks's Hunt*, the description or narrative passage of the text is in a sense repeated by the artist—a part of the story is retold in line and light and shade.

A book consisting almost entirely of pictures, or having those for its principal subject, cannot be said to be an illustrated book. Thus the volumes of the Paris *Salon*, with large photographs of the paintings and statuary of the year with a text which is rather perfunctory, or that little volume which made the delight of schoolboys fifty years ago, *Mr. Jonathan Oldbuck*, or in more recent times, the albums of Caran D'Ache and Forain, or Howard Pyle's or T. S. Sullivant's "Fables" are of this class. In the one case the pictures are the book, and the text is not absolutely needed; in the other case the pictures and the brief legends or the re-written Æsop Fable a hundred words long, form together a humorous study of which the picture is much the more important part. This is hardly illustration. And in like manner when the pictures drawn for a book are large, and few in number, and are printed on separate plates and bound in, they have less the air of illustration, and indeed, serve less well their purpose as illustration, than those which, being smaller, are inserted in the text. The very admirable pictures by Albert Lynch given with the quarto edition of Maupassant's *Pierre et Jean*, although spoken of with great respect by excellent judges, and although admirable compositions, are yet less effective as illustrations than the less pretentious and really less able drawings by Merbach, and others which are scattered through the duodecimo volumes of Daudet's *L'Immortel* or Bourget's *Mensonges*, and immeasurably inferior to the roughly cut headpieces by Meissonier in *Les Contes Kémois*. From this point of view the famous 'vignettes' of the eighteenth century illustrated books are the least satisfactory of illustrations. They render, indeed, a single scene or incident of the story, but they are wholly unrealistic in character, the figures being posed without general truth of attitude or truth of gesture, and while they are attractive and instructive as works of the draughtsman and of the engraver's art, they are also models of all that is to be avoided in book illustration.

HISTORY. The history of illustration is hard to treat as a continuous narrative. The Egyptian manuscript *Books of the Dead* contain numbers of delicate and very ornamental paintings, usually of small size and combined with the text in an admirable way; and the paintings in the Ani Papyrus in the British Museum, and a few other recently discovered manuscripts, have larger drawings. On the other hand, we are without any knowledge of Greek manuscripts with drawings accompanying them. Of Roman Imperial manuscripts with illustrations there is nothing known prior to the Christian epoch; but the paintings which accompany the famous *Genesis* of the Vienna Museum and a very few contemporary books remain to us. It is the opinion of excellent critics that these monuments of a decadent epoch will mislead us, if we try to

judge from them the character of work of the earlier and better times; but those who urge this may forget that one art continues to flourish while others lapse. In the fourth century sculpture had declined; but mosaic was just beginning its magnificent development, and the most startling examples of Roman vaulted construction in solid mortar masonry date also from that time. Moreover, the antique look and the pagan spirit are still to be found in the Christian illustrations of the fourth and fifth centuries, whereas the Church has had its own way with the mediæval manuscripts of the eleventh and twelfth centuries; and those of much earlier date, like the Irish and the Anglo-Saxon, are too barbaric to have any relation to this inquiry in their paintings—whatever the illuminated page may have of decorative effectiveness.

The mediæval manuscripts combine illustration by means of miniatures with the decoration of the page in a very wonderful way. (See MANUSCRIPTS, ILLUMINATION OF.) With the revival of learning in Italy, the painting of miniatures became very much more elaborate as an art, and some of these miniatures of early time are finished pictures with background, distance, and everything that a modern landscape or genre picture has, except cast shadows. Even the shadows appear toward the close of the fifteenth century, and with the shadows comes the end of illumination considered as a separate art. The famous *Breviario Grimani* is, however, without shadows, and yet is dated at the very close of the fifteenth century; and the borders which Albert Dürer drew for the margins of the printed book called *Maximilian's Prayer Book*, and which were executed in 1515, have their elaborate groups of busy little figures drawn without traceable or outlined shadows, although the figures may be partly relieved on a dark shading.

With the earliest printed books come the earliest wood-engravings, which are of exclusively artistic character. The *Hyperotomachia* of the so-called Poliphilo (Francisco Colonna), printed in 1499, has large and very open drawings, sometimes filling nearly the whole of a small folio page. The *Epistles of Saint Jerome*, of 1497, has a great number of small illustrations, not larger than a lady's visiting card, but full of character and containing sometimes a dozen figures boldly drawn and skillfully grouped. The several illustrated editions of the *Divine Comedy* of Dante, of which perhaps the earliest is of 1497, have woodcuts and illustrations also in outline. During the next century this same tendency to simple and rather formal illustration, in outline except for some arbitrary shading, continues; and it is not to be doubted that the expectation was that hand coloring would be called in to complete these designs. Books, with their pictures elaborately colored by hand, remain to us from this epoch. In the National Library in Paris a special permanent exhibition of these is maintained. The constant reprinting of the early books tended to preserve the abstract and simple character of illustration, and it is not until the middle of the sixteenth century, with the copper engraved plates illustrating the different manuals of sword-play, and the delicate little woodcuts illustrating the Old Testament, and the "Dance of Death" ascribed to Holbein, that a freer style is introduced. Entire freedom in drawing for wood-engraving came slowly; even Albert

Dürer's work is largely confined to outline, and single plates of the "Apocalypse" and the "Life of Mary" are found elaborately painted in water-color, and touched with gold. But with the last quarter of the sixteenth century complete light and shade is sought for, as in the woodcuts ascribed to Jost Amman, published by Feyera-bend of Frankfort, and those of Vecellia, dated 1590. In the seventeenth century were published curious books of history and topography, sometimes adorned with crowded battle pieces, or, like the curious history of the wars between England, France, and the United Provinces, with views of sea-fights, minutely engraved on copper, and effective enough in a black and crowded way. One of these pictures shows the great fire of London in 1666, the book being printed two years later. The books published by Matthäus Merian of Frankfort with the admirable views of German cities are of this time: and Wenceslaus Hollar began his wonderful career of simple and perfect work as an engraver in Merian's employ. Book illustration was, however, feeble during the hundred years from 1650 to 1750, and the French *Livres à Vignette* mentioned above are remarkable in spite of their inadequacy as helping to restore the art. Wood-engraving was revived in the course of the eighteenth century, and as early as 1775 Thomas Bewick produced his illustrations of *Æsop's Fables*, and his natural history books, the *Quadrupeds* and the *Birds*; the little narrative drawings serving as tail-pieces to the chapters of the quadrupeds forming the most important step in book illustration which had been made for a century.

The great modern movement in book illustration begins about 1830 with the woodcuts made for French classics, such as Molière and Bernardin de Saint-Pierre; and in England with the earliest books illustrated by Cruikshank. The work of Rowlandson, ending as Cruikshank began, must have influenced him greatly at first, but Cruikshank soon worked out of the exaggerated and purely farcical manner which the earlier artist retained to his death, and became an excellent illustrator of books, keeping up his full power until an advanced age. His work exists in great abundance in woodcut, and also in a simple kind of etching, in which last process he was followed and surpassed as to technical excellence by John Leech.

For the important influence of the humorous journals, see CARICATURE. The foundation of *Punch* led to the creation of a whole school of illustrations, and Leech, as a draughtsman for wood-engraving, was the chief of Englishmen of his time, keeping up his power till his death in 1864. Richard Doyle and Hablot K. Browne were his contemporaries; Du Maurier and Charles Keene, the latter one of the greatest artists in black and white, were his successors. All these men did much work in illustrating separate books. The Frenchmen Jean François, Gigous, Tony Johannot, Sulpice Chevallier (Gavarni) were their contemporaries in the French world of books. Adolph Menzel, as being mainly a lithographer, is less obviously an illustrator of books; he is rather a painter who has made many designs to a single general theme, like the *Life of Frederick the Great*—designs which have to be published in large folios.

The book illustrations of the years since 1850 are remarkable for the introduction of photo-

graphic process prints (see PHOTO-ENGRAVING); but there has been also a notable rise and decline of wood-engraving (q.v.). Colored illustrations can be produced now at reasonable cost, and some of them are of great beauty. (See THREE-COLOR PROCESS; LITHOGRAPHY.) Of decisive influence upon the development of illustration of the present day are the numerous illustrated magazines and newspapers in America and Europe. See PERIODICALS; NEWSPAPERS.

That form of illustration which is sometimes called Extra Illustration or Grangerism (from James Granger, died 1776, a celebrated print collector) is the insertion into a book of pictures which did not originally belong to it. Thus, a history or an historical novel may be illustrated by collecting portraits of men famous at the time dealt with in the book, and scenes of historical interest previously drawn and engraved, and these prints may be bound into the book or simply laid between its leaves. In this way a book of one volume may be extended to a dozen, and as some of the plates will be large, the smaller ones are perhaps 'inlaid,' that is, their edges fitted into a hole cut in a larger sheet of paper while the printed leaves are treated in the same way, so that all the leaves of the enlarged book may be of the same size. This proceeding has been the cause of the destruction of many valuable books, for a whole volume will be sacrificed for the sake of its frontispiece or its illustrated title-page, or marred by the extraction from it of one or two portraits.

ILLUSTRATION, é'lu'strá'syôn', L'. An illustrated Paris weekly founded in 1843, modeled on the *London Illustrated News*.

ILLUSTRIERTE ZEITUNG, é'l'wōs'trēr'te tsi'tōōng (Ger., illustrated news). The oldest German illustrated weekly, founded in Leipzig, by J. J. Weber, in 1843.

ILLYRIANS (Lat. *Illyria*, from Gk. Ἰλλυριοί, *Illyrioi*, from Ἰλλυρίς, *Illyris*, Ἰλλυρία, *Illyria*, *Illyria*). A people of doubtful ethnic kinship, who at the dawn of history inhabited the northern and eastern shores of the Adriatic and the northwestern part of modern Greece. From this latter region a migration took place at a very early period across the Ionian Sea to the southeastern corner of Italy. It seems on the whole plausible to regard the modern Albanians as the representatives of the Illyrians, both in ethnology and in language. See ALBANIA; ALBANIAN LANGUAGE.

ILLYRICUM (Lat., from Gk. Ἰλλυρικόν, *Illyrikon*, from Ἰλλυρίς, *Illyris*, Ἰλλυρία, *Illyria*, *Illyria*). The Roman name of a country whose limits in ancient times varied very considerably. In the fourth century B.C. the Illyrians inhabited the eastern coast of the Adriatic Sea and adjacent islands, with the western parts of Macedonia as far south as Epirus. Philip of Macedon conquered the country as far as the river Drilon (modern Drino), and thence arose the division into *Illyris Græca* and *Illyris Barbara*, afterwards *Romana*. The former, now Albania (q.v.), was incorporated with Macedonia. *Illyris Barbara* or *Romana* was divided into Iapydia, Liburnia, and Dalmatia. The Illyrians were much addicted to piracy, which soon brought them into collision with the Romans, who waged a successful war against the Illyrian Queen, Teuta, in B.C. 229. About B.C. 168 the southern Illyrians became subject to Rome, but

the subjugation of the northern Illyrians was not effected until the time of Augustus. Under the Roman Empire the country of the Illyrians, under the name of Dalmatia (in the wider sense), formed the southern part of the diocese of Illyricum, which extended as far north as the Danube. It is represented in modern times by part of Croatia, nearly all of Bosnia, Dalmatia, Herzegovina, Montenegro, and a part of Albania. Under Constantine the prefecture of Illyricum embraced a great part of the Roman dominions in Europe east of the Adriatic. A decree of Napoleon, October 14, 1809, organized the dominion known as the Illyrian Provinces, erected out of territories taken from Austria. It comprised Carniola, part of Carinthia, most of Croatia, Dalmatia, Istria, Fiume, etc. At his fall these provinces were united as a kingdom to the Austrian Empire, and some alterations were made in its boundaries. The kingdom was divided into the two governments of Laibach and Triest, Laibach being the capital, which arrangement subsisted till 1849, when it was subdivided, for administrative purposes, into the duchies of Carinthia and Carniola, and the coast district, containing Görz and Gradisca, Istria and Triest.

ILMEN, il'mën or é'ly'-mā-ny'. A lake in the Russian Government of Novgorod, situated about 60 feet above the level of the Gulf of Finland (Map: Russia, D 3). Area, over 350 square miles. The banks are mostly low, and in some parts marshy. Ilmen receives many streams, and discharges its superfluous water into Lake Ladoga through the Volkhov. The fisheries of the lake are extensive, and exploited largely by artels (q.v.). There is steam navigation during the summer between Novgorod and Staraja Russa.

ILMENITE (so called from the *Ilmen* mountains in the southern Urals), or **MENACCANITE**. A mineral with the composition (FeTi)₂O₃, possessing a semi-metallic lustre, and a color ranging from brown to iron-black. It occurs in scattered grains and crystals as an abundant constituent of certain igneous rocks, including basalt, diabase, and gabbro, and of magnetic iron ore. The proportion of titanium, which varies within wide limits, gives rise to a number of varieties of ilmenite, such as *kibdelophane*, *crichtonite*, *hystalite*, *mohsinite*, etc. When mixed with magnetite (titaniferous iron ore) in any considerable amount it greatly lessens the value of the latter for smelting purposes. Ilmenite is found at various localities in Russia, Norway, France, in the Adirondacks of New York, in Connecticut, Massachusetts, and in Canada.

ILME'NIUM (Neo-Lat., from the *Ilmen* mountains in the southern Urals). A name given to a mixture of columbium and tantalum, which was at one time mistaken for an element.

ILOCANO, é'lō-kā'nō. A Malay people widely spread in Northwestern Luzon, having distinctive speech, alphabet, and culture. See PHILIPPINE ISLANDS.

ILOCOS NORTE, é-lō'kōs nōr'tá. A Philippine province occupying the northwestern corner of the island of Luzon. It is bounded on the west and north by the China Sea, on the east by the provinces of Cagayán and Abra, and on the south by the latter and Ilocos Sur. Its area is 1873 square miles. It is traversed from north to south by a chain of mountains rising in Mount

Burnay to a height of 6300 feet, and covered with forests producing rich cabinet woods. As the province is exposed in winter to the north winds, its climate is more tempered, and more agreeable to foreigners than that of other parts of the island. The province is well watered, the principal river being the Pagsan or Laoag, and the valleys are very fertile, producing, besides the grains and fruits of the temperate zone, a fine quality of rice, good cotton and tobacco, and sugar. Iron ore is abundant. The *carabaos*, a species of ox or buffalo peculiar to the Philippines, is very numerous. The fisheries on the coast are also very lucrative, and on the whole the province is one of the best developed on the island. Communications are good; a high road leads through the province from Manila, and a railroad is projected from that city to Laoag (q.v.), the capital. Ilocos Norte was united with Ilocos Sur previous to 1818, when they were separated on account of their growing importance and population. Population, in 1900, 156,700.

ILOCOS SUR, sōr. A Philippine province, situated in the northwestern part of the island of Luzon. It is bounded on the north by Ilocos Norte, on the east by Abra and Lepanto, on the south by Union, and on the west by the China Sea. It is a narrow strip of rather low and flat coastland with an area of 644 square miles. It is crossed by the large river Agra, and a number of smaller streams; the soil is very fertile, producing indigo, sugar, and coconuts, all of which are exported. There are manufactures of furniture and carriages, and the weaving of cotton textiles by the women in their homes is practiced all over the province. The towns are connected by good roads, though most of the rivers have to be forded, as there are few bridges. The high road and projected railroad from Manila to Laoag passes through the province. The population in 1900 was 172,836. The capital is Vigan (q.v.). See ILOCOS NORTE.

ILOILO, ē'lō-ē'lō. A province comprising the southern half of the island of Panay in the Philippines and about thirty, mostly small, outlying islands, one of which, however, Guimaras, is 30 miles long by 10 miles wide. The area of the province is 2660 square miles, and its population in 1900 was 472,798. It has a coast-line of 270 miles with numerous safe harbors and anchoring grounds, among which those of Iloilo and Concepcion are the most notable. The province is separated from those of Capiz and Antique on the north by a chain of rugged mountains covered with forests, from which numerous rivers and torrents flow to the sea, often bringing destructive floods. The climate, tempered by the constant monsoons, is much more moderate and far more healthful than that of Manila. The level lands, which constitute the greater part of the area of the province, are very productive, all kinds of tropical fruits flourishing; but the inhabitants are chiefly given to the cultivation of sugar and tobacco. The chief manufacturing industry is that of textiles such as homespun fabrics of sinamay, piña, jusi, etc. Commercial communication between the cities is easy and regular, the roads being generally in good condition. The greater part of the inhabitants consist of tribes of Bisayas, with many European and Chinese *Mestizos*, or half-breeds, in the cities, and a few Negritos in the mountains. The Bi-

sayas were first converted to Christianity by the Augustine Fathers in the middle of the sixteenth century. The province suffered for a long time from the piratical Moros, and forts were built here by the Spaniards as early as 1581. In 1616 an unsuccessful attempt was made by the Dutch to capture Panay. At the end of the Spanish-American War in 1898 the natives were in complete possession of the island, and showed determined resistance to American authority. Capital, Iloilo (q.v.).

ILOILO. The capital of the Province of Iloilo (q.v.), situated on the southeastern shore of the island of Panay, on the strait separating Guimaras Island from the mainland (Map: Philippine Islands, F 7). It has an excellent harbor, and is, next to Manila, the chief commercial centre of the Philippines. Its chief exports are sugar, tobacco, rice, coffee, and dyewoods, and it supports several industrial establishments, among which are a machine-shop and a foundry. It is irregularly built, but has a number of prominent buildings, among them a cathedral, a seminary, and several Government buildings. Population, in 1898, 10,400. In February, 1899, it was bombarded and occupied by United States troops.

ILONGOS, ē-lōn'gōs. A town of the Philippine Islands. See HILONGOS.

ILONGOTE, ē'lōn-gō'tā. A wild Malay people, of Mongoloid type, in Middle Luzon. See PHILIPPINE ISLANDS.

ILOPANGO, ē'lō-pān'gō. A lake in the Central American Republic of Salvador, situated in a fertile and beautiful plain surrounded by high hills, a short distance east of the capital (Map: Central America, C 4). Its water is saline and sulphurous and unfit to drink, though it abounds in fish. It is 10 miles long by 6 broad, and contains a number of islets, of which one was raised to about 400 feet by an eruption in 1879-80, and remains in the form of a volcanic cone.

ILORIN, ē-lō'rēn, or **ALORI**, ā-lō'rē. The capital of a British province of Northern Nigeria, West Africa, on the Asa, a tributary of the Niger, 170 miles northeast of Lagos (Map: Africa, E 4). Like Abeokuta (q.v.), it was a municipal confederation of the Kingdom of Yoruba, established for mutual protection. The town is surrounded by a mud wall 12 miles in circumference, and has several mosques, Mohammedans predominating among the heterogeneous population of natives. It has an extensive caravan trade with Central Africa, and numerous local industries, including wood-carving, pottery, and leather manufactures. Population (estimated), in 1901, 50,000.

ILOW, ē'lō. CHRISTIAN. BARON (c.1585-1634). An Imperial general in the Thirty Years' War, born at Neumark. He fought bravely under Tilly at Stadtlohn (1623), and soon after was transferred to Wallenstein's army. He easily won the confidence of his general, and took part in the intrigues which resulted in the break between Wallenstein and the Emperor. He was assassinated at the banquet of Eger.

ILSE, ē'l'ze, PRINCESS. In German legend, the daughter of the giant of the Ilsestein, who threw herself into the flood when parted from her lover, and was changed into a water spirit.

ILUS (Lat., from Gk. Ἴλος). In Greek mythology, the reputed founder of Troy. He was

born in Dardania, on Mount Ida, and was the son of Tros, great-grandson of Dardanus, and father of Laomedon. In an athletic contest in Phrygia he received, as the prize of victory, fifty youths and fifty maidens. In addition, at the command of the oracle, a spotted cow was given to him, and he was directed to follow her until she should lie down, and on that spot to establish a city. This spot was the hill of the Phrygian Ate, where he founded the town which from his name was called Ilios, and from the name of his father Troy. The Palladium came to him there as a sign from Zeus.

ILYA MUROMETS, é-lyä' mōō'rō-měts (Russ., Elijah of Murom). The favorite hero of the Russian *bylina* (q.v.), a representative of the peasant class. The strongest of the 'younger paladins,' he spent his life in guarding his country against her enemies and in protecting widows and orphans. In extreme cases only did he shed blood. Usually the foe was frightened away by the exhibition of Ilya's strength in turning some mighty oak into splinters or some similar display of prowess.

IMAGE-WORSHIP. The use, in public or private religious services, of graven or painted representations of sacred persons or things, and especially the exhibition of honor, reverence, or worship to such representations. Under the old law, because the Jews were constantly tempted by the example of the surrounding idolatrous nations, the strictures with regard to the worship of images were very severe. There were images of the cherubim placed in the Holy of Holies, however, so that such representations were not entirely forbidden. There is no mention of the use of images in public or private worship in the New Testament, nor in the chronicles of the first century of Christianity. They seem to have been introduced very early, however, for Tertullian at the beginning of the third century mentions the image of the Good Shepherd as engraved upon chalices quite as if this were and had been for a long time a common practice. Crucifixes seem to have been introduced very early; this is proved by a graffito, often supposed to be a pagan caricature of Christianity, probably of the end of the second century, scratched upon the wall of a room in the palace of the Cæsars. (See GRAFFITO.) It is a rude representation of a man standing in the attitude of prayer, with outstretched hands, before a grotesque caricature of the crucifixion, bearing the legend 'Alexamenus worships God.' The tombs of the Christians in the Roman catacombs, many of which are of a date anterior to Constantine, frequently have graven representations of the dove, of the cross, of the symbolical fish, of the ship, of Adam and Eve, of Moses striking the rock, of Jonah, of Daniel in the lion's den, of the Apostles Peter and Paul, and above all of the Good Shepherd. The chapels of the catacombs are profusely decorated with sacred representations, the age of which it is not easy to determine with accuracy, though some of them seem to come at least from the second century. After the condemnation of the Nestorian heresy in 430, statues and pictures of Christ, of the Virgin Mary, and the saints were very commonly used in public and private religious services and in churches and religious edifices. As the mass of the people became more ignorant in the sixth and seventh cen-

turies, certain abuses with regard to the veneration of images in religious worship crept in. These led to a reaction against image-worship in the East, which culminated in the movement known as iconoclasm, because it commanded the breaking of images. The formal beginning of iconoclasm was an edict by the Emperor Leo III. (717-741), known in history as the Isaurian. The exact terms, as well as the exact date, of the edict are unknown, though Hefele places it in 726. It commanded the destruction of all pious images in public places. The removal of a famous image of Christ over the palace door caused a popular uprising in Constantinople. In Greece and Lower Italy the opposition to the edict was pronounced. The Patriarch of Constantinople refused to allow it to be put into force, and Pope Gregory II. (715-731) condemned it. Leo persisted, however, apparently influenced by the Caliph Yezid II., who set the example of destroying images in accordance with the Mohammedan religion. Saint John of Damascus (died about 760), who lived under the Caliph, wrote three discourses in defense of the use of images for religious purposes. Under Leo's successor, Constantine Copronymus, a council confirmed the Imperial edict. Leo IV. also upheld iconoclasm. Under his widow, Irene, however, the second Council of Nicæa (787) reaffirmed the orthodox views as to image-worship; but succeeding emperors, except Michael the Stammerer (820-829), who tried to effect a compromise, were iconoclasts. On February 19, 842, Theodora, widow of Theophilus (829-842), brought back the images in triumph to the Cathedral of Constantinople. This date is kept as the feast of orthodoxy. By an error the acts of the Nicene Council were sent in a garbled translation to Charlemagne. He objected to their publication in his realm in the *Libri Carolini*, now generally considered authentic, sent to Pope Hadrian I. (772-795) about 793. The Nicene Council solemnly declared that the worship to be paid to images is not true adoration, *latreia*, which is to be given to God alone, but *douleia*, or veneration. While the Greek verb Προσκύβειν, 'to worship,' is used, it is explained that it is only in the sense of honoring because they represent God or His saints, and because the honor which is given to images is referred to their prototypes. When the error of translation was explained, the misunderstanding ceased to exist. The Council of Trent reaffirmed the declarations and distinctions of the second Nicene Council as to image-worship, adding that there is "no virtue in images themselves on account of which they are to be worshiped; that no petition can be addressed to them; and that no trust is to be placed in them." The council advocates the true use of images, however, contending that they are of great advantage especially for the rude and unlearned, for whom they serve as memorials of the sufferings and of the mercy of Christ, as instructive records of the virtues of the saints, and exhortations to the imitation of their example and as incentives to the love of God and to the practice of piety. In certain parts of the world there are in Roman Catholic churches images for which there is a special veneration. It is well understood that it is not because any virtue resides in the image itself that it is believed that prayers are more frequently heard when said before it, but because of the special faith and fervor awakened by the traditions attached to it, and

the recorded examples of the effect of the mercy of God with which it is associated in the minds of the faithful. In the Eastern churches, especially the Russian, great reverence is paid to printed pictures of the saints, or representations in relief, called icons. Every house has one or more; and in the churches the iconostasis or screen which separates the sanctuary from the body of the church is covered with them. Statues, except of the angels, are not used.

The Reformers generally rejected the use of images as an unscriptural novelty, and stigmatized the Catholic practice as superstitious, or even idolatrous. The Zwinglian and subsequently the Calvinistic churches absolutely and entirely repudiated all use of images for the purpose of worship. Luther, on the contrary, while he condemned the Roman worship of images, regarded the simple use of them, even in the church for the purpose of instruction and as incentive to faith and devotion, as one of those indifferent things which may be permitted, although not of necessary institution. In the Lutheran churches of Germany and the northern kingdoms, pictures, crucifixes, and religious emblems are still freely retained. In all wholly Protestant communions images are entirely unknown, although their use has been freely revived in the Anglican communion of late years. Consult: Lütke, *Die Bilderverehrung und bildlichen Darstellungen in den ersten christlichen Jahrhunderten* (Freiburg, 1874); Hefele, *Conciliengeschichte* (7 vols., ib., 1854-71); Kraus, *Roma sotterranea* (ib., 1879).

IMAGINARY POINTS AND LINES. In analytic geometry, a point is said to be imaginary if one or more of its coördinates are imaginary. E.g. the points of intersection of the straight line $x=6$ and the circle $x^2+y^2=4$, found by solving the two equations, are $x=6$, $y=4\sqrt{-2}$, and $x=6$, $y=-4\sqrt{-2}$, the two values of y (i.e. the ordinates of the points) being imaginary, the points of intersection of the given line and circle are said to be imaginary. Similarly, the conjugate axis of the hyperbola (q.v.) cuts the hyperbola in two imaginary points. A line whose equation contains imaginary coefficients is called an imaginary line. E.g. the asymptotes of an ellipse or circle are imaginary lines. Their equations may be obtained from the equations of the curves thus: Let $x^2+y^2=0$, then $(x+yi)(x-yi)=0$, and $x+yi=0$, $x-yi=0$ are the imaginary asymptotes to the circle. Similarly,

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 0,$$

then

$$\left(\frac{x}{a} + \frac{y}{b}i\right)\left(\frac{x}{a} - \frac{y}{b}i\right) = 0;$$

and

$$\frac{x}{a} + \frac{y}{b}i = 0, \quad \frac{x}{a} - \frac{y}{b}i = 0,$$

are the imaginary asymptotes to the ellipse. All of these imaginary lines have the real point $x=0$, $y=0$. See CONTINUITY.

IMAGINARY QUANTITY. See COMPLEX NUMBER.

IMAGINATION (from Lat. *imaginatio*, from *imaginari*, to imagine, from *imago*, image). Taken in its broadest significance, thinking in images. In this sense it is synonymous with

phantasy. Thus one may imagine a mountain, the sound of flowing water, the fatigue of a long journey, the rhythmic march of an army, or the articulatory 'feel' of a word in the throat. The power to image, to imagine, is dependent, first of all, upon past experience. An individual born blind never has visual images; one born deaf never hears words 'ringing in his head.' Moreover, the ability to image varies greatly from individual to individual. Visual images predominate in one mind, auditory in another, tactual or motor in a third. See MEMORY.

In a more restricted sense, imagination covers a single class of mental images. In this significance, 'an imagination' is coördinate with a 'memory image' or an 'expectation image.' Taken as clusters of sensations, these three classes of images are identical. They differ only in their reference and in their setting. A memory image refers to some part of one's past experience (one has a visual image of one's childhood home, or an auditory image of a familiar piece of music). Its function is to 'reproduce' the past. Similarly, expectation images are set within the individual's experience, but within the part that exists only in anticipation. Their function is to connect the present with the future. Finally, an imagination has no direct connection with the course of one's personal experience. As one reads a volume of fiction, one may imagine scenes, voices, movements, situations. The whole narrative is held together by a succession of imaginations, or 'imagination images,' as they might be called. This is passive or reproductive imagination. Over against it stands active or constructive imagination, an instance of which is furnished by the artistic productions of the painter and the sculptor. Between passive and active imagination there exists the same difference as between musing and 'hard thinking.' In the passive type there is a nucleus—e.g. the text of the novel—about which are clustered various near-lying associations; in the active type, images, more or less discrete and unrelated, are brought together and wrought into a systematic whole. The difference is rather one of degree than of kind. Active imaginations show greater selectiveness; a disjunction of elements succeeded by an aggregation of those most fit to express some feeling or idea. This is evident in a painting of natural scenery, where the artist has modified nature to suit his purposes.

James Mill and Bain confine imagination to those constructions which are produced under the influence of emotion—e.g. ghosts and hobgoblins evoked by terror, or the creations of the poet and the musician. Sully, on the other hand, makes it cover three distinct forms of mental construction—cognitive imagination, practical imagination (or invention), and æsthetic (or poetic) imagination.

Consult: Bain, *The Senses and the Intellect* (London, 1888); James, *Principles of Psychology*, vol. ii. (New York, 1890); Sully, *Outlines of Psychology* (New York, 1891); Ambrosi, *Psicologia dell'immaginazione* (Rome, 1898); Hoefler, *Psychologie* (Vienna, 1897).

IMA'GO. The adult, sexually mature form of an insect which passes through metamorphoses. See INSECT; METAMORPHOSIS.

IMAM, *â-mäm'* (Ar. *'imäm*, leader, from *'amma*, to lead, set an example). The appellation

given in general to teachers among the Mohammedans, as leaders whose example is to be followed. It is commonly employed to designate any of the persons belonging to the Mohammedan ulema (q.v.) or 'learned' body. They are distinguished from the laity by a turban somewhat higher than usual, and are held in great reverence by the people. Besides this general use, there are also certain specific applications of the term. Among the Shiites (i.e. the followers of Ali) the term imam is applied to the twelve legitimate successors of Ali. Among the orthodox Mohammedans the imam is properly the caliph, or leader of the entire body of Mohammedans, but the name is also extended to any authority whose views on theology and law are followed. In the course of time every Mohammedan community came to have its imam, whose chief function it was to lead the congregation in prayer. He takes his stand in front of the group of worshippers, who take up a position behind him arranged in fixed rows and imitate the genuflections and attitudes assumed by the leader in the course of the prescribed prayers.

IMAMITES, é-mám'īts. A Mohammedan sect whose members recognize the twelve imams, descendants of Mohammed's son-in-law Ali, whom they consider the first real imam or caliph. They are commonly known as Shiites.

IMAZIGHEN, é'má'z'é'gän'. The designation of all the Berber tribes of the Atlas Mountains, in Algeria and Morocco, comprising the Kabyles, Shulluhs, and Haratin. The Kabyles, who call themselves Imazighen, are furthest north, and more mixed with Semitic and Europeans; the Shulluhs (Shluhs) are to be found on the northward sloping valleys of the Atlas Mountains, while the Haratin Berbers are on the southern slopes and mixed with negroes. (See **KABYLE**; **SHULLUHS**; **HARATIN**.) They are Hamites fundamentally in blood, but have long been acculturated with Arab speech and religion. Their mountain retreats have enabled the Imazighen Berbers to preserve their ancient patriarchal mode of life, so that many hundreds of clans and families keep up their small organizations at the same time that they are united into larger nations. A similar social structure existed in America, where, within the powerful confederacies and nations of Indians, were innumerable minor divisions.

IMBATTLED. See **EMBATTLED**.

IMBECILITY. (from Lat. *imbecillitas*, weakness, from *imbecillus*, weak). (1) Mental weakness or defect. Imbecility and idiocy are comparative terms. They are both states due to similar processes, consisting of imperfect development of the brain, and due to congenital influences or acquired injury or disease. (See **IDIOCY**.) Thus it is almost impossible to determine the dividing line that separates an idiot from an imbecile, and such differentiation may entail much study and careful following of the mental development. In general understanding, an idiot is unable to attend to the simple primary affairs of his organization. An imbecile is able to attend to these. At the older end of the scale the imbecile shades into the normal average human mind by imperceptible gradations, and it may be just as difficult to separate the imbecile from weak-minded, dull, and stupid individuals as it is to separate the idiots from imbeciles. There are large num-

bers of weak-minded, useless persons in every community who differ from the more robust intellects solely in degree. But the more marked and recognizable imbecility is characterized by many of the following signs: The vacant expression, dull senses, small head, deformed body, vacillating and restless gait; pendent, thrown back, or agitated head; escaping saliva, limited and infantile language. The ideas may be few, and consist of mere sensuous impressions; the temper, timid, facile, and vain; and the passions are little susceptible of control. The affection has been regarded as general, or involving the whole mind; or as partial, when the intellect only, or the sentiments only, or a particular faculty, may be feeble and ineducable.

(2) As a generic legal term, a weakness of mind falling short of idiocy (q.v.) on the one hand and full mental capacity to contract or to distinguish between right and wrong on the other. The victim of imbecility, using the word in this sense, is not absolutely incapable of binding himself by contract or of committing crime. If his weakness is taken advantage of by another, any contract or conveyance so secured may be set aside, but the mere fact that a man is of weak understanding, or that his intellectual capacity is below the average of mankind, if no fraud, or no undue advantage be taken, is not of itself an adequate ground to set aside a transaction. It should be added that a lower degree of intelligence is required for a valid will than a business contract or conveyance. In various jurisdictions imbeciles are more or less protected against the fraud of others or their own acts of indiscretion by placing them more or less under the control of others, as in Scotland by interdiction, or by the appointment of a committee or guardian. See **INTERDICTION**; **COMMITTEE**; **GUARDIAN**; also see **IDIOCY**; **INSANITY**; **LUNACY**; and the authorities there referred to.

IMBER, NAPHTALI HERZ (1856—). A Hebrew poet and Cabbalist, born of poor parentage at Flochow in Galicia. He received a thorough training in the Talmud, and after the age of fourteen led the life of a wandering scholar, visiting in turn Constantinople, Egypt, and Palestine. There he studied the Oriental languages, and especially Hebrew. From Palestine he went to England, where he worked for some time in collaboration with Israel Zangwill. In 1892 he came to America, and made his home at different times in New York City, Boston, Chicago, San Francisco, and Los Angeles. In addition to many volumes of poetry and Cabbalistic lore, he wrote extensively for the Hebrew press. In his mastery of the ancient language of the Bible he takes rank with the leading scholars of Europe and America. His poetical works in form and thought are modeled to a great extent upon the songs of Juda Halevy (q.v.), whose fervent love for and hope in Zion Imber more than echoes. Among his works are: *Austria*, a poem; *The Mystery of the Golden Calf*; *The Keynote to Mystic Science*; *The Treasures of Ancient Jerusalem*; *The Letters of Rabbi Akibah*; *The Education of the Talmud*, printed by the United States Government; *Music of the Psalms*. His "Hope of Zion" has become the hymn of the Zionist party the world over.

IMBERT DE SAINT-AMAND, än'bar' de sän'tá'män', ARTHUR LÉON, Baron (1834-1900).

A French author, born in Paris. He was privately educated, studied law, and after being admitted to practice entered the Government service in the Department of Foreign Affairs. Here he rose through the several ranks to the grade of Minister Plenipotentiary of the first class in 1882, and was assigned to special service in the central offices of the department in Paris. He is best known as the author of an interesting and popular series of biographical and social studies of the women of the French courts. The first of these, entitled *Les femmes de Versailles* (5 vols., 1875-79), covered the period from Louis XIV. to the close of the *ancien régime*; the second, *Les femmes des Tuileries* (37 vols., 1880-99), began with the last days of Marie Antoinette and concluded with the women of the Second Empire. The series has been translated into English under the title of *Women of the French Court*. Among his other published works, some of which have also been translated into English, are: *Portraits de femmes françaises du XVIII. et du XIX. siècle* (1869); *Les femmes de la cour des derniers Valois* (1872); *Madame de Girardin* (1874); *Portraits de grandes dames* (1875); *La cour de Louis XVIII.* (1891); *La cour de Charles X.* (1891).

IMBIBITION (from Lat. *imbibere*, to drink in, from *in*, in + *bibere*, for **pibere*, to drink, Skt. *pā*, to drink, OIr. *ibim*, I drink). The physical process of swelling of solids by the absorption of liquid. It is exhibited most freely by organized bodies; i.e. those formed by living beings, which have therefore a characteristic structure, but is not confined to them. The swelling depends on a separation of the structural units of the body, which are believed to be not its molecules, but rather molecular complexes. Imbibition, therefore, differs from solution in that the separation of the particles is not so extensive, and when the water is removed by evaporation or otherwise they return to their original relations, so that the body regains its previous form and structure. After solution, on the contrary, the separated molecules may rearrange themselves completely. In a normal condition all parts of plants hold large quantities of water imbibed in their substance. Even in the walls of wood-cells, the least watery material, there is usually 50 per cent. of water, while in the protoplasm there may be as much as 95 per cent. Indeed, the plant may be considered as a mass of water held between the structural particles of the cells composing it and exceeding in volume the material by which it is so held. This condition alone makes it possible for plants to obtain materials from the water and air about them. See ABSORPTION.

The force of imbibition depends upon the surface tension of the water and upon the relation between the molecules of water and those particles of the swelling body whose cohesion is thereby overcome. When a dry starch-grain imbibes water, heat is developed (on account of the compression of the water) to an amount which indicates (according to Rodewald) a pressure of over 2500 atmospheres. The force exerted by a confined swelling body is at first enormous, but becomes rapidly weaker as the particles are separated farther and farther. Correspondingly, water is held loosely when abundant, but more and more tenaciously when only a little is imbibed. Thus, when a bit of laminaria is completely swollen, water can be removed from it by

slight pressure; when it holds 170 per cent. of water it requires a pressure of 16 atmospheres to extract water; when only 93 per cent. is present a pressure of 200 atmospheres is needed. Applications of the force of swelling are made in splitting stone by wooden wedges driven in and then wetted; in shortening ropes by wetting; in the use of laminaria for surgical distension, etc. The phenomena of imbibition afford the chief basis for theories concerning the molecular structure of organized bodies. See COLLOIDS.

IMBRIANI, ém'brè-ì-né, VITTORIO (1840-86). An Italian poet and critic, born in Naples. He pursued studies in the universities of Naples, Zürich, and Berlin, and took part in the campaigns of 1859 and 1866. In 1884 he was appointed to the chair of aesthetics at the university of his native city, but was then too ill to assume the duties of this post. His political life was a troublesome one by reason of his excessively passionate nature, which was ever exciting the bitterest antagonism. As a littérateur he is best known for his collections of popular tales and verse, such as *Canti popolari delle provincie meridionali* (1871-72); *Dodici canti pomiglianesi* (1876); *La novellaja fiorentina* (1877), etc. A number of his poems are to be found in a collection entitled *Esercizj di prosodia* (1874). Among his critical works are some monographs on Dante and the *Fame usurpate* (1877), in which he seeks to demonstrate that Goethe's *Faust* is a production devoid of all merit.

IMBRICATED SNOUT-BEETLE. A very injurious weevil (*Epicærus imbricatus*), which damages many different kinds of garden vegetables and fruits, such as onions, radishes, cabbages, beans, watermelons, cucumbers, corn, beets, and strawberries, by sucking the juices of the leaves, stems, roots, or fruit. It also punctures the leaves and twigs of the apple and pear. The life-history is not thoroughly known, although the eggs and young larvæ found on the leaves of the strawberry have been described by Chittenden. The best remedy consists in spraying with a Paris green or some other standard mixture.

IMBROS, ém'brôs. A Turkish island in the Ægean Sea, situated about 13 miles northeast of Lemnos. Area, about 100 square miles. It is of volcanic origin, rocky and mostly barren, only a small part of its area being cultivable. Population, over 9000, mostly Greeks, engaged in fishing. The chief town is Kastron (Castro), the seat of a Greek metropolitan.

IMER, é'mâr, EDOUARD (1820-81). A French painter, born at Avignon. Though he received no regular instruction, he became an excellent landscape painter, particularly of scenery in Middle France. His Eastern pictures are also well known. Among his works are: "Sycamores at Gizeh;" "Island of Philæ" (1857); "Ruins of Crozant;" and "Oak Tree of Vouliers" (1873).

IMERITIA, é'mè-rîsh'î-â. Formerly an independent kingdom in Georgia (q.v.), now constituting a part of the Government of Kutais (q.v.) in Russian Transcaucasia. Its history as an independent country begins toward the end of the fifteenth century. About 1750 it was occupied by the Turks, who were expelled by the Russians in 1769. In 1810 it was annexed to Russia. The Imers, or Imeritians, who number less than half

a million, are one of the tribes belonging to the southern or Georgian group of peoples of the Caucasus. They are considered by Pantiukhoff to be the purest representatives of the primitive Georgian type. See GEORGIANS.

IMHOFF, ém'hôf, AMALIE VON. See HELVIG.

IMHOFFER, ém'hôf-ër, GUSTAV MELCHIOR (1593-1651). An Austrian Jesuit, famed as a South American explorer. He was born near Gratz, Styria, and went to Peru as a missionary in 1624. Twelve years afterwards he crossed the Andes to the source of the Amazon, and was the first European to leave upon record his exploration of that stream to its mouth. His account was published in two volumes in Madrid (1640) and in London (1689), the latter edition called *A Relation of a Journey Along the River Amazon*. Father Imhoffer was head of the Jesuit College at Bahia, and the author of several treatises upon the language, history, and customs of his adopted country that were published by the Society of Jesus twenty years after his death.

IMHOOF-BLUMER, ém'hôf blō'mër, FRIEDRICH (1838—). A German numismatist, known as an authority on Greek coins. He was born at Winterthur, became interested in numismatics when he was a boy, gave up the business career planned for him, received a classical education, and amassed a valuable collection of more than twenty thousand ancient Greek coins, bought in 1900 by the Royal Numismatic Cabinet in Berlin. The great work of the Prussian Academy of Science, *Die antiken Münzen Nordgriechenlands* (1899 sqq.), was undertaken at his instance; and in 1901 he gave to the Academy the sum of one hundred thousand francs for the promotion of the science. He wrote: *Zur Münzkunde und Paläographie Böotiens* (1871); *Die Münzen Akarnaniens* (1878); *Porträtköpfe auf römischen Münzen* (2d ed. 1893); *Porträtköpfe auf antiken Münzen hellenischer und hellenisierter Völker* (1885); *Zur Münzkunde Grossgriechenlands* (1886); *Tier- und Pflanzenbilder auf Münzen und Gemmen*, with Keller (1889); *Lydische Stadtmünzen* (1897); and *Kleinasiatische Münzen* (1901 sqq.), as well as the great illustrated works, *Monnaies grecques* (1883) and *Griechische Münzen* (1890).

IMHOTEP, ém-hō'tép. An Egyptian divinity, identified with Æsculapius; the son of Ptah and Sekhmet, who with Imhotep formed the triad chiefly honored at Memphis.

IMITATION (Lat. *imitatio*, from *imitari*, to imitate). The repetition of any thought or act, or the copying of any example or model. The example or model is a stimulus which sets up nervous reactions that result in more or less nearly perfect repetition or duplication. The repetition may be by one's self or one's own thoughts or acts, as when a child, having learned to pronounce a new word, says it over and over; or it may be repetition by one person of the example or copy set by any other person. Imitation may further be subconscious, and due largely to suggestion, as it sometimes is in the behavior of crowds, or it may be clearly conscious, as it is in learning to write or to draw. The phenomena of imitation are of great importance in education, in the theory of art, in ethnology, and in sociology. Froebel and Preyer especially have treated of the educational aspects. The discussion of imitation in art dates from Aristotle.

In ethnology imitation is the key to an understanding of magic and primitive religion. The savage believes that he can reproduce or control desirable conditions by imitating them. In fishing he puts a bit of wood cut in imitation of a fish into the stream, to attract the fish that he would catch. In hunting he dresses in imitation of his prey. To his enemy he aims to bring death by sticking an image of him full of thorns, or by filling it with poison. The whole investigation and literature of this subject the reader will find opened to him in Skeat's *Malay Magic* and Frazer's *The Golden Bough*. Imitation as a social fact was shrewdly commented on by Bacon in the essays, but the first writer to deal with it in a systematic way was Bagehot in his most thoughtful and suggestive *Physics and Politics*. The 'crust of custom,' which characterizes primitive and unprogressive communities, was shown to be the product of imitation. The most profound study of imitation, however, is Gabriel Tarde's great work, *Les lois de l'imitation*. Tarde finds in imitation the elementary and fundamental social fact, and he makes it therefore the basis of a system of sociology. Imitations he classes as 'custom' imitations, in which the copy is ancient or even immemorial, and 'mode' or fashion imitations, in which the copy is new. Imitations extend from above (the higher social or intellectual ranks) downward, and all imitations tend to spread in a geometrical progression. One imitation may, however, interfere with another. In the resulting duel, if one does not extinguish the other, they combine, each modifying the other, and so creating a new model to be imitated. All 'inventions' Tarde thus explains as a product of the conflict of imitations. Thus by imitations and their product, inventions, he tries to account for all the phenomena of language, manners, costume, amusement, art, religion, science, economy, morals, law, and politics. All modern civilization, he avers, is but the continuing imitation of Greece and Rome. The chief criticism to be made of Tarde's theory is that it fails to take account of original similarities of activity in the universe. Not all resembling phenomena are alike merely because they form a sequence. They may be simultaneously alike, as a part of coexistence. Therefore, another system of sociology is possible, which builds upon the simultaneous like responses of like organisms to the same stimulus. See SOCIOLOGY.

IMITATION. In the science of musical composition, the repetition of the same passage, or the following of a passage with a similar one, in one or more of the other parts or voices. It may be either strict or free. When the imitated passage is repeated note for note, and every interval is the same, it is called strict, and it may take place in the unison or octave, or in any other of the degrees of the scale, either above or below the original passage. The progression of a passage may also be imitated by an inversion, or by reversing the movement of the original; also by notes of a greater or of a lesser value. (See CANON; COUNTERPOINT; FUGUE.) Imitation in composition is one of the most important means of producing unity and animation in the progression of the parts, and is used in a strict, and also in a free manner, in the instrumental works of Haydn and Beethoven, and also by Mozart in his earlier operatic works. Many composers,

however, resort to imitation improperly, either from poverty of musical ideas or from pedantry. In the works of the contrapuntal writers of the Netherlands examples of retrograde imitation are found. This is hardly legitimate art.

IMITATION OF CHRIST (Lat. *De Imitatione Christi*). The most widely read, after the Bible, of all spiritual books. It is a series of counsels for the attainment of perfection, written in a spirit of sincere and humble piety, interspersed with prayers and colloquies between Christ and the devout soul. It is strange that the authorship of a book so popular and comparatively so recent should have been the subject of one of the most curious controversies in literary history. Following his own counsels of humility, the author concealed his name. The oldest certainly dated manuscripts—the Wolfenbüttel (1424), the Gaesdonck (1427), and the Roelf (1431)—are all anonymous. The book was attributed with more or less positiveness to as many as thirty-five different authors, including Saint Bernard, Innocent III., and John Scotus Erigena. The choice finally narrowed to three—Thomas a Kempis, the great Chancellor Gerson (q.v.), and a person of the name of John Gersen, a Benedictine abbot of Vercelli. Most of the fifteenth century printed copies bear the Chancellor's name; but the proportion alters in the sixteenth, and the claimant Gersen or Gesen appears for the first time in 1604. The controversy raged acrimoniously in religious orders, universities, and even the Parliament of Paris. Between 1615 and 1837 no less than 150 works devoted to the question appeared in France alone. The weight of evidence, both internal and external, has for a long time been considered to rest on the side of Thomas a Kempis (q.v.). The book was finished in 1421, and first printed at Augsburg probably between 1470 and 1472. The best critical edition of the text is by C. Hirsche (Berlin, 1874; 2d ed. 1891). Consult: Kettlewell, *The Authorship of the De Imitatione Christi* (London, 1777); Malou, *Recherches historiques et critiques sur le véritable auteur du livre de l'Imitation* (3d ed., Louvain, 1858); Wheatley, *The Story of the Imitatio Christi* (London, 1891); and an excellent bibliography by a learned modern defender of the Gersen theory, Wolfgruber, in *Giovanni Gersen, sein Leben und sein Werk De Imitatione Christi* (Augsburg, 1880).

IMITATIVE INSANITY, INDUCED MANIA, INSANITY BY IMITATION. These old terms were adopted upon a mistaken notion. It has been supposed that sane people became insane through imitation of maniacs, through too constant intercourse with them, or through the efforts of a strong imagination in the sane. This is untrue. The physicians or nurses who become insane while living in institutions for those of unsound mind are affected because of stress of over-work or alcoholism, or other debilitating cause which would have been operative had they been engaged in other vocations. Insane people are imitative. Frequently cases occur in a family in which a sister, previously unsuspected of being insane, betrays the delusions and adopts the obsessions of an avowedly maniacal sister. This is called *folie à deux*, or 'communicated insanity.' The insanity exists first, and then the imitation occurs. Imitation of crimes upon reading of them

or seeing them committed is due to idiocy (q.v.) or hysteria (q.v.) in most cases.

IM'LAC. A character in Dr. Johnson's *Rasselas*. He is the companion of Rasselas in his wanderings, and returns with him to the happy valley.

IMMACULATE CONCEPTION OF THE VIRGIN MARY. A dogma of the Roman Catholic Church, promulgated by Pope Pius IX. in 1854. It declares that the "doctrine which holds the blessed Virgin Mary, from the first instant of her conception, to have been kept free from all stain of original sin, by the singular grace and privilege of Almighty God, in view of the merits of Christ Jesus the Saviour of mankind, is revealed by God, and therefore firmly and constantly to be believed by all the faithful."

Previous to 1854 Roman Catholic theologians had commonly believed in the immaculate conception, but it was held only as a 'pious opinion,' not as a dogma. Its history may be traced from early times, and shows gradual enlargements. The New Testament is silent on the subject of Mary's conception. In the ancient Church many persons believed in her perpetual virginity, and this found expression in some of the apocryphal Gospels. Belief seems next to have advanced to her sinlessness after the birth of Christ, then to sinlessness from her own birth, and finally to the idea that she was sinless from her very conception; Roman Catholics believe that the modern definition involves its having been held, at least implicitly, from the first. The fact that Mohammed seems to have known of these Christian tenets (cf. *Koran*, Sura, iii.) is an indication that they were widespread among the Asiatic churches at an early date. The Eastern Church, however, has not formulated the dogma, and to this day the immaculate conception remains only a pious opinion in that great branch of Christendom. In the West the history of the doctrine is closely associated with that of the feast. An effort was made in Lyons, in 1139, to introduce the festival of the Immaculate Conception, but it met with pronounced opposition from Bernard of Clairvaux, who did not accept the doctrine exactly as generally explained, and urged that the feast had not received official sanction from Rome. A prolonged controversy broke out early in the fourteenth century, which rather involved a minute technical point of the exact moment of her sanctification than the absolute acceptance or rejection of the main doctrine. The Schoolmen took opposite sides, Duns Scotus and the Scotists maintaining the doctrine in its exactness, while the Thomists, following their leader, Thomas Aquinas, opposed it. The dispute extended to the two great mendicant orders. Scotus was a Franciscan, Thomas a Dominican. The Franciscans accordingly sided with the Scotists in supporting the doctrine; the Dominicans sided with the Thomists in opposing it. There were keen debates, and mutual charges of heresy. The influential University of Paris at first sided with the Dominicans and Thomists, but afterwards its position was reversed, and by the end of the fifteenth century it required from every candidate for its doctorate an oath to defend the truth of the immaculate conception wherever it was denied. Among many other forces which worked toward the same end, we may mention the favorable action of the Council of Basel (1439), the pronouncements of Pope Sixtus IV.

(especially his constitution *Grave nimis*, in 1483), the decrees of Trent, excepting Mary from the universal curse of original sin (Session V. 1546), and the strong support of the Society of Jesus (e.g. in the person of Bellarmine). In 1622 Pope Gregory XV. forbade any one (with the conspicuous exception of the Dominicans, and these only in discussions among themselves) to teach that the Virgin Mary was stained by original sin. About forty years later (1661) Alexander VII. set forth the belief of the Church in terms very like those of the decree of 1854. Yet in spite of the general acceptance of the doctrine, the most that could be said for it down to modern times was what Benedict XIV. cautiously affirmed, about the middle of the eighteenth century: "The Church inclines to the opinion of the immaculate conception."

Pius IX. was assiduously devoted to the cult of the Virgin. In 1849 he addressed a circular letter to the bishops, inviting their opinions on the advisability of defining the dogma of her immaculate conception. Out of some 600 replies, the great majority favored the proposed action. Four opposed it. Several influential bishops, especially in Germany and France, deemed it inopportune, inexpedient, and possibly injurious to the Church. In view of the generally favorable sentiment, however, the Pope proceeded to promulgate the dogma, as stated above. The decree was read in the presence of about 200 cardinals, archbishops, and bishops, assembled in Saint Peter's, on December 8, 1854, the Feast of the Immaculate Conception. Although not a conciliar decision, it has binding force for the whole Roman Catholic world.

In explanation of the dogma, Catholic writers sometimes quote from a sermon by Bossuet, delivered on a Feast of the Immaculate Conception, in which he thus addresses Christ: "Thou art innocent by nature, Mary only by grace; Thou by excellence, she only by privilege; Thou as Redeemer, she as the first of those whom Thy precious blood hath purified." The Catholic interpretation of the matter is clearly implied in these few words. For Roman theologians distinguish between 'active' and 'passive' conception. The former is the physical act of the parents, and so far as this is concerned, Mary is held to have been conceived like other mortals. The latter is the divine infusion of the rational soul (on the theory of creationism), and this, in the case of Mary, is held to have been accompanied by a special gift of grace, whereby she differs from all other mortals. She was sanctified, and therefore sinless, from the beginning. But this was through the merits of the Son who was to be born from her, not through independent merits of her own. In this way the Church believes that it solves the two main problems raised by the doctrine of the immaculate conception, first, how it affects the Virgin Mary in her relation to the rest of the human race, and, secondly, how it affects her in relation to Christ. See Gen. iii. 15; Luke i. 28, 42.

The Feast of the Immaculate Conception, in the Roman calendar, falls on December 8th; in the Greek calendar, on the day following.

dis and Arnold, *Catholic Dictionary*, art. "Immaculate Conception" (London, 1884). On the Protestant side, consult: Schaff, *Creeds of Christendom* (New York, 1877), which gives the history of the doctrine, and the Latin and English text of the constitution *Ineffabilis Deus*.

IMMANUEL. See EMMANUEL.

IMMERMANN, KARL (1796-1840). A German dramatist, born in Magdeburg, April 24, 1796. From a school in Magdeburg Immermann went in 1813 to the University of Halle to study law, but he interrupted his studies in order to take part in the War of Liberation. Disabled by a nervous disorder, he left the field in 1815 and returned to Halle, where he was soon embroiled with other students on account of the terrorism exercised by the students' unions. He entered the Government service and in 1823 became a judge. He had become widely known as a dramatist when, in 1835, he took charge of the Düsseldorf theatre, which he developed artistically, but the theatre failed, and he became a judge again. Immermann died August 25, 1840. His plays were strongly influenced by Shakespeare. Among his best pieces are *Das Trauerspiel in Tirol* (1827) and *Merlin* (1831). Two representative novels are *Die Epigonen* (1835), an echo of *Wilhelm Meister*, and *Münchhausen* (1838-39), in which the village life of Westphalia is imaginatively described. In *Münchhausen* Poe may have found a hint for *The Fall of the House of Usher*. Immermann's *Collected Works* appeared at Düsseldorf in 1835-43, and a new edition, with *Biography and Introduction*, came out in twenty volumes at Berlin in 1883. Consult Putlitz, *Karl Immermann, sein Leben und Werke* (Berlin, 1870).

IMMERSION. See BAPTISM.

IMMIGRATION (from Lat. *immigrare*, to remove into, from *in*, in + *migrare*, to migrate). In its broadest sense, the transfer of residence from one country to another, viewed from the standpoint of the country in which the new residence is taken. The causes of this phenomenon have been discussed in the article devoted to emigration, which treated the movement at its source. We are concerned here with the effect of these movements on the countries which receive the newcomers. The invasion of the immigrant is the movement of the individual who seeks to improve his condition by a change of residence, who submits to the political institutions of the land of his adoption, and whose coming thither is frequently openly encouraged, or, at least, not actually opposed, by the country in which he settles.

Immigration and colonization are intimately related. When a new country is to be developed and its resources increased by human labor, immigration is encouraged by its authorities, and every gain in population is deemed an economic advantage. It has been in such countries in the past century into which the flow of emigration from Europe has been poured. They are Australia, South America, Canada, and the United States, in each of which immigration has raised diverse social and economic questions which must be individually studied and do not lend themselves to a general treatment. Before turning to the United States, where the immigration problem is perhaps the most acute, we may

briefly consider the facts connected with immigration in other countries.

AUSTRALIA. The Australian Commonwealth owes its origin to the penal settlement established there by Great Britain at the close of the eighteenth century, to which a considerable number of convicts were deported until the middle of the last century, when, at the earnest solicitation of the colonials, the system was abandoned. Efforts were made by the Government to send out free colonists to Australia, but, despite the

SOUTH AMERICA. Of the South American countries, the Argentine Republic, Brazil, and Uruguay are the only ones in which immigration brings any considerable increment to the population. In Uruguay the immigration varies between eight and ten thousand persons annually. In Brazil, 860,991 are reported for the years 1871-92. In the Argentine Republic the immigration in the years 1851-99 is reported as 2,564,391. For several recent years the available data are given in the following table:

	Argentina		Uruguay		Brazil
	Immig.	Emig.	Immig.	Emig.	Immig.
1892.....	86,513
1893.....	84,143
1894.....	80,671	41,921	60,294
1895.....	80,988	36,820	164,371
1896.....	135,205	45,921	10,505	5,916	157,948
1897.....	105,143	57,457	9,140	6,779	112,495
1898.....	95,190	55,596	9,467	6,411	53,822
1899.....	111,083	62,241	9,066	5,850
1900.....	8,892	6,705

liberal assistance of the Government, the total population by 1851 was only 430,596. Following the discovery of gold in 1850, the population increased three-fold in the next ten years, and considerable increments have been made to it at each subsequent census.

The following table gives the increase of population ascribed to the excess of immigration over emigration from 1851 to 1889 in four decennial periods and for the nine years ending in 1899:

1851-1860.....	613,253
1861-1870.....	291,342
1871-1880.....	336,297
1881-1890.....	386,018
1891-1899.....	61,824

The colonies showed great variations from year to year, as the discovery of gold in one colony after another attracted the fortune-seekers. The distance of Australia from Europe and the cost of passage have been an obstacle to immigration to that country compared with the more accessible Canada and the United States. The attractive force of the gold-mines has partially offset the difficulty, while the colonies have generally adopted a policy of aiding immigrants by paying a portion, if not all, of the passage money. This policy still prevails in Queensland and in Western Australia, and it is only within the last fifteen years that it has been abandoned by the other colonies. Up to 1896 there had been introduced into the colonies, either wholly or partially at the expense of the State, no less than 756,695 persons, of whom 578,559 came in the period prior to 1881.

Under these circumstances, the Australian colonies have to a large extent chosen their immigrants. It is not surprising, therefore, that the great bulk of the immigrants into Australia have been natives of the United Kingdom. According to the census of 1891, 68.58 per cent. of the population were Australian born, 14.76 per cent. born in England and Wales, 3.86 per cent. in Scotland, 7.13 per cent. in Ireland. In other words, 25.75 per cent. of the total population were natives of the United Kingdom, leaving only 5.72 per cent. aborigines, natives of other British colonies outside of New Zealand, and foreigners. Among the last Germans and Scandinavians predominate.

In the immigration to the South American countries, the States of Southern Europe are the largest contributors. Italy stands at the head of the list. In a foreign population of 866,983 in the Argentine Republic in 1895, the Italians numbered 492,636, the Spanish 198,685. The same races predominate in the immigration to Uruguay, while in that of Brazil the Portuguese take the second place, following the Italians, who constitute about one-half of the aggregate immigration.

CANADA. There is greater difficulty in determining the amount of immigration to Canada than to other countries, not only because a large number of persons land there whose destination is the United States, but because a considerable number whose original intention was to remain in Canada drift into the United States. So great is the difficulty of precisely ascertaining the number that a few years ago the Canadian authorities gave up the attempt. The most recent figures which are obtainable terminate with the year 1890, and these are put forward by the authorities with many cautions as to their accuracy. In five periods the figures are as follows:

ANNUAL AVERAGE IMMIGRATION TO CANADA

1871-1875.....	34,212
1876-1880.....	36,304
1881-1885.....	115,413
1886-1890.....	40,911

A computation by British authorities that from 1815-89, 12,481,708 persons emigrated from the United Kingdom, showed that of these 8,317,019 went to the United States, 1,987,247 to Canada, and 1,663,388 to Australasia.

The immigration into Canada is largely from the mother country. The census of 1891 showed that there were 647,362 foreign born in the population, of whom, after deducting natives of the United States, 566,444 had come from across the sea. Of these England and Wales furnished 219,685, Scotland 107,584, and Ireland 149,184, while the quota of foreign nations, among whom Germans predominated, was only 89,991.

UNITED STATES. The great bulk of those who have left Europe to seek new homes have come to the United States. Here the various phenomena connected with immigration can be

studied in their fullest development. Records of immigration to the United States begin in 1820. For the period before that time the chief sources of information as to immigration are the frequent newspaper allusions to the arrival of vessels bringing immigrants, of whom a certain number were 'foreigners,' i.e. those who spoke a language other than English. The record of arrivals since 1820 is shown in accompanying table.

In long periods the increase is marked, but year by year the fluctuation is considerable. It mirrors the economic conditions at home and abroad. Thus the panic of 1837 is reflected in the decline of immigration from 79,340 in that year to 38,914 in 1838. The wholesale emigration from Ireland after the potato famine is reflected in the rise of our immigration from 154,416 in 1846 to 234,968 in 1847, and before this influence and that of the political disturbances in Europe was spent came the discovery of gold and the rush to the mines, which culminated in an immigration of 427,833 in 1854, a figure not reached again until nearly twenty years later. After that year immigration fell off slightly, and received a sudden check after the panic of 1857, when it was reduced from 246,945 in 1857 to 119,501 in 1858. The year 1860 showed symptoms of a rising tide, but this was checked by the outbreak of the Civil War. The prosperous times which followed the close of the war increased immigration until, in 1873, it reached a figure of 459,803, higher than in 1854. Again economic distress brought a falling off, and in 1878 it was not more than 138,469. But the symptoms of returning prosperity in the early eighties reacted powerfully upon the volume of immigration, which in 1882 reached the enormous total of 788,992. By 1886 immigration had fallen to 334,203, but it soon recovered and maintained high figures until 1893. In the following year it dropped to 285,631, and reached its lowest point in recent years in 1898, when it was 229,299, but again there has been a rapid recovery, and in 1902 the total of 648,743 is exceeded by only two previous years, 1881 and 1882.

Influenced by temporary causes, as we have seen, the progress of immigration has been generally forward, with setbacks, apparently temporary, only in the decades 1860-70 and 1890-1900. In estimating the force of immigration it is well to take into account the concurrent growth of the population. The following table brings out the facts:

DECADE	Population at beginning	Immigrants	Immigrants in 10 years per 1000 of initial population
1821-1830.....	9,633,822	143,439	15
1831-1840.....	12,866,020	599,125	47
1841-1850.....	17,069,453	1,713,251	100
1851-1860.....	23,191,876	2,598,214	110
1861-1870.....	31,443,321	2,314,824	73
1871-1880.....	38,558,371	2,812,191	73
1881-1890.....	50,155,783	5,246,616	104
1891-1900.....	62,622,250	3,844,420	61

It appears in this table that the greatest relative immigration has been in the ten years ending 1860, closely followed by the decade 1881-90, and it is to be noted that in each of these periods the agitation against the policy of unrestricted immigration was widespread.

NUMBER OF IMMIGRANTS ARRIVING IN THE UNITED STATES EACH YEAR FROM 1820 TO 1902

PERIOD	Immigrants
Year ending September 30—	
1820.....	8,385
1821.....	9,127

1870.....	387,260
1871.....	321,350
1872.....	404,806
1873.....	459,803
1874.....	313,339
1875.....	227,498
1876.....	169,986
1877.....	141,857
1878.....	138,469
1879.....	177,826
1880.....	457,257
1881.....	669,431
1882.....	788,992
1883.....	603,322
1884.....	518,592
1885.....	395,346
1886.....	334,203
1887.....	490,109
1888.....	546,889
1889.....	444,427
1890.....	455,302
1891.....	560,319
1892.....	479,663
1893.....	439,730
1894.....	285,631
1895.....	258,536
1896.....	343,267
1897.....	230,832
1898.....	229,299
1899.....	311,715
1900.....	448,572
1901.....	487,918
1902.....	648,743

The effect of this immigration on the population can be traced since 1850 in the number of foreign born enumerated by the census, and is shown in the following table:

YEAR	Population	Foreign born	Per cent. foreign born	Increase of foreign born over previous census	Immigration previous decade
1850	23,191,876	2,244,602	9.7		
1860	31,443,321	4,138,697	13.2	1,894,095	2,598,214
1870	38,558,371	5,567,229	14.4	1,428,532	2,314,824
1880	50,155,783	6,679,943	13.3	1,112,714	2,812,191
1890	63,069,756	9,308,104	14.8	2,628,161	5,246,613
1900	76,303,387	10,460,085	13.7	1,151,981	3,687,564

While the total number of the foreign born has increased at each census, the proportion to the total population has not materially changed since 1860. The increase in the foreign born for each decade falls far short of the total number of immigrants by reason of the following factors: (1) Deaths among the foreign born present at the beginning of the decade, and (2) emigration from among the same; (3) deaths among the immigrants during the decade, and (4) return of some of these latter to their native lands. The census of 1900 permits us to estimate some of these factors. There were present in the United States in 1900, 2,609,173 persons who had arrived since 1890, or 7.8 per cent. of the immigration in the period. These had not only made up the loss by emigration in the foreign-born population enumerated in 1890, but had, as shown in the table, increased the total number. There remained 1,078,391 persons who arrived in the period 1891-1900 not accounted for by the census of 1900. A certain proportion had died. Were the annual contingent 368,756, or one-tenth of the total, and the death-rate 15 per thousand, the deaths for each contingent would be 5531 annually. Disregarding the year of arrival, the first contingent was here nine years, and the ninth one year, or forty-five years for the first nine contingents, the tenth being disregarded. At this rate the deaths for the period would be 248,895, leaving a remainder of 829,496 immigrants not accounted for, who seemingly contributed nothing to our population. This remainder consists of two classes of persons: first, those who left the United States only to return again; and, second, those

these arrivals were doubtless enumerated in 1890, and do not therefore figure in the foreign born enumerated in 1900 who had arrived in the previous decade. Others had arrived twice be-

tween 1891 and 1900, but were, of course, enumerated only once, at the census of 1900.

There remain of the immigrants of 1891-1900, 243,273 to be accounted for, and these would seem to represent the immigrants who, after a brief sojourn in the United States, returned to their own lands to stay. Fuller information on the whole subject could be obtained had we at our disposal figures for the passengers departing from our shores as well as those who arrive.

Enough has been said to show that immigration does not make the additions to our population which a cursory examination of the figures indicates. It is probable that the duplications, with the greater ease and cheapness of ocean travel, are more numerous of late years than formerly. These duplications do not rob the problem of its seriousness, but give it simply another aspect.

There has been of late years a change in the character of immigration which has been the cause of much concern, and much has been written of the 'undesirable' quality of recent immigration. The most desirable immigrant is doubtless he who promises most rapidly to be absorbed into the great mass of our population and lose his identity as a newcomer. Kinship in language and race is the prime mark of this desirability. Other things being equal, English-speaking immigrants are preferable to all others, those of allied race and language more to be desired than those allied by neither race nor language to the mass of the people.

The developments of recent years are shown in the following figures:

INHABITANTS	Per cent. of total immigration						
	1821-30	1851-60	1871-80	1881-90	1891-1900	1901	1902
United Kingdom	76.5	54.5	43.5	29.9	19.4	9.2	7.1
Germany	6.8	38.2	34.3	30.7	14.1	4.4	4.4
Sweden, Denmark, and Norway	0.2	1.0	11.2	16.0	9.9	8.0	8.3
Italy, Russia, Poland, and Austria-Hungary ..	0.3	0.4	8.1	19.4	49.3	68.6	70.5
All others	16.0	5.9	2.9	4.0	7.3	9.8	9.7

who arrived after the enumeration of 1890 and left before that of 1900. We have some data to estimate the relative magnitude of these elements, as we know from figures for the port of New York in 1896, and in the years 1897-1900 for the entire country, that 235,908 arriving immigrants had been in the country before. As this is 15.9 per cent. of the total arrivals, we may estimate that for the entire decade, 1891-1900, 586,223 persons arrived in the United States who had been here before, and so far as any addition to our population is concerned, represented simply a double counting. Some of

The last decade shows marked contrasts with the first. Then more than three-quarters of our immigrants spoke English, but now this element represents less than one-fifth of the total. This relative decline was at first made up by an influx of Germans and Scandinavians, peoples of a certain racial kinship, who as late as the decade 1881-90 comprised nearly one-half of the immigrants, while in the latter periods the nations of Southern and Eastern Europe have assumed the leadership. Equally instructive is the separation of the immigrants by race, which for the fiscal years 1901 and 1902 was as follows:

	Per cent. of total immigration	
	1901	1902
Italian.....	28	28
Polish.....	9	11

That such a notable change in the character of immigration must affect the composition of the foreign born in the United States is obvious, and is disclosed in the following statement from the census of 1900:

It will be noted that in the case of the Irish the women even outnumbered the men, that the races named which show a less percentage of men than the average already quoted, 70.1, belong, with the exception of the Hebrews, to the older immigration. The Hebrews represent more largely than the other races immigration by families.

Among the immigrants the proportion of per-

FOREIGN-BORN POPULATION, 1900 AND 1890, BY NATIONALITIES

*Figures in italics show decrease.

†The total here given differs from that of a previous table, as this does not include Alaska and Hawaii.

These figures show that the older immigration, relatively stronger in the foreign born than in the new arrivals, is still losing ground. The arrivals in the past decade are insufficient, except among the Scandinavians, to maintain the absolute numbers of ten years ago. On the other hand, the absolute numbers of the foreign born from Eastern and Southern Europe have more than doubled. The apparently anomalous fact that the group 'Other Countries' has increased more rapidly than the aggregate immigration is explained by the entire absence in the immigration returns of any Canadians, who constitute more than one-half of the undistributed foreign born in the above table.

The reports of the Bureau of Immigration enable us to study many characteristics of the immigrants: That males predominate over females, inasmuch as the immigration embraces so many unmarried men, and so many married men who have left their families behind them, who come to seek fortune in the New World, is well known. It is, however, interesting to note that the proportion of males is increasing. In 1893 to 1895 it was 61.5 per cent. of the total; in 1896 to 1900, 63.5 per cent.; and in the last two fiscal years, 1901 and 1902, it averaged as much as 70.1 per cent. The older immigration was by families to a larger extent than at present, and this is seen by comparing some of the older and newer elements in our immigration.

In 1902 the figures for some of the prominent races were as follows:

sons in the prime of life is always considerable. The increase of the proportion indicates a falling off of family immigration. Figures for the entire period are not uniform, but the following statement shows this characteristic plainly:

PER CENT. OF TOTAL IMMIGRATION		
FISCAL YEARS	Under 15 years	15-40 years
1893-95.....	18.8	71.1
1896-98.....	16.1	72.7

FISCAL YEARS	Under 14 years	14-45 years
1899-1900.....	13.0	81.4
1901-1902.....	12.0	82.3

Considering the same races as in the case of the sexes, we find the percentage of children under fourteen in 1902 to be as follows, the average being 11.4:

English, Scotch, and Welsh.....	16.0	Italian.....	10.6
Irish.....	4.1	Polish.....	8.6
German.....	16.6	Croatian and Slovenian.....	3.3
Scandinavian.....	7.8	Slovak.....	8.1
		Hebrew.....	26.5

Here again it appears that family immigration is especially prominent among the Hebrews, and plays a considerable rôle among Germans, and natives of Great Britain. The low percentage of children among the Irish is a consequence of the large immigration of unmarried women,

and this is true, in some measure, of the Scandinavians. Among the newer races, children are very infrequent in the Croatian and Slovenian immigration.

Statistics of occupation among the immigrants show comparatively few in the professional class

tion of illiterates is generally higher among immigrants than in the population at large of the countries whence they come.

EFFECT UPON THE POPULATION. The influence of immigration upon the population at large depends not only upon its volume, but also upon its

SECTIONS	Native born		Foreign born	
	Number	Per cent.	Number	Per cent.
United States	65,843,302		10,460,085	86.3
North Atlantic States	16,283,899		4,762,796	77.4
South Atlantic States	10,227,450		216,030	97.9
Northern Central States	22,174,530		4,158,474	84.2
Southern Central States	13,722,392		357,655	97.5
Western States	3,245,028		846,321	79.3

or that of skilled laborers. By far the greatest number are in the classes grouped as miscellaneous, in which laborers, farm laborers, and personal and domestic servants make up nearly the entire number (393,154 out of 412,879 in 1902). The general results are given in the following table:

OCCUPATIONS	Fiscal years 1881-90		Fiscal year 1902	
	Number	Per cent.	Number	Per cent.
Professional	27,006	1.0	2,937	0.6
Skilled Labor	540,411	19.6	79,768	16.1
Miscellaneous	2,195,292	79.4	412,879	83.3
Total with occupation	2,780,709	100.0	495,584	100.0
No occupation	2,483,904		153,159	
Total	5,264,613		648,584	

The figures above given afford a comparison of the decade ending June 30, 1890, with the last fiscal year, and show that there has been a falling off of the proportion of skilled labor and a growth in that of unskilled labor. That this change is largely due to the newer elements can be seen from an examination of the figures for 1902. For certain races we find the following percentages:

	English	German	Italian	Croatian and Slovenian
Professional	6.2	0.9	0.3	
Skilled Labor	45.9	28.0	13.7	5.4
Miscellaneous	47.9	71.1	86.0	94.6

Corresponding to the figures for occupations are those for illiteracy. The following instructive table is taken from the Report of the Industrial Commission (xv. p. 284):

ILLITERACY AMONG IMMIGRANTS 14 YEARS OF AGE AND OVER

Western Europe		1899	1900	Eastern and Southern Europe		1899	1900
Scandinavian		0.6	0.8	Magyar		10.0	16.9
English		1.7	2.0	Greek		23.8	17.5
Scottish		1.5	2.1	Hebrew		23.0	22.8
Finnish		1.2	2.7	Slovak		27.7	28.0
Bohemian and Moravian		3.4	3.0	Russian		13.5	28.8
Irish		4.0	3.2	Polish		31.3	31.6
French		3.5	4.1	Lithuanian		32.5	32.1
German		3.2	5.8	Croatian and Slovenian		24.9	37.4
Dutch and Flemish		9.3	9.9	Ruthenian		42.6	49.3
Northern Italian		11.4	11.8	Southern Italian		57.3	54.5
				Portuguese		65.6	60.2
Average		2.8	4.0	Average		38.4	36.6

The races here enumerated range themselves according to the general degree of education at home, though it should be noted that the propor-

tion of illiterates is generally higher among immigrants than in the population at large of the countries whence they come.

The figures for 1900 are in the table above.

It will be noted that the largest number of foreign born is in the North Atlantic division, and here, too, the proportion is the largest. In 1890 the largest proportion was in the Western division, the largest number in the North Central division. Of the aggregate increase of 1,151,891 in the number of the foreign born, 874,619 are credited to the North Atlantic States. Here the proportion of foreign born slightly exceeds 30 per cent. in Rhode Island and Massachusetts, and is greater than 25 per cent. in New York and Connecticut. In the Northwest these figures are paralleled by 35.4 per cent. in North Dakota, 28.9 in Minnesota, and 24.9 in Wisconsin. While not drawn from urban classes at home, the foreigners tend to concentrate in cities. In the principal cities of the nation (161 cities, having over 25,000 inhabitants), as much as 26.1 per cent. of the population is foreign born, while in the remainder of the country but 9.4 per cent. are foreign born.

This tendency to the cities is due not only to the fact that cities represent the most rapidly developing part of our population, and hence exercise the strongest attraction for the floating elements, but in part also to the fact that the immigrant finds in the cities groups of his own countrymen, upon whom he naturally relies to establish relations with the world into which he has come. Hence it occurs that in one place certain nationalities will predominate which are insignificant in numbers in other cities. The

census report of 1900 gives in detail nationalities of nineteen cities having 200,000 inhabitants, and of ten other cities where the foreign born number

at least 30,000. In seventeen cities the Germans lead, their proportions varying from 28.8 per cent. of all foreign born in New York, to 65.9 per cent. in Cincinnati; in nine cities the Irish lead, with proportions between 17.3 in Paterson, N. J., and 36.9 in Cambridge, Mass.; in two cities, Fall River and Lowell, the French Canadians are most numerous, with proportions of 40.3 and 35.8 per cent. respectively; while Swedes, with 32.8 per cent., lead the foreign born in Minneapolis.

The cities having, on the one hand, the largest number of foreign born, and, on the other, the largest percentage of foreign born, were:

FOREIGN BORN IN CITIES, 1900

CITIES	Population	Foreign born	Per cent.	CITIES	Population	Foreign born	Per cent.
New York.....	3,437,202	1,270,080	37.0	Milwaukee.....	285,315	88,991	31.2
Chicago.....	1,698,575	587,112	34.6	Fall River.....	104,863	50,042	47.7

Hungary.....	31,516
Ireland.....	275,102	73,912	98,427
Italy.....	145,433
Poland.....	32,893	59,723
Russia.....	155,201	28,951
Sweden.....	28,320	48,836
Total foreign born	1,270,080	587,112	295,340

In the census report the Poles are distributed to Austria, Germany, and Russia. Those from Russia are most numerous in New York; those from Germany in Chicago.

Buffalo, Cincinnati, Cleveland, Detroit, Milwaukee, New York, Saint Louis, and San Francisco have German populations exceeding 25,000, while Boston has like groups of Irish and English Canadian, and Detroit such a group of her Canadian neighbors.

But these figures do not display the whole significance of the city concentration, for it will be remembered that immigrants are largely men and adults. The proportion of foreigners among males of voting age is perhaps a more forcible indication of their influence in the community. A few figures for the cities where the foreigners are numerous may be noted:

MALES OF VOTING AGE, 1900

CITIES	Total	Native born	Foreign born
New York.....	1,007,670	460,445	547,225
Chicago.....	511,048	237,688	273,360
Philadelphia.....	386,953	257,575	129,378
Boston.....	176,068	93,488	82,580
Cleveland.....	111,522	54,378	57,144
San Francisco.....	128,985	62,251	66,734
Saint Louis.....	171,798	116,218	55,580
Buffalo.....	97,938	52,917	45,021
Detroit.....	78,855	38,496	40,359
Milwaukee.....	75,020	34,535	40,485

In the ten cities there are four only, Philadelphia, Boston, Saint Louis, and Buffalo, in which the number of foreign born potential voters does not exceed the number of the native born. This does not imply that the foreign born have anywhere a political majority, as there is among them a considerable proportion of unnaturalized persons, the average for the nation showing about one-fourth of the foreign born to be aliens.

The significance of this concentration is in its relation to the problem of assimilation. The evidences of assimilation cannot well be treated statistically, and we have only a few indications of it.

One of these lies in naturalization. In 1900, 56.1 per cent. of the foreign born adult males had been naturalized, and 8.2 per cent. had taken out their first papers. The extent of naturalization depends upon the length of time which the foreigners have been in the country. Thus, of the 1,001,595 aliens enumerated in 1900, 599,917 had been in the United States less than ten years, while the much larger contingent of foreign born of longer residence showed only 441,678 aliens.

Another statistical evidence of assimilation is found in the acquisition of the English language. There were enumerated in 1900 1,217,280 foreign born persons over ten years of age, or 12.0 per cent. of the total, who could not speak English. But many of the foreign born from Great Britain and Ireland and Canada speak English as their mother tongue, as much as 24.5 per cent. of all. Allowing for these, the percentage of foreign born who had no English antecedents and who had not acquired English was 18.3. The census reports do not go sufficiently into details to give us any indication how far the inability to speak English was due to unwillingness to acquire it and how far to lack of opportunity, due to recent arrival in the United States. It has already been noted that 2,609,173 of the foreign born had arrived in the preceding decade, and that in the decade the non-English speaking elements, even allowing for immigration from Canada, approximated three-fourths of the arrivals. That the foreign element is not averse to learning English would seem to be indicated by the fact that among the native whites of foreign parentage the proportion who do not speak English is only 0.6 per cent.

If we turn now to consider the social effects of immigration we find our testimony chiefly in the statistics of illiteracy, crime, pauperism, and insanity. The effect of immigration can be seen in comparing the figures showing the proportion of illiterates in the population ten years of age and over in the United States, and in those sections where the foreign born are most strongly represented.

PERCENTAGE OF ILLITERACY

	United States	North Atlantic States	Northern Central States	Western
Native white, native parents, foreign parents . . .	5.7	1.7	2.7	3.4
Native white, foreign parents . . .	1.6	1.5	1.3	1.3
Foreign white . . .	12.9	15.9	9.4	8.5
Colored	44.5	14.6	24.6	42.8
Total	10.7	5.9	4.2	6.3

In the United States at large the illiteracy among the foreign white is far greater than among the native white, and this discrepancy is still greater in the Northern and Western States. It is, however, interesting to note that in the second generation, the native white of foreign parents, the discrepancy disappears. On the face of the figures there is even a superiority over the natives of native parents; but this is probably due to the better school facilities in the cities and towns, where so large a proportion of the foreign element dwell.

CRIME. It is often claimed that the immigrants fill the jails and penitentiaries of the country; and the impression is widespread that, were it not for immigration, there would be little use for such institutions. This impression is entirely erroneous. While it is likely that the foreign born contribute somewhat more than their proportional quota to the army of law-breakers, the disproportion is by no means such as to change materially the amount of crime which would occur were there no foreigners in the population. The extent of their influence upon the volume of crime may be briefly studied.

No data are available for 1900, but in the census of 1890 we read that the ratio of prisoners to one million of the population is 898 for the native white and 1768 for the foreign white. As the foreign white are little more than one-eighth of the entire community, it is clear that these proportions would not attribute to them an absolute majority of the crimes committed. Nor is the relative proportion of crime among the foreign born as great as these figures would indicate. They relate to the entire population, while the adult population only contributes to the population of prisons. A comparison of the two elements by age classes, as shown by the following table, is more accurate:

MALE PRISONERS, 1890

AGES	Numbers		Ratio to 1,000,000 population	
	Native white	Foreign white	Native white	Foreign white
10-19	4,227	599	780	1,308
20-29	17,713	4,492	4,353	4,164
30-39	9,737	3,695	3,257	3,536
40-49	4,068	2,744	2,189	3,020
50-59	1,623	1,547	1,327	2,336
60-79	676	722	614	1,263
80 and over	15	22	161	638

The larger proportion of foreign born in the ages ten to nineteen is due to the fact that the foreign born increase in number as they approach twenty years of age, while among the native born the numbers decrease from ten years onward. In the characteristic ages of twenty to forty there is no substantial difference between

the foreign white and the native white. In the later age classes the comparison is slightly unfavorable to the foreign white.

These figures relating to the population of prisons are not altogether satisfactory. They lay undue emphasis on the more serious crimes and minimize the lesser offenses, and thus fail to give an accurate picture of the amount of crime committed in a given year. The fact that the foreign born are more numerous among the prisoners with short sentences shows us that if the enormous volume of petty crime which is committed annually were adequately recorded the proportion of the foreigners would considerably increase. There is, moreover, evidence which cannot be recited here in detail that the native whites of foreign parents are less law-abiding than the foreign whites and contrast very unfavorably with the native whites of native parentage.

There are few subjects upon which the official records are more thoroughly unsatisfactory than in regard to crime, and all statements must be made in broad, general terms. It should, however, be remembered that a greater proportion of law-breaking among the foreign element might be adequately accounted for if we were able to divide the population into the social classes as respects wealth, education, and mode of living which actually exist in it. It is not improbable that in such a division it would appear that the foreign element showed no greater proportion of crime than the social strata to which they belong.

PAUPERISM. It is natural that the foreign born should contribute in larger measure than do the native to the population of the almshouses. They come here without property and are found generally among the poorer classes. Moreover, when age or incapacity overtakes them they have not the same relatives or friends to care for them as is frequently the case among the native population. It need not surprise us that the census of 1890, no figures for 1900 being available, showed that in every million of the population there were 829 native white paupers and 3131 foreign white paupers, or nearly four times as many. While this is due in part to the condition above described, the figures are again misleading, since the active ages in the population contribute little to the population of almshouses. This is brought out in the following table, showing the paupers by age classes, in which it is to be noted that nowhere is the disproportion nearly so great as in the figures for the aggregate population:

PAUPERS IN ALMSHOUSES, 1890

AGES	Numbers		Ratio to 1,000,000 population	
	Native born	Foreign born	Native born	Foreign born
Under 10	3,651	55	287	164
10-19	2,228	172	207	187
20-29	3,979	1,352	491	680
30-39	5,400	2,403	934	1,326
40-49	4,931	3,832	1,341	2,396
50-59	4,383	4,810	1,835	3,979
60-69	4,548	6,956	3,110	8,814
70-79	4,542	5,553	6,451	18,498
80 and over	2,543	2,199	12,515	31,196

INSANE. A greater tendency toward insanity has been noted among the foreign element of the population than among the native. No adequate

explanation has been given for this phenomenon. The figures usually quoted, to the effect that in 1890 there were 1405 native white insane and 3870 foreign white insane per million of their respective populations, like most of the figures relating to social conditions of the foreign born, exaggerate the situation. An examination of the ages of the insane shows that the greater number of those so afflicted are between the ages of twenty-five and fifty-five. A comparison for these ages of the foreign white and native white shows that the disproportion, while considerable, is by no means as large as in the general population.

INSANE, 1890

AGES	Numbers		Ratio to 1,000,000 population	
	Native born	Foreign born	Native born	Foreign born
25-40	17,293	7,569	1,850	2,658
40-55	13,787	10,848	2,725	4,602

INDUSTRIAL EFFECTS. Looking at the immigration problem from the economic side, we not infrequently hear a complaint that immigration lowers wages. In prosperous times little is heard of this, but when depression sets in complaint becomes general.

The difficulty here is to determine the facts. So complex are the conditions affecting wages that the Industrial Commission, after hearing the most conflicting evidence on both sides of the question, is forced to conclude that a positive effect of immigration on wages cannot be predicated.

The proposition can be supported by inference rather than by direct proof. If the numbers of the foreign born in a given industry are small, it is contrary to reason to suppose that they have a depressing effect upon wages. This raises the question of the amount of competition in a given industry. To this the answer can be found in the census statistics of occupations. The analysis of occupations by nativity has been reserved by the census authorities for a special volume, and we must therefore have recourse to the figures for 1890. The following table shows the percentage in each of the main branches of industry of the foreign born and of the native born in comparison with the population of ten years and over:

OCCUPATIONS OF MALES, 1890. PERCENTAGE OF FOREIGN BORN

	Foreign born
Agriculture, fisheries, and mining	15.54
Professional service	15.13
Domestic and personal service	36.21
Trade and transportation	22.25
Manufacturing and mechanical industries	34.04
All occupations	23.58
Population 15 years old and upward	22.05
SPECIAL OCCUPATIONS	
Gardeners, florists, nurserymen, and vine-growers ..	44.50
Restaurant and saloon-keepers	49.66
Hucksters and peddlers	53.13
Bakers	59.52
Boot and shoe makers and repairers	40.07
Cabinet-makers and upholsterers	46.17
Cotton, woolen, and other textile mill operators ..	46.05
Leather carriers, dressers, finishers, and tanners ..	47.62
Marble and stone cutters	46.28
Tailors	71.12

The concentration of the foreigners in industrial pursuits, as indicated by this table, is to be

correlated with their tendency to gravitate toward the cities already discussed. They have gone to the cities because the latter furnish the opportunities of employment, and this was due to the development of mechanical and manufacturing industries. The proportion of the foreign born in these broad groups is not such as to lead us to infer that they exercise a dominating influence upon wages, even if it could be proved, which is extremely doubtful, that they are any more willing than the native laborer to work for low wages. It can therefore only be in certain specified industries, in which the proportion of the foreign born is very large and in which the pressure for work is considerable, that any appreciable influence upon wages will be exerted. Where they do not thus dominate an industry they conform to the current rate of wages. Investigations of the Commissioner of Labor into the cost of production in the iron and steel industries and in the textile industries amply prove this proposition.

On the other hand, where the foreign born crowd for employment and dominate a given industry, as in the clothing industry in New York and Philadelphia, they reduce the rate of wages, and such a permanent reduction is possible because the standard of living which they adopt is so much inferior to that which is customary among their American competitors. The contest with the sweatshop in our great cities leaves no doubt upon this point. The report of the industrial Commission furnishes cumulative evidence of this tendency in a few lines of activity to build up industries on a basis of starvation wages which themselves rest upon the ignorance, helplessness, and incapacity of the foreign-born population of the tenement-house districts.

The testimony which has been brought forward with respect to the political, social, and industrial effects of immigration is of necessity indefinite in character. The problem of immigration is a problem of assimilation; and this means conformity to modes of living, modes of thought, and modes of action in many different fields of activity. There may be incapacity, but undoubtedly there is no unwillingness on the part of those who permanently reside among us to share to the fullest extent possible in the life of the community, with its opportunities and privileges. With respect to the permanent additions to the population, the question which concerns us is as to how far it is desirable that we should continue to recruit what are economically the weakest and least promising classes in the community. The idea that there must always be some one to do rough work has no standing in court. Modern engineering devises mechanical appliances for these purposes, and we have no fear that progress will cease because the human race is unwilling to be mere hewers of wood and drawers of water. It remains to consider, therefore, how far legislation has attempted to cope with the problem, and what has been its success in such an effort.

LEGISLATION. It has already been pointed out that immigration into the United States was so much a matter of course that before 1820 it was not even recorded. While in that year records of the number of arrivals were introduced, nothing was done in the way of legislation, either to promote or to restrict immigration into the United States, until the year 1864.

We may disregard the brief period in which the famous Alien Law was in force, 1798 to 1801, which authorized the President to expel foreigners dangerous to the peace of the nation, for this law was passed to meet a supposed political danger, and not to avert a threatened economic injury. Nor did the agitation against the foreigner, which gained such force in the Know-nothing movement during the early part of the fifties, lead to legislation. It is doubtful if the question would have assumed so large an importance had it not been for popular discontent with the older political parties. Moreover, the agitation was quite as much anti-Catholic as it was anti-foreign, and no majority of the American people could be gained for an attitude savoring of religious persecution.

The police and sanitary regulations, including quarantine, affecting the immigrants upon their landing in the United States, were matters of State, and not Federal legislation.

When, in 1864, Congress finally took cognizance of the immigration question, it was with the idea of encouraging immigration into this country. Under the pressure of the demand for laborers in industrial pursuits, an act was passed to encourage immigration which offered to the immigrants freedom from compulsory military service, and the services, upon their arrival, of a Commissioner of Immigration, whose duty it was to assist immigrants in obtaining transportation to their destination, and to protect them from the impositions to which their ignorance exposed them. The act was repealed in 1868, and no further legislation to promote immigration was enacted. The general spirit of the times was, however, favorable to immigration, and certain special reports of the Bureau of Statistics, *Labor in Europe and America* (1870), for instance, were widely disseminated with a view to encouraging immigration. About the same time the States, particularly those of the West, established boards and commissioners of immigration, charged with the duty of promoting immigration into their respective States.

It soon became evident that encouragement was no longer needed, and the tide of public opinion began to turn toward restriction. This did not at first extend beyond the idea of preventing the introduction into the country of manifestly undesirable elements—the criminal, the pauper, the insane, and the vicious. Section 1 of the act of August 3, 1882, imposed a head tax of 50 cents (increased to \$1 by the act approved August 18, 1894, and to \$2 by act of March 3, 1903) on each passenger not a citizen of the United States, stipulating that the money collected shall be paid into the United States Treasury as a fund to defray the expenses of regulating immigration, of caring for immigrants, and relieving those in distress, and for the general purposes and expenses of carrying the act into effect. (This fund, it may be remarked, has been found ample for its purposes, and an annual surplus has been turned into the Treasury.)

Section 2 provided that the Secretary of the Treasury should be charged with the duty of executing the provisions of the act, and for that purpose empowered him to enter into contracts with the officials of the several States at their several ports. By the act of March 3, 1903, the Commissioner-General of Immigration is placed

under the authority of the Secretary of the Treasury, although the Immigration Bureau is subordinate to the Department of Commerce.

Section 3 provided that the Secretary of the Treasury establish such rules and regulations, and issue, from time to time, such instructions, not inconsistent with law, as he should deem best calculated for the protection of immigrants from fraud and loss, and for carrying out the provisions of the act and the immigration laws of the United States, etc.

Section 4 treated of the exclusion and deportation of specified classes. It provided that foreign convicts, except those convicted of political offenses, lunatics, idiots, or any persons not able to take care of themselves without becoming public charges, should be sent back at the expense of the owners of the vessels on which they had come.

The act of 1882 is still in force in principle, though in minor points it was modified by a law of March 3, 1891, of which the following section is the most important:

"That the following classes of aliens shall be excluded from admission into the United States, in accordance with the existing acts regulating immigration, other than those concerning Chinese laborers: All idiots, insane persons, paupers, or persons likely to become a public charge, persons suffering from a loathsome or a dangerous contagious disease, persons who have been convicted of a felony or other infamous crime or misdemeanor involving moral turpitude, polygamists, and also any person whose ticket or passage is paid for with the money of another, or who is assisted by others to come, unless it is affirmatively and satisfactorily shown, on special inquiry, that such person does not belong to one of the foregoing excluded classes, or to the class of contract laborers excluded by the act of February 26, 1885; but this section shall not be held to exclude persons living in the United States from sending for a relative or a friend who is not of the excluded classes under such regulations as the Secretary of the Treasury may prescribe. *Provided*, That nothing in this act shall be construed to apply to or exclude persons convicted of a political offense, notwithstanding said political offense may be designated as a 'felony, crime, infamous crime, or misdemeanor involving moral turpitude' by the laws of the land whence he came, or by the court convicting."

The act was further amended by the law of March 3, 1903. By this law the Bureau of Immigration is given a right to deport epileptics, persons who have been insane within the five years preceding their arrival in America, and persons who advocate the overthrow of all governments or the assassination of public officials. Deportation may take place any time within two years after arrival.

The joint administration of immigration affairs by Federal and State officials which had been in vogue since the passage of the act of 1882 had not proved satisfactory, and by the act of 1891 the entire charge of the matter was assumed by the general Government. The statute of March 3, 1893, took a step in advance of previous legislation by requiring at least a preliminary inspection of immigrants at the point of departure. Each immigrant is provided with a number identifying him to the inspectors of

the United States. The medical inspection provided by the act has been a useful aid in preventing the introduction of disease.

Side by side with legislation to exclude persons morally and physically undesirable has gone the effort to exclude the contract laborer. The first law on this subject was passed February 26, 1885. It made it unlawful for any person, company, partnership, or corporation in any manner whatsoever to prepay the transportation or in any way assist or encourage the importation or migration of any alien or foreigner into the United States, under contract or agreement or parole, special, expressed or implied, made previous to the importation of such alien or foreigner to perform labor or service of any kind in the United States.

The object of this legislation was to prevent the agents of manufacturers from contracting in Europe with the laborers, oftentimes in herds, for the purpose of breaking strikes or introducing a supposedly more docile, because more ignorant, class of laborers. Moreover, it is plain that contracts made abroad would be made with reference to the scale of wages existing in foreign countries rather than those in force here, and would thus introduce a lower-priced competition, dangerous to the well-being of the working classes. The general spirit of the law has been commended by public opinion, though in its first form it presented some crudities which placed it in a ridiculous light, as where a clergyman was denied admission to the United States by reason of a contract made in England to assume charge of a parish in New York. Subsequent modifications distinctly eliminating the professional classes and bringing the operation of the law within the intention of the legislators have much improved the statute.

The general characteristic of the United States immigration laws is, that whoever enters in violation of the law is to be returned to the point of departure at the expense of the steamship company which brought him, and that this liability extends in all cases for a period of one year after arrival. The machinery for the enforcement of the law has been progressively improved. The number of immigrants who have been returned is as follows:

YEAR	No. returned	Per cent. of total immigration	YEAR	No. returned	Per cent. of total immigration
1890..	535	0.11	1896..	2,799	0.81
1891..	1,026	.19	1897..	1,880	0.81
1892..	3,732	.64	1898..	3,229	1.45
1893..	1,630	.36	1899..	4,061	1.30
1894..	2,806	.98	1900..	4,602	1.02
1895..	2,419	.93			

The main reason for the return of immigrants is pauperism.

One of the great difficulties in the way of the thorough administration of the law is the comparative ease with which persons of the undesirable classes obtain access to the United States through Canada. Arrangements have recently been perfected between the Canadian Government and the immigration service establishing an inspection in Canada. The effort is made to inspect not only the immigrants who give the United States as their destination, though arriving at Canadian ports, but also those who give Canada as their destination, but come into the

United States. The fact that of less than 5000 persons of the latter class inspected, 2000 were turned back, indicates clearly that the ineligible classes have been coming into the United States over the Canadian border.

The present immigration laws represent little more than sanitary measures designed to protect our society from the introduction of positively vicious and undesirable elements. The demand has been heard, and has been supported by a wealth of argument, that we should be more liberal in our interpretation of the word 'undesirable,' and exclude also such immigrants as, by reason of incapacity and ignorance, give the least promise of assimilation.

The question of still further restricting immigration made its appearance in the early nineties. It was felt that many persons were admitted into the United States who were not desirable acquisitions to our population. The demand was heard in many quarters that the illiterate should be excluded, and the question was actively agitated in Congress until 1897. In that year a bill passed both Houses of Congress which excluded from admission to the United States all foreign persons over sixteen years of age who could not read or write the English or some other language, except parents or grandparents accompanying persons otherwise qualified, or coming to join relatives already in the United States. The bill was vetoed in the closing hours of Congress, March 3, 1897, by President Cleveland, on grounds of general policy, as well as for material defects in the measure, such as the exclusion of the illiterate wives of qualified persons. The bill was reconsidered in the House of Representatives and passed over the President's veto by the constitutional majority of two-thirds; but as it passed the Senate by a narrow margin, no attempt was made to force a vote in that body, and the veto message was simply referred to the appropriate committee. In the following years the agitation subsided in view of the decreased number of immigrants.

IMMOLATION (Lat. *immolatio*, from *immolare*, to sacrifice, from *in*, in + *mola*, meal, mill-stone, from *molere*, to grind; connected with Goth., AS., OHG. *malan*, Icel. *mala*, Ger. *mahlen*, to grind, Eng. *meal*). A Roman sacrificial ceremony in which the victim was sprinkled with meal coarsely ground and mixed with salt (called *mola salsa*). Hence to 'immolate' means 'to sacrifice.'

IMMORALITY (from Lat. *in-*, not + *moralis*, moral, from *mos*, custom, right). In its broadest sense, any breach of the moral law; in a narrower sense, as contrasted with illegal conduct, an act of omission which is condemned by the law of morality, but which may not violate any rule of municipal law (q.v.). Many forms of moral conduct come under the con-

demnation of the criminal law, and it is the tendency of advancing civilization to brand with criminality many classes of acts which were formerly left to the penalties of conscience or of the Church. Other classes of immoral acts, not branded as criminal, yet incur indirectly the condemnation of the law, as by denying to the person who has been guilty of them his right to enforce a claim arising upon a contract or a tort. Thus a bond given for an immoral consideration, or to secure the performance of an immoral act, is unenforceable. Immorality which does not fall under the ban of municipal law rarely if ever affects the legal rights or status of a person. It may subject him to social censure, but it does not defeat him in the prosecution of a legal claim. Compare MALUM IN SE.

IMMORTALITY (Lat. *immortalitas*, from *immortalis*, undying, from *in-*, not + *mortalis*, mortal, from *mors*, death; connected with *Skt. mar*, to die, Gk. *μῆρος*, *moros*, death, and *βροτός*, *brōtos*, mortal, Lith. *mirti*, to die, OChurch Slav. *mrŭtvŭ*, dead, OHG. *mord*, Ger. *Mord*, murder, AS. *morþ*, death). The endless existence of the human soul in the continued possession of its distinct personality and consciousness. How early the idea of a survival after death entered the mind of man cannot be determined. There is no evidence of it in the Paleolithic period. But in the Neolithic period not only the ornaments, weapons, tools, and food placed by the side of the dead, but the houses, mounds, chulpas, and tombs built for them, testify to a belief that some of the dead for some time continue some kind of an existence after death. It is probable that at first death was looked upon as a deep and prolonged sleep. The dead was left in his dwelling-place, the survivors seeking a new home, or a special structure was made for him. Visions of the departed in dreams naturally led to the conclusion that they left their dwellings in the night, and, upon further reflection, to the theory of a double or finer material, but dependent upon the food and drink brought to the tomb. The practices of the Neolithic period already imply the development of some such theory of a 'soul.' The fact that these customs and the faith they imply survived into the more advanced civilizations of antiquity and are to be found extensively at the present time among peoples that have remained upon lower stages of development, indicates for them a very high age.

Tombs were the earliest temples, and the ancestral cult was the earliest form of divine worship. As long as offerings were made to the dead the departed ancestors were believed to exist and to protect their descendants. Thus the cult itself tended to create a confidence in an indefinite prolongation of existence in the case of the objects of filial worship. As the great cosmic forces began to attract more attention the double of the dead might be connected with them in one way or another, and thereby become more independent of the tomb. But even where, as in Egypt, this process can be most clearly perceived, the ancestral cult as the basis of hope for survival maintained itself to the latest times. Whether the mass of men in Egypt who were too poor to pay the cost of embalming and 'a house for eternity' were regarded as long surviving the shock of death is doubtful. But the assurance in a future life, as rich as the present

and not very different in its outward conditions, for those properly embalmed and entombed, was very strong. Numerous pictorial representations and inscriptions in tombs and papyri from different periods show how intensely the inhabitants of the Nile Valley believed in a life after death.

Starting from the same premises, speculation as to the future took a different turn in India. The doctrine of metempsychosis was developed. Without losing its identity, the spiritual substance in man was supposed to enter into other forms of life, rising or sinking in the scale of being in consequence of the deeds wrought in the body and the character formed. (See ESCHATOLOGY.) This transmigration of souls implied eternal existence before as well as after any appearance in the world as a human being. It precluded the idea of a disembodied spirit, and it adjusted outward circumstance to inner character, punishment to crime, and reward to virtue more nicely than any other system of thought. But this assurance of eternal life became itself a burden to the mind of man, and it cried out for deliverance from the endlessly turning wheel of existence. Buddhism offered relief in the hope of Nirvana. In Persia, Mazdaism proclaimed, possibly not in the Gathic period, but certainly as early as the third century B.C., the doctrine of a resurrection (q.v.). This doctrine was no doubt based upon the simpler and more widespread belief that the sleepers in the dust might be aroused. Cases of apparent death and successful resuscitation would strengthen this expectation. The animistic basis is quite evident.

Among the Iranian peoples of the northwest, the Sarmatians, the Scythians, and the Thracians, the faith in a future life was very strong. From Thrace the Orphic cult spread in the Greek world. While the Mycenaean tombs, as compared with the remains of the preceding age, reveal a growing importance attached to the life beyond, but no conceptions differing from those generally associated with the ancestral cult, and the Homeric poems tell of Elysian fields as well as a barren and cheerless Hades, but put no emphasis upon what still is a somewhat shadowy existence beyond with no moral distinctions, the Orphic cult societies offered to the initiated the hope of a blessed immortality. (See ESCHATOLOGY; HEAVEN; HELL.) The arguments of Socrates and Plato are far from being the first intimations of immortality among the Greeks. They are not endeavors to open new vistas into a life beyond. On the contrary, they represent a critical tendency seeking to establish the truth of a view held by many, and to find the rational grounds on which it can be maintained, if at all. In the following periods skepticism prevailed in some circles, ardent belief in others. If the practical character of the Roman caused him to cling to the ancestral cult, his hospitality to religious ideas opened the doors to the doctrines taught by the Orphic and Dionysiac societies. It was a real life of battle and of joy to which the Teutonic warriors looked forward in Odin's hall, Valhalla.

Among the Semitic nations the prevailing view left little joy in the thought of man's fate after death. The Babylonians and Assyrians seem to have believed in a semi-conscious later existence, but with no distinctions based on character or conduct, and no feature rendering it desirable. The myth of Ishtar's descent to the nether world

shows that imagination occupied itself with the abode of the dead, and the translation of some heroes to be with the gods tends to mark the contrast with the ordinary issues of human life. Substantially the same conception of the future was held by the ancient Hebrews. (See SHEOL; HADES.) There was no conception of an endless existence of the human soul in possession of a distinct consciousness, and no intimation of a difference based on conduct in this life. A poetic passage (Isa. xiv.) possibly shows that the kings were thought of as sitting upon thrones—consequently a social distinction. The intense religious life of the nation did not occupy itself much with the future of the individual. Neither the prophets, nor the legislators, nor the poets, nor the great wisdom-teachers, seem to have attached much importance to it. Their opposition to the ancestral cult and to necromancy may account in a measure for this indifference. Only as the sufferings of innocent individuals, particularly in the Exile, made the question of the divine government of the world acute, did 'the hope of man' receive attention by the thinkers of Israel. But the author of Job presents this possibility of a restoration to life only in order to reject it. He is not willing to obscure the issues by the introduction of what he considers a vain and improbable speculation. A high type of piety thus flourished without a hope of immortality. But the growing demand for a justification of the ways of God was met by foreign conceptions that brought relief by a temporary postponement of the problem. Persia contributed the thought of a resurrection, Greece that of immortality, in the stricter sense. The conception of a resurrection appears for the first time in Jewish literature in the Book of Daniel (written about B.C. 165). Here some of the dead are raised, probably the martyrs of the great persecution and their oppressors, to continue their life on earth.

There is evidence that this new life was sometimes regarded as of limited duration. In regard to the new body, some maintained that it was identical with the old, or of a similar substance; others that it was spiritual; some that it was bestowed on men at a general resurrection in the future; others that it was given immediately after death. In some circles it was thought that only the Israelites or the good would be raised; in others, that all men, even the wicked, would rise. (See RESURRECTION.) The new doctrine was chiefly accepted by the Pharisees; the Sadducees strongly opposed it. Ecclesiastes rejected the idea of a survival after death in every form. Meanwhile the Greek conception of immortality based on the nature of the soul, with or without the notion of preëxistence, found acceptance not only among the Alexandrian Jews, but to some extent also in Palestine. A doctrine of a future life in which the resurrection had no place is found in the Slavonic Enoch, Wisdom of Solomon, Philo, among the Essenes, and elsewhere. Jesus himself seems to have believed in a spiritual resurrection occurring immediately after death. A somewhat similar conception is found in the Pauline literature, while the Fourth Gospel presents the eternal life as a sharing in the divine nature that may begin, in time and continue through eternity, and seems to use the term 'resurrection' figuratively. The firm conviction of the early Church that Jesus had risen from the nether

world and ascended to heaven, and that He would presently return in glory to raise the dead and establish His kingdom on earth, tended to base the hope of survival upon His resurrection.

In I. Corinthians xv. the thought is expressed that if Jesus was not risen His disciples are not raised, and that it does not matter how life is lived, if that is the case. It was felt that through His resurrection He had thrown light upon life and immortality. Much of the success of Christianity was no doubt due to the prospect that it held out for a future life. It offered to all men, even slaves and barbarians not permitted to participate in the official cult and not invited to take the holy vows of the secret cult-societies, the same blessed immortality that was promised to those initiated in the Orphic, Dionysiac, and Mithraic mysteries, and it was itself influenced by the thoughts that had prevailed in these religious societies. (See HEAVEN; HELL.) The Greek idea that the soul is immortal by virtue of its own nature became dominant in Christian theology. The controversies within the Church have not affected this fundamental position, but have had reference to the character of the future life.

Through Maimonides the Greek conception of immortality found its way into the synagogue. At first it had a tendency to exclude the doctrine of a resurrection; subsequently it was made the philosophical basis of this doctrine as in the Church. With the renaissance of learning and the development of natural science doubts as to the immortality of the soul began to be expressed. Uriel Acosta (q.v.) was persecuted for rejecting this doctrine, and he had sympathizers among the deists. The growth of evolutionary philosophy in the nineteenth century led many minds to question the survival of the human soul after death, and the possibility of a continued life of the spirit apart from the bodily organism is today widely denied in scientific circles. Various reasons are given for this negative position. It is maintained that the mental life of man is so closely connected with and invariably dependent upon the brain that a continuance of any intellectual functions after the dissolution of the body is inconceivable. As the mentality of man appears to differ from that of the animal only in degree, and not in kind, any argument from the peculiarities of the human mind is held to imply also the immortality of the lower organisms.

Still greater difficulties are thought to arise from man's embryological development. The lack of any convincing evidence of communication between the dead and the living is pointed out, and it is urged that the origin of the belief can be naturally accounted for, and that its persistence is largely due to the social conditions in which man is placed. On the other hand, the doctrine is defended not only from the standpoint of belief in an infallible revelation, but also by thinkers who claim the right of free inquiry, and base their views solely upon what appears to them to be sufficient evidence. As a more careful exegesis renders it increasingly difficult to appeal to the Old Testament on that subject, it is generally the New Testament, and particularly the words ascribed to Jesus himself, that furnish the authority. Even from an independent point of view, great weight is often accorded to the conception of Jesus and the New

Testament writers, on the ground of the deeper intuition into religious truth possessed by them. The uncertainty, however, as to the actual words of Jesus and the growing impression that some at least of the writers of the New Testament did not believe in a natural immortality, but in an endless life bestowed as a free gift of God upon His children in an especial sense, have led many scholars who attach much importance to these spiritual authorities to accept the theory of a conditional immortality. The good will continue to exist; the wicked are destined for final annihilation.

Where the question of man's survival is decided in the affirmative without an appeal to authority, the reasons given are such as the inadequacy of the objections, the difficulty of accounting for certain phenomena except as manifestations of spirits, the incompleteness of the present life, and the 'intimations of immortality' to which it is felt that an objective reality must correspond. Facts are quoted that tend to show the independence of man's mind operating with great clearness, precision, and strength even in wholly abnormal physical conditions; and though, to render the argument strictly cogent, it would be necessary to prove that in these instances the brain was also affected, and that the mental power would not have been enhanced if the physical conditions had been more normal, importance seems to be rightly attached to this consideration. That the relation between mental activities and cerebral changes is very intimate is not denied; but it is thought that a distinct and separable spirit using the brain as its organ might act upon it in such a manner as to express different perceptions through different cerebral centres. The argument based on the evolution of mental life in animal and man, and the transmission of psychical as well as physical characteristics from man to man, is met by the observation that the consciousness of self, whatever its origin, is so distinguishing a mark of human nature and so intrinsically significant that a greater permanence and a loftier destiny may well be associated with it. Instead of making self-consciousness the basis of immortality, others prefer to think of the possession of a sense of right or a peculiarly high development of the moral nature as furnishing the ground for survival.

A mass of testimony is produced, ancient and modern, to show actual communication between the dead and the living. Much of this testimony comes from persons bereaved of some relative or friend whose potent personality still occupies the mind. In almost all instances the initiative is taken by the living, and the communication is mediated through a third person. A critical sifting is often impossible. Where the manifestations through a medium have been watched and studied by scientifically trained observers, there is at best only a small residue of facts that cannot be accounted for by known laws of nature. In the present state of our knowledge of psychic phenomena, it is sometimes hazardous to pronounce a judgment. The scientist is, as a rule, inclined to assume the operation of some law of nature not yet fully understood. The manifestations may thus furnish to our minds a presumption in favor of immortality, but they cannot prove it. With more effect an argument is founded upon the incompleteness of the present

life. The largest part of the human race die in infancy, or before years of discretion have been reached, and it is natural to ask whether there is no outflowing elsewhere of the human life that only buds here. Even the longest lifetime raises more intellectual problems than it solves, and leaves the mind curiously looking for their solutions to the last. The moral imperfections, seen even in the best, painfully apparent in the masses of men, give the impression of something fragmentary, unfinished, partially realized. The inequalities of life as regards wealth, position, health, opportunity for self-realization, and the still more marked inequalities of character, seem to call for a readjustment, for compensations in another life. If these considerations strictly prove only a dissatisfaction with prevailing conditions, and would to some extent lose their validity as arguments in a state of society better organized, more intelligent, resourceful, and strong than the present, the shrinking from even a painless death, the sense of an inalienable personality, and the long and widespread prevalence of the hope of a future life are deemed by many to have evidential value. The fear of death may indeed be a dread of extinction, and the fear of something after death the involuntary reflection of a belief long cherished by mankind. But it is forcefully argued that a belief so strong and persistent is not likely to be a sheer delusion.

While manifestly it is not safe to conclude from the intensity and popularity of an idea that there must be an objective reality corresponding to it, and while it is especially to be considered that modern science has revolutionized that estimate of the universe, held throughout the ages, with which all eschatological speculations in antiquity were closely connected, it nevertheless seems plausible that some fact in nature's economy is reflected in the hope of immortality. That the elements composing man's body at death are imperishable and will forever continue to be integral parts of forms that manifest the eternal energy is reasonably certain. That his psychical peculiarities survive in his offspring and in the human lives that directly or indirectly come into contact with him, is a matter of easy observation. Whether this survival in the race is endless seems to some thinkers doubtful, on the ground that the earth itself will some day have run its course and ceased to be the bearer through space of organic life. But as it is quite inconceivable that in an infinite universe, constituted, as spectral analysis shows, of essentially the same substances, a single satellite of a single sun should have produced intelligence like that of man, the secret of the earth's life may become known, and the influence of the human race, large or small, good or bad, may be felt elsewhere in the universe ere the final catastrophe comes, and even out of the death of this planet are likely to rise new forms of life.

That man will live forever in other forms of physical organization and of consciousness may therefore be regarded as exceedingly probable. Whether the consciousness of personal identity which cannot be stripped off or dissolved in the succession of fluctuating mental states and the accompanying sense of moral accountability can be fully explained as products of the brain due to the persistency of the physical type, in spite of incessant changes in the organism, may be gravely questioned. From the standpoint of idealistic

philosophy this consciousness of self is interpreted as betokening the presence of a spiritual monad reflected to human sense-perception only as though it possessed a material form. But even if the ultimate reality is conceived of as an infinite, eternal, and inexhaustible energy, it does not seem to follow that each or any of its individualized expressions shares its everlasting persistence. Rather would it seem as if the reality that no longer is shadowed forth to our sense in the outward form of a man must have ceased to be what it was. The idea of a conditional immortality has received some additional strength from the doctrine of a survival of the fittest. It encounters great difficulties, however, in attempting to define what constitutes fitness. The difference between a short life on earth and an endless existence is so infinitely great that the mind shrinks from ascribing the power to determine so momentous a fate to any conviction that has been formed, or disposition that has been developed, or line of conduct that had been adhered to, during a few years of earthly life, especially in view of the enormous influence of heredity and environment. If, therefore, scientific inquiry apparently leads to a *non liquet*, and assurance based on authority can be preserved only until the authority itself is questioned, it is the more gratifying to note the important place the doctrine of immortality has had in the education of the human race in enhancing the worth of the individual and emphasizing his higher spiritual interests, in maintaining his confidence in the inherent rightness of the universe, and in training him to regulate his present conduct by considerations of the future.

IMMORTALS, THE. A name given to the guards of the early Persian kings, forming a regiment of 10,000 foot-soldiers.

IMMORTEL, é'môr'têl', L'. A romance by Alphonse Daudet (1888), picturing with keen insight and irony the intrigues and petty strivings of the Academic world. The chief personages are the Academician Professor Astrier-Réhu, a second-rate scholar, who finds the sources on which he has based his work to be forgeries; his false,

intriguing wife; their spendthrift son; and Abel de Freydet, a candidate for the Academy.

IMMORTELLE (Fr., fem. sg. of *immortel*, immortal). A name applied to various species of Helichrysum, especially Helichrysum arenarium, which is grown extensively in France, where the flowers are made into compact wreaths for home use or for export. They are chiefly used as mortuary decorations, either in their natural color (yellow) or bleached white. Like other flowers, such as tuberoses and callas, that have been used largely for funereal decoration, immortelles have suffered in popularity, especially since the barbarous practice of dyeing them purple and vermilion, and working them into fantastic designs, came into vogue. The most striking feature of the immortelle is the one that suggested the name; the flowers, being dry and firm, are so-called 'everlasting.' They retain their natural colors for months or even years. See AMARANTH.

IMMUNITY (from Lat. *immunitas*, exemption, from *immunis*, exempt, from *in*, not + *munis*, serving, from *munus*, duty). Resistance of the living organism to infection. There is an astonishing difference in the resistance shown to the invasion by germs of disease by certain animals of allied nature. Human beings, cattle, and guinea-pigs show great susceptibility to tuberculosis; while the cat, dog, and horse resist it. Man easily becomes a victim of typhoid fever, while domestic animals never suffer from it. Immunity is either (1) natural or (2) acquired. *Natural immunity* is a congenital insensitiveness to infection or contagion which is possessed by certain individuals or families, or which exists as a racial characteristic. The same individual may be immune against a certain disease at one age and become susceptible to it at another age; thus infants are almost entirely immune against yellow fever, and but few cases occur among them. The Arab is said to be absolutely immune to typhoid fever. The Japanese are immune to scarlet fever. *Acquired immunity* is a condition of insusceptibility which results from passing through an attack of the disease, or from being inoculated with the poison of the disease, which results in a change in the blood. Immunity to yellow fever results after one attack of the disease. One attack of typhoid fever is almost a certain guard against another, a statement which is true also of scarlet fever and measles. *Experimental immunity* is acquired immunity resulting from introducing, for experimental purposes, attenuated microorganisms into susceptible animals, and thereby causing the production of immunity to virulent forms of those organisms. The house mouse and the white mouse, naturally very susceptible to anthrax, are rendered immune to this disease by receiving an inoculation of blood from a convalescent tetanic animal.

Immunity is lost or destroyed in a number of ways. It may be destroyed by (1) *variation from the normal temperature*. Pasteur found that chickens, naturally immune to anthrax, became susceptible to the disease after being plunged into a cold bath. (2) *Altering the chemical composition of the blood* by changing the diet, or by injection of drugs. (3) *Loss of strength, or exhaustion*, is a cause of loss of immunity, as Roget demonstrated by inoculating previously immune white rats with anthrax, after compelling them to work at revolving a

wheel. (4) *Removal of the spleen* is followed by susceptibility to disease (Bardach). (5) *Combining various microorganisms* destroys immunity in some experimental cases.

THEORIES OF IMMUNITY. In 1880 Pasteur taught that the microorganism, by its growth in the body, uses up some substances necessary for its existence, and then perishes. If the removal of this substance be complete, perfect immunity results. This is the *exhaustion theory*. Sternberg combats it, saying that if it were true, we must have in each of our bodies certain smallpox material, measles material, and scarlet-fever material, etc., each of which must be exhausted by its appropriate microorganism, thus necessitating an almost inconceivably complex body chemistry. The *retention theory* was advanced in 1880 by Chauveau, who suggested that the growth of the bacteria in the body probably originated some substance prejudicial to their further development. The *phagocytosis theory* was suggested by Carl Roser in 1881, received attention from Sternberg, and also from Koch, but was not advanced with any insistence till in 1884 Metchnikoff enthusiastically championed it and gave it his name. There are two varieties of the white blood-corpuscule whose duty it is to destroy bacteria: these are the large, unicellular leucocyte, or macrophagocyte, and the smaller form, the microphagocyte. Both these forms exhibit amœboid movements, and possess the attractive force called *chemotaxis* which exists between amœboid cells and food particles. Phagocytosis is the incorporation of foreign particles by these amœboid white blood-corpuscules. Leucocytes actually take up and envelop living pathogenic organisms, as demonstrated by Koch in 1878. The *humoral theory*, suggested by Grohmann in 1884, was advanced by Buehner, who claimed that not phagocytosis, but the bactericidal action of blood-plasma, is the cause of the destruction of pathogenic bacteria. He showed that freshly drained blood, blood-plasma, as well as aqueous humor destroyed such organisms. It was shown in rebuttal that dispersion in a large amount of watery fluid causes the death of microorganisms, which grow well when allowed to remain in a close colony. The prevalent and generally adopted theory is the *antitoxin theory*, defended by Behring and Kitasato, Brieger, Tizzoni, Cattani, Roux, Vaillard, and others. According to this theory, the metabolism of bacteria, during disease, gives rise in the blood of the sick person, not only to poisonous alkaloids called *toxins* (existing either in the bodies of the bacteria or produced by them), but also to defensive proteids called *anti-toxins*, which possess the property of neutralizing the toxins. Hankin divides the antitoxins (formerly called *alexins* by Buchner) into four groups. Proteid substances that occur naturally in animals and possess the power of destroying bacteria or their products, he calls *sozins*. Similar proteids resulting from acquired immunity in animals he calls *phylaxins*. Sozins are subdivided into those which have the property of killing bacteria, or *mycosozins*, and those which neutralize bacterial products, or *toxozozins*. A phylaxin which destroys bacteria he calls a *mycophylaxin*, and a phylaxin which neutralizes their ptomaines he calls a *toxophylaxin*. Consult: Roser, *Entzündung und Heilung* (Leipzig, 1886); Chauveau, *Traité de physique biologique* (Paris, 1901); Behring, *Die Blutserum-*

therapie (Leipzig, 1892); Sternberg, *Immunity: Protective Inoculations in Infectious Diseases and Serum Therapy* (New York, 1895). For the method of securing artificial immunity by means of defensive proteids, see ANTITOXIN; TOXINS; SERUM THERAPY; and VACCINATION.

IMMUNITY, in feudal law, and in international law. See FEUDALISM; INVIOABILITY.

IMOGEN, im'ô-jën. The daughter of Cymbeline and wife of Posthumus, in Shakespeare's *Cymbeline*, whom her husband is made to believe false by Iachimo, but whose fidelity is afterwards proved.

IMOGENE, im'ô-jën, THE FAIR. The heroine of Lewis's ballad "Alonzo the Brave and the Fair Imogene."

IMOLA, ã'mô-lâ. A walled city, on the Santerno, in the Province of Bologna, Italy, 21 miles southeast of the city of Bologna (Map: Italy, F 3). It has been the seat of a bishop since 422. It has an ancient castle, several asylums, and two theatres. It markets wine and vegetables, and manufactures leather, majolica, bricks, gunpowder, and fertilizers. Near by are mineral springs. In Roman times the city was called 'Forum Cornelli,' after its founder, L. Cornelius Sulla. Here was born Saint Peter Chrysologus, Archbishop of Ravenna, who died in 449, and the painter Innocenzo da Imola, who died about 1550. Population of commune, in 1881, 29,343; in 1901, 33,210.

IMOLA, INNOCENZO DA (c.1494-c.1550). An Italian painter, born at Imola. His real name was Innocenzo di Pietro Francucci, and he was the pupil of Francia at Bologna, and then studied under Albertinelli in Florence. Afterwards he went to Bologna and painted the frescoes of the "Death and Assumption of the Virgin" at San Michele (1519), also the "Madonna in Glory," and a "Madonna with Kneeling Donors," both in the gallery of that city. Among his other works are altar-pieces in the cathedral at Faenza, in Berlin, and in Munich. His best pictures are reminiscent of Raphael.

IMOSHAGH, ã'mô-shäg'. The national name of certain pastoral tribes of Tuaregs in the Sahara Desert, who are independent. See TUAREG.

IMPACT (from OF. *impacter*, *empacter*, to press close together, from Lat. *impingere*, to dash against, from *in*, in + *pangere*, to fasten). If a body in motion meets a second body—either at rest or in motion itself—there is said to be an 'impact' between them. The general principles of mechanics of course may be applied to the changes in the motion. (See MECHANICS.) The geometrical sum of the linear momentum of the two bodies is not changed by the impact: nor is the sum of their kinetic energies provided they are perfectly elastic. Consider the two bodies as moving along the same horizontal line. Let their masses be m_1 and m_2 and the velocities of their centres of inertia before and after impact be v_1 and v_2 and V_1 and V_2 , respectively. Then, for all bodies

$$m_1v_1 + m_2v_2 = m_1V_1 + m_2V_2.$$

(This law was given by Wallis, Wren, and Huygens almost simultaneously, 1668. The first applied it to inelastic bodies; the last two to elastic ones.) If the bodies are absolutely inelastic, $V_1 = V_2$; if they are perfectly elastic

$$\frac{1}{2}m_1v_1^2 + \frac{1}{2}m_2v_2^2 = \frac{1}{2}m_1V_1^2 + \frac{1}{2}m_2V_2^2;$$

if they are imperfectly elastic and of the same material, Newton has shown that

$$\frac{V_1 - v_1}{v_2 - V_2} = e$$

a constant for a given kind of material, which is called the 'coefficient of restitution.'

IMPALE (from Fr. *empaler*, It. *impalare*, ML. *impalare*, to impale, from Lat. *in*, in + *palus*, pole). In heraldry, to arrange two coats of arms side by side in one shield divided per pale. It is usual thus to exhibit the conjoined coats of husband and wife, the husband's arms occupying the dexter side or place of honor, and the wife's the sinister side of the escutcheon. A husband impaling his wife's coat with his own is not allowed to surround the former with the collar or insignia of any order of knighthood to which he may belong. Bishops, deans, heads of colleges, and kings of arms, impale their arms with their insignia of office, giving the dexter side to the former. In early heraldry, when two coats were represented in one shield side by side, only half of each was exhibited, an arrangement which had been called dimidiation (q.v.). Sometimes the one coat only was dimidiated. A reminiscence of dimidiation is preserved in the practice of omitting bordures, orles, and tressures in impaled arms on the side bounded by the line of impalement.

IMPAL/LA (African name). An antelope. See **PALLA**.

IMPANATION (Fr. *impanation*, Port. *impanacão*, It. *impanazione*, from Lat. *in*, in + *panis*, bread). A word coined in the Middle Ages to indicate a modification of the theory of transubstantiation. Formed upon the model of the word 'incarnation,' it ought to denote that the divine Logos took upon Himself the elements of the bread and wine of the Eucharist, just as He did humanity in the Incarnation. But it was used to denote the view that instead of a transubstantiation by which the substance of the bread and wine became the substance of the body and blood, there was in the Eucharist an assumption by the whole Christ, body as well as divine Logos, of the bread and wine, so that He was wholly present in them. This scarcely differs from Luther's personal view, which was that of the "sacramental permeation of the substance of the bread by the substance of the body," etc., and he was charged by Bellarmine and other Roman Catholics with reviving the old error of impanation. The official doctrine of the Lutheran Church, however, is that of the "sacramental coexistence at the same place of the two substances, both continuing to exist in their unmodified integrity." See **LORD'S SUPPER**; **TRANSUBSTANTIATION**.

IMPARLANCE (OF. *emparlance*, from *em-parler*, to talk, from *en*, in + *parler*, to talk, from ML. *parabolare*, to discourse, from Lat. *parabola*, parable, from Gk. *παραβολή*, *parabolē*, comparison, from *παραβάλλειν*, *paraballein*, to place beside, from *πάρᾱ*, *para*, beside + *βάλλειν*, *ballein*, to throw). In common-law pleading, an allowance of time to the defendant in a civil suit to put in his defense. As the name indicates, the grant of time was originally made to enable the defendant, before pleading, to talk with the plaintiff, with the view of coming to an amicable

understanding with him. Later, in certain classes of cases, the defendant was entitled to demand one imparlance (*licentia loquendi*) for this purpose, and this practice, in course of time, became a mere device for securing a reasonable time in which to plead. The term is not in general use in this sense in the United States. See **PLEA**; **PLEADING**. Consult Blackstone, *Commentaries on the Laws of England*.

IMPAS/TO (It., covered with paste). The name given to the practice of painters who lay on their color with solidity and thickness. Certain schools at one time loaded with color the light portions of their picture, and left the shadows thinly painted. In this way they thought to secure transparency, as it was called, in the shadows. The practice to-day, however, is to attain transparency in shadows by their true relation to the light parts of the picture, and this is done by painting all parts with equal thickness of pigment.

IMPATIENS. See **BALSAM**.

IMPEACHMENT (OF. *empeschement*, Fr. *empêchement*, hindrance, from OF. *empescher*, Fr. *empêcher*, to hinder, from ML. *impedicare*, to entangle, fetter, from Lat. *in*, in + *pedica*, fetter, from *pes*, foot). The act of calling a person to account for some misconduct, or of discrediting a witness, a document, or a record. Impeachment of waste is an ancient statutory proceeding instituted to restrain and punish the commission of acts of waste by tenants for life or years. (See **IMPEACHMENT OF WASTE**, and **WASTE**.) The manner in which a document or record or witness is impeached, and the legal effect of such impeachment, are explained in the articles on **TESTIMONY** and **WITNESS**.

There remains for our present consideration the peculiar method, known as impeachment, of prosecuting certain public offenders. In England it differs from the ordinary criminal prosecution in two respects: (1) the prosecutor is the House of Commons, and not the Crown; (2) the trial court is the House of Lords, and not an ordinary judiciary tribunal. In the United States an impeachment is generally instituted and prosecuted by the Lower House of Congress or of a State Legislature before the Upper House or Senate, although a few of our States provide for impeachments in the ordinary courts of justice.

This method of prosecuting criminals was employed for the first time in the case of Lord Latimer and others, who were accused of different kinds of frauds and malpractices connected with the revenue during the latter part of the reign of Edward III., and who were found guilty and condemned to imprisonment and removed from office. The proceeding is one of the monuments of the Good Parliament of 1376. Several other cases of impeachment of crime followed; but after 1459 acts of attainder (see **ATTAINDER**) took the place of impeachments for nearly two centuries. Under the Stuarts, however, Parliament again returned to impeachments as an effective method of dealing with officers of the Crown who were corrupt or oppressive. In 1621 Sir Giles Mompesson and Lord Bacon were impeached and convicted, removed from office, and heavily fined, for gross official misconduct. Since that date there have been fifty-two cases of impeachment in England, of which number but one has occurred within a hundred years, and

that one in 1805. The proceeding is practically obsolete there.

In the United States, however, it is still a live and vigorous institution. The court for the trial of impeachment is accounted the very capstone of our judicial systems, Federal as well as State. Its existence is secured and its organization is regulated by national and State constitutions. For example, the organic law of the Union provides that "the House of Representatives shall have the sole power of impeachment" (Art. I., Sec. 2, cl. 5), and "the Senate shall have the sole power to try all impeachments. When sitting for that purpose," it is declared, "they shall be on oath or affirmation. When the President of the United States is tried, the Chief Justice shall preside; and no person shall be convicted without the concurrence of two-thirds of the members present. Judgment in cases of impeachment shall not extend further than to the removal from office and disqualification to hold and enjoy any office of honor, trust, or profit under the United States, but the party convicted shall nevertheless be liable and subject to indictment, trial, judgment, and punishment, according to law." (Art. I., Sec. 3, cl. 6 and 7.) The Constitution further provides that "the President . . . shall have power to grant reprieves and pardons for offenses against the United States, except in cases of impeachment" (Art. II., Sec. 2, cl. 1); and again, "the President, Vice-President and all civil officers of the United States, shall be removed from office on impeachment for, and conviction of, treason, bribery, or other high crimes and misdemeanors." (Art. II., Sec. 4.) Similar provisions are contained in nearly every State constitution, although a few States remit impeachment trials to the ordinary courts of justice.

It will be observed that this extraordinary proceeding is limited by the Federal Constitution to the punishment of Federal officers. Can a Federal officer escape impeachment by resigning his office? The Senate decided in the case of Belknap, by a vote of 37 to 29, that he cannot. On the other hand, the Supreme Court of Nebraska has held that the prime object of impeachment proceedings is to protect the State from official misconduct, and that as soon as an officer resigns, the reason for resorting to these proceedings ceases. Thereafter, the offender is to be prosecuted like any other criminal by indictment and trial in the proper judicial tribunal.

Differences of opinion have developed, also, in this country concerning the nature of impeachable offenses. According to one view, only such official misconduct as renders the wrongdoer liable to indictment will warrant an impeachment; while another view is that this proceeding was intended to be very elastic and comprehensive, and to be applicable to every sort of official misdemeanor which is subversive of any fundamental or essential principle of government or highly prejudicial to the public interests. This view was adopted by the House of Representatives in preparing its articles of impeachment of President Johnson, and has been approved by the Supreme Court of Nebraska. It has been embodied in the constitutions of some of the States.

The literature upon this topic is quite extensive, both in England and in this country. See Blackstone, *Commentaries*; Anson, *Law and*

Custom of the Constitution (Oxford, 1886); Stephen, *History of the Criminal Law of England* (London, 1883); May, *Parliamentary Practice* (10th ed., London, 1901); Pike, *Constitutional History of the House of Lords* (London, 1894); Poore, *Federal and State Constitutions* (Washington, 1877); 6 *American Law Register*, N. S. 257, 641; *State v. Hastings*, 37 Nebraska Reports, 96 (1893); Story, *Commentaries on the Constitution* (Boston, 1882); *Addison Trial* (Lancaster, 1803); *Chas's Trial* (Baltimore, 1805); *Peck's Trial* (Boston, 1883); *Prescott's Trial* (Boston, 1821); *Impeachment of President Johnson* (Washington, 1868); *Bellknapp's Trial* (Washington, 1876); Mechem, *On the Law of Public Offices and Officers* (Chicago, 1890).

IMPEACHMENT OF WASTE (liability for waste). An expression of English law used to denote the liability of tenants for life or years for waste committed by them upon the estate. The phrase is commonly employed in connection with a lease of land for life or for a term of years, when an estate is given to such a tenant, "without impeachment of waste." He is then entitled to cut timber, and do many things on the estate which otherwise he would be unable to do. The privilege so granted is, however, not unlimited, but is confined to such reasonable use of the land as is included within the description of 'ordinary waste,' such as the cutting of timber for building and repairs, the improvement of the estate, etc. If the tenant abuses the right and attempts to cut down ornamental timber, for example, or deface the family mansion, the Court of Chancery will interfere by injunction to restrain the unauthorized waste. See WASTE.

IMPENDING CRISIS, THE. See HELPER, HINTON ROWAN.

IMPERATIVE, CATEGORICAL. See CATEGORICAL IMPERATIVE; ETHICS.

IMPERATIVE MOOD. See VERB.

IMPERATOR. See EMPEROR.

IMPERIAL CHAMBER (Ger. *Reichskammergericht*). One of the two highest courts of the Holy Roman Empire, coördinate with the Aulic Council (q.v.). It was created in 1495 by the Emperor Maximilian under pressure of the princes of the Empire, whose influence was greatly strengthened by the erection of the new tribunal. It was composed of a president nominated by the Emperor, two vice-presidents, and a number of associate judges, varying at different times from sixteen to fifty, selected partly from among men learned in the law and partly from the ranks of the nobility. Its jurisdiction included primarily all cases involving the princes of the Empire, but it sat also as the highest court of appeal in civil cases involving the interests of the member of any estate. It also offered redress for any refusal, delay, or miscarriage of justice on the part of any inferior court. Its sessions were held at Frankfort, Speyer, and, after 1693, at Wetzlar. It exercised a profound influence on the development of the civil codes in the various territories of the Empire.

IMPERIAL CITY, THE. A title frequently given to Rome.

IMPERIAL EAGLE, PIGEON, etc. See EAGLE, PIGEON, etc.

IMPERIAL FEDERATION. A plan to unite the different parts of the British Empire

more closely. At present the only formal tie between the various parts of the British Empire is the Crown. Many of these parts being so distant, of such diverse local interests, and having no representation in the Imperial Parliament, must naturally drift into complete independence, unless some reconstruction of the British Constitution be effected which shall retain and strengthen the interests of the self-governing colonies in the Empire. For several years this question has occupied the minds of British statesmen. In 1884 a gathering of leading members of both the Liberal and Conservative parties, in London, under the presidency of the Right Hon. W. E. Forster, resulted in the formation of the Imperial Federation League. A practical scheme of federation, prepared by a special committee of the League, was presented in 1892. It recommended the establishment of a council of the Empire, on which the chief self-governing colonies should be represented, including India and the Crown Colonies. This Council should deal with Imperial defense, to which each part of the Empire should contribute. The adoption of this report marks the end of the stage of general discussion without any definite plan, and the beginning of the period for taking steps to bring the matter to an issue. As the work for which the League was founded belonged rather to the first than the second stage, and as the members differed as to the best plan to be followed, it was decided to dissolve the League at the end of 1893, in order that there might be complete freedom in deciding on practical steps. Its place was taken by several organizations; among which are The United Empire Trade League, The British Empire League, The Imperial Federation (Defense) Committee, and The Unity of the Empire Association. Besides these there are many societies in the various colonies.

A conference which met in Ottawa June 28, 1894, composed of delegates from nearly all the self-governing colonies, marks a step in the progress of the movement. The object of the meeting was to promote the development of trade within the Empire by means of improved intercolonial communication. The keynote of the discussions was loyalty to the mother country and a determination to maintain intercolonial solidarity. Thus the conference served to bring about a mutual acquaintanceship and to arouse a feeling of intercolonial kinship. There are several practical difficulties to be encountered. Critics of the project doubt if the mother country would permit herself to be outvoted by a combination of the colonies, or whether each part would be willing to aid the others in matters not directly affecting itself. The various colonies have different tariff systems, some being strongly protectionist, and it is a question whether these last would agree to the free-trade preferences of the mother country, or whether England would modify her policy to please them. The basis upon which India could be included within the union is also a matter frequently discussed. These and other problems, it is asserted, must be solved before the federation can be accomplished.

On the other hand, the project has received the warm approval of a large section of the British and colonial press, and of men of such widely differing political views as Mr. Forster, Lord Randolph Churchill, Sir John Lubbock, and Mr. Cecil Rhodes. The growing intimacy be-

tween the parts of the Empire, as shown by the conference of 1894, and the gradual reduction of the barriers of time and distance, augur well for the success of the movement. The existence of a real and practical, though not formal, union is demonstrated by the aid furnished to the mother country in the Transvaal War of 1899-1902, and in the Chinese fighting of 1900. Many persons see a strong tendency toward ultimate Imperial federation in the recent federal unions of Canada (q.v.) and Australia. See AUSTRALIAN FEDERATION.

IMPERIAL INSTITUTE OF THE UNITED KINGDOM, THE COLONIES, AND INDIA. A memorial of the Queen's Jubilee of 1887, which is a public institution in South Kensington intended to contain "sample collections of the natural products and resources of every portion of the British Empire, so arranged and displayed as to be of practical benefit to commercial business men, and to allow of scientific research by every class of students." It is furnished, therefore, with laboratories and with reading and lecture rooms as well as with exhibitory departments. The University of London is now housed also in the buildings of the Imperial Institution. For a description of the building, with illustrations, consult in *Magazine of Art*, March, 1890, an article by Sir Somers Vane.

IMPERIALISM. A term originally applied to the character and spirit of that form of government known as an empire (q.v.), and connoting absolute power vested in the hands of a single ruler. More recently the term has been generally used to describe the policy, pursued by various nations, of establishing 'world powers' through the extension of their rule over other and especially inferior races of mankind, and, sometimes, through the acquisition, on whatever motive, of new territory lying outside their 'natural' boundaries. The policy, when logically carried out, results in the establishment or maintenance of colonies or outlying dependencies. In Great Britain the term is sometimes applied to the doctrine which calls for the closer union, into a so-called Imperial Federation, of the component parts of the British Empire. With reference to the questions of expansion of territory and extension of power, there has been much discussion in recent years, especially in Great Britain and the United States. In the former country those favoring such a policy are popularly known as 'Jingoes,' and those opposing it as 'Little Englanders.' Each acquisition or attempted acquisition of new outlying territory by the United States has met with much opposition, and the opposition was particularly pronounced at the close of the Spanish-American War, when a group of citizens, who soon came to be known as 'Anti-Imperialists,' vigorously contended against the acquisition by this country of the Philippines and Porto Rico. By various political leaders and a large number of voters 'imperialism' was regarded as the 'paramount' issue in the Presidential campaign of 1900.

IMPERIAL MOTH. The largest of the 'royal moths' (*Basilona imperialis*), sulphur yellow marked with purplish brown. The wings expand from four to five inches; the larva is thinly clothed with hairs and bears spiny horns on the

second and third segments. It feeds on the hickory, butternut, and other forest trees.

IMPERIAL ORDER OF SERVICE. A new order instituted in London June 26, 1902, by King Edward VII., to confer honor on those who have held continuous office under the British Crown either in England or in the colonies. The order consists of a sovereign and companions. Though the number of companions is unlimited, the order is practically confined to persons who have been employed in the various branches of the British Civil Service for at least forty years. Up to January 1, 1903, the order had been conferred on about one hundred and five gentlemen.

IMPERIAL WOODPECKER. See **IVORY-BILL.**

IMPERIUM (Lat., power, jurisdiction). A term applied to the sovereign power of a Roman magistrate when in command outside of Rome. Thus, a Roman consul, when operating in war, was invested with the power, *imperium*, that in Rome was the inalienable prerogative of the *Senatus Populusque Romanus*; and he was known as *imperator*, general-in-chief. When Augustus took under his own control all the important functions of the State, the republic merged into a monarchy, the *imperium* became the exclusive prerogative of the monarch, and *imperator* passed to its modern meaning of 'emperor.'

IMPETIGO (Lat., from *impetere*, to attack, from *in*, in + *petere*, to seek). A disease of the skin. The term was formerly applied to many different diseases of the skin which were characterized by pimples, pustules, and scales. In modern times Willan restricted the term to a disease of the skin, characterized by an eruption of small itching pustules, single or in groups, terminating in scaly crusts of a yellowish color. Hebra and more recent writers discard the term, and classify the old impetigo as a form of eczema (q.v.). Tillbury Fox, of London, describes impetigo contagiosa as an acute pustular, contagious skin disease, during which the patient suffers from fever, with vesicles and pustules on the face and hands, and thence extending to other parts of the body and followed by the production of yellowish crusts. Impetigo herpeticiformis is a similar, non-contagious eruptive dermatosis, occurring in pregnant women, attended with grave general symptoms. Impetigo rodens is either cancer or syphilis. For treatment of impetiginous eczema, see **ECZEMA.**

IMPEY, im'pī, Sir ELIJAH (1732-1809). An English jurist, Chief Justice of Bengal, born at Hammersmith. He was educated at Westminster School and Trinity College, Cambridge, and was called to the bar in 1756. He was counsel for the East India Company in 1772, and two years later was knighted and sent out to Calcutta as the first Chief Justice under the new regulating act. He naturally sided with his old school-fellow, Warren Hastings, in that Governor's political troubles, and this course of conduct, together with his condemning to death the famous forger Raja Nand Kumar, brought about his own recall and impeachment (1783); but he was discharged with honor, having been revealed as an amiable and upright judge, perhaps a trifle vain and too easily led by Hastings. Impey was elected member of Parliament for New Romney in 1790, but, although he held his seat until 1796, retired to the country in a couple of years, and

spent his latter days in educating his family and enjoying the society of his friends.

IMPEYAN PHEASANT. See **PHEASANT.**

IMPHEE. See **SORGHUM.**

IMPLEMENTS, AGRICULTURAL. A loose term applied to all implements and tools used in farming, not only in the tilling of the soil, but in the later preparation of the crop for market. Doubtless the first tools used were such as required only human strength in their manipulation. The crude spade, hoe, rake, sickle or scythe, and the flail of the ancients are the prototypes of the modern plow, cultivator, harrow, self-binder, and threshing-machine. After animals were subjected by man, the primitive plow and harrow appeared. At first these were branches of trees; the former a crocheted stick drawn through the ground, the latter a twiggy limb dragged over the surface. Cultivators and other implements for clearing the ground of weeds, for the occasional stirring of the ground while under crop, and for earthing up crops are all modern inventions. Especially during the nineteenth century were improvements made in almost every kind of farm implement. Indeed, not a few first appeared during that period, notably the perfected seed-drill, reaper, and self-binder. The threshing-machine has not only supplanted the flail and the use of animals in treading out the grain, but has also rendered obsolete the ancient methods of winnowing away the chaff. In short, every necessary operation of the farm is now performed with some implement or machine specially adapted to the purpose, and horse, steam, and in some instances electric power, have supplanted manual labor as far as such substitution has been deemed feasible. Since the publication of Thomas's *Farm Implements and Machinery* (1859 and 1869), a few American books have appeared which illustrate and describe many farm conveniences and appliances; but improvements in farm implements have been so numerous and important, and the applications of science so striking, that there is great need of a work which shall deal with fundamental principles.

Consult: Bailey, article "Tools," in *Cyclopedia of American Horticulture* (New York, 1900); Myrick, *Farm Conveniences* (New York, 1884); Martin, *Farm Appliances* (New York, 1887).

IMPLUVIUM (Lat., receptacle for rain-water). A tank or cistern in the centre of the hall or atrium of a Roman house. In the examples which remain at Pompeii the impluvium is generally formed of marble. It is placed immediately under the unroofed part of the atrium, and is intended to receive the rain which runs down from the roof through the opening or compluvium. The impluvium was frequently adorned with a fountain, and with busts, statues, and vases, and formed a very peculiar and interesting feature in the house. The term was also applied to the central open space of the atrium, even if unprovided with a collecting basin.

IMPOON, im-pōon' (Zulu name). One of the duikers (*Cephalolophus mergens*), a small antelope, very plentiful in South Africa, in wooded districts. See **DUKER.**

IMPORTS AND EXPORTS. In a general sense, imports and exports are goods which are conveyed across the boundaries of a region which

is economically a unit. Thus we read of the imports and exports of mediæval cities, and the intercolonial trade in America before the Revolution is classified in imports and exports. Since, however, almost all of our knowledge of imports and exports is connected with the collection of duties from them, it has become customary to apply the terms to goods carried into or away from regions which are units politically, in which no part levies discriminating duties against goods from another part. The trade between different parts of Australia, which formerly figured in statistics of imports and exports, has ceased to be so classed since the federation of the Australian colonies. A mere customs union of independent political units, however, would not change the character of the trade among its members.

The formation of extensive empires and federations which has taken place in modern times would in itself have largely diminished imports and exports. So also would the great diversification of industry which has marked the recent economic history of the chief modern States. Agricultural countries are rapidly becoming manufacturing countries also, and hence have less reason to export raw produce and import manufactures. On the other hand, the great cheapening of transportation and the development of a wider range of wants have had a tendency greatly to increase imports and exports. How greatly the latter set of forces have overbalanced the former may be seen by comparing the statistics of foreign trade of a hundred years ago with those of the present. See COMMERCE.

Since the opening of the modern epoch there has existed a feeling that imports are injurious to a country, while exports are advantageous to it. Early statesmen believed that imports tended to drain a country of its bullion, while exports tended to restore that form of wealth. Hence the numerous regulations of the mercantile period which aimed to discourage importation and encourage exportation. The special character of English imports and exports of the time assisted in developing this prejudice against imports. England largely exported wool and corn—commodities of high utility—and imported chiefly fine wares and articles of luxury, which were regarded by statesmen as injurious. The physiocratic school of writers, on the other hand, argued that since exportation of useful articles encouraged their production, it was to the advantage of a country to import its luxuries and devote itself to production of necessities. But this point of view has never been widely adopted by practical statesmen.

Prejudice against imports still exists; but it is chiefly on the ground that importation tends to diminish the employment of labor and capital within a country. Exports are regarded with favor as encouraging industry. Economists have shown that exports and imports have an irresistible tendency to balance each other. An excess of imports, followed by a drain of specie, lowers prices in the importing nation, and so encourages exportation. On the other hand, development of export trade must sooner or later result in an inflow of specie, higher prices, and consequent importation. The advantages of foreign trade in its entirety should, therefore, be the subject of study, not the advantages and disadvantages of the correlative phenomena that compose it.

In practical politics much stress is still laid upon the character of imports and exports. It is commonly regarded as highly desirable that a nation should export manufactures, and that its imports should as far as possible be raw materials. Manufacturers draw less upon the natural resources of a country and more upon the industry of its people. It is obvious, however, that a country with unique natural resources may attain a higher standard of well-being if it devotes its labor and capital to the exploitation of those resources, instead of endeavoring to produce manufactures in which it would have no relative advantage over other countries.

It has been said that there is a natural tendency for imports and exports to balance each other. This is true, however, only with qualifications. The total value of imports of the world must naturally exceed that of exports, since the cost of carriage enhances the value of goods transported from one nation to another. A nation like England, which does a more than proportionate part of the world's carrying trade, can permanently import more than it exports; while the United States, since it carries only a small part of its imports and exports, must permanently have a balance of exports. Again, a nation may invest the wealth gained by exportation in foreign enterprises, and will therefore have no corresponding surplus of imports until the returns from such enterprises begin to come in. Thereafter it may receive a permanent surplus of imports. So England, having invested heavily in other countries, normally shows a great excess of imports over exports, as does also France, while the countries which are heavily indebted to foreign capitalists export as a rule far more than they import. See COMMERCE; INTERNATIONAL TRADE; BALANCE OF TRADE.

IMPOST (Fr. *imposte*, from Lat. *impositus*, p.p. of *imponere*, to place upon, from *in*, in + *ponere*, to place, from *po-*, Gk. *ἀπό*, *apo*, away + *sinere*, to allow). The point where an arch rests on a wall or column, or the part of the structure from which it springs. It is usually marked by horizontal moldings; but sometimes these are absent, especially in Gothic architecture, where different forms of impost are used. These have been classed as—first, the continuous impost, where the arch moldings are carried down the pier; second, the discontinuous impost, where the arch moldings abut and are stopped on the pier; third, the shafted impost, where the arch moldings spring from a capital, and are different from those of the pier, the form used in best Gothic; fourth, the banded impost, where the pier and arch have the same moldings, but the impost is marked by a band of horizontal moldings, as is frequently the case in Italian-Gothic buildings. Two adjoining arches often spring from the same impost block. The member which receives this name was unknown before mediæval architecture.

IMPOSTORS, THE THREE (Lat. *De Tribus Impostoribus*). The name given to a work alleged to deny all divine revelation, characterizing the three great founders of religions—Moses, Jesus, and Mohammed—as impostors. Though it is often mentioned since the tenth century, and attributed to heretics of various ages and various degrees of eminence, no authentic copy is known to have ever been seen. A book bearing this title, and professedly published in 1598, was reprinted

by E. Weller, with German translation, Leipzig, 1846; without the translation, Heilbronn, 1876. In the eighteenth century renewed attention directed to the subject by the spread of infidelity caused the appearance of an apocryphal edition, which has been frequently reprinted.

IMPOTENCY (from Lat. *impotentia*, inability, from *impotens*, powerless, from *in-*, not + *potens*, able, from *potis*, powerful; connected with Lith. *patis*, Skt. *pati*, lord). As a legal term, an incurable incapacity that admits of neither copulation nor procreation. It is a ground for divorce by either spouse if it existed at the time of marriage and is incurable, whether it results from a defect caused by nature, or by accident, or by the acts of the party. It has been held that "where impotency is simply the result of old age, the marriage is still binding; that a man of sixty who marries a woman of fifty-two should be content to take her *tamquam soror*." The burden of proving impotency is upon the party alleging it as a ground for a divorce. Consult the authorities referred to under DIVORCE; HUSBAND AND WIFE.

IMPOUNDING. The placing in a pound goods which have been taken by distress (q.v.), or cattle which have been taken damage feasant or found astray. See POUND; STRAY.

Also, the retention of a deed or other legal document in the custody of a court in which it is produced. This may be done where the instrument is suspected of being forged, or is otherwise of such a character as to satisfy the court that it may be used as the basis of a criminal prosecution. It is then impounded by order of the court, in order that it may be available when required for that purpose.

IMPRESSIONIST SCHOOL OF PAINTING (from Lat. *impressio*, from *imprimere*, to impress, from *in*, in + *primere*, to press). A group of painters who endeavor to render the impression of an object, or being, exactly as it is in nature. Strictly speaking, every painter is an impressionist, in so far as he renders his own impressions, and the term 'Luminists' has been proposed by Van Dyke as more appropriate, since the school is mainly concerned with rendering light. They constitute a branch of the Realist school, and are also called Naturalists, corresponding to the modern Naturalist schools of sculpture and literature. They differ from Realists like Courbet in that they conceive nature to present a series of flat, colored surfaces, and not figures in rounded contours. Their pictures are marked by an absence of modeling.

The chief object of the Impressionists is to render the effects of light. They paint everything in full light, and condemn the practice of painting in the studio as giving untrue tones. All their pigments are light. Bright colors are placed side by side, and the school avoids the middle tones by which earlier painters achieved harmony of color. Their works, being momentary impressions, are marked by great rapidity of execution, and seem sketchy in character. Indeed, the members of the school have justly laid themselves open to the criticism of exhibiting unfinished sketches for pictures. So great a painter as Monet, for example, held an exhibition of studies of poplars seen at different times of day and seasons of the year. Closely inspected, their paintings seem mere blotches of color rough-

ly applied; but seen at a distance they present pictures strikingly true to nature. Their rapidity of execution enables the Impressionists to portray motion and the nuances of expression to an extent not previously attained. Their figures are real men and women in the actions of daily life, not models posed in a studio. They took the final step in the liberation of modern art from ancient tradition in color—a revolution begun by the Romanticists under Delacroix, and continued by the Realists under Courbet. Being the latest school, they have also come nearest to solving the specific problem of nineteenth-century art—the representation of light, color, and moving life.

The Impressionists found their way to public favor very slowly. At first they were the subject of much ridicule. Manet, the founder of the school, had to exhibit his first Impressionist picture in the Salon des Refusés in 1863. A powerful factor in their progress to public favor was their championship by Zola, whose articles in behalf of Manet attracted great attention. They were much aided by the picture dealer Durand-Ruel, who, at a time when they were generally condemned, held exhibitions of their work side by side with that of the Barbison masters. It was not until the early seventies that critics and the general public began to take them seriously. Painters, however, were quicker to recognize the progress in color and atmosphere which Impressionism represents. Its work is quite generally accepted and followed, and its permanent influence has been to raise the pitch of light in present painting. It is, however, a question whether there will not be a reaction in favor of greater form and solidity in painting than is the present practice.

The chief French representatives of Impressionism are Monet, the present head of the school, and Siseley, in landscape; Degas, Raffaelli, and Pissaro, in figure and genre painting. Its influence is strongly felt at Munich and Glasgow, and in the United States, where the chief representatives are Weir and Twachtmann. The late Theodore Robinson was also a prominent exponent of the school. Consult: Duranty, *La nouvelle peinture* (Paris, 1876); Duret, *Les peintres impressionnistes* (ib., 1878); Lecomte, *L'art impressionniste* (ib., 1892); Muther, *History of Modern Painting* (London, 1896).

IMPRESSMENT. A procedure formerly adopted in Great Britain to obtain additional seamen for manning the navy. It was admitted to be unjust to the individual, but was made legal on the ground that the country had the right in time of war to the services of any individual. All seafaring men, except masters and mates of merchant vessels, watermen-apprentices, and certain other exempted persons, were liable to be forcibly seized, taken on board men-of-war, and compelled to serve. The practice was extended to cover men on board vessels in other than home waters. As the British Government claimed a right to the services of her seamen wherever found, men were seized on board foreign merchant vessels, and even on men-of-war which were too weak to resist. Similarity of language and the fact that many American seamen were of British birth caused the United States to be the greatest sufferer from the British press-gangs, and eventually this grievance became a leading cause of the War of 1812. It is stated that the number of

impressed Americans serving in British ships between the years 1802 and 1812 was seldom less than the total enlisted force of the United States Navy at the time, and at the beginning of the war more than 2000 Americans were discharged into prison ships for refusing to fight against their own country. In the treaty of peace Great Britain did not formally give up her claim to the right of impressment as respected seamen in American ships, for the subject was not mentioned; but the claim of the United States was tacitly admitted, and no further attempts were made to impress men from American ships.

IMPRISONMENT (from *imprison*, OF., Fr. *emprisonner*, from *en*, in + *prison*, prison, from Lat. *prænsio*, arrest, from *prehendere*, *prendere*, to seize). The restraint of a person's liberty for any cause whatever, whether by authority of the Government or in defiance thereof. In the latter case it is 'false imprisonment' (q.v.). It does not necessarily imply a prison with bolts and bars, but may be exercised by any use or display of force, lawfully or unlawfully, in the open street. A man becomes a prisoner, wherever he may be, by the mere word or touch of a duly authorized officer directed to that end. Usually, however, imprisonment is understood to imply an actual confinement in some jail or prison employed for the purpose according to the provisions of law. The power to imprison is in many cases inherent in courts or magistrates, and in others conferred upon them by statute, and it may be employed in civil as well as criminal proceedings. Imprisonment for debt, once universal in this country, under the operation of the English common law, is now generally abolished by statute, except in cases where the action of the debtor is tainted by fraud, or he is reasonably suspected of an intention to avoid his debts by concealing his property, or removing that and himself from the State. Witnesses whose testimony is necessary for the conviction of a criminal often are imprisoned to prevent their escape from the jurisdiction of the court. Persons accused of crime are either confined till the day of trial or released on bail, according to the gravity of the offense. Courts have the power to imprison for contempt of their authority, and persons found guilty of crime are imprisoned for periods definitely fixed by statute or by the judgment of the court. The confinement of lunatics in asylums appointed for the purpose is not here considered, as such asylums are not usually regarded as prisons. A person who wrongfully or illegally deprives another of liberty may be sued in a civil action for false imprisonment by the person aggrieved, or prosecuted as for a criminal offense. A prisoner desiring release is entitled to a writ of *habeas corpus* to obtain the judgment of a competent court as to the legality of his imprisonment. See **ARREST**; **DEBTOR**; **DURESS**; **PUNISHMENT**; **BAIL**; **DEBT**; etc.

IMPROBATION (Lat. *improbatio*, disapproval, from *improbare*, to disapprove, from *in-*, not + *probare*, to approve, from *probus*, good). In Scotch law, the title of a proceeding for setting aside a deed or other instrument, which is apparently valid and probative, on the ground of forgery or falsehood. It belongs to the class of 'rescissory' actions, and is equivalent to the jurisdiction exercised by the courts of equity in England and America, in setting aside and canceling

legal instruments, and in removing clouds on title. See **EQUITY**; **FRAUD**; **MISTAKE**.

IMPROMPTU (Lat., in readiness). In music, a short extemporaneous composition. Also a title given to compositions for pianoforte that have little thematic development.

IMPROMPTU DE VERSAILLES, ăn'prôn'tu' de văr'să'y', L'. A play by Molière (1663), in which he attacked the critics of his *Ecole des femmes*.

IM'PROPE'RIA (Lat. nom. pl., reproaches). A series of antiphons and responses which are sung in the Catholic Church on Good Friday, as a part of the mass of the presanctified. Ever since 1560 Palestrina's famous Improperia have been sung in the Sistine Chapel in Rome.

IMPROPRIATION (from ML. *impropriatio*, from *impropriare*, to impropriate, from Lat. *in-*, in + *proprius*, own). A term used in England, signifying the transfer to a layman of the revenues of a benefice to which the cure of souls is annexed, with an obligation to provide for the performance of the spiritual duties attached to the benefice. The spiritual duties are discharged by a clergyman, who is called a vicar, and who receives a certain portion of the emoluments of the living, generally consisting of a part of the glebe-land of the parsonage, together with what are called the 'small tithes' (i.e. tithes of hops, potatoes, and the like farming products) of the parish.

IMPROVISATION (from Lat. *improvisus*, unforeseen, from *in-*, not + *providere*, to foresee, from *pro*, before + *videre*, to see). The art of producing without previous preparation a poem, or a musical composition. Oratory, although in its original form it is founded on spontaneous efforts, is not ordinarily considered under the head of improvisation; but poetry and music, while subject to inspiration, are rather dominated by their complexity, and improvisation in these branches represents a peculiar and unusual ability. Poetry and music, like the dance and music, were inseparable in their early history; the Egyptian priests chanted improvised hymns to their deities; while in Greece, the real home of improvisation in antiquity, it was customary for poets to recite impromptu verses to the accompaniment of the lyre. In later Roman times Archias, the friend of Cicero, Publilius Syrus, Ovid, and Statius, were famous improvisatori. But as in the course of centuries languages grew more compact, and as less license was allowed, improvisation almost died out among civilized nations. Among savage peoples it has always been practiced. From the decline of Rome to the ninth century improvisation as an art was practically unknown. Then, however, came the renaissance, and the troubadours, the trouvères, the minnesingers, and the meistersingers (qq.v.) followed each other in rapid succession. Italy was quick to take advantage of the adaptability of her language, and the courts of Naples, Milan, and Ferrara became poetical centres from which the new art spread throughout the Peninsula. In Germany and in France improvisation was soon superseded by careful composition, but in Spain, and especially in Italy, it lingered long. Petrarch, in the twelfth century, gave a great impetus to improvisation, and down to the present day in Italy it has played an important rôle in the imaginative life of the

poorer classes. Improvisation is by no means limited to brief poems of a few verses, and of simple structure, but is often carried on in complicated metres, and to great length. Some of the most famous of the Italian improvisatori have been: the Venetian Leonceno (died 1524); Serafino of Aquila (died 1500); Accolti of Arezzo (sixteenth century); Metastasio (q.v.), who, however, soon abandoned the art; and Tommaso Syrici (died 1836). In Corsica and Sardinia there are many women (improvisatrices) who improvise long memorial poems at funerals. Among the best-known improvisatrices may be mentioned Magdalena Fernandez (died 1800), Signora Mazzei (born c.1800); and Giovannina Milli.

In music, improvisation is the art of performing extemporaneously upon an instrument. A given theme or themes may be developed in strict form, or the performer may give himself up to momentary impulses and employ any number of themes in a free fantasia. The former, however, is a great art, and nearly all the masters, notably Bach and Beethoven, excelled in it. To improvise in a given form requires not only an unusual command over the technique, but also a marvelous power of concentration. Undoubtedly the improvisation of a strict fugue is the most difficult task imaginable. Bach was a master of this.

IMPULSE (from Lat. *impulsus*, incitement, from *impellere*, to incite, from *in*, in + *pellere*, to drive). The typical motive to voluntary action. (See ACTION.) Such action is, at first, unequivocally determined: that is to say, the bodily movement follows, without hesitation or reflection, upon the formation of single, unchallenged motive. As the physical organism and the mind grow in complexity, voluntary action comes to be equivocally conditioned; there is a period of deliberation and doubt, characterized by a conflict of motives, some one of which ultimately prevails, as actual motive, over the potential motives, its rivals.

The simplest form of voluntary action, that which is prompted unequivocally by one unquestioned motive, is termed in psychology impulsive action, and the motive itself an impulse. The scientific definition of the terms is reflected in popular usage: we call a character 'impulsive' which acts off-hand, without balancing of alternatives: though the ideas of waywardness and unaccountability that we associate with the idea of an 'impulsive character' do not attach to the impulse as such, but indicate rather some inherited idiosyncrasy or defect of early training. The impulse proves, on analysis, to be a fairly stable connection of sensational and affective processes. If we look at it in its complete or perfect form, but make its constituent processes as simple as possible, we find the following components: (1) the perception of an *object* to which we are attracted or from which we are repelled; (2) an idea of our own movement toward or away from the object, based upon previous experience of actual movements; (3) an idea of the result of our movement; and (4) an affective process, the resultant of the affective colorings—oftentimes mutually opposed—of the three sensory factors. It is not difficult, in laboratory practice, to arrange for the formation of a motive in which these latter processes shall be represented on practically equal terms. In

real life, although (as we said) the impulse is fairly stable in composition, we usually find a predominance of some one of the three ideas, and a subordination of the others. Thus, the idea of our own movement may recede far into the background of the impulsive consciousness, where it finds expression, perhaps, only in some inconspicuous fringe of organic sensation; while, as the reach of consciousness increases, the idea of object comes more and more to be lost sight of in comparison with the idea of end or result. It should be remarked, further, that the idea of our own movement, important as it is at a certain level of mental development, cannot be contained in the very first impulse, and cannot be of much importance for a considerable time after voluntary movements have been initiated: for, on the one hand, we must have moved before we can have an idea of our movement (so that the most primitive action of all is an 'action upon presentation,' made in response to the simple perception of object); and, on the other, primitive movements are too vague, and too little differentiated to play the regulating and refining part that they later assume. Conversely, the complex motives that enter into conflict with one another in volitional and selective action are simply complicated impulses, in which the place of perception and idea is taken by associations of ideas or by judgments or trains of reasoning.

It is difficult to give an illustration of an impulsive action, for the reason that what is impulsive in one man's consciousness need not be so in another's. The impulsive action which we select may have been repeated so often as to have degenerated into ideomotor action, or even into a secondary reflex; or it may be so unaccustomed as rather to deserve the name of selective or volitional action. We can, however, take a fictitious case. Suppose that a boating party, arriving at a secluded bay, are seized with the impulse to bathe. Here we have the object-perception of the cool, clear water; the anticipation in idea of the free movements of diving and swimming; and the further forecast of the bodily vigor and refreshment that will ensue. All three ideas are pleasant. An opposition of affective processes might arise if the water is distinctly cold: in this case, the combined pleasantness of movement and result overcome the unpleasantness of the object-perception. It is, however, easy to see that, for persons who always bathed when they had the opportunity, the action would be rather ideomotor than impulsive; whereas, by those members of the party who were weak swimmers, the plunge might be taken only after a good deal of hesitancy and indecision.

IMPULSE OF A FORCE. See MECHANICS.

IMPUTATION (Lat. *imputatio*, from *imputare*, to ascribe, from *in*, in + *putare*, to think, from *putus*, clear; connected with Lat. *purus*, pure, Skt. *pā*, to purify). One of the common technical terms of Christian theology. It de-

notes the transference of the *merit*, in a legal sense, of punishment or reward.

The two problems in connection with which the term is used are those offered by the universal prevalence of sin in the world, and by the forgiveness of men, which the New Testament teaches is for Christ's sake. The former problem arose in connection with the Pelagian controversies in the time of Augustine (see PELAGIANISM; PELAGIUS; AUGUSTINE); the latter in connection with the controversies of the Reformation. The Scriptures teach *some* connection between Adam's sin and the sinfulness of all men (cf. Rom. v. 12). Augustine explained it by a theory of realism, that men sinned *in* Adam. Calvinism taught that Adam's sin was *imputed* to his posterity, so that they were treated *as if* they had committed it, being held to the consequences of it in the form of disorder of nature, and actual sin resulting therefrom. In the course of time several varieties of imputation were distinguished, immediate, mediate, etc. This phraseology was supposed to be derived from the scriptural usage, but no like use can be found in the Scriptures. Properly understood, it conveys erroneous ideas, and may be allowed as one of the standard forms of theological expression. But it has the disadvantage of being a purely external, forensic form of statement, and of neglecting the ethical elements of the doctrine. In respect to the forgiveness of sinners for Christ's sake, imputation was originally applied by the Church of the Reformation only to Christ's passive obedience, or suffering on the cross; and when this was said to be imputed to us, nothing more was meant than that we are forgiven for Christ's sake. Later, by that scholastic tendency which always dominates in the period of systemization, distinction was made between the passive and the active obedience of Christ or His obedience to the law, and this was also said to be imputed to the sinner in the act of justification. A new connotation was insensibly added to the word impute, and it was supposed that only that could be imputed to one which he did *not have*. Thus the Westminster Confession finally went so far as to say that faith itself is not imputed to believers as 'their righteousness,' although it is said in Rom. iv. 3 that Abraham's faith was imputed to him for righteousness. The distinction is correct if it be understood that faith is not imputed as the *ground* of their forgiveness, which ground is the work of Christ. This is the indubitable meaning of the Confession. But it is as certainly the meaning of the Epistle to the Romans that faith, since it involves complete and loving submission to God's will, is of the essence of righteousness.

Modern theology, even when of Calvinistic descent and in sympathy with the truths which Calvinism sought to formulate and defend, professes to emphasize the internal and ethical aspects of the doctrine. The connection of Adam and the race in the matter of sin, instead of being explained by realism and imputation, is explained by the law of heredity. If Adam sinned, it was inevitable that so serious and deep-reaching a fact should propagate itself. Like begets like; a web-footed bird, another web-footed one; a sinner, a sinner. The law of habit plus the law of heredity is all that is necessary to explain the universal corruption of human nature and the universality of sin. Forgiveness for Christ's sake, in like

manner, can be better explained without than with the employment of the idea of imputation. Christ cannot, strictly speaking, *merit* anything for us, because merit, like demerit, is essentially personal, and cannot be transferred. But Christ can do that *on account of which* it is consistent with the nature and attributes of God, and with the honor of the law and of the divine justice, freely to forgive sin. He alone can do this. And therefore He alone can lay the ground of our forgiveness. His sufferings are, therefore, that on account of which we are forgiven; and this covers the whole subject without need of bringing in any imputation whatever. The difference is, however, more one of point of view and phraseology than of essential doctrine.

IMUS, Ἐμόος. A town of Luzon, Philippines, in the Province of Cavité, founded in 1795 (Map: Philippine Islands, E 5). It lies within a short distance of Manila Bay, and about 18 miles south of Cavité. Population, in 1898, 14,675.

INACHUS, Ἰνάκῦς (Lat., from Gk. Ἰναχός). The Greek name of a river in Argos, and also of the god of the river. When Poseidon disputed about the possession of Argos, and Inachus decided for Hera, Poseidon is said to have dried up the bed of the stream, so that no water could flow through it in summer. Inachus is described also as the first King of Argos, and leader of the Argives from the mountains to the plains, whence Argos is called Inachian. In the legends he is especially celebrated as the father of Io (q.v.).

INAGUA, Ἰνάγκωα, GREAT and LITTLE. Two of the Bahama Islands, West Indies, situated at the southern end of the group (Map: West Indies, L 4). Great Inagua lies about 60 miles northeast of Cuba, and occupies an area of over 660 square miles. It is only slightly elevated, and is surrounded by reefs. The chief settlement is Matthew Town. Little Inagua lies about 10 miles northeast of the larger island, and has an area of about 36 square miles, and but few inhabitants. The population of Great Inagua is estimated at 1500.

INAJA PALM, Ἰνάτζα (probably from the native name), *Maximiliana regia*. A South American palm, common in the countries near the Amazon. It has a massive stem 15 to 20 feet high; very long, drooping, pinnate leaves, which are sometimes more than 15 feet long, with leaflets in groups of three, four, or five at intervals along the midrib, from which they stand out in different directions; numerous spadices; large woody spathes; and densely clustered elongate fruit, with tough skin and soft pulp, and hard stony seed. The spathes are used by hunters to cook meat in, and with water in them they stand in the fire well enough for the purpose. They are also used as baskets, and as cradles by the Indians, who also eat the fruit, which is particularly attractive to monkeys and some kinds of birds. The leaves yield a serviceable fibre that is used by the natives in the manufacture of ropes, hats, etc.

INAMA-STERNEGG, Ἰνάμα-στέρνεγκ, KARL THEODOR VON (1843—). An Austrian economist and statistician, born at Augsburg. Educated at Munich, he became docent there (1867), professor at Innsbruck (1868), and at Prague (1880). In the following year he was made head of the Statistical Bureau in Vienna, and professor of the University of Vienna. He was

president of the Central Statistical Commission (1884), and in 1891 he was named a life member of the Austrian Upper House. An economist of the historical school, he was editor of the *Zeitschrift für Volkswirtschaft, Socialpolitik und Verwaltung* (1892), and of many departmental publications. He wrote: *Verwaltungslehre* (1870); *Die Ausbildung der grossen Grundherrschaften in Deutschland während der Karolingerzeit* (1878); *Deutsche Wirtschaftsgeschichte* (1879-1901); the important *Zur Verfassungsgeschichte der deutschen Salinen im Mittelalter* (1886); *Salandsstudien* (1889); *Abriss der deutschen Wirtschaftsgeschichte* (in Paul's *Grundriss der germanischen Philologie*, 1889); and *Die persönlichen Verhältnisse der Wiener Armen* (1889).

INANITION. See STARVATION.

INARCHING. A method of grafting (q.v.).

INBREEDING. See CROSS-FERTILIZATION.

INCANDESCENT ELECTRIC LIGHT.

See ELECTRIC LIGHTING.

INCANDESCENT GAS LIGHT. See GAS, ILLUMINATING.

INCANTATION (Lat. *incantatio*, from *incantare*, to enchant, from *in*, in + *cantare*, frequentative of *canere*, to sing). The employment of song for magical purposes. In consequence of the excitement awakened by rhythmical utterance, verse has from early times been supposed to possess a divine element. Vergil and Horace represent songs as able to bring down from heaven the moon and the stars; and such influence, in these poets only fanciful, was at an earlier period commonly ascribed to sacred verses. It was further believed that both gods and ghosts were placated by song; and it is a universal feature of worship that in all ceremonies chants are employed which have been handed down from antiquity, preserved with scrupulous exactitude, and supposed to exert supernatural effect. In ancient times every function of human life was accompanied with incantations, presumed to be as essential as were the natural means employed. Poetic formulæ, it was supposed, had power to summon and banish demons, to raise and disperse storms, to bestow sunshine and rain, to grant success in war and in love, to inflict and remove disease, to cause crops to grow, wither, or remove from one granary to another, to make cattle breed and bees swarm, to bring success to the fisherman and hunter, and so on indefinitely. Song, when used for magic ends, is often reinforced by appropriate motions and actions, and frequently recited by a shaman (medicine-man, magician). Thus, among Navahos the rite called the Mountain Chant, primarily intended for the cure of disease, constitutes an elaborate festival of nine days' duration. It is explained by a myth, to which the songs allude. These form sequences, of which the order must not be changed, and among them are prayers of a simple character, which recite the nature of the sickness, entreat that it may be healed, and end with an assertion that the work is accomplished. Similarly, ancient Babylonian formulæ of an exorcistic character, directed against diseases conceived as evil spirits, ordinarily begin with enumerating the effects of the malady or names of the hostile powers, express the desire of the suppliant for recovery, and conclude with an invocation to Heaven and Earth, who are besought to deliver the sufferer.

These also were often associated with ritual, for the performance of which directions are given. Of course, with the songs are sometimes employed other agencies, as when in the *Odyssey* the hero, injured by a boar's tusk, has his hurt bound by the sons of Autolyceus, who then proceed to employ an incantation, supposed to stanch the wound. In process of time the ceremonies employed in such cases fell into disuse, and the words of such charms became half intelligible, or altogether meaningless. It seems to have been always usual that the miraculous healer should recite his rhymes in a low tone of voice, in such a manner as to be unintelligible to spectators, whose sense of mystery was thereby heightened. Considering the tenacity of tradition, it might be expected that some of these formulæ should have a long history. For instance, a German incantation recorded in the tenth century, and evidently of heathen origin, relates that while certain deities were riding in the forest, a horse dislocated his leg, which the gods wished to heal; Wodan was successful by means of an incantation. A similar charm at a later time appears in Christian form, Peter and John replacing the deities, and Christ taking the place of Wodan as the healer. In the nineteenth century, a form of this incantation was still in use in Shetland, but accompanied by an elaborate ceremony, every part of which was regarded as essential, and which included the use of a thread spun from black wool and having nine knots, wound about the sprained part. At the present day the custom remains in force among simple peoples. In English nursery lore the habit of incantation survives in some simple rhymes of children and young people, as, for example, in verses directed against rain, or those addressed to the moon and stars in order to obtain auguries as to the future mate. Consult the authorities referred to under MAGIC. See SPELLS.

INCARNATION (ML. *incarnatio*, from Lat. *incarnari*, to be made flesh, from *in*, in + *caro*, flesh, Gk. *κρέας*, *kreas*, AS. *hrāw*, Skt. *kravya*, raw flesh). In Christian theology, the assumption of humanity, by the second person of the divine Trinity, by which He was both God and man in one person. The idea of the manifestation of God in human form is as old as religion. It underlies all the supposed appearances of God to men. It is found especially in the religion of India, where there are repeated incarnations of the divine principle in beasts and men. (See TRANSMIGRATION.) The biblical doctrine is, however, entirely different from all these doctrines, since it is the doctrine of a real assumption of human nature, by a distinct person of the Trinity, for a specific purpose, and once only. It is as different from other doctrines of incarnation as the Christian doctrine of sin is from other doctrines.

The fact of the incarnation is variously represented and sustained in the Scriptures. It is introduced by the story of the miraculous conception of Jesus. He was not born, as other men are, of two parents, but was born of a virgin, miraculously conceived by her of the Holy Ghost. The direct evidence for this is confined to the two Gospels of Matthew and Luke. The disposition has been frequently manifested to deny the value of the accounts and the reality of the miraculous conception. This has recently received some furtherance from the higher criticism of the New Testament. The fact that the accounts are not

confirmed from other sources of the Gospel history, that the genealogies seem to derive Jesus' descent from Joseph, that various expressions are used in the body of all the Gospels implying that He was born in the natural way, and that Paul and other New Testament writers know nothing of the matter, is variously urged. But there is nothing inconsistent with the accounts or the fact in other portions of the New Testament, and the peculiar nature of the subject demanded a degree of reticence upon it which would naturally lead to its late explanation, and to the silence of most of the New Testament, written when it was, upon this point. For an excellent discussion of the subject, consult Weiss, *Life of Christ*, book ii., ch. 11 (Eng. trans., Edinburgh, 1883).

By the miraculous conception God specially prepared the humanity of Jesus, and the natural conclusion is that it was prepared for a special purpose. Then, all through the Gospels Jesus is represented as having 'come' into the world. In the Gospel of John it is said that the Word, who "was in the beginning with God and was God," "became flesh" (John i. 14), or man, and in Philippians (ii. 6-7) it is similarly said that Christ, "being in the form of God," emptied Himself and took "the form of man." The whole atmosphere of the New Testament is that in Christ we have a heavenly, an eternal, a divine, being come to earth for the salvation of man. And that there may be no doubt that such is the real meaning of the Bible (intimated in the Old Testament as well as declared in the New), the later writers of the New Testament ascribe to Christ the work of creation, that of preservation, and that of divine government of the world, designate Him as the goal toward whose glorification the world is tending, and teach that He will come in glory to be our judge, to close the history of this world, and to deliver up the kingdom again to the Trinity.

Thus the reality of the divine nature of Christ is set forth. But another point must be understood before the biblical doctrine is fully comprehended. This heavenly being, come to earth of His own act for the salvation of man, is the proper 'self,' the dominating and willing 'I,' in the person of Christ. Thus Christ is not a man in whom God dwells, illuminating Him and fitting Him for the work of a prophet, but He is God Himself, acting variously for the instruction, enlightenment, and salvation of man.

At the same time, the human nature of Christ is real and entire. He was truly born, and lived as other men do. All this in perfect unity of consciousness, which was the consciousness of the divine Logos. The explanation of the union of these two natures in one person is the task of Christology (q.v.).

IN/CAS. See PERU.

INCE-IN-MAKERFIELD, ins'in-māk'ēr-feld. A town in Lancashire, England, one mile east-southeast of Wigan (Map: England, D 3). It has railway-wagon works, iron-works, blast-furnaces, cotton-works, and extensive coal-mining. The town has owned its water-works since 1871. Population, in 1891, 19,250; in 1901, 21,270.

INCENDIARISM. See ARSON.

INCENDIO DEL BORGIO, ên-chân/dê-ô dël bôr'gô (It., burning of the city). A fresco by Raphael in the Vatican.

INCENSE (from OF., Fr. *encens*, Lat. *incensum*, incense, from *incendere*, to burn, from *in*, in + *candere*, to glow; connected with Gk. *καθαρός*, *katharos*, pure, Skt. *śandra*, *candra*, shining, noon, from *śand*, to be bright). A perfume the odor of which is evolved by burning. Its use in public worship prevailed in many ancient religions. The incense at present in use consists of some resinous base, such as gum olibanum, mingled with odoriferous gums, balsams, etc. There is no regular formula for it, almost every maker having his own peculiar recipe. The ingredients are usually olibanum, benzoin, styrax, and powdered cascarilla bark. These materials, well mingled, are so placed in the censer (q.v.) or thurible as to fall by sprinkling on hot charcoal, which immediately volatilizes them, and their odor is diffused through the edifice. Among the Jews the burning of incense was exclusively employed as an act of worship. In the Catholic Church, both of the West and of the East, incense is used in public worship, more particularly in connection with the eucharistic service, which is regarded as a sacrifice; but writers are not agreed as to the exact date at which such use was introduced. Saint Ambrose, in the Western Church (340-397), alludes to incense in terms which suppose the practice of burning it to be an established one; and in later writers it is mentioned familiarly as a part of ordinary public worship. It is used in the solemn (or high) mass, in the consecration of churches, in solemn consecrations of objects intended for use in public worship, and in the burial of the dead. In the reformed churches the use of incense was abandoned, but in the last half-century it has been restored to some extent in the Anglican communion; and the 'Catholic Apostolic' (or Irvingite) Church (q.v.) has used it since its foundation.

INCEST (OF., Fr. *inceste*, from Lat. *incestum*, incest, neut. sg. of *incestus*, unchaste, from *in*, not + *castus*, chaste). Sexual intercourse between persons who are legally prohibited from marrying because of their affinity or consanguinity (q.v.). It is not a common-law offense, but in England is punishable in the ecclesiastical courts by excommunication and penance. It is said to be the only form of immorality which, in the case of the laity, is still punished by the

ecclesiastical courts on the general ground of its sinfulness.

In most of the American States it is a criminal offense by statute, punishable by imprisonment for a term of years, usually not exceeding ten. In some States the marriage of persons within the prohibited degrees, even when not followed by cohabitation or accompanied by sexual intercourse, amounts to criminal incest. Consult: Stephen, *History of the Criminal Law of England* (London, 1883); Blackstone, *Commentaries*; Bishop, *Statutory Crimes* (Chicago, 1901).

INCH/BALD, ELIZABETH SIMPSON (1753-1821). An English novelist and playwright, born at Stanningfield, near Bury Saint Edmund's, Suffolk. She educated herself, mostly by general reading. After vain attempts to engage herself as actress, both in Norfolk and in London, she married, in 1772, the actor Joseph Inchbald. Later in the same year she made her first appearance on the stage at Bristol in the rôle of Cordelia. With her husband she performed in the provincial towns till his death (1779), and continued to appear for ten years more. As an actress she had the advantage of great personal charm, but an impediment in speech prevented the highest success. Beginning to write for the stage as early as 1782, she produced about twenty comedies and farces, which were well received at the London theatres. But of her literary work, only her two novels have survived: *A Simple Story* (1791), which, though ill-constructed, was one of the best novels since the death of Smollett; and *Nature and Art* (1796), which was also very popular. Mrs. Inchbald also edited three collections of plays: *The British Theatre* (25 vols., 1806-09); *Modern Theatre* (10 vols., 1809); and *Farces* (7 vols., 1809). She wrote her memoirs, but destroyed them. Consult: Scott's edition of her *Novels* with a memoir (London, 1880); Boaden, *Memoir* (ib., 1833); Elwood, *Memoirs of the Literary Ladies of England* (ib., 1842).

INCH/CAPE ROCK, or BELL ROCK. A dangerous reef in the North Sea, east of the Firth of Tay in Scotland. A bell attached to a buoy is said to have been placed here by an abbot of Aberbrothock to warn sailors. This bell was cut from its support by a pirate, who, on a subsequent voyage, was lost on the spot. The tradition is embodied in Southey's ballad "The Inchcape Rock." In 1810 a lighthouse was built with much difficulty on the reef.

INCH/COLM. A picturesque islet in the Firth of Forth, Scotland, separated from the Fife shore by 'Mortimer's Deep,' a channel about a mile wide (Map: Scotland, B 4). It is half a mile long, with a maximum width of one-third of a mile, and is noted for its monastic ruins, which exhibit traces of the twelfth-century Romanesque architecture, but are chiefly in the early pointed style of the thirteenth and fourteenth centuries. They consist of the remains of an abbey of Austin Canons regular, founded by Alexander I. in 1123, and include a vaulted oratory, and a chapter-house with groined roof and three elegant sedilia. The Latin names of the islet are *Æmonia* and *Insula Sancti Columbae*, the latter derived from Saint Colm or Columba (q.v.) of Iona, who dwelt here in the sixth century. As Saint Colm's Inch, it is mentioned in Shakespeare's *Macbeth*,

act i., scene 2. The monastery was frequently sacked by the English during the fourteenth, fifteenth, and sixteenth centuries. Consult Simpson, *Æmona and the Islands of the Forth* (Edinburgh, 1861).

INCHKEITH, inch'kéth. A small fortified island of historic interest in the Firth of Forth, Scotland, nearly midway between Leith and Kinghorn (Map: Scotland, B 4). It has a lighthouse 220 feet above high water, visible 21 miles.

INCHWORM, or MEASURING WORM. See GEOMETRID MOTIL.

INCIDENT (from Lat. *incidere*, to fall upon, from *in*, in + *cadere*, to fall). In law, a right, privilege, or burden inseparably annexed to an estate or tenure of lands. Thus, rent reserved upon a lease for life or years is incident to the reversion, or estate of the landlord, and passes with the latter upon its assignment; and a right to distrain is incident to a rent charge and attends it into whosoever hands it may come; and a court baron is incident to a manor (q.v.), which, indeed, cannot exist without such a court. In the same sense, the rights of inheritance and of free alienation are incidents of an estate in fee simple, and the right to take estovers (q.v.) is an incident of a tenancy for life or years, while dower and curtesy are among the incidents of estates of inheritance.

More specifically, the term incident is employed in English law to describe a certain class of obligations attaching to the several forms of feudal tenure. Viewed from the standpoint of the lord of whom the lands were held, these were certain legally defined rights which inured to him by virtue of his superior or paramount title. They were due, as a matter of legal obligation, from all land held by such tenure, and not by virtue of any understanding or agreement—which fact distinguishes them from the *services* due from the tenant to the lord, which were entirely a matter of agreement.

The most important of these 'feudal incidents,' as they are termed, were *aids*, *reliefs*, and *escheats*, which were due from all secular tenures, and *wardship* and *marriage*, which were peculiar to the military tenures. These will be described under their appropriate titles. Though differing greatly in the kind and amount of the burden which they imposed upon the land, they had this in common, that they came to be regarded as the essential and distinguishing characteristics of the several forms of tenure to which they were appropriate. The military structure of the feudal system in England decayed rapidly after the Conquest, and the expression military tenure, or tenure in chivalry, was regarded not as tenure for which military service was in fact to be rendered, but tenure attended by the burdensome incidents of wardship and marriage; while socage tenure was not so much a tenure by a fixed and determinate service, but one free from those incidents.

Most of the incidents of tenure were done away with by the famous statute which abolished military tenures (12 Chas. II., c. 14), and only the right of escheat remains to remind us of the feudal origin of our land law. See FEUDALISM; KNIGHT SERVICE; SOCAGE; TENURE; and the authorities there referred to.

INCIDENTALS (from *incident*, from Lat. *incidere*, to fall in, from *in*, in + *cadere*, to fall).

In music, the notes of a chord which are not absolutely essential to its harmonic completeness. Incidentals are thus opposed to essentials (q.v.). They are divided into two classes, consonant or strong incidentals, and dissonant or weak incidentals.

INCLEDON, *in'k'l-don*, CHARLES BENJAMIN (1763-1826). An English singer, born at Saint Keverne, Cornwall. He received his musical education in the choir of the Exeter Cathedral, to which he was admitted in 1771. A few years afterwards he entered the navy, and served until 1783. His professional career as a musician began when he appeared at the Southampton Theatre in the *Castle of Andalusia*. In 1817 he visited America, and sang the rôle of Hawthorn in *Love in a Village*, at the Park Theatre, in New York City. Soon after his return to England he left the stage, and from that time traveled in the provinces as a musical entertainer. His voice was best adapted to ballads, and it was in this kind of singing that he excelled. Three songs which contributed greatly to his popularity were "The Storm," "Black-Eyed Susan," and "Arethusa."

INCLINATION, MAGNETIC, OR DIP. The angle made with the horizontal by the axis of a magnetic needle swinging freely in a vertical plane. The inclination of a magnetic needle varies at different places of the earth's surface, ranging from 90° at the magnetic poles to zero at the magnetic equator. The varying amount of magnetic inclination will be found indicated on the isoclinic charts accompanying the article **MAGNETISM, TERRESTRIAL**. This property of a magnetic needle was first discovered by Robert Norman in 1576, and an instrument was devised by him by which the amount could be measured. The phenomenon had previously been noticed by George Hartman, in Nuremberg, in 1544, but he was neither able to measure the amount of inclination accurately nor to explain the phenomenon. The amount of inclination is determined by the dipping needle (q.v.) and is measured when the magnetic needle is freely swinging in a vertical plane containing the meridian. If the plane of the needle is placed at right angles to the magnetic meridian the axis needle will form an angle of 90° with the horizontal. The dip of the needle is subject to the same periodic variations as its declination (q.v.), but these changes play a far less important part. In order that an ordinary compass-needle may swing in a horizontal plane, it is customary in northern latitudes to make the southern end of the needle heavier; or the same effect may be secured by using a symmetrical needle which has been weighted with a small bit of brass on its southern half. See **COMPASS; DECLINATION; DIP OF THE MAGNETIC NEEDLE; DIPPING NEEDLE; MAGNETISM; MAGNETISM, TERRESTRIAL**.

INCLINED PLANE. A smooth plane inclined to the horizontal plane at any point on the earth's surface. Imagine a plane section through this inclined plane and the horizontal one, perpendicular to their line of intersection. Let the plane be supported by an upright; and let two bodies of masses m_1 and m_2 , joined by an inextensible string, be placed, as shown, one on the plane, and one hanging freely, the string passing over a pulley. If the bodies are in equilibrium, the forces on the body of mass m_1 ,

parallel to the plane, must balance each other. There is a force $m_1 g \sin \theta$ down the plane and a

INCLINED PLANE.

force $m_2 g$ up the plane; hence $m_1 g \sin \theta = m_2 g$; or, in general, the force up the plane equals the weight of the body on the plane multiplied by the sine of the angle of inclination of the plane. To produce motion up the plane of a heavy body requires, therefore, less force than its weight.

The 'mechanical advantage' is $\frac{1}{\sin \theta}$

Another method for solving this problem is to consider as before the two bodies in equilibrium, and to produce a small displacement; let the body whose mass is m_1 move up the plane a distance x_1 , and the body whose mass is m_2 move vertically down, owing to this, a distance x_2 . By the principle of energy $m_1 g \sin \theta x_1 = m_2 g x_2$; but $x_1 = x_2$; hence, as before, $m_1 g \sin \theta = m_2 g$. Inclined planes are still used daily for rolling up heavy weights. They were used by all ancient peoples for raising heavy stones for building purposes. The screw is nothing but an inclined plane rolled around a cylinder.

INCLOSED ARC LAMP. See **ELECTRIC LIGHTING**.

INCLOSURES OF COMMONS. At common law, the only method by which the right to inclose lands subject to common rights could be gained was by mutual agreement between all who had commonable privileges therein. It was a tedious and unsatisfactory method. Oftentimes some of the interested persons were subject to disabilities, in which event a special act of Parliament was required. The benefits of inclosure became evident centuries ago, and as early as the reign of Henry III. a general act of Parliament, known as the Statute of Merton, was passed, authorizing the 'inclosure and improvement' of commons of pasture, upon certain conditions. In the reign of Edward I. the Statute of Westminster the Second was passed in amendment and extension of the former act. Comparatively little progress was made under the laws in the partition of common lands. Not until 1801 was a general inclosure act passed. This has been followed by a large amount of legislation, all tending in the direction of facilitating the division of commons, their conversion into separate and independent land holdings, the inclosure of such holdings, and the improvement of those portions that are retained for the common use of towns or villages. Consult: Williams, *Rights of Commons* (London, 1880); Scrutton, *Commons and Common Fields* (London, 1887).

IN CÆNA DOMINI (Lat., at the Supper of the Lord). A celebrated Papal bull, so called because designed to be read in the Church on every Holy Thursday, the day on which the Lord's Supper was instituted. It is not, as other bulls, the work of a single pope, but with various ad-

ditions and modifications, dates back to early times; some tracing it to Urban V., and others to Martin V., Clement V., and some to Boniface VIII. Its present form, however, it received from the popes Julius II., Paul III., and finally Urban VIII., in 1627, after which it continued for a century and a half to be published annually. Pius V., in 1568, decreed that it should be read every Holy Thursday until superseded. The contents of this bull have been a fertile subject of controversy. It may be briefly described as a summary of ecclesiastical censures, especially of those with which grievous violation of the faith of the Church, or of the rights of the Church or of the Roman see, are visited; excommunication being denounced against heresy, schism, sacrilege, usurpation of the rights of the Church or of the Pope, forcible and unlawful seizure of Church property, personal violence against ecclesiastics, unlawful interruption of the free intercourse of the faithful with Rome, etc. The bull, however, although mainly dealing with offenses against the Church, also denounced under similar censures other crimes, as piracy, plunder of shipwrecked goods, forgery, etc. This bull, being regarded by most of the sovereigns of Europe as an infringement of their rights, encountered in the seventeenth century the determined opposition of nearly all the courts, even the most Catholic; and at length, in 1770, Clement XIV. discontinued its publication, which has never since been renewed. Pius IX., on October 12, 1869, abrogated many of its censures.

INCOMBUSTIBLE FABRICS. Much attention has been paid to the production of incombustible fabrics, and of solutions which may be applied to any fabrics to render them more or less fireproof. As typical of the first may be mentioned asbestos cloth when this fibre is used either wholly or in part to form the fabric. Experiments have shown that many salts possess this power of rendering substances which were immersed in solution of them incombustible, but at the same time some of these injure the fabric, spoil the color, or are so very expensive as to render their general use impossible. Two, however, viz. tungstate of soda and sulphate of ammonia, produce the best results without injuring the tissue or color of the fabric. The first of these acts physically by preventing contact with the air, and does not interfere with the process of ironing and starching; it is, therefore, preferable for goods requiring washing. For fabrics which are used without previous washing, sulphate of ammonia is preferable. Soluble glass is a highly alkaline solution of minerals composing glass which is applied to textures, in theatres especially for curtains and scenery, to render them fireproof. Fire touching them melts the invisible minerals into a glaze which excludes air and prevents combustion. All these solutions, however, are likely to lose their efficiency if some time has elapsed since they were applied. See **FIREPROOFING.**

INCOME TAX. A tax upon the income of individuals. It may be levied directly upon the individuals receiving the income, or it may be collected from the income at its source in the form of a tax upon dividends, interest on bonds, etc. It may be uniform, taxing all incomes at a uniform rate, or progressive, increasing the rate

of taxation with the amount of income received by the individual. An income tax may differentiate between various forms of income, as, for example, between incomes from labor and incomes from property, or between permanent and temporary incomes. Differentiation may be attained either by levying a higher rate upon some forms of income than upon others, or by the imposition of a supplementary tax upon property or upon consumption which will in effect fall upon the incomes discriminated against.

In States which levy an income tax it is usually the practice to exempt small incomes, or that portion of the income necessary to mere independent existence or to the maintenance of the usual standard of life, and to levy the tax only upon the excess. The theory of such exemption is that the State should not take from the individual in the form of taxes what it will be obliged to return to him in the form of poor relief or otherwise.

In theory the income tax, more nearly than any other system, meets the requirements laid down in the most advanced canons of taxation. A man should be taxed according to his ability, or 'faculty'; and income is the best test of ability. A graduated tax on incomes is popularly defended on the ground that it may be employed to bring about a more equal distribution of wealth. In the latest financial theory, however, graduated taxation is justified on the ground that a man's ability to pay taxes increases more rapidly than his income. Differentiation of taxation is advocated on similar grounds. One who receives an income from permanent property is in a more favorable position than one who receives an equal income from labor, since the latter is compelled to make provision against unemployment, while the income of the former is quite at his disposal. It is, therefore, in accordance with the faculty test that incomes from property should pay a higher rate than incomes from labor.

In practice it is found to be difficult to determine directly the magnitude of a man's income. This is especially true in countries like America and England, where it is the policy of Government to interfere as little as possible in the business affairs of the individual. This difficulty is greatly reduced when the tax is levied, not directly upon the individual, but upon the source of the income. Under this system, corporations may be required to withhold a part of the dividends for the payment of the tax as well as a part of the salary of employees. When the tax is levied at the source, however, it is difficult to graduate it so as to tax those who receive large incomes at a higher rate than those whose incomes are small.

The income tax was introduced in England as a purely fiscal expedient. The huge expenditure of the Napoleonic wars forced the adoption in 1799 of an income tax, which, with a short intermission, lasted till the close of the war. It was again revived in 1842, and although in 1874 an attempt was made by Gladstone to secure the repeal of the tax, it has maintained its position to this day as an integral part of the British financial structure. The British income tax is levied on the source of the income, and does not attempt to provide for graduation or differentiation. It has proved to be a very productive tax; and by changing the rate the Government is enabled to increase or diminish its revenue so as

to cover exactly fiscal needs. In Italy the income tax was introduced by the law of 1864 (amended in 1877), and the fiscal needs of France after the Franco-Prussian War forced it also to adopt a national tax upon the income of corporations and associations. By a law of 1891 Prussia introduced a direct tax upon incomes. The tax was graduated, but at first made no provision for differentiation. In 1893 an auxiliary tax was levied upon property, thus establishing differentiation in effect. In 1893 Holland adopted an income-tax law which provided both for graduation and differentiation. By this law corporations as well as individuals are subject to the tax; but the holders of corporate securities pay no additional income tax on the revenue from them. A similar law was introduced in New Zealand in 1893. Switzerland, Denmark, and Austria levy income taxes, as does also Australia.

During the War of 1812 an income tax was advocated for the Federal Government by Secretary Dallas, and in 1862 such a tax was actually adopted, and remained in force until 1872, despite the opposition of the propertied classes. No satisfactory machinery was established for its application. Individuals were required to submit estimates of their incomes, and as there was no means of verifying these estimates, the tax was paid only by those who were scrupulous enough to admit that their incomes exceeded the untaxed minimum. In spite of the great increase in national wealth, the receipts from the income tax declined from year to year. In 1894 the income tax was again introduced as a part of the Wilson Tariff Bill, and was carried largely by the Western and Southern members, despite violent opposition from the cities of the East. The tax, however, was declared unconstitutional (May 20, 1894) because, although a direct tax, it was not apportioned among the States according to population.

Income taxes have been imposed in several States (Massachusetts, Pennsylvania, Louisiana, Virginia, North Carolina, South Carolina), but in no case have they been rigidly enforced and justly administered, and in no case have they been productive of large revenue. The Income Law of Massachusetts dates from colonial times, and exempts incomes under \$2000, as well as income derived from property already taxed. See FINANCE; TAXATION.

INCOMMENSURABLE. See COMMENSURABLE.

INCONNU, *ān'kō'nu'* (Fr., unknown). A fish, usually called the Mackenzie River salmon (*Stenodus Mackenzii*), which is intermediate between salmon and whitefish, usually weighs ten pounds, though sometimes it is much larger. It ascends all the rivers of Arctic America and Asia, and is of much importance to the natives of their valleys, though the fish is oily. It was discovered by Alexander Mackenzie, whose followers named it.

INCONSTANT, THE; OR, THE WAY TO WIN HIM. A comedy by George Farquhar (1702), adapted from Fletcher's *Wild Goose Chase*.

INCORPORATED SOCIETY OF AUTHORS, THE. A society organized in London, in 1884, by Sir Walter Besant, for the protection of authors and composers, and modeled on *La Société des Gens de Lettres* of Paris. Its purpose is to maintain the rights of authors, to

advise them as to questions of copyright, to assist them in making contracts with publishers, and in recovering money due under contracts. The society has also vigorously advocated amendments to the copyright law, and in 1899 sent its secretary, Mr. G. Herbert Thring, to Canada to bring about a settlement of the colonial copyright question. The official organ is the *Author*, which is published monthly from the society's office. Among its other publications are: *Grievances of Authors; Literature and the Pension List; Copyright Law Reform; The Methods of Publication*. The first president of the society was Lord Tennyson.

INCORPORATION. The act by which a corporation is formed; also, the body or legal person so formed, which is more usually called a *corporation*. This act consists in the incorporators (or persons of whom the corporation is initially to consist) fulfilling the conditions which are imposed by law as a condition precedent to the formation of the corporation, which may consist in accepting a charter (q.v.), or in complying with the conditions of enabling statutes, or, for some purposes, the performance of acts as if the persons constituted a corporation (a corporation *de facto*). The effect of the act of incorporation is to create the rights and liabilities which the law attaches to the form of corporation so created, so that future acts relating to the corporate body may affect that as legal entity instead of the individual by whom the corporation is represented. For a treatment of the various classes of corporations and the specific acts necessary to their creation, see CORPORATION; CHARTER; also consult the authorities there referred to.

INCORPOREAL (from Lat. *incorporeus*, bodiless, from *in-*, not + *corporeus*, bodily, from *corpus*, body). In the common-law classification of real property, that which is not accompanied by seisin or the right of possession. Present estates in land, such as freeholds and leaseholds in possession, are identified with the land itself, and are described as *corporeal*; that is, as something substantial and tangible; while corresponding interests not in possession, such as future estates and rights in the land of others, are regarded as being of an unsubstantial and intangible nature, and are accordingly described as *incorporeal*. The distinction has no scientific value, as the idea connoted by the terms 'property' and 'ownership' is always that of a legal right, and rights are always bodiless things, and are equally immaterial and unsubstantial, whether they relate to present or future enjoyment of land, and, indeed, whether they have to do with things or persons. But the distinction is a convenient one, nevertheless, and has had an important influence on the development of property law.

In our legal system the classification of property as corporeal and incorporeal is confined to interests in land. Though future interests in chattels and such property as shares of stock, patent rights, and copyrights are sometimes described as incorporeal, and though such eminent legal authorities as Sir Matthew Hale and Blackstone apply the term corporeal to jewels and other personal chattels, the distinction is of no value or importance in the law of personal property. On the other hand, the usual limitation of the terms corporeal and incorporeal to hereditaments, i.e. to such interests as descend to the heir of the owner upon his death, is too narrow,

as a future leasehold estate, or a profit *à prendre* (q.v.) for a term of years, which pass like other personal property to the executor or administrator, are equally entitled to be described as incorporeal.

It was in the methods of conveyance employed in creating or transferring the two kinds of property that the distinction between them attained its principal importance. Corporeal interests being susceptible of seisin, of possession, were said to 'lie in livery,' i.e. to be capable of transfer by the method of livery of seisin, or delivery of possession; whereas the more intangible incorporeal property, not being susceptible of physical transfer, was said to 'lie in grant,' i.e. to be transferable only by the form of deed known as a grant (q.v.). With the abolition of conveyance by livery of seisin and the general adoption of the method of conveyance by deed for all kinds of property, corporeal and incorporeal, the distinction has largely lost its importance. See **HEREDITAMENT; REAL PROPERTY.**

INCREMENT, THE UNEARNED. See **UNEARNED INCREMENT.**

INCROYABLES, ăn'kwri'yă'bl' (Fr. word, meaning incredibles). A name applied to the Parisian dandies under the Directory, who made themselves conspicuous by their extravagance in dress, manner, and speech. One of their peculiarities was the omission of *r* in speaking, and they got their name from their favorite expression, *Ma petite pa'ole d'honneur, c'est incroyable* (me wold of honnah, it's incedible). They were mostly royalists. The type has been known at different periods in the history of France, by various names: *Agréables, Gommeux, Mervcilleux, Mirriflors, Lions, Muscadins, Muguets, Petit-mâtres,* etc. (See **JEUNESSE DORÉE.**) The term 'Incrovables' is also applied to the exaggerated style of hats which they wore.

INCUBATOR (Lat. *incubator*, one who lies in a place, from *incubare*, to lie within, to incubate, from *in*, in + *cubare*, to lie). A term applied in poultry-raising to devices used for artificial incubation or the hatching of eggs. Artificial incubation was successfully practiced in very ancient times in Egypt and China, and probably other countries. The methods and appliances still used in China are quite simple, and even crude, but are employed with great skill and

chickens were absolutely sterile, and if the process were persisted in the race of fowls would necessarily die out." Similar prejudice against incubator chicks has persisted until within comparatively recent years; but artificial incubation has become so firmly established, and, the experimental stages having long been passed, the methods and appliances have been made so simple and practical, that it is considered absolutely necessary in the rearing of fowls in large numbers. There were, of course, many failures in the early attempts to devise a practical incubator, although in the first application for a patent on such a device in this country, in 1847, some of the principles on which incubators should be constructed were stated with remarkable clearness and accuracy. Practical success with

FIG. 2. MODERN INCUBATOR.

modern incubators may be said to date from the Paris Exposition of 1877, at which Rouillier and Arnoult exhibited their 'hydro-incubator.' "This incubator," says Beale, "has a very large tank, holding about fourteen gallons of water, which is divided into three horizontal compartments, each communicating with the others by means of a few small holes. This tank is placed in a wooden case, and surrounded on all sides save the bottom (under which is the egg-drawer) by an inch or more of felt, or some other non-conducting material, tightly pressed down. When this tank is filled with hot water, it is found that the water loses only from two to five degrees every twenty-four hours, according to the temperature of the place where it is kept. If the water in the top compartment only be drawn off, and that in the lower ones be left undisturbed, the former being again filled with boiling water, the heat from this will gradually affect the [temperature of the] lower body, and prevent its going down. By repeating this every twelve hours, the heat in the egg-drawer can be maintained at almost any degree of temperature, with a scarcely perceptible variation." Notwithstanding the simplicity and efficiency of incubators of this type, attempts to devise a practical automatic, self-regulating incubator were persisted in until incubators of this kind have been brought to a high state of perfection, and have been generally adopted. Incubators of the automatic type are of two main classes—hot-water and hot-air. The advantages and disadvantages of the better makes of the two classes are very

FIG. 1. CHINESE INCUBATOR.

success. Réaumur, the eminent French physicist, used successfully a very crude form of incubator, consisting of a barrel heated with fermenting manure; but he encountered much criticism and opposition on the ground that chickens so hatched "were unfit for human food because they tasted of the heating material, and that such

evenly balanced. There are hundreds of different makes of incubators on the market, many of them very efficient when properly handled. An average hatch of over 80 per cent. of fertile eggs is secured by experienced poultrymen, but experience, skill, and careful attention to details are essential to such success.

The essentials of a good incubator are an egg-chamber uniformly heated, preferably from above; a self-regulating source of heat, controlled by a thermo-regulator, the actuating arm of which is situated in the egg-chamber, and which is sensitive to 1°, or preferably ½°, above or below the desired temperature; and provisions for the ventilation of the egg-chamber, and for maintaining the proper degree of humidity therein. In addition to these, says Watson, "a convenient appliance for turning the eggs, positive in action, should accompany each incubator. This may be an extra tray that is to be placed bottom side up over the tray of eggs and held firmly in this position while both trays are turned, thus completely transferring the eggs from one tray to another without jar. The different machines have very different appliances for accomplishing this result." The object sought in artificial incubation is to imitate as closely as possible the conditions of heat, air, moisture, etc., which obtain in natural incubation under the hen. The temperature is carefully maintained at about 100° F. or only a few degrees above by placing the incubator in a basement, cellar, or other room where the temperature is stable, and by using a sensitive thermo-regulator to control the heat applied; the moisture of the air in the egg-chamber is carefully controlled, so that evaporation from the eggs proceeds as under normal conditions; and a sufficient amount of fresh air is supplied to the chamber to carry off the harmful gases which may accumulate and kill the incubating chick. The frequent turning of the eggs during the earlier stages of incubation is believed to have an analogy in the practice of the hen. However, it is not considered advisable to disturb the eggs after the eighteenth day, or to open the incubator thereafter until the hatch is complete, and the chicks dry. As the success of incubation depends so largely upon maintaining the proper moisture conditions in the air of the egg-chamber, some reliable means of controlling these conditions is essential. It has been proposed to use the normal loss of weight of eggs during incubation under brooding hens as a guide for this purpose. The West Virginia Agricultural Experiment Station found that the eggs which hatched under hens lost on an average 16.5 per cent. of their weight in nineteen days. The infertile eggs and those which did not hatch lost from 1 to 2 per cent. less. The normal loss of weight of 100 eggs under natural incubation was found to be about 10 ounces in 6 days, 20 ounces in 12 days, and 31 ounces in 18 days. By weighing the eggs in the tray at the beginning of incubation, and at intervals during the process, the progress of evaporation (loss of weight) may be determined, and the ventilation and humidity so controlled as to make the loss of weight conform to the normal figures. Except in very dry climates there is said to be more danger of over-saturation than under-saturation of the air. A humidity of 45 per cent. saturation is considered safe, as a rule.

If artificial incubation is practiced, some pro-

vision must be made for the care of the chicks when they leave the incubator. Various artificially heated devices known as brooders are used for this purpose. These may be very simple and cheap, or elaborate and expensive. Almost all manufacturers of incubators also make brooders, and there is consequently a great variety of forms to choose from. The requisites of a good brooder are that it should be: (1) Warm (90°-100° during the first week, with gradually lowering temperature thereafter), and economical of heat, which is preferably applied mainly from the sides or above; (2) clean, dry, and well-ventilated; (3) simple in construction, and so arranged that the chicks may be seen. The brooder should be so constructed that the chicks may go out for exercise, and return at will.

BIBLIOGRAPHY. The literature of the subject is voluminous. All up-to-date treatises on poultry-raising explain the processes of artificial incubation, and describe methods and appliances. Among the books which may be consulted are: Watson, *Farm Poultry* (New York, 1901); Beale, *Profitable Poultry Keeping* (New York, 1895); Stoddard, *The New Egg Farm* (New York, 1900); Cyphers, *Incubation and Its Natural Laws* (Boston, 1894); *Incubators and Chicken-Raising Appliances* (London, 1899); Fiske, *Poultry Appliances and Handicraft* (New York, 1902). See **POULTRY**.

INCUBUS (Lat., nightmare). (1) A sprite or demon, thought to have been the cause of nightmare. In the Middle Ages both Church and State believed that the incubus had carnal knowledge of women while asleep, and that from this connection deformed children sprang. The *succuba* was the corresponding female sprite, supposed to consort with sleeping men. (2) Metaphorically, a burden upon mind or spirit. (3) A genus of parasitic hymenoptera of the family Braconidæ.

INCUMBRANCE (OF. *encombrance*, from *encombrer*, to incumber, from *en*, in + *combrer*, to cumber, from *combre*, obstruction, from Lat. *cumulus*, heap). A generic term including every kind of charge or burden upon land; every right to or interest in land which may be held by a third person in diminution of its value, but not preventing the passing of the fee from a grantor to a grantee. The most frequent examples are afforded by *judgments, leases, mechanics' liens, mortgages, easements*, and similar burdens.

A covenant against incumbrances is one of the usual 'covenants for title' contained in a conveyance of land. As usually construed it amounts to a contract of indemnity, securing the grantee against loss by reason of any incumbrance which may exist upon the land at the time of the conveyance. See **COVENANT**.

INCUNABULA (Lat., cradles). A name applied to printed books published before 1500. Specimens of such works are generally rare, and sought after for their historical bearing on the art of printing, and, as in first editions of Greek and Latin classics, for their scientific value. The number of incunabula is variously estimated, but is probably upward of 20,000. Among the works on the subject are: Hain's *Repertorium Bibliographicum* (Stuttgart, 1828-38) and Bernard, *De l'origine et des débuts de l'imprimerie en Europe* (Paris, 1853), besides a number of later treatises.

IND. A poetical form of India.

INDEBITATUS ASSUMPSIT. See ASSUMPSIT; DEBT.

INDEMNITY (from Fr. *indemnité*, from Lat. *indemnitas*, security from loss or damage, from *indemnis*, unhurt, from *in-*, not + *damnum*, loss). An engagement, either express or implied, to make good a loss or expenditure. It is not a guaranty within the fourth section of the Statute of Frauds (q.v.), which requires a special promise to answer for the debt or default of another to be in writing. When the indemnitor performs his engagement he may in so doing pay the debt of another, but the discharge of such debt is not what he promises to do; it is a mere accident of the situation. At times the engagement takes the form of a bond or other writing; but more frequently it is implied from the acts of the parties. Whenever a person asks another to become surety (q.v.) for him, the law implies the promise by the principal debtor to indemnify the surety for any loss that he may sustain by acceding to the request. So if two or more persons become co-sureties, there is an implied engagement on the part of each to indemnify the other to the extent of his share of the common loss. Fire and marine insurance policies are contracts of indemnity, the obligation of the insurer being not to pay the amount of the policy in any event, but only to save the insured harmless from loss in the event insured against. See INSURANCE. Consult the authorities referred to under SURETY.

INDENTED (from *indent*, OF., Fr. *endenter*, It., ML. *indentare*, to notch, from Lat. *in*, in + *dens*, tooth). In heraldry, one of the partition lines of the shield notched similarly to dancetté (q.v.), but with the notches much smaller, and not limited in number. See HERALDRY.

INDENTURE. See DEED.

INDEPENDENCE. A city and the county-seat of Buchanan County, Iowa, 69 miles west of Dubuque; on the Wapsipinicon River, and on the Illinois Central and the Rock Island railroads (Map: Iowa, F 2). It is in a farming and dairying region, and is noted for its horse-breeding farms. There are here the well-known Rush Park, with its kite-shaped race-track, the State Insane Hospital for Northern Iowa, and a public library. The water-works and electric-light plant are owned by the city. Population, in 1890, 3163; in 1900, 3656.

INDEPENDENCE. A city and the county-seat of Montgomery County, Kan., 85 miles southwest of Fort Scott; on the Verdigris River, and on the Missouri Pacific and the Atchison, Topeka and Santa Fé railroads (Map: Kansas, G 4). It has a public library and a fine courthouse. The city is of considerable importance as a distributing point for an agricultural region, and has flour-mills, planing-mills, cracker-factories, cotton-mills, paper-mills, sugar-mills, a window-glass factory, vitrified-brick works, and a creamery. Natural-gas and oil wells are numerous in the vicinity. Population, in 1890, 3127; in 1900, 4851.

INDEPENDENCE. A city and the county-seat of Jackson County, Mo., five miles east of Kansas City; on the Chicago and Alton, the Missouri Pacific, and the Kansas City and Independence Air Line railroads (Map: Missouri,

B 2). It is rapidly developing into a residential suburb of Kansas City. The Kansas City Ladies' College and Saint Mary's Academy are private schools situated here, and there is a public library. The industrial establishments include a large flouring-mill, a planing-mill, a canning factory, and scale-works. Independence was settled and incorporated in 1827, and was organized as a third-class city in 1889, the charter of that year still being in operation, and providing for a mayor, elected biennially, and a unicameral council. The electric-light plant is owned by the city. Population, in 1890, 6380; in 1900, 6974. Independence was occupied in 1831-38 by the Mormons, who regard the city as the 'Zion' where the chief Mormon temple will be ultimately erected on the famous 'Temple lot.' About 2000 members of the Reorganized Church of Jesus Christ of Latter-Day Saints, which disclaims belief in polygamy, now live in this vicinity. In 1849-50 Independence was a rendezvous and a starting-point for emigrants to California, two of the great trails leading from here westward. In the summer of 1862, during the Civil War, a Federal garrison of 312 under Lieutenant-Colonel Buel was captured here by a superior Confederate force under Colonel Hughes, and here on October 22, 1864, General Pleasanton attacked and defeated the rear of General Price's Confederate Army.

INDEPENDENCE, DECLARATION OF. See DECLARATION OF INDEPENDENCE.

INDEPENDENCE DAY. July Fourth, the United States national holiday.

INDEPENDENCE HALL. An unpretentious brick building in Chestnut Street, Philadelphia, erected in 1729-34, and intimately connected with the birth of the nation. In it the Continental Congress met, Washington was made commander-in-chief of the American Army in 1775, and the Declaration of Independence was adopted on July 4, 1776, and read to the people assembled in the street. It is now a museum of Revolutionary and historical relics.

INDEPENDENT CATHOLIC CHURCH IN THE UNITED STATES, THE (POLISH). An independent Church organized among the Polish immigrants in Chicago, with the hope of staying the progress of agnosticism among citizens of Polish descent who had become disaffected toward the Roman Catholic Church. Its founder, the Rev. Anthony Kozlowski, attended one of the Old Catholic conferences in Europe, and was there consecrated a bishop. A steady growth is affirmed of the Church, both in the consciousness of actual reformatory tendencies, and in numbers of adherents and strength of organization. It has established a hospital, a dispensary, an orphanage, and a Home for the Aged in Chicago, and has acquired a considerable property; primary, a grammar, high, and industrial schools have been established, with a college enterprise under way. All these schemes are connected, and form integral parts of a central philanthropic institution, called Saint Anthony's Home. In October, 1902, Bishop Kozlowski addressed a letter to the House of Bishops of the Protestant Episcopal Church in the United States asking for intercommunion. The subject was referred to a committee for consideration. The estimates of members in the Church vary. A careful computa-

tion gives it 33 ministers, 43 churches, and 42,850 communicants.

INDEPENDENT METHODIST CHURCH.

See METHODISM.

INDEPENDENTS. Such bodies of Christians as claim the right of each individual church to administer its own affairs, free from ecclesiastical or civil authority. In history the name has been usually applied to the Congregationalists of Great Britain, who differ from the Congregationalists of America and other countries in regarding the fellowship of the local churches as unessential. The first Independent Church was organized in London about 1555, and the Brownists (q.v.), or Separatists, as the Independents were first called, steadily increased in numbers, in spite of persecutions and emigration. They were prominent in the Westminster Assembly. See CONGREGATIONALISM.

INDEPENDENT TREASURY. The name given to the system of keeping and disbursing the public money without the intermediary action of banks, State or national, adopted by the United States in 1846. The act of August 6, 1846, provided, in brief, that the public revenues should be held, until actually paid out, in the vaults of the Treasury at Washington or in the several subtreasuries in the larger cities created by the act. Prior to this date the Government receipts had been deposited in banks. The first Bank of the United States (see BANK; BANKING) was established in 1791, largely with the view of facilitating the fiscal operations of the Government. In it or its branches were deposited the Government funds, and from it were obtained temporary loans in anticipation of the revenue. When the bank charter expired, in 1811, the Government funds were deposited in the State banks throughout the country. With the subsequent suspension of specie payments, in 1814, the Government not only suffered with other creditors, but was seriously embarrassed by the fact that there was no standard national currency. In 1816 the second bank of the United States was chartered for a period of twenty years, and for the greater part of its existence it acted as the fiscal agent of the Government. Its effort, beginning in 1829, to obtain a renewal of its charter, led to a violent political contest, in which the opponents of the bank, led by President Jackson, won the victory. Though the charter did not expire until 1836, the President in 1833 ordered that no further deposits of Government funds be made in the bank, and that the funds of the Government be gradually withdrawn. This order for the 'removal of the deposits' was made on the alleged ground that the bank was unsound and that the public money was in danger.

Beginning October, 1833, the Government funds were deposited in State banks. Contracts were entered into between the Secretary of the Treasury and the several banks fixing the conditions upon which deposits were to be received. The refusal to recharter the Bank of the United States, together with the deposit of Government funds in the State banks, led to an ominous expansion of these institutions. A speculative era, marked especially by enormous sales of public lands, and the deposit or distribution of the Government surplus with the States (1837), now set in, which culminated in the panic of 1837. The Government funds were tied up in the non-specie-paying

banks, and Congress was called together in September, 1837, to devise measures of relief. President Van Buren favored a complete separation of the Government from the banks, the establishment of an independent treasury, and a requirement that all debts due the Government be paid in specie. It was the latter provision which caused the defeat of the measure, as it appeared to the friends of the banks as a discrimination against the bank-note. Toward the close of Van Buren's Administration (June 30, 1840) the measure for which the President had fought valiantly was enacted into law, but not without the concession that in the first year of its operation only one-fourth of the Government receipts need be in specie, a further fourth being added each year until the whole should be so payable. The victory was dearly bought, for the party went down to defeat at the polls in November. The new Administration promptly repealed the law (August 13, 1841); but in the fruitless controversy with President Tyler over the Bank Law failed to provide any substitute for it. Public officials were left to their own devices in the custody of the public funds, and it was not until a new political revolution had occurred that the independent treasury system was finally established by the act of August 6, 1846.

The spirit of the measure was an absolute divorce of the Treasury from the banks. The Government was henceforth to keep its own funds, and to recognize only money issued by Federal authority, specie and Treasury notes, in the Government operations. The vaults and safes provided for keeping the money of the Government at Washington, and at such other places of deposit as were fixed by the law, were declared to constitute the Treasury of the United States. The Treasurer of the United States and assistant treasurers, and all other officials, were required to keep safely, without lending, using, depositing in banks, or exchanging for other funds, except as allowed by the act, all public money received by them or otherwise in their custody, until the same was ordered by proper authority to be transferred or paid out. In the early experience of the system some embarrassment was created by the failure to provide at once the necessary protection for the money in all the places where it was kept. But in general the system has worked well, and loss by theft or defalcation has been slight compared to the loss suffered through dealings with unsound banks in earlier years.

The isolation of the Treasury contemplated by the act soon proved illusory, and little by little inroads have been made upon the principle. The spectacle of the Treasury coming to the 'relief of the money market' has become familiar. The 'relief' thus afforded consists of placing in circulation money which the law accumulates in the hands of the Government. Operating with a surplus of revenue over expenditure, the Government balances may and do grow to such a size as to materially affect the volume of money in circulation. This, then, is a Treasury reserve which may be unloosed when a stringency in the money market occurs, and the fact that the Secretary of the Treasury is called upon for such relief is evidence of the futility of attempting utterly to separate the Government's operations from all business affairs. The independent Treasury was not ten years old before the possible dangers of

an accumulation of funds were perceived, and in 1853 large redemptions of bonds were made to avoid them. In the panic of 1857 the Government escaped unscathed, and this added to the popularity of the independent treasury system.

But with the fiscal necessities of the Civil War the principle of isolation was broken down. The banks became essential to the support of the Government. The Secretary of the Treasury secured their aid in making the first loans of the war. He would not recognize their notes in the Government operations, but soon brought forward his plans for transforming the banks into national institutions under Federal control, with power to issue notes of a kind which could be recognized by the Government. When the national banking system was organized, in 1863, the banks were allowed to become depositories of the public money, except the receipts from customs, under regulations established by the Treasury Department. Customs receipts, being in specie, were excluded from the funds capable of being deposited, since banks were not then paying specie. These deposits in the banks are secured by funds deposited with the Treasury Department. The extent to which the banks have been used as places of deposit has varied with the state of the Treasury and the nature of its operations. When loans have been made the money has been paid in through banks and allowed to remain there until expended. In the refunding operations of 1879 the banks sold nearly \$400,000,000 worth of bonds, and held at one time (May, 1879) as much as \$279,544,645. On the other hand, when the surplus has dwindled the amount of money so deposited has decreased, while in periods of an abundant surplus it has swollen in size. On October 1, 1902, the amount so deposited in banks was \$126,102,430.

The idea of the Independent Treasury Law was that the banks should not interfere with the Treasury, while in its practical administration, with the enormous growth of Government revenue, the problem has been for the Treasury so to conduct its operations that it shall interfere as little as possible with the banks and the ordinary course of business. In principle the Government pays cash, demands cash, and keeps its funds in a strong box—a method of conducting business entirely at variance with the usual practice in mercantile life. The income and outgo of the Government have not, moreover, the regularity which frequently characterizes mercantile affairs. Money accumulating in the Treasury in anticipation of future payments is withdrawn from circulation. Such withdrawal may accentuate a stringency, while the subsequent payment may aggravate a plethora. As an offset to these disadvantages of the system, it has been contended that it equalizes conditions by permitting the Secretary of the Treasury to come to the 'relief' of the money market. This is a questionable advantage. The relief is contingent upon a plethoric Treasury; it is, moreover, largely in the discretion of one man, the Secretary of the Treasury, whose impulsiveness or conservatism may materially affect the relief afforded. Finally, when determined upon, it is not always as speedy as desired. The Secretary of the Treasury can increase the money in circulation (1) by additional deposits in banks, (2) by anticipating payments, (3) by redemption or purchase of the public debt. Of these methods

the first is gradual, as no transfers can be made from the Treasury to the banks, the latter's holdings increasing only by deposit of internal revenue and other general receipts. Moreover, banks have been unable, even during periods of stringency, to apply for funds that could legally be deposited with them, owing to the requirement that such funds were to be secured by deposit of national bonds—a requirement sometimes difficult to meet, because of the high price of such bonds. By an order of the Secretary, dated October 4, 1902, banks are permitted, under certain conditions, to substitute specified State and municipal bonds for the national bonds hitherto required. It is hoped that in this way the Treasury will be able to give a larger measure of relief than formerly. The second method applies chiefly to certain definite payments, like the interest upon the public debt. The third is the most satisfactory, so long as there is outstanding a redeemable debt, but cannot be free from criticism when the Government goes into the market to buy up its own bonds. Moreover, with the debt limit of the United States growing less, and with a larger part of the debt held by banks as a security for deposits or currency, this resource is growing weaker. Since any sale of bonds by banks would diminish the circulation in other directions, it is only the bonds held by individuals whose sale to the Government would affect the volume of the circulation. Hence the 'relief' which the Treasury can afford the monetary situation is spasmodic, irregular, and uncertain; it is very far from being a scientific automatic corrective of the excesses of the money market.

It is the opinion of those who have examined the matter in all its details that the independent Treasury offers the Government no advantages which could not be secured by properly guarded contracts with the banks. Such contracts would relieve the Government of the custody of its own surplus, and would not withdraw that surplus from the ordinary channels of trade. There is a growing feeling that our Treasury methods are antiquated, and should be replaced by methods more in harmony with business principles. It has been pointed out that if others should follow the example of the Government, business would come to a standstill. See FINANCE; BANKS; BANKING. Consult Kinley, *The Independent Treasury System of the United States* (New York, 1893).

INDESTRUCTIBILITY OF MATTER. See MATTER, PROPERTIES OF.

INDETERMINATE COEFFICIENT. See COEFFICIENT; EQUATION.

INDETERMINATE EQUATION. See EQUATION.

INDETERMINATE MULTIPLIERS. The use of indeterminate multipliers is well illustrated by Bezout's method of elimination in solving systems of simultaneous equations. E.g. let it be required to solve the system of equations,

$$(1) 4x - 5y + 2z = 0.$$

$$(2) 3x + 2y + 7z = 28.$$

$$(3) x - y + 2z = 5.$$

Multiplying the members of the first equation by λ and those of the second equation by χ and adding to those of the third equation, we obtain the equivalent system,

$$(4) 4x - 5y + 2z = 0.$$

$$(5) 3x + 2y + 7z = 28.$$

$$(6) (4\lambda + 3\lambda' + 1)x - (5\lambda - 2\lambda' + 1)y + (2\lambda + 7\lambda' + 2)z = 28\lambda + 5$$

Selecting for λ, λ' values such that

$$(7) 5\lambda - 2\lambda' + 1 = 0$$

$$(8) 2\lambda + 7\lambda' + 2 = 0,$$

then $\lambda = -\frac{1}{3}, \lambda' = -\frac{2}{3}$, and from equation (6), $x = 1$. Choosing next λ, λ' such that

$$(9) 4\lambda + 3\lambda' + 1 = 0$$

$$(10) 2\lambda + 7\lambda' + 2 = 0,$$

then $\lambda = -\frac{1}{2}, \lambda' = -\frac{3}{2}$, and, from equation (6), $y = 2$. It may similarly be found that $z = 3$.

INDETERMINATE PROBLEMS. See DIOPHANTINE ANALYSIS.

INDETERMINISM. See INDIFFERENTISM.

INDEX (Lat., indicator). An alphabetical list of names, topics, words, and the like, with indications of the passages in which they occur. The index usually comes at the end of the book; the analytical table of contents is normally placed at the beginning, except in the case of French, Italian and Spanish books.

As books began to multiply the need of indexes was felt and their value was recognized. Many old books of the sixteenth and seventeenth centuries have well-made indexes of such fullness and value as put to shame the farcical substitutes issued by many modern publishers when they give any at all. Numerous authorities might be cited as to the worth of a good index in enhancing the value and usefulness of a good book. Long and loud have been and are the complaints against the publication of books of knowledge without indexes, emphasizing Carlyle's growl against "books born of Chaos, which want all things, even an index." Lord Campbell of England, and Horace Binney of Philadelphia, each advocated withholding copyright from any author who published a book without an index. "I have come," says the latter, "to regard a good book as curtailed of half its value if it has not a pretty full index. It is almost impossible, without such a guide, to reproduce on demand the most striking thoughts or facts the book may contain, whether for citation or further consideration." The value put by many scholars on the old Delphin edition of the classics is based on its copious indexes, by means of which a classical quotation can be made or located with the least trouble. Years of time have been lost to students and scholars in fruitless search for much wanted bits of information buried from sight in unindexed pages of books of value and authority. What the seeker demands is a complete index, and it is essential that this should not only refer to the letter, but should also embody the spirit of the work indexed. To this end the indexer must possess intelligence, quickness of perception, the power of analysis and condensation, and the ability to put himself *en rapport* with the author and his work, of the subject of which he must himself have a very considerable knowledge. Any index is valuable in proportion as it is concise in expression and accurately exhaustive, not only of the broader statements of fact or of opinion, but also of the small points of detail, the incidental and illustrative references contained in the book or volumes to which it aims to be the guide or key.

Minuteness of indexing must vary according to character and uses of books indexed. Before beginning to make entries, an indexer should read the book. He may then indicate by underlining text or writing chosen headings in the margins against the topics to be indexed. A book may

require a general index of quite obvious subjects treated in it, as Bryce's *American Commonwealth*; a name or word index, as for atlases, botanies, quotations, etc.; an index of ideas more or less difficult to reduce to alphabetic keywords, as Emerson's *Essays*, Holmes's *Autocrat*. The indexer cannot be too careful in choosing headings or catch-words, which must not only represent the subject treated, but also be such as would occur to the seeker who has not the text before him. Entries on the same subject should not be scattered among various synonymous headings. Each subject must be indexed every time it occurs, and related matter should be indicated by cross-references. If entries under headings are few it is better to repeat them under each heading needed to make reference easy and complete; if many, a single heading may be chosen for entries and cross-references made from other possible headings. Entries should be concise, definite, and specific. Scattered page references should not be massed under a heading without clew to the character of the information given. Where matter relating to a single subject is given consecutively and is brief, a single reference may suffice, but if extended it should be analyzed under headings. In a book on municipal affairs, the seeker must not be forced to examine several pages on the Mayor of New York to ascertain his salary. Specific rather than general headings should be chosen; e.g. entry should be under potatoes, not tubers, sparrows rather than birds, cross-reference being made only when necessary. In general, indexing under the main subject of the book should be avoided. This would bring too great a mass together, and render the heading practically useless. The excellent index of Fiske's *American Revolution* has but seven entries under 'Revolution.' A work in several volumes should have a general index to all in the last one. Separate indexes to each volume (except for serials) are seldom afforded.

Each entry should be written on a separate slip and the slips alphabetized in trays. Library supply houses make slips 5 × 7.5 cm. or 7.5 × 12.5 cm., and trays to fit. The smaller size is usually better. Careful, final editing of entries is necessary to assure consistency, proper cross-reference, clear punctuation, and absolute accuracy. Words alike in spelling but different in meaning should be repeated as headings. Entries like the following are confusing:

Lead, copper
metallurgy
kindly light
poisoning

Entries should be arranged in alphabetic order. Two or more distinct words should not be treated as integral parts of one word. Thus the arrangement should be:

New Bedford	} not	Newark
New reasons for		New Bedford
New York		New reasons for
Newark		News from abroad
News from abroad		Newton
Newton		New York

When verified and edited, slips may be sent to the printer either pasted in order on large sheets, or numbered, punched, and tied together, or entries may be copied on sheets. Great care is essential in verifying both the original entries and the printer's work, an index error being serious. A paper on "Indexing," by J. B. Nichols in *Library Journal*, October, 1892, gives the best directions and suggestions in print for would-be

indexers. H. B. Wheatley's *How to Make an Index* (London, 1902) is entertaining reading and valuable in suggestion. It contains the rules of the English Index Society. The American Library Association's *List of Subject Headings for Use in Dictionary Catalogs*, Cutter's *Rules for a Dictionary Catalogue* (Washington, 1891), and various articles referred to under *Index* and *Indexing* in Poole's *Index to Periodical Literature* are also useful. A study of well-made indexes and criticism of poor ones will aid materially.

INDEX, in mathematics. See EXPONENT.

INDEX (more fully INDEX LIBRORUM PROHIBITORUM). A catalogue published by Papal authority in the Roman Catholic Church of books the reading of which is prohibited to members of that Church, whether on doctrinal, moral, or religious grounds. A natural consequence of the claim of the Church to authority in matters of religion is the right or the duty of watching over the faith of its members, and of guarding it against every danger of corruption from books believed to be injurious to faith or to morality. The earliest recorded exercise of this restrictive authority is the prohibition of the *Thalia* of Arius; and a council of Carthage, in the year 398, issued, even for bishops, a similar prohibition of Gentile books, although it permitted to them the reading of the works of heretics. The earliest example of a prohibitory catalogue is found in the decree of a council held at Rome (494), under Pope Gelasius, which, having enumerated the canonical books of Scripture and other approved works, recites also the apocryphal books, together with a long list of heretical authors, whose writings it prohibits. The mediæval popes and councils pursued the same course as to the heterodox or dangerous writings of their respective periods, and the multiplication of such books after the invention of printing led to a more stringent as well as more systematic procedure. Henry VIII. of England published a list of prohibited books in 1526, and a larger one (containing 85 titles) in 1529, in which year Charles V. published for the Netherlands his most noteworthy edict against dangerous reading, with a long list, which was included in that issued by the university press of Louvain in 1546, and again in 1550. Similar lists appeared by authority at Venice, Paris, and Cologne, and Paul IV. issued in 1557 and 1559 what may be regarded as properly the first *Roman Index*. One of the gravest undertakings of the Council of Trent was a complete and authoritative enumeration of all those books the use of which it was expedient to prohibit to the faithful. A committee was appointed for the purpose, and had made great progress in the work; but it was found impossible to bring the examination of the books to an end before the close of the council, and all the papers of the committee were handed over by the council to the Pope. When the work was completed, the result, known as the *Tridentine Index*, was issued with the bull *Dominici Gregis Custodiam*, by Pius IV. in 1564. From this time the burning of dangerous books fell into disuse, and the Church contented herself with warning her children against their use, under penalty of purely ecclesiastical censure. Further additions and certain modifications of the rules of this *Index* were made by Sixtus V., Clement VIII., Alexander VII., and Benedictine XIV. It was

republished in 1595, and, with the addition of such books as from time to time it was deemed expedient to prohibit, in several subsequent editions, the most remarkable of which are those of Brasichelli (Rome, 1607); Quiroga, *Index Librorum Expurgatorum* (Salamanca, 1601); and Sotomayor, *Novissimus Index* (Madrid, 1648). In the intervals between the editions, the decrees which make further additions to the *Index* are published at Rome and circulated in the various countries. The latest edition of the *Index* is by Leo XIII. (Turin, 1895).

The prohibitions of the *Roman Index* are of two classes, either absolute and total, or partial and provisional, until the books shall have been corrected. The edition of Quiroga, mentioned above, gives a list of the latter class, known as *Index Expurgatorius*. The ground of the prohibition may be either the authorship of the work, or its subject, or both together. Under the first head are prohibited all the writings of *heresiarchs*—i.e. the first founders of heresies—no matter what may be the subject. Under the second head are prohibited all books confessedly immoral, and all books on magic, necromancy, etc. Under the third are prohibited all books of heretical authorship treating on doctrinal subjects; all versions of the Bible by heretical authors; and all books, no matter by whom written, which contain statements, doctrines, or insinuations prejudicial to the Catholic religion. The preparation of the *Index*, in the first instance, was committed to the care of the Congregation of the Inquisition in Rome; but a special Congregation of the Index was established by Pius V., and more fully organized by Sixtus V. This congregation consists of a prefect (who is always a cardinal), of consulters, and of examiners of books (*qualificatores*). Its proceedings are governed by rules which have been authoritatively laid down by several popes, especially by Benedict XIV., in a constitution issued July 10, 1753, which is the best and most authentic exposition of a subject on which much misconception exists. The edition of the *Index* by Brasichelli was reprinted, with an English preface, by Richard Gibbings (Dublin, 1837). By far the most elaborate study of its contents is by F. H. Reusch, *Der Index der verbotenen Bücher* (2 vols., Bonn, 1883-85). The same author also reprinted all accessible indices of the sixteenth century in the *Bibliothek des Stuttgarter litterarischen Vereins*, vol. clxxvi. (Stuttgart, 1886).

INDEX, CEPHALIC, CRANIAL, PELVIC, etc. A term employed by anthropologists to mark the proportions of certain related parts of the human body, especially of the head or cranium, in order to distinguish biological varieties in mankind. The most important of these, and the easiest to obtain, is the ratio of the width of the head to the length, called cranial index for the skull, and cephalic index for the living subject. To avoid the decimal point at the beginning of the index, the width of the skull is multiplied by 100 and divided by the length, the formula being thus

$$\frac{W100}{L} = I.$$

The extreme length is between the glabella and the most prominent portion of the occiput, and the width is the greatest breadth, wherever that may be. All appliances necessary for these measurements are a set of calipers and a rule, in centimeters or in inches.

Three terms are applied by anthropologists to heads, according to these measures. Those having cephalic indexes with a ratio below 80 are called dolichocephalic, those between 80 and 82 are mesocephalic, and those above 82 are brachycephalic. For crania, or skulls of the dead, the indexes are about two points lower. In the numerous cases where a finer subdivision is necessary, a quinary method of nomenclature is followed, the Germans adopting a series called the Frankfort Agreement, the French, the scheme of Broca, modified by Deniker, as follows:

	Cranial index	Cephalic index
Dolichocephals.....	below 75	below 77
Sub-dolichocephals....	75 - 77.6	77 - 79.6
Mesocephals.....	77.7-79.9	79.7-81.9
Sub-brachycephals....	80 - 83.2	82 - 85.2
Brachycephals.....	83.3-84.9	85.3-86.9
Hyper-brachycephals...	85 and upward	87 upward

Dolichocephalic skulls of exceptional length have reached an index of 58, the lowest limit, while brachycephalic examples have gone as high as 90 or even 100.

Before proceeding to other indexes it should be stated that the cranial and cephalic indexes just described are far from being a perfect guide to the classification of mankind, for the subdivisions of the human species have no governing rule and are not subspecies, but separate varieties and mixtures, as with domestic animals.

Again, the ratio between the width and the length of the skull does not give complete information as to its shape. The measurements, therefore, lead to uncertain conclusions, since precisely the same figures would be obtained from crania or heads of widely different cross-section, so that one having an almost rectangular shape, an oval with a narrow end far in front, and a long ellipse would lead to the same index. Unless a large number of skulls among the same people are measured and give something like a uniform result, the measurements are an unsafe guide. Very little good arises from simply adding a number of indexes and dividing by a number of observations. The average result might be a number to which not a single head in the whole series measured would correspond. It is customary, therefore, to tabulate results by coördinates. Frequently, when such a plan is pursued there arise several apexes, as in Italy, the higher number representing the brachycephalic Northern Italians with Celtic blood in their veins, and the lower number the Southern long-headed Mediterranean type.

The cranial and cephalic indexes are not precisely coördinated with purely descriptive characteristics of the human body. It cannot be said that any one of the subspecies of man is either dolichocephalic or brachycephalic, but tendencies toward one or the other exist, as the following table of cephalic indexes shows:

Caroline Islanders (black).....	69.4
Kashmirians (yellow-white).....	72.2
Bakongo (black).....	72.5
Hindus (white, mixed).....	72.8
Karaya Indians, South America (red).....	73.0
Australians (straight-haired blacks).....	74.2
Norwegians (blondes).....	76.0
Corseans (white).....	76.6
Spaniards of Valencia.....	76.8
British Isles.....	77-79
Parsis of Bombay (white).....	82.0
Koreans (yellow).....	82.6
Malays (brown).....	82.8

Negritos, Philippines (black).....	84.7
Arawaks, Guiana (red).....	82.6
Saras, Chad-basin, Sudan (black).....	82.4
Samoans (brown mixed).....	83.7
Votyaks (yellow).....	82.0
Walloons (white).....	82.2
Italians (white).....	82.7
Armenians (white).....	85.6
Piedmontese (white).....	85.9
Sudanese (brown).....	86.3
Savoyards (white).....	86.9
Tahitians (brown).....	85.6
Aleuts (red).....	87.8
Magyars (mixed).....	87.8
Burmese (yellow).....	85.7
Aissor, Transcaucasian (white-yellow).....	88.7

Among the European whites the people of the British Isles are mesocephalic; of France the index is 78-88; of Italy, 75-87; of Spain, 77-80; Switzerland, 76-85, with two types, the long and the short head; Austria, 80-84.

Other indexes than those expressing the relation of width to length are also employed. The facial index is the ratio of the width to the height, from the glabella to the alveolar border, and separates skulls into brachyfacial and dolichofacial. The ratio of width to length in the orbital orifice separates crania into megasemes (90 and upward), mesosemes (89 to 84), and microsesemes (below 84). The nasal index is the ratio between the width of the bony mass of the nose and its height, giving rise to leptorhine, or narrow-nosed, platyrhine, or flat-nosed, with the intermediate term, mesorhine. The dental index is based upon the importance which naturalists place on dentition in the classification of mammals. Upon the ratio of the size of the teeth to related parts, Flower divides men into megadont, mesodont, and microdont; and this series bears a surprising relation to the three anthropometric types of man—Negroid, Mongoloid, Caucasoid.

SCHEME OF PRINCIPAL CLASSIFICATIONS ACCORDING TO INDEXES

Skull	{ Dolichocephalic, long skulls. Mesocephalic, medium skulls. Brachycephalic, broad skulls.
Nose	{ Leptorhine, narrow noses. Mesorhine, medium noses. Platyrhine, flat or broad noses.
Eyes	{ Megaseme, round eyes. Mesoseme, medium eyes. Microsese, narrow eyes.
Teeth	{ Megadont, large teeth. Mesodont, medium teeth. Microdont, small teeth.
Jaws	{ Orthognathic, straight or vertical jaws. Mesognathic, medium jaws. Prognathic, projecting jaws.
Face	{ Chamæproscopic, low or broad face. Mesoproscopic, medium face. Leptoproscopic, narrow or high face.
Pelvis	{ Platypellic, broad pelvis. Mesopellic, medium pelvis. Leptopellic, narrow pelvis.

INDEX EX'PURGATO'RIOUS. See INDEX.

INDEX KEWENSIS. A reference book of the names of flowering plants, accepted as authoritative throughout the world. It was conceived by Darwin, who, having experienced difficulty in definitely identifying many of the plant

species with which he worked, provided the money for its completion. It was compiled by Benjamin Daydon Jackson (q.v.), whose aim was to record every genus and species of phanerogamous plants published up to 1885; to follow Bentham and Hooker's *Genera Plantarum* as authority for the limitation of genera; to add to each name, whether retained or synonymic, a full reference to its place of publication, retained names being the earliest under which they were published in the recognized genus and not necessarily the earliest specific names; and, finally, to indicate the geographical distribution of each species. Two supplements, bringing the work down to 1895, and embracing specific names between Aalius and Irika, appeared in 1902. In these the author was assisted by Theophilus Durand of Brussels.

INDEX LAWS. See EXPONENT.

INDEX NOTATION. See NUMERALS; NOTATION.

INDEX NUMBERS. An index number is a method adopted by statistical and economic writers to exhibit the course of prices of a group of commodities or of commodities generally.

A crude method of attaining this result is to add the prices of the various commodities together. The defects of such a procedure are apparent from the following simple illustration:

	1st date	2d date
Cotton, per lb.....	\$0.08	\$0.07
Flour, per bbl.....	3.50	3.25
Pig iron, per ton (2000 lbs.).....	18.00	18.50
Total.....	\$21.58	\$21.82

If the sum be a criterion, it appears that there has been on the whole an advance in price of the group despite the fall in cotton and flour. A little reflection will show that had pig iron been quoted by the pound instead of by the ton the result would have been different, as follows:

	1st date	2d date
Cotton, per lb.....	\$0.08	\$0.07
Flour, per bbl.....	3.50	3.25
Pig iron, per lb.....	.009	.00925
Total.....	\$3.589	\$3.32925

But even here there are still great differences in the initial prices and the variations are measured on very different scales.

The index number avoids this difficulty by reducing the initial prices to common terms. It establishes the variation of each price from its own starting-point, and then determines the average variation. The assumed figures above given will serve the purpose of demonstration, and the following statement of relative prices is true for either of the series:

	Price at 1st date	Price at 2d date in terms of price at 1st date
Cotton.....	\$100	\$87.5
Flour.....	100	92.9
Pig iron.....	100	102.8
Total.....	\$300	\$283.2
Average.....	100	94.4

In this comparison, where each article has an equal weight in determining the result, there appears to have been a fall in price of 5.6 per cent.; while in the first statement, where pig iron predominated, a rise in price of 1.2 per cent. appeared, and in the second statement, where flour predominated, the fall in price appeared to be 7.2 per cent. It is obvious that the third statement or simple index number is a far better indication of the course of prices of these articles than the other two, where one article or the other dominates the result simply by reason of the fortuitous circumstance that its unit of measurement is relatively large.

The third statement is not, however, an absolutely exact measure of the total price change, since it is not of equal significance that flour falls and that pig iron rises. To the individual consumer no doubt a slight fall in flour is more important than an equal rise in pig iron. It may readily be assumed that he buys for his daily needs 10 times as many things affected by the price of cotton as are affected by that of pig iron, and perhaps four times as many affected by the price of flour as are affected by that of cotton. His relative consumption might be: pig iron, 1; cotton, 10; flour, 40. Hence the price changes noted affect him in varying measure, and this must be accounted for in estimating the significance of the total change. The calculations are as follows:

	Price	Units of importance	Product
Cotton.....	\$87.5	10	875.0
Flour.....	92.9	40	3716.0
Pig iron.....	102.8	1	102.8
Total.....	\$283.2	51	4693.8
Average.....	94.4	...	92.0

On the other hand, in the aggregate consumption of the nation the proportions of the different articles might be quite different, and hence also the significance of these combined changes in the wholesale market. Let us assume them to be: pig iron 1, cotton 2, and flour 4. We then have the following calculation:

	Price	Units of importance	Product
Cotton.....	\$87.5	2	175.0
Flour.....	92.9	4	371.6
Pig iron.....	102.8	1	102.8
Total.....	\$283.2	7	649.4
Average.....	94.4	...	92.8

We have now determined by these slightly different methods the price of the group to have been at the second date, compared with the first, as 94.4, 92.0, and 92.8 respectively are to \$100, and we have in these results from assumed figures a fair illustration of the methods of index number calculations, and the problems to which they give rise.

The problems of a general index number are not dissimilar. The first is the choice of articles whose prices are to be included. No definite statement of what articles should or should not be comprised in the index can be made except that they should be staple articles of general use. It would defeat the object of an investigation

aiming to determine the course of general prices, to include specialties, or rarities, or objects of such restricted use as not to be subject to the ordinary influences affecting prices.

The character of the component price series being thus stated, how shall the number be fixed? It must evidently be large enough to include all the more important lines of staple commodities. No precise limit can be fixed. While it would seem obvious that in any effort to determine general prices, the greater the number of commodities embraced in the comparison, the more accurate the result, such is not the case, since, as the number multiplies, the proportion of articles of limited demand which are more or less removed from the primary influences affecting prices generally increases.

The base line with which prices are compared is usually the average of a series of years, the purpose of taking such an average being to overcome any eccentricities of prices which might characterize a briefer period of time. This practice is not universal, and some well-known calculations have been based upon the prices of a single year. This method is justified on the ground that the prices so chosen were those of normal conditions.

In the combination of the price series into a general index of prices, the simple mean is the most frequent method employed, as illustrated in our first index calculation. This has been the subject of much criticism on the ground of the unequal importance of the objects concerned. To overcome this difficulty two sets of weighted averages have been proposed. The first was one which measured all articles by their importance in the national consumption as illustrated in the third calculation; the second measures articles by their importance in individual consumption as revealed by family budgets and typified in our second calculation. In applying national consumption as a test, we find that calculations of such consumption are very precarious and extend to comparatively few articles. In family consumption we can ascertain for certain groups of persons the proportions of expenditure which cover a much wider range of commodities. But the commodities covered by the family budgets are not the same as those covered by price statistics, since the former represent the retail, and the latter the wholesale markets. In the food products this makes little difference, but in textiles, metals, lumber, and the like there is no little adjustment needed to bring the prices and the relative expenditures into relation.

Those who have done the most to establish more rational and at the same time more complicated calculations have been the first to point out that the ultimate results differ but slightly from those obtained by the somewhat rough calculation of a simple average.

The index number of the London *Economist* is based upon the wholesale prices of 47 commodities which by combination are reduced to 22. The quarterly prices for 1845 to 1850 were arranged as a basis for calculation and the relative prices for subsequent years upon the January prices. The total price index for 1845 to 1850 was 2200, and for later years the price indices are also expressed as an aggregate, without reduction to 100. As in a few cases the full number of articles was not given, this was somewhat misleading. In the following table we

give the results of this calculation as published by the *Economist*, together with a reduction to the scale of 100:

"ECONOMIST" INDEX NUMBER

YEAR	Total as published	Reduced to scale of 100	YEAR	Total as published	Reduced to scale of 100
1845-50	2,200	100	1879	2,225	101
1851	2,293	104	1880	2,538	115
1852	2,612	119	1881	2,376	108
1861	2,737	124	1882	2,435	111
1862	2,878	131	1883	2,342	106
1863	3,492	159	1884	2,221	101
1864	3,787	172	1885	2,098	95
1865	3,575	163	1886	2,023	92
1866	3,564	162	1887	2,059	94
1867	3,024	137	1888	2,230	101

* Twenty-one articles only.

The general tendencies of price movements, the rising tendency till 1873, and the subsequent downward trend as shown in these figures are amply confirmed by other investigations. The enormous rise in the period of 1861 to 1865 was due not only to the extravagant prices for cotton paid in this period, but also to the fact that in the twenty-two series represented in the total as many as three were for cotton. This fact, and the prominence given to indigo, and the absence of so important a staple as coal, led to numerous efforts to improve the calculation. Mr. R. H. Inglis Palgrave sought to remedy the defects by a system of weighing each article by its importance in the national consumption—a method already indicated.

Mr. Augustus Sauerbeck published in 1886 in the *Journal of the Royal Statistical Society* an index number which has been brought down to date in subsequent issues of that periodical, and which is in many respects an improvement upon the older calculation. His annual prices are based upon averages of the monthly, and in some important commodities weekly prices, and these are compared with the average prices of 1867 to 1877. The tables embrace 45 series of quotations; and while some commodities are repeated (in different grades), they have been chosen in such a manner that the total number of quotations for a group of commodities such as meats, textiles, iron and steel represents approximately in its proportion to the whole number of quotations—forty-five—the importance of this group in the commerce of the United Kingdom. The superiority of this calculation rests, therefore, on the more trustworthy character of its material, and the breadth of choice.

In France similar calculations have been based upon the import prices of commodities, and in Germany (Soetbeer's) upon the import prices of goods at Hamburg. The latter are more comprehensive, since Hamburg was so long a free city that practically its entire trade was in commodities imported by sea and land. The calcu-

lations of Dr. Soetbeer for Hamburg, based on the average prices of 1847 to 1850, embraced 100 articles, to which were added 14 articles from the British trade returns. Neither the more limited French calculations nor those of Dr. Soetbeer developed any mode of combination other than the simple average.

In the United States comprehensive statistics of prices for the period of 1840 to 1891 were published in the Senate report on wholesale prices, wages, and transportation. The report based its calculations upon the prices of 1860 and furnished an index number comprising 223 different series of prices. These were combined by the method of simple average, and also by estimating the importance of the price series as measured by family consumption. As in previous instances when different methods of combination had been tested upon the same figures, the results of the two methods differed but little. This price index closed with 1891, but the United States Department of Labor in its *Bulletin* has furnished the material for carrying the study of price movements down to the present day.

It should perhaps be mentioned that this report applied the index-number principle to its statement of wage statistics, a procedure which had been previously suggested, but was carried here to execution for the first time. It is also applied effectively to the study of transportation rates. The methods of the report, especially as applied to wages, have been made the subject of searching criticism by the English statistician A. L. Bowley, who has effectively used the index principle in his investigations of the course of wages in England.

Consult: Bowley, *Wages in the United Kingdom* (Cambridge, 1900); id., *Elements of Statistics* (London, 1901); Falkner, *Wage Statistics in Theory and Practice* (Boston, 1899), in *Publications of the American Statistical Association*; Mayo-Smith, *Statistics and Economics* (New York, 1899); *Senate Report 1394*, Fifty-second Congress, second session, 1893, four volumes.

INDEX OF REFRACTION. See LIGHT.

INDIA. A region comprising the middle member of the three great southern peninsulas of Asia and a territory of nearly equal extent to the north, together with an extension eastward as far as the Malay Peninsula. India in this sense constitutes the Empire of India, one of the members, and by far the most populous, of the British Empire. India proper, however, does not extend farther east than the head of the Bay of Bengal; nor does it include some of the northern or westernmost districts of the Empire. The name Hindustan was formerly frequently used instead of India, but it belongs more properly to the north-central portion of India, the land of the Hindus. The name India has been used in a very broad sense, but improperly, so as to embrace the great southeastern peninsula of Asia, which is still sometimes spoken of as Farther India. This article will treat of the Empire of India. Since British influence became predominant there no other country of the Asian mainland has been so diligently explored or is now so well known as India. In the form of a great triangle, the Indian Peninsula extends southward between the Bay of Bengal, on the east, and the Arabian Sea, on the west, through 15° of latitude to Cape

Comorin (latitude 8° 5' N.). On the north the peninsula unites with the continental mass in the lowlands of the Ganges Basin and the great plains east of the Indus, which connect it with the mighty highlands of the Himalayas. India, within the official boundaries of the British possession (including the Native States), stretches north and south through about 29° of latitude. Its east and west extension is across nearly 40° of longitude. The Empire has an area of about 1,860,000 square miles, including the Native States and dependencies (Baluchistan, etc.). (See INDIA, NATIVE STATES OF.) It is thus about half as large as the United States (inclusive of Alaska). It is a world in itself, for the great barrier of the Himalayas, the Hindu Kush, and the Suleiman Mountains shuts it off from land communications with the rest of Asia, except through very difficult mountain passes; the sea is the only means of easy approach. Thus guarded, though by no means completely, by mountain bulwarks and wide seas against intrusion, India was able to develop a civilization and social system peculiar to itself.

TOPOGRAPHY. The coasts of India are comparatively little indented except at the mouths of the larger rivers and along the northwest shores; and though there are many roadsteads and harbors for small vessels, there are only a few good harbors for large vessels, and they are in the deltas of the rivers, or, as at Bombay, under the shelter of islands. The railroad system was, therefore, planned so as to connect all the leading trade centres of the interior with the largest seaports.

Three distinctly defined physical regions are recognized—the mountain districts of the Himalayas, the low plains of the three great rivers of North India, and the high plateau of the Deccan, extending from the plain of the Ganges to the south end of the peninsula. The colossal ranges of the Himalayas, 1500 miles in length, extend along the north part of the country in several parallel chains separated by deep valleys and tablelands. The most northerly of these ranges is the loftiest, and Mount Everest or Gaurisankar, the highest mountain in the world, rises to a height of 29,000 feet. In the west the Himalayan ranges are continued by the Hindu Kush, from which the Suleiman and Hala chains stretch to the south, along the western borders of India. The barrier presented by the Himalayas is far more formidable than those of the other ranges, and can be crossed only by passes of 17,000 to 19,000 feet in height, above which tower many snow-capped summits. It was through the less difficult but still formidable passes on the northwest border that India was long subjected to invasion; and Burma was the victim of similar attacks through the passes on its northern frontier. The mountain rampart has the greatest influence on climate and fertility, for it wards off the freezing winter blasts from the north and condenses the immense volume of water vapor brought by the summer monsoon to vivify the plain below. The barren mountain slopes fall to the south in successive terraces down to the fertile plain teeming with animal and vegetable life. But while the higher slopes of the mountains are devoid of vegetation, some of the wide, high mountain valleys are exceedingly beautiful, most notably that of Kashmir, unexcelled for healthful climate and fertile soil.

The great river plains cross India in a wide belt from east to west, south of the mountains; and at their ends the plains are projected southward, where the Indus and the Ganges-Brahmaputra have advanced their deltas far seaward. On the alluvial lands are the densest population and the richest cultivation; for density of population is determined in India, not by the temperature, but by the supply of water available for the farms. But there are waste and almost unpeopled districts also among these lowlands; and the rainless Desert of Thar or Indian Desert, to the east of the Indus delta, extends north-eastward almost to the base of the Himalayas.

The third topographic division of the country is the peninsula, the great triangular plateau of the Deccan, from 1600 to 3000 feet above the sea. The northern boundary of the plateau is the Vindhya Mountains, which join the plateau to the low plain. The Deccan triangle is further defined by the Western Ghats rising above the fertile and accessible Malabar coast, and in the east by the Eastern Ghats overlooking the Coromandel coast, which is difficult of access, for the harbors are few and very poor. No other part of the world testifies more eloquently than the Deccan tableland to the prodigious energy formerly displayed by plutonic forces. The greater part of this immense plateau was built up by outpourings of lava and basalt (trap), which in places are 6000 feet thick.

The coast-line of Burma is not deeply indented except where the projecting delta of the Irrawaddy forms the Gulf of Martaban. The low coast and the flooded valleys make Burma the greatest producer of export rice in the world. Farther inland, to the east of the Irrawaddy and on both sides of the river in its upper course, the country is hilly and heavily forested.

HYDROGRAPHY. The four great rivers of India are the Indus, the Ganges, the Brahmaputra, and the Irrawaddy, the last named in Burma. The heaviest rainfall is not on the plains or on the southern plateau, but on the slopes of the mountains, which pour their torrents into the great rivers below, with the result that the Ganges and the Brahmaputra carry to the sea a volume of water that is entirely out of proportion to their length or the area of their drainage basins. The Indus contributes to the basin of the Arabian Sea the waters derived from the Punjab (land of five streams), and from the plateau of Afghanistan. It is navigable for over 900 miles, but its value as a water highway is small on account of the impetuosity of its current. It is least important among the great rivers. The majestic and smoothly flowing Ganges is far more valuable for navigation than any other river of India. Both the Ganges and the Brahmaputra, which joins it near its mouth, are turbid with fertilizing silt from the mountains, which has formed the great Bengal delta. The Irrawaddy of Burma is navigable by steamers to Mandalay. The rivers of the peninsular part of India, though some of them are of considerable length, are not important for navigation. Among them may be mentioned the Nerbudda (Nerbudda) and Tapti, both flowing into the Arabian Sea, and the Mahanuddy (Mahanadi), Godavery (Godavari), Kistna (Krishna), and Kavery, which pour their waters into the Bay of Bengal.

CLIMATE. On account of the great extent of India and its differing altitudes, the country

has many differences of climate. The whole land may be described as more or less tropical except in the higher altitudes. Slopes of the Himalayas, as high as they are habitable, enjoy a temperate climate; neither is there for the natives an oppressive degree of heat on the high plateau of the Deccan. Among the Himalayas and the Nilgiris Europeans have established sanatoriums amid the most agreeable climatic conditions, where many of them take refuge from the prostrating heat of the hot months. The climate of India, except in the districts of jungle and marsh lands, is not, on the whole, unhealthful for the white race if the ordinary precautions required in all hot countries are observed. The most heated area is that of the northwest, in or about the region of the Indian Desert, where the mean July temperature exceeds 95°.

By far the most important climatic element is the rainfall, upon which depends the very existence of the people. Throughout the country in general there are only two seasons, the dry and the rainy, also known as the season of the north-east monsoon and the season of the southwest monsoon. These names are derived from the direction of the winds prevailing in the Arabian Sea and Bay of Bengal during the two periods. They are really inapplicable, however, over a great part of India, where the winds are from directions nearly opposite to those indicated by the names of the seasons, and are chiefly determined by the axial directions of the local river valleys. Thus the winds in South Bengal are from the southeast, and in Behar from the east, during the southwest monsoon, and are from the opposite directions in the northeast monsoon. The two seasons in India might, therefore, more appropriately be called the dry monsoon and the wet monsoon, from their most characteristic features.

The dry monsoon or season usually begins in November or December, and continues until May. Winds of land origin prevail more or less steadily in the interior, and hence the period is usually marked by great dryness of the air and little or no rain. The first three months of this period (December to February), characterized by a comparatively low temperature, are known as the cold-weather season; and the second three months (March to May), when the temperature increases rapidly and culminates in a period of excessive heat in May, as the hot-weather season. During the cold-weather season storms of large extent, the majority of which form in Persia, enter India from Beluchistan and traverse Northern India from west to east, distributing light rains in the Indo-Gangetic plains and heavy snow over the Western Himalayas. The severity of the hot-weather season is occasionally relieved by the occurrence of thunder-storms and dust-storms, which cool the air for brief periods. The characteristic features of the dry season are persistent dry weather, with clear skies, and large diurnal range of temperature.

The rains of the wet season or the southwest monsoon set in suddenly on the west coast of India in the first week of June, and a little later (in the second or third week of June) on the Bengal coast, and extend more or less rapidly into the interior. The prevailing winds of this period are of oceanic origin, and are, in fact, the northward extension of the winds of the south-east trades. The extension of these winds north-

INDIA is either directly or indirectly under British Rule, and includes BARRISH INDIA and the NATIVE STATES. The former is in all respects under the direct control of British Officials. For administrative purposes, British India is divided into PROVINCES, and the NATIVE STATES are shown under control of the Central Government. The territory is colored by the government of the British Province in which it is located, it is shown in yellow tint.

NEPAL and BHUTAN are independent States.

ward across the equator and up the Indian seas usually begins in the third week of May and gives a complete and permanent change of weather (lasting for five or six months), more especially over the land area of India. The winds due to the extension of these massive humid air-currents usually begin to give daily rain to the Malabar coast in the last week of May, and to the Bombay coast on June 4th or 5th. The humid currents advance more slowly into the interior, but are usually established before the end of the month over the whole of India. Cloudy, showery, or rainy weather, with a moderately high temperature and small diurnal range of temperature, prevail during the next three months, which are in striking contrast with the excessively hot and dry weather that has prevailed during the previous two or three months. Over the mountain tracts of Assam and over the plains of Lower Burma the yearly rainfall exceeds 500-600 inches, and in one particular year the record of 805 inches was established.

Sometimes the wet monsoon is greatly delayed or has little strength, and this failure of an adequate supply of rain involves the direst tragedy. (See FAMINES, below.) India and the adjacent seas are often visited by the destructive hurricanes called typhoons, whose tracks are frequently traced by ruined towns and crops.

The soil, except on the steep mountain slopes, is of great fertility, being largely composed of alluvium throughout the plains and in the mountain valleys and of disintegrated volcanic rocks, from which many rich soils are derived, on the southern plateau. The food demands of the enormous population make it necessary to maintain a high degree of fertility.

FLORA. The very unequally distributed rainfall causes great differences in vegetation. The almost rainless region just east of the Indus has desert conditions of plant life, while the low-lying coast lands along the Gulf of Bengal have large areas of dense, wet jungle. The plains of the Deccan east of the Western Ghats have little rain, for it falls on these mountains instead of on the plains. Vegetation is therefore sparse where irrigation is not applied; while the lower slopes of the northern mountains, drenched with rain, are densely wooded; and far above the forests there is an Arctic flora close to the glaciers and snow-fields. The greatest possible area of plowed fields is needed for food production, and so a large amount of forest area has been cleared for cultivation. Timber supplies are chiefly derived from the mountain slopes, from the hilly lands of parts of the Deccan, and from Burma. Teak, the most valuable wood, is cut on the slopes of the Western and Eastern Ghats, in Lower Burma, and to some extent among the western hills of the Deccan. Sandalwood and blackwood are found in the teak-growing regions; sal, another hard wood, and cedars, on the slopes of the Himalayas; and the common woods are scattered, not profusely, over various parts of the country. The larger part of the plain has no forests, and in the irrigated districts there are few trees except in the watered gardens. The Government has all the best timber areas under protection, and applies forestry methods to their management. The bamboo, the mango, and the cocoanut and other palms are widely distributed, and are of the greatest utility. One of the most distinctive

of the Indian trees is the banyan. The forests of Assam, Malabar, and the lower slopes of portions of the Himalayas are luxuriant in the extreme, and present a wealth and variety of vegetable forms which are equaled or surpassed only by the forests of tropical America. In the Himalayas is the home of the giant rhododendron. Orchidaceous plants are markedly numerous, and the upper floral zones of the mountain range have furnished the most valuable types to the floriculturist.

FAUNA. The country forms a part of the Oriental Region (q.v.) of zoögeography. Although the plains of the northwest partake of the characteristics of Central Asia, India possesses the lion (in the northwest, but now nearly extinct), the wild ass, and sundry smaller mammals, birds, and reptiles that belong rather to the country westward. The massive ranges of the Himalaya also contain a peculiar montanic fauna, characterized especially by an abundance of wild sheep, goats, and of goat-antelopes (qq.v.), such as the Charal Pulis sheep, the ibex, markhor, goral, and others elsewhere described. These, too, are more closely related to Palearctic than to Oriental forms; but two or more species of goats exist on the Nilgiri Hills and other heights of the Peninsula. The forests, swamps, and grassy plains of Peninsular India support life in extraordinary profusion, and civilization seems to have little effect upon it because of the jungle fastnesses to which animals may everywhere retreat and be safe. The elephant (which is still met with in many parts in large herds), however, requires protection, and the wild cattle are becoming scarce. Several kinds of deer, including the sambur, axis, and swamp-deer, and several kinds of antelopes are numerous, as well as very many of the minor mammals.

India is the home of the gallinaceous tribe of birds, and is rich in many kinds of pheasants, partridges, and jungle-fowl (to which is traced the origin of domestic poultry), besides a rich avifauna of the woods and fields. With this plenitude of prey, to which may be added a great variety of fresh-water and marine life, including many valuable food-fishes, there would naturally be found carnivorous beasts, rapacious birds, and poisonous predatory reptiles. The tiger (which is probably indigenous to India), leopard, cheeta, and several lesser cats wander throughout the whole country, and are dangerous to man as well as to beast. Other animals are the rhinoceros, gayal (or bison of the Ghats), bear, jackal, and various forms of ape. The true buffalo, as well as the camel, is domesticated, and is largely used in the service of the field and farm. India is famous also for venomous snakes (see COBRA, etc.), crocodiles, and sea-snakes. The deaths of human beings by wild beasts and snakes number thousands each year, and the loss of cattle reaches hundreds of thousands of dollars in value. On the other hand, India is one of the most attractive regions of the world for sportsmen, who annually distribute much wealth within its confines.

GEOLOGY. The topographic divisions of India with their characteristic features are based largely upon differences in geological structure. The main system of the Himalayas, so far as explored, has been found to be composed of crystalline strata—gneisses, schists, and igneous rocks—which show the effects of upheaval and

folding during the great crustal movements that elevated the ranges in late Tertiary times. In the southern flanking chains, or sub-Himalayas, the most prominent formation comprises Tertiary sandstones, conglomerates, and clays, in disturbed position. These strata (the Siwalik group) are enormously developed, and contain a remarkable assemblage of fossil mammals. The great river plains of India occupy depressions in sedimentary strata, mostly of Eocene age. The Deccan plateau is formed largely of basalt which poured out from great fissures during the Cretaceous period. These basaltic sheets occupy an area estimated at 200,000 square miles, and attain a vertical thickness of several thousand feet. The Vindhya Mountains on the north have a gneissic axis, with Paleozoic sediments on the flanks. East and south of this range there is a large area underlain by sandstones and shales, to which the name Gondwana system has been given. This group extends probably from the Permian to the Jurassic period; its fossil fauna and flora are more nearly allied to the life-forms of South Africa and Australia than to those of the Eurasian continent.

MINING. Considering the extent of area and the large population, the mining industry is strikingly insignificant, though the recent developments are beginning to give it some importance. Increased utilization is being made of the coal resources of the country, much to the advantage of the railroad and milling interests. The annual output of coal increased from 2,562,000 tons in 1893 to 6,095,000 tons in 1900. The Province of Bengal produces over three-fourths of the total product, the output having grown from 1,915,000 tons in 1893 to 3,883,000 tons in 1899. The principal other coal-mining regions are the Nizam's Dominions, Assam, the Central Provinces, and Central India (Rewa), in each of which the output was greater in 1899 than in any preceding year. The increased production has resulted in the decrease of the imports of coal—which amounted in 1900 to only 83,200 tons—and the increase in the exports of coal, amounting to 541,400 tons in the same year. Coolie labor is prominent in the working of the coal-mines.

The mining of gold is also rapidly becoming important, the yield having steadily increased from 107,273 ounces in 1890 to 513,266 ounces in 1900. The greater part of this is mined from the quartz deposits of Mysore, although some gold is obtained from river gravels in the Himalayas and elsewhere. A parallel growth is being made in the production of petroleum, the output in 1900 having been nearly 38,000,000 gallons, the greater part of which was obtained from Upper Burma. The importation of mineral oil is still more than twice as great as the home production. The Government has long maintained a monopoly in the production of salt. It is obtained mainly by the process of evaporation, and the industry is carried on along the coast region and at some of the interior lakes. The annual yield is estimated at about 1,000,000 tons. Salt-petre is obtained in the plains, lead and copper are mined in the Himalayas, and tin and rubies in Burma. India was long famous for its diamonds, but the output in the last century has shrunk into insignificance.

AGRICULTURE. This industry, which has always been the principal source of subsistence

for the people of India, is increasing in importance under British control, as improved means of production and transportation enable foreign manufacturers to deprive native artisans of their occupation, forcing them back to dependence on the cultivation of the soil. The land of India, though varying in composition, is generally fertile and is very productive, being aided by the tropical climate. The country is kept in continuous danger, however, of crop failure and consequent famine by the general uncertainty of rainfall. Practically the only districts exempt are the southwestern Malabar Coast, the Deltaic district of the Ganges, Brahmputra, and Burma. (See paragraph above on CLIMATE.) In some regions, as in the lower Ganges Valley, the precipitation is ordinarily quite heavy, rarely failing to meet the needs.

IRRIGATION. From remote times the inhabitants of India have sought, by means of artificial water-supply, to protect themselves against the calamities of drought. Under British control the irrigation works have been enlarged and new ones constructed on an enormous scale. In 1900 there were 31,544,000 acres, one-seventh of the total crop area, under irrigation. This was over four times the area irrigated in the United States, which ranks next to India in this respect. The area actually irrigated varies with the lack of rainfall from year to year, and the commercial value of irrigation schemes varies in different sections. In Sindh and Lower Punjab irrigation is necessary every year. In the valley of the Indus the necessity for irrigation decreases with the distance from the Himalayas, but the system is used as a protection against drought years, and to supplement the rainfall of average years. This is true also of the Upper Ganges region. In the Lower Ganges valley, as indicated above, irrigation becomes less and less necessary toward the Deltaic region, in portions of which the danger of drought gives place to that of inundation. In Madras (except the west coast) and the Deccan or Central India region, irrigation is a practical necessity as a protection against frequent droughts, and to supplement the usual rainfall. On the east coast of Madras, especially where 'wet crops' principally are grown, irrigation is an absolute necessity. In Orissa and Upper Bengal, though the ordinary rainfall is quite adequate and droughts seldom occur, the Government has constructed irrigation works as a safeguard against dry periods. These works are considered indirectly profitable to the Government, however, since they obviate the loss of land revenue and the expense of supplying a famine-stricken district with food during a drought year. The Orissa and some of the other canals are also valuable for navigation.

The sources and methods of irrigation vary throughout the country. Before the British occupation wells were used chiefly, and have continued to increase in absolute, though not in relative, importance, because, where practicable, they constitute the cheapest method. They are generally employed by private enterprise, and are still the largest source of irrigation in the United Provinces of Agra, Oudh, and Gujarat. Reservoirs, generally called tanks, have been used since ancient times to furnish water for irrigation, and are especially adaptable to broken, hilly regions, where the construction of a long system of canals is impracticable. They are found

chiefly in the eastern portion of Madras, where they vary in size, according to the supply of water and the irrigable area which they command. In many instances they are dry during a part of the year, and crops are sometimes raised in them. This tank system is also carried on by private enterprise. But since India has been in the hands of the British the greatest progress in irrigation has been accomplished through the extension of the canal system.

This method also was used in ancient times, but some of the more important systems had fallen into disuse when the British took possession. Their construction requires heavy outlays of capital, and presupposes a stable form of government. The numerous legal complications which rise out of such an undertaking, and the relation of the Government to the land, together

for their great length and capacity. Many of them are remarkable feats of engineering, owing to the difficulties surmounted in their construction, such as the crossing of other streams. Among the most famous of these are the Ganges Canal (q.v.), the Bari Doab Canal, which waters a large district to the northeast of Lahore, and the Western Jumna Canal, generally considered the oldest in India, which waters the region between the Sutlej and Jumna rivers, tributaries, respectively, of the Indus and Ganges rivers.

The following table shows the area in the different provinces irrigated during the years 1899-1900, the relative importance of the different sources of irrigation, and the proportion of irrigated land to the total crop area. It will be seen that the Punjab is the most, and Assam the least, dependent upon irrigation:

AREA IN ACRES UNDER IRRIGATION IN 1899-1900

ADMINISTRATIONS	Total area under crops	Area irrigated					Total area irrigated
		By canals		By tanks	By wells	Other sources	
		Government	Private				
Bengal	65,708,800	754,577					754,577
United Provinces of Agra	30,189,651	1,981,373	5,692	1,215,683	4,478,507	553,595	8,234,850

Total	223,654,333	12,333,737	1,310,723	4,388,375	12,287,218	1,224,003	31,544,056

with the necessity of constructing certain systems having no remunerative financial value, have all led the British Government to take the system almost wholly in its own hands. The execution of this method requires a fairly level area. The methods used for the application vary in different localities. In the Madras Deltas, dams are constructed across the rivers at their entrance to the Delta region, and since their beds are almost on a level with the surface of the land, water is easily diverted into artificial channels. They yield their main supply during the annual flood period, and the region dependent upon them is therefore limited to one crop. In the Lower Punjab and Sindh the channel of the Indus River lies so far below the surface of the riparian country that its waters cannot easily be diverted by dams. Through the high banks deep cuts are made, and 'inundation canals' are constructed, which convey the water of the river during the flood period. By this means the land is watered sufficiently to produce one crop a year. The valleys of the Upper Ganges and Upper Indus are also too deep and broad to admit of damming, nor would the inundation system of the Lower Indus answer the purpose. Some of the crops commonly raised, and which require irrigation, grow in those seasons during which the rivers are at their lowest. For their irrigation, canals are dug so as to strike the rivers where they emerge from the mountains. The channels conduct the water along the water-shed of the plains, finally reuniting with the main streams. Some of these canals are notable both

CROPS. In 1899-1900 the area actually cropped was 180,150,454 acres, and the current fallow 57,165,960 acres. The estimated area of the cultivable waste for the same year was 106,404,704 acres, besides which there were 135,506,014 acres not available for culture, and 65,843,924 acres under forest. The crop statistics for the year mentioned are given in the table on the next page.

The kind of crops grown is determined largely by the amount of the water-supply. In regions where the rainfall is excessive, or an abundant supply is readily obtainable, rice is almost the only crop. It is therefore confined largely to the Deltaic regions, and especially to the Bengal Delta. Here the annual overflow of the rivers makes irrigation easy. From the table below will be seen the great importance of rice in Bengal, Lower Burma, and Assam. The consumption of rice is not nearly so universal in India as is popularly supposed. It is not the cheapest food, and in many regions only the wealthy classes can afford it, while even in Bengal there are great numbers of the lowest classes who use but little. Sir William Hunter estimates that it is the staple food of less than one-third the total population of India. The main crop is reaped in the early winter—November to January—but in Bengal there is also a summer crop. Throughout the dry, non-irrigated portions of India millet is the commonest food crop, and is the largest item in the food of the lower classes over the greater part of the country, being most used in the southern districts. Practically the

* Jute and cinchona included in totals.

whole crop is used for domestic consumption, whereas rice is exported in large quantities. The planting and harvesting periods vary with different sections; in some regions two crops are raised, and in others, especially in the northwest, but one crop is produced, the rainfall being the controlling factor. The acreage shown in the table is somewhat less than the average for the decade.

After rice and millet pulse is the most important food product. In the United Provinces of Agra and Oudh it constitutes the largest crop. The figures in the table under the heading "Other food grains, including pulse," include gram, maize, and barley; the average each for the decade being approximately ten, five and one-half, and six million acres respectively.

Wheat is confined largely to the northwestern part of India, being the chief crop in the Punjab. It is a very important factor in the agriculture of the United Provinces of Agra and Oudh, and is produced to a less extent in the Central Provinces and Sindh. While there was formerly much apprehension in the United States that the wheat crop of India would drive that of the former from the world market, recent developments have not justified such fears, since the increase in area devoted to wheat in India was much less in the last fifteen years of the nineteenth century than in the preceding fifteen-year period. The wheat-producing area varies widely from year to year, the figures given in the table being over six million acres less than those for 1895. The average for the decade was a little less than 20,000,000 acres, about half of which is subject to irrigation. The average yield per acre varies with climatic conditions—in the Punjab it is about 13 bushels. The harvest occurs during April and May. Potatoes and other root crops are grown successfully, but they are not as favorite a food in India as in European countries. A large variety of tropical or semi-tropical fruits are grown for local consumption. The cocoanut is the most important export from the southwest coast. There are several kinds of dates having a local and commercial importance. Throughout India the raising of oil-seeds receives much attention, an average of about 12,000,000 acres being devoted to their cultivation. The product has been long an important item in local consumption, and in the last half of the nineteenth century large quantities were exported to Europe—the foreign demand giving an increased impetus to its cultivation.

Sugar-cane is grown in most provinces, but only in the United Provinces of Agra and Oudh and Bengal is it important. The crop requires irrigation and cultivation on a capitalistic scale, which tends to limit the development of the industry. The product has also to compete with the bountied sugars from Austria-Hungary and other European countries, and although contravening duties are placed upon imports from these countries, they failed to prevent their importation. But the local product supplies much the greater part of the home consumption. In Southern India coffee is raised in Coorg, and southward in Madras. The industry enjoyed a period of development following 1860, but during recent years it has remained stationary. The culture of tea and that of opium owe their development to the fostering efforts of the Government. Tea culture was introduced about the middle of the nineteenth century, and has continued to increase to the present time. Requiring an abundance of water, it is best adapted to Assam and Lower Bengal, and is largely confined to these two regions, being grown for foreign markets rather than home consumption.

Opium is a Government monopoly, and its growth is restricted to certain regions, principally Behar, the country around Benares, and

Oudh. The poppy-plant, from which the opium is obtained, requires irrigation and careful attention. Most of the product is exported to China and the Straits Settlements. The area devoted to its culture does not vary greatly and increases slowly. Some tobacco is grown in most parts of the country for local consumption. About half of the total product is grown in Bengal, and part of it is exported. The tobacco is generally inferior to that grown in other countries, and therefore does not compete seriously in the European market. Indigo has ceased to hold its own, even in absolute importance. The acreage for 1900 was one-third less than that for 1895. The industry has suffered from competition with various substitutes, and with the product grown in Java. Bengal (particularly Behar), the United Provinces of Agra, and Madras lead in its production. Spices are raised and exported, but are of minor importance. The last half-century has witnessed a remarkable increase in the production of fibrous plants—cotton and jute.

Cotton had long been raised, but had not been drawn upon to supply the foreign market to any great extent until the Civil War in America stopped the supply from there. A reaction soon followed its rapid and extensive development, and though it subsequently increased again, it never regained the position held in the early seventies. During the last decade of the nineteenth century the area cultivated averaged about 9,000,000 acres. Cotton cultivation is not confined to any distinct region, but is relatively most important about the centre of the peninsula in Berar. The soil of this and the surrounding country is called the 'black cotton soil,' and is noted for the remarkable extent to which it holds moisture. The cotton is a short-staple grade, and therefore inferior to the American and Egyptian products. The production of jute is more restricted in extent, the plant growing best in the flooded lands along the Lower Ganges and Brahmaputra in Eastern Bengal. The average annual acreage for the last decade of the nineteenth century was over 2,000,000 acres. Like cotton, the product is largely exported, though there is not so large a per cent. of it that is exported in the raw state. A considerable part of the product is shipped to the United States. Silk culture is an important industry in the Punjab, Assam, and Lower Bengal.

The methods of cultivating crops in India are such as have prevailed for centuries. The natives show little inclination to take suggestions from

the British. The efforts of the latter to accomplish results by means of experimental farms and the holding of fairs have not generally been successful. If better methods or superior kinds of seed, intended to secure greater results, are urged upon the farmer, he suspects the ulterior motive to be that of raising rents; nor is he very willing to show his stock at fairs unless he can secure a reward even if unmerited. But it is claimed that the native has adapted himself to the soil, and understands it better perhaps than his foreign instructors. If he does not plow deep the soil is such that it does not require it. The principle of the rotation of crops is known, though not widely practiced. Manures are utilized, but the necessity of using them as fuel in many places greatly limits their supply available for fertilizing.

STOCK-RAISING. The above table of cultivated crops does not embrace fodder crops. These, however, are not important, as other Government tables show, a fact which suggests the unimportance of the stock-raising industry. During the decade ending with 1900 the area of the fodder crops varied from less than 2,000,000 to nearly 3,000,000 acres, showing some tendency to increase during the decade. A number of conditions are responsible for the undeveloped and unsatisfactory state of stock-raising. As is common in a tropical climate, the people are given almost wholly to a vegetable diet. Religious or caste prejudices prevent the greater portion of the Hindus from eating beef or pork. The period preceding the annual rains is characterized over a large portion of the country by a scarcity of both water and pasturage, and stock are generally reduced almost to starvation. This tends to make the breeds deteriorate. The disregard of proper methods in breeding has a similar influence. The grade of stock, therefore, is generally very inferior. Over the greater portion of British India cattle serve the same purpose that horses do in most countries. The breed of cattle is one that is unknown in this country, being of the humped variety. Buffaloes are also used as work-animals throughout almost all India. They are somewhat harder than cattle and thrive in districts climatically unfavorable to the latter. Mules and donkeys are about equal in number to horses and ponies, the former being raised in the largest numbers in the Punjab and the latter in the United Provinces of Agra.

In the dry regions of the Lower Punjab and Sindh camels are the principal domesticated ani-

mals. In a few localities elephants are of great value in performing certain kinds of work, but their number and use are much more limited than is popularly supposed. The grazing industry is best represented in the raising of sheep and goats. These animals are valued chiefly for their wool. Some pigs are raised, but their number is not recorded in the Government reports. The preceding table shows the number of domestic animals by provinces for the year 1899-1900. Compared with the figures of a decade earlier a slight increase is found for almost every variety in most of the provinces.

FAMINES. From the earliest historical times India has suffered often and terribly from famines. There is much disagreement, however, in the matter of locating the responsibility among the different factors which have been held accountable for them. While famines are, of course, always preceded by local crop failure, almost every community is said to produce enough in ordinary times to bridge over the occasional period of scarcity, and it would appear that there has never been a year when the whole country did not produce enough food for all its inhabitants. Since crop failure always is at least the local cause of these awful experiences, it is worthy of first consideration. The general cause of crop failure is in the first instance a lack of sufficient moisture for the growing crops, though the period of insufficient crops may be extended because of the want of seed for a new crop, or of animals to till the soil. In limited districts floods sometimes destroy the crops, but the construction of embankments and canals has greatly lessened their destructiveness. In former years, under a less stable form of government, wars were not infrequent, and a shortage of crops and resultant famine ensued. But this factor has been much less conspicuous since the British control. In the paragraph above on climate will be found described the important natural elements which determine the distribution of moisture in India. It is only necessary here to note that there are districts in which the rainfall is always heavy—the chief of these being the region south of Bombay, the Deltaic region of the Ganges-Brahmaputra in the northeast, and Assam. There are other regions in which the rainfall is always very light, the largest being in Sindh and Rajputana. Throughout the remainder and most extensive portion of India the rainfall is subject to more or less uncertainty. In some portions, as in Upper Bengal and in Orissa, the fall is ordinarily heavy. In other regions, i.e. the upper valleys of the Ganges and Indus rivers, and throughout the Deccan and southeast coast—the precipitation is less constant, and failures of crops more frequent. The more densely populated districts, where the rainfall is abundant, are always ill prepared to meet a crop failure, and consequently suffer terribly when it comes. By means of irrigation works (see *Irrigation*) the extent of crop failure, however, has been greatly lessened over many parts of the country, especially where the rainfall is most uncertain and inadequate. Under British administration such works have even been extended into districts where the rainfall is usually sufficient. Irrigation itself sometimes fails, as in Madras, where the precipitation may not be great enough to supply the reservoirs or keep the streams full enough to supply the irrigation ca-

nals. Naturally the extent of the area affected by drought and the intensity of the distress and the frequency of occurrence vary greatly. The area may represent a third or more of the total population. The failure of a single season seldom, if ever, brings distress. It is when the second or sometimes the third failure occurs that relief is necessary.

It has been maintained that the destruction of the forests, which has been especially great in recent years, is not a little responsible for the droughts. A policy of reforestation therefore has been advocated, and steps have been taken to preserve the remaining forest areas. The fact that in districts adjacent to those where a famine may prevail a surplus of food crops is usually found, but cannot be transported owing to lack of facilities, has led the Government to construct railways, which would help greatly to solve the famine problem. The beneficial results, however, have been much disputed. The lack of rolling stock, for instance, has sometimes prevented the timely delivery of famine stores. A more serious accusation is that by bringing a district visited by famine in communication with the world's markets the district is annually drained of the surplus food which would otherwise remain in store for a year of scarcity. The main portion of the wheat crop of the Northwest is exported to Europe, though the natives may die of want before another crop is harvested. This criticism is part of a more general charge against the influence of the British Administration. The native, deprived of his manufacturing industries (see *MANUFACTURES* in this article), and forced to purchase foreign products, as well as being obliged to pay a land tax which many claim is overburdensome, finds it impossible to retain any considerable portion of his produce. On the other hand, it is claimed that the native burdens himself with unnecessary debt; that he lacks thrift and is improvident. Before the British came it was more or less common for both private and public stores of grain to be kept from year to year; the latter were even required by law to be so kept. Lately, however, the public stores, and to a large extent the private granaries, have disappeared.

The work of mitigating distress from famines has accordingly come to constitute a large part of the work of the British Government in India. Elaborate preliminary preparations are made in fear of their recurrence. The work is carefully systematized and officered. The country is districted, and in each district an examination is made of such matters as the water-supply, the social condition of the people, the probable extent of need in case of famine, and public works. The budget makes annual provision against famines whether they actually prevail or not. In the relief extended the Government policy aims at preventing death and at benefiting the individual. Wages are better for the individual than doles. Accordingly, the able-bodied man is given employment on public works, for which he is paid in money. The amount paid is much less than the normal wage, but sufficient to keep him in working condition. Provisions are supplied by the merchant, and the Government railway makes every effort to facilitate their transportation. For those not able to work hospitals and orphanages are prepared.

The public works are generally such as are

considered of value in affording protection against a recurrence of famine. They are of two classes—those which facilitate transportation, and those which increase the water-supply. Special difficulty is always encountered in the administration of relief in any district, because there are not to be found local organizations whose purpose has been to deal with charitable problems, or individuals trained in the management of men and the superintendence of public works. Nor does the conscience of the native prove to be generally trustworthy. Public relief is not extended until the villagers begin to leave their homes and wander about the country in search of doles, usually toward a large centre of population, the profuse though indiscriminate village charity having been well-nigh exhausted. The people as a rule, especially the agriculturists, are very loath to abandon their homes. The mendicants and the day laborers are the first victims of distress and the first to quit the village. They are soon followed by artisans and agriculturists. The public works are usually many miles away, and the journey thither is likely to be exceptionally critical. At the public works the family unit is not destroyed. When all the members of the family are accustomed to labor outdoors at home they are fitted to work also on the public works. Artisans make or repair tools, weavers make clothing, and the assemblage becomes in many respects a normal community. When climatic conditions are again favorable the farmers especially are eager to return to their lands. And then the final, and oftentimes the most necessary, mission of the Government is to see that they are provided with seed, with cattle, and the necessaries for producing a crop.

The loss of life from starvation is sometimes considerable, but deaths from diseases which so frequently accompany the famine are generally greater. One of the most difficult tasks of the Government during the famine period is to enforce necessary sanitary regulations. However, taking one year with another for the whole country, the loss of life from famines constitutes but a small per cent. of the total death-rate. Their influence in reducing the population is greatly augmented through the very decided decrease in the birth-rate during the famine period. (See POPULATION, below.) The ravages of disease in India are not peculiar alone to famine periods. The climatic and sanitary conditions give rise to pestilences which at intervals carry desolation over the country. Hospitals, richly endowed and admirably regulated, supported by Government as well as by private munificence, exist in all the large towns; and great efforts are constantly made to bring the benefits of medical skill and knowledge within reach of the poorer classes. In all parts of the country dispensaries have been opened where medicines are given out and patients advised. Disease in India is not a little due to bad water and bad drainage. Where a new water-supply has been introduced, and drains have been made, as in Calcutta, the improvement in the health of the inhabitants has been marked. Several millions of persons are vaccinated annually in India. Mortality is aggravated by the passion of the people for pilgrimages. All ages and both sexes each year traverse vast areas for their devotions, and die by hundreds on the route. The Mohammedan pilgrims go in numbers to

Mecca, Kербela, and Jerusalem, and a large proportion never return. The effort of the English to enforce sanitary regulations naturally meets with serious difficulties which grow out of the prejudices and customs of the people. Visits of the sanitary officers to the dwellings of the Mohammedans, as is sometimes necessary during the prevalence of a plague, occasion much complaint on the part of the natives.

MANUFACTURES. For centuries India has been noted for its beautiful fabrics and metal-work, made chiefly in the houses of the natives. They formerly constituted a large proportion of the exports of the country, and competed even with English goods until prohibitory laws were passed by Parliament to protect the British industry. Some Indian products, on account of the exquisiteness of the workmanship, occupy a class of their own, and have not been supplanted. But most native Indian industries are of a primitive type, and in a society so thoroughly impervious to the spirit of progress their modification and improvement have been impossible. Consequently the development of the factory system in England made it possible to manufacture products much more cheaply than could be done by the laborious methods of Indian workmen. In addition, recent improvements in transportation facilities have enabled European manufacturing centres to command a large part of the Indian market, with the result that in the home market in some localities, and in some outside markets, the Indian products have been almost entirely supplanted. The enormous growth of the imports of cotton manufactures is suggestive of the extent to which the native industry has been supplanted. For a further account of these movements, see paragraph on COMMERCE.

Large numbers of native workmen have thus been either thrown out of employment or forced to make a change of occupation, which was discountenanced by the prevailing social order. This has resulted in widespread poverty among the laboring classes and given occasion for one of the most serious charges against the alien administration. The National Indian Congress (see GOVERNMENT) has voiced the prevailing sentiment in numerous resolutions demanding a high tariff on imported manufactures in order to protect the home industry. Another emphatic demand is that the educational system of the country be altered so as to place more emphasis upon industrial training in order that rising generations may be better prepared to assist in the introduction of Western methods. (See EDUCATION, below.) Attempts to establish improved methods have generally depended upon foreign management and untrained native labor, besides having to contend with obstacles growing out of differences of caste. Of disadvantages growing out of a lack of material resources, the great want of fuel and the inferior quality of the coal are the most serious. Under these conditions the progress of improved methods of manufacturing is slow.

The most important manufacture is that of the coarser grades of cotton. The average number of hands employed in the cotton-mills increased gradually from 53,624 in 1883 to 112,000 in 1890 and 163,000 in 1900, while the number of mills increased from 62 in 1883 to 186 in 1900. About three-fourths of this industry centres in the city of Bombay. A similar increase was observed in the jute and hemp industry, which in

1900 employed 101,600 hands, as against 42,797 in 1883. It centres in the region about Calcutta. Among the other more important establishments are woolen, paper, flour, rice, oil, and lumber mills, the breweries, coffee-works and indigo and sugar factories. The total number of factories inspected under the Factories Act in 1899 was 1110, employing 360,000 men, 65,300 women, and 27,400 children. The provinces of Bombay and Madras each employed over a third of the total force. Among other manufactured Indian products are silk (including beautiful figured stuffs), various articles of luxury, such as highly wrought work in ivory, gold, silver, copper, and brass, cashmere shawls, etc. In weaving and in carving and inlaying wood and ivory, the native artisans are unsurpassed.

TRANSPORTATION AND COMMUNICATION. The network of railways to be seen on a map of India presents a decided contrast with the sparsity of railway lines in other parts of Asia. The mileage for British India is three-fifths the total for all Asia. The development of the railway system was prompted by a number of motives, and has been prolific and far-reaching in results. The military exigencies, development of the resources of the country, extension of British trade, and humanitarian sentiments or the desire to lessen the horrors of famine have each played varying parts in determining the location of lines and methods of administration. The results show that each of these efforts has been abundantly justified. Closely allied with the influence of the railway system as an economic factor has been its socializing influence—the beginning of the transformation of the native society, a lessening of the rigors of caste, and at least a portend of a reconstructed civilization along more modern and progressive lines.

Railway development in India has been in the main in harmony with a policy laid down as early as 1850 by Lord Dalhousie. This policy comprehended the construction throughout India of a system of grand trunk lines with a uniform gauge, connecting all the large centres of industry and population, and the construction of subsidiary or feeding lines with a narrower gauge and on a less expensive scale. The grand trunk lines were accordingly begun in the early fifties under a system of Government guarantee. The constructing companies were guaranteed 5 per cent. on the capital invested for a period of twenty-five years, and at the end of the contract period the Government had the right under specified conditions to take possession of the lines. The policy attracted capital to the country, and led to a more rapid railway construction than would have been secured by State construction. The guarantee, however, led to some extravagance in expenditure and became a heavy burden to the Government. A new policy accordingly was taken by the Government in 1863-64, under which assistance was advanced to new lines, which in turn obligated themselves to perform certain duties for the State.

A third policy was introduced in 1870 under which new lines were built and operated directly by the Government. The widespread and disastrous famines a few years later made it evident that new lines should be constructed faster than the Government could assume financial responsibility for their undertaking, and forced it to fall back upon private enterprise. New lines were

built without regard to a uniform policy, the Government generally extending a guarantee, but for as brief a period as possible. Meanwhile the contract period of four companies had terminated, and new contracts were made for another twenty-five years, according to which the State, allowing certain concessions, was to share in the surplus income above 5 per cent. But subsequently, at the expiration of other contracts, the lines have been acquired by the State. Though no settled system has yet been adopted for the administration of railways, it will be seen that the greatest mileage is included in the lines belonging to the Government, but controlled by private companies. In 1900 a little less than half of the total mileage, or 11,654 miles, was represented by Government lines operated by companies; 1560 miles were owned by native States and operated by companies; 5884 miles represented State lines operated by the State; 1157 miles were owned and operated by the native States; 2663 miles were owned and operated by guaranteed companies; 1519 miles were owned and operated by assisted companies; 157 miles owned by the native States were operated by State Railway Agency; and there were 74 miles of foreign lines. The total mileage increased from 16,380 in 1890 to 24,668 in 1900. The total capital expended on Indian railways to the end of 1900 amounted to Rx. 332,751,083. Many of the lines net a large profit to the State, but these are more than counterbalanced by the more strictly military or famine-protecting roads, which result in an annual burden to the taxpayers of India, the amount fluctuating widely, but usually exceeding £1,000,000.

The number of post-offices in 1900 was 10,823, which was an increase of 29 per cent. during the last decade of the nineteenth century. The number of letters handled during the same period increased 60 per cent. The Imperial system of telegraph and the railway system have been united, and there is a uniformity of telegraph charges throughout the whole system, including 52,900 miles of line and 170,760 miles of wire (1900). The mileage of wire increased 50 per cent. in the last decade of the nineteenth century. There are three grades of messages—the urgent, ordinary, and deferred. The charges are less for the messages delivered with the less speed. For a period of ten years ending in 1899 the Government realized an annual average of 4.8 per cent. net revenue (based on the capital sum employed) after allowing for all working expenses.

COMMERCE. From the earliest periods of history India has held high rank in the trade of the world, having been a large producer of commodities that were highly prized in general commerce. The attempts of Portugal, Holland, and France to secure the largest share of India's trade form an important chapter not only of its own history, but of that of the world. The desire to find a short route thither by sea furnished much of the impetus given to the spirit of exploration during the fifteenth century, of which the achievement of Vasco da Gama (q.v.) affords a conspicuous example.

In 1600 an English trading company, the East India Company (q.v.), joined in the rivalry, and opened the way for the extension of English influence and power over the whole country. For over two centuries trade between England and India increased slowly. After the Eng-

lish East India Company was deprived of its monopoly in 1834 there began an epoch of rapid trade development. The abolition of the inland duties, the assumption of control by the English Government, the construction of the Suez Canal, and the improvement of inland transportation have been most influential factors in accelerating this trade movement. The magnitude of the increase since 1834, in which year the total foreign exports by sea were less than £10,000,000, is shown *pro tanto* by the following table:

VALUE OF FOREIGN IMPORTS AND EXPORTS BY SEA, EXCLUDING GOVERNMENT STORES AND TREASURES

	Imports			Exports		
	Merchandise	Treasure	Total	Merchandise	Treasure	Total
1869-1870	£32,879,000	£13,954,000	£46,834,000	£52,471,000	£1,025,000	£53,496,000
1889-1890	Rx. 66,560,000	Rx. 17,459,000	Rx. 84,019,000	Rx. 103,396,000	Rx. 1,841,000	Rx. 105,238,000
1899-1900	£47,141,000	£13,972,000	£61,113,000	£72,650,000	£5,300,000	£77,950,000

The rate of increase has declined somewhat during the last decade. Since 1834, with few exceptions, the exports have annually exceeded the imports. A large proportion of the Indian foreign trade (about four-fifths of the imports and a little less than three-fifths of the exports) passes through the Suez Canal. Of this the greater share is with the United Kingdom. The figures for 1900 are: Imports via Suez Canal, £48,737,000, by other routes £12,376,000; exports via Suez Canal, £44,840,000, by other routes £33,110,000. The following table shows the amount of trade with other countries since 1869:

VALUE OF PRIVATE MERCHANDISE AND TREASURE TRANSPORTED TO AND FROM BRITISH INDIA BY SEA

*Including Hong Kong and Treaty Ports. **1871-72.

†Western Hemisphere, not including West Indies. ††1875-76.

It will be noted in the above table that the preëminence of the United Kingdom in the trade with India is waning, particularly in the exports. They have been reduced to less than a third of the total exports, while the imports from Great Britain are almost two-thirds of the total imports. The increase in the exports from India has been largely in the exports to other Oriental countries. The United States is making significant gains in exports from India, but the amount of American products sent to India is still insignificant. The exports accredited to Egypt are probably intended largely for the Mediterranean trade. Among Continental European countries Germany, France, and Belgium are in the lead, the former being first in the amount of imports from India. In Asia the Straits Settlements and Ceylon have a large trade with India.

Two cities, Calcutta on the east and Bombay on the west, have the only good, large natural harbors on the coast, and about three-fourths of the entire trade passes through their ports; the

former being more prominent in exports and the latter in imports. Adequate harbor facilities have been secured at great expense at Karachi, and it now serves as a port for the Indus Valley region. A harbor has only recently been completed at Madras and another at Rangoon—the port for the Irrawaddy Valley region.

The large increase in commerce during the last century has been accompanied by a radical change in the quality of the trade, and considered from this standpoint the increase has not

meant a corresponding growth in the welfare of the country. A large proportion of the trade during the earlier period was in manufactured products, especially manufactures of metals and textiles. But the factories of Manchester and other foreign places have in a large measure supplanted the hand labor of India. Textiles, once an important export, now far exceed all other imports, and amount to over two-fifths of the total imports. The exports have become predominantly those of raw materials: the imports have become almost wholly manufactured products. As manufactured cotton leads in the imports, so

raw cotton for a long time held first place among the exports. Cotton exportation received a great impetus during the Civil War in the United States, but it declined materially after the war, and has continued to do so ever since. Three or four other articles have surpassed it. Nearly all the cotton goods are imported from the United Kingdom, but that country receives only a small part of India's exports of raw cotton. The exports of India were formerly distributed among the European countries, but during the decade ending with 1900 the demand from Japan rapidly increased until it amounted to over half the total, or £3,730,000. The importation of cotton twist and yarn decreased one-half during the decade ending with 1900, and there was a corresponding increase in the exports of that article. These exports in 1900 amounted to £4,671,000, almost all going to China.

The other leading imported commodities, all having about equal rank, are hardware, machinery, iron, steel, and copper, mineral oil, railway plant and rolling stock, woollens, and sugar.

Great Britain has a practical monopoly for India in the supply of railway material and machinery, and it supplies also the larger part of other metal products, Belgium, of the other countries, sharing most extensively in the trade. Mineral oil is the principal import from the United States, but Russia now furnishes the bulk of this article. Among several exports of relatively great importance, rice—the only export upon which export duties are levied—is the most prominent and fluctuates the least, reaching an average value in recent years of about 13,000,000 tens of rupees. Most of the rice goes to Egypt, the United Kingdom, Ceylon, and the Straits Settlements. During the last quarter of a century there has been a great increase in the exports of oil seeds to Europe, averaging for the last decade nearly 11,000,000 tens of rupees. Exports of hides and skins, jute—raw and manufactured—and tea increased very rapidly during the decade ending with 1900, reaching in that year values of £6,975,000, £9,557,000, and £6,117,000 respectively. Raw hides and skins and jute cloth constitute the principal exports to the United States. The amount of each increased enormously during the decade and far exceeds that sent to any other country. Exports of manufactured jute increased 20 per cent. during the last decade of the nineteenth century. Nearly all the tea exported goes to the United Kingdom; it has not yet become a formidable competitor with the Chinese product for the United States markets.

Opium, which is exported to China and the Straits Settlements, is decreasing in amount, the total value for 1900 being £5,469,000. Exports of wheat fluctuate widely; the value for 1900, which was higher than the average for five years previously, was £2,606,000; the total for the last decade was much less than that for the preceding ten years. Most of the product goes to the United Kingdom. From 1890 to 1900, exports of indigo averaged about 4,000,000 tens of rupees annually, with a tendency latterly to decline. For more than two decades, ending with 1900, exports of coffee have varied from about 1,500,000 to 2,000,000 tens of rupees. Spices, which once were a large part of the exports, are now relatively insignificant. Treasure has long constituted one of the most valuable imports, and has annually exceeded in amount the exports of treasure for more than half a century. The value for the decade 1890-1900 averaged over 16,000,000 tens of rupees, over two-thirds of which was silver. Since the Government stopped the free coinage of rupees in 1893 the net imports of gold have been gaining upon those of silver. The exports of gold and silver for the same period averaged over 5,500,000 tens of rupees.

The imports and exports by land are not large, the totals for 1900 being respectively £4,700,000 and £3,759,000, which, however, constituted a considerable increase over the early years of the decade. Over half of the former and nearly half of the latter were to and from Nepal and Kashmir. The most important land imports were grain, pulse, timber, and provisions, while more than one-half the exports were cotton goods. Native craft carry on an extensive coastwise trade, particularly along the coast of Bombay. The traffic along this coast amounts to over one-third of the total coastwise trade. The large inland trade increases with the development of

means of transportation. The inland and the local trade are very largely in the hands of natives, there being certain sects or castes, as the Parsis of Bombay, who devote themselves especially to this branch of industry.

The foreign trade of India is done mainly in British vessels, the tonnage of these in 1897-98 amounting to 89 per cent. of the total. This total was greater than that for the corresponding year of either of the two preceding decades. Germany and Austria-Hungary are the most important of the other nations represented.

GOVERNMENT. By an act of Parliament, which received the royal assent August 2, 1858, Queen Victoria was declared sovereign of India, and various regulations were enacted for the better government of the country. In 1877, in virtue of an act of Parliament, passed in 1876, the Queen was proclaimed Empress of India. The Home Government of India is vested in a Secretary of State, who is a member of the English Cabinet. He is assisted by an Under-Secretary and a council of fifteen members. The Indian Executive Government is administered by a Viceroy or Governor-General, appointed by the Crown, and acting under the control of the Secretary of State for India. The Viceroy's term of office is for six years, and he is assisted by a council of five ordinary members, three appointed by the Secretary of State, and two by his Majesty's warrant. Each of them has charge of a department of the executive. The Viceroy himself retains the oversight of foreign affairs, and can overrule a majority vote of his council. The commander-in-chief is an extraordinary member of the council. This council, whenever it acts as a legislative body, is enlarged. It then has from ten to sixteen additional members who are nominated by the Viceroy for terms of two years, half of them being non-officials. Five of these councillors must be individuals who have been recommended, one each respectively by the unofficial members of the councils of Madras, Bombay, Bengal, and the United Provinces of Agra, and one by the Calcutta Chamber of Commerce. Proposals to legislate upon subjects such as finance, religion, military and naval forces, or the relations of the Government with foreign princes or States, must first receive the sanction of the Governor-General.

For purposes of administration, British India is separated into a number of divisions or provinces. They differ in the method of their government. The two governments of Madras and Bombay are under the rule of Governors appointed by the Crown, and assisted by legislative and executive councils. The executive council consists of only two men. From eight to twenty others are added to form the legislative council. These bodies communicate only with regard to important matters with the Home Government through the Governor-General. As regards affairs of minor importance, they correspond directly with the Secretary of State for India. The Provinces of Bengal, the United Provinces of Agra and Oudh, the Punjab, and Burma are administered by Lieutenant-Governors appointed by the Governor-General, subject to the approbation of the Secretary of State for India. These officers act without the aid of any executive councils, but have legislative councils of not more than twenty members, nominated by the Lieutenant-Governor on the approval of the Gov-

ernor-General. There are a number of points upon which the local legislators in India cannot touch, and their proceedings are void if disapproved by the Governor or Lieutenant-Governor, the Governor-General, or by the Home Government. The following divisions, viz.: Assam, Central Provinces, Berar, Ajmere-Merwara, Coorg, British Baluchistan, the Andaman Islands, and the new Northwest Frontier Province, are under chief commissioners. There are no local councils for these provinces, such legislation as they may need being supplied by the Governor-General in legislative council. All the foregoing governmental divisions are subdivided into smaller divisions called districts, of which there are in all 250, varying both in size and population. The executive officer in each district is called the collector magistrate or deputy commissioner. This office is remarkable in that its powers extend over every department of administration. The officer has charge of the collecting of the revenue, of education, roads, sanitation, police, and jails, and he is judge both of first instance and of appeals.

It has been the policy of the British Government to try to awaken a sense of civic responsibility among the natives, and it has encouraged the creation of the necessary machinery for local self-government. Much difficulty has attended the effort, owing to the absolute dominance which class distinction holds over the social order, making almost impossible the development of the idea of a mutual community interest. Some progress, nevertheless, is being made. Every province of India has since 1860 secured laws which place the administration of municipal affairs in the hands of local bodies. In small places these bodies are nominated from among the townfolk, but in large places they are mostly elected. Under specified regulations, the local bodies may raise funds or receive grants of public money for local purposes. In 1901 there were 764 of these municipal towns, containing an aggregate population of 16,500,000. The total income of these towns for the year mentioned was £4,828,288. The rural regions have also been supplied with district and local boards for purposes of self-government. In 1901 there were 1101 of these boards, including a total of 5553 elected members and 10,661 ex-official and nominated members. The income of these rural regions for the year mentioned was £2,509,829. The probability of the development of a national representative native government is scarcely conceivable. The idea of a common country or a national life does not exist. The masses are ignorant of even the geographical conception implied in the name India. There is, it is true, a national native Congress, which meets annually, but it is scarcely representative in any true sense or indicative of any popular national tendencies.

There are high courts of jurisdiction at Calcutta, Madras, Allahabad, and Bombay, appointments being made to them by the Home Government. These courts have a general oversight of the lower courts and are courts of appeal, but there is an ultimate appeal to the judicial committee of the Privy Council in England. The Punjab has a chief court, and the Central Provinces, Oudh, and Mysore have each a judicial commissioner. Burma has two judicial commissioners, as well as a recorder. The great majority

of the magistrates in the courts of original jurisdiction and of the civil judges are natives. Europeans have certain privileges in court not possessed by natives.

FINANCE. In the consideration of Indian finance, regard must be given to the denomination in which the estimates are made. If estimated in pounds, as in the following table, there is an apparent decrease in most of the non-commercial items of revenue and expenditure. On the contrary, if estimated in rupees, most of them show a very decided increase. The depreciation in the value of the rupee, as measured in gold, accounts for this difference; but since the burden upon the taxpayer is determined by the local purchasing power of the rupee, the question of the effect upon the welfare of the native is a subject of dispute.

Leaving out of account the productive enterprises of the Government, which are largely self-supporting, it will be seen that customs and excise play a minor part in the support of the Government, while land revenue has contributed on an average considerably over a fourth of the total amount. The stamp, salt, and opium revenues also play a conspicuous part. The land revenue, however, is not absolutely nor relatively so important as formerly. This revenue partakes of the nature of a rent as well as of a tax. The rent varies with soil and the distance from the town, but averages about 1s. 10d. per acre for the total acreage of cultivated land. The opium revenues are secured mainly from the monopoly of the industry in Eastern India, and the export duty collected in Western India. An increase in the salt duties in 1888 established the present uniform rate of 2½ rupees per maund. The collections from stamps are principally obtained from court fee stamps. The largest item in the excise revenue is that collected from the manufacturer of spirits, but other sources, as, for instance, the monopolies for the sale of liquors and intoxicating drugs, help to swell the amount. The interests of British trade have determined the policy of keeping the import duties—especially those on cotton goods—at a minimum figure, though the natives have at the same time demanded tariff protection. The general customs duties of 5 per cent. existing prior to 1882 were abolished in that year, except those on salt, opium, wine, beer, spirits, and arms. In 1894 a 5 per cent. ad valorem was reimposed, except on machinery and a few other articles; but two years later the duty on woven cotton goods was reduced to 3½ per cent. ad valorem, and cotton yarn was exempted from duty. Since 1886 an income tax has been assessed upon incomes exceeding 500 rupees.

In the last two decades of the nineteenth century the budget yielded a surplus for twelve years of the period, and showed a deficit for eight years. The heaviest drain upon the Imperial Exchequer is made by the military charges. They are followed closely by the cost of the civil service. Both of these items, according to the consensus of native opinion, are unnecessarily burdensome upon the country. The army charges are irritating because the natives consider the army too large, and particularly because of the large proportion of British soldiers who monopolize most of the best positions, and whose salary and pensions are largely taken or sent out of the country. The Civil Service excites native criti-

cism because of the practical monopoly exercised by the English over the higher offices, and the excessive salaries attached to them. A few English officers receive an aggregate remuneration considerably greater than that given to the numerous native minor officials. The control of the opium, customs, post-office and telegraph, tributes, mint and currency, receipts and the expenditure under the heads of army and military works, political relations, public debt, and certain trunk railways, is retained by the Central Government. The management of all provincial revenues and some of the Imperial revenues is delegated to the local governments.

The following table gives a statement of the average annual expenditure for the two decades indicated and the year 1901:

DETAILS	1881-90	1891-1900	1901
Direct demand on revenue	£9,198,111	£6,797,206	£7,552,341
Interest	4,600,546	2,480,488	2,138,946
Salaries and expenses of civil service	12,277,556	9,916,049	10,971,622
Miscellaneous civil charges	4,597,045	4,441,431	3,987,370
Famine relief and insurance (excluding charges on account of protective railways)	931,379	1,141,481	4,156,344
Buildings and roads	5,279,111	3,862,520	4,068,721
Army services	19,484,591	15,585,835	15,082,799
Special defense works	275,255	152,685	6,864
Construction of railways (charged against Revenue in addition to that of Famine Insurance)	199,942	41,373	
Post-office, telegraph, and mint	2,126,871	1,736,072	5,157,660
Railway revenue account	14,953,786	14,487,566	17,968,505
Irrigation	2,380,082	2,025,011	2,320,327

The total average in round numbers for each decade is, respectively, £76,300,000 and £62,600,000. The total for 1901 is £73,400,000.

The following table shows the average annual revenues for each of the three decades indicated and for the year 1901:

DETAILS	1871-80	1881-90	1891-1900	1901
Land revenue	£21,100,759	£22,496,636	£16,869,344	£17,503,031
Opium	8,936,068	9,176,138	4,591,820	5,102,242
Salt	6,383,315	6,885,891	5,764,241	5,967,034
Stamps	2,802,489	3,643,720	3,063,493	3,342,948
Excise	2,463,086	4,088,094	3,638,876	3,937,202
Customs	2,558,202	1,504,890	2,283,491	3,371,597
Interest	520,793	792,203	608,327	651,479
Receipts by civil departments	981,740	1,468,413	1,115,376	1,243,076
Miscellaneous	457,045	1,076,186	525,298	529,492
Building and roads		605,741	447,953	458,470
Receipts by military departments		1,762,080	603,187	817,274
Provincial rates	575,946	2,948,487	2,426,251	2,562,713
Assessed taxes	527,345	905,669	1,198,645	1,322,094
Forest	594,910	1,071,281	1,115,425	1,297,863
Tributes from native States	720,079	721,006	552,748	577,823
Registration		300,133	284,843	312,558
Post-office, telegraph, and mint	1,278,055	1,911,061	1,951,095	5,425,847
Railways	2,519,049	12,997,363	13,922,181	18,293,629
Irrigation	552,189	1,677,791	1,838,804	2,555,919

The total average for the decade 1871-80 was £55,000,000; for 1881-90, £75,000,000; and for 1891-1900, £62,800,000. The total for the year 1901 was £75,200,000.

DEBT. The permanent debt of India gradually increased from £33,577,414 in 1842 to £51,327,958 in 1857, when it rapidly grew in consequence of the Indian mutiny, and stood in 1862 at £97,037,062, and gradually increased to £205,323,315 in 1901. Of this last amount, £76,887,936 was held in India and £128,435,379 in England. The greater part of the debt in India bears interest at the rate of 3½ per cent., and about one-half the debt in England bears interest at the same rate, the remainder paying interest at the rate of 3, 3¼, and 2½ per cent. Besides the above there were an unfunded debt in England of

£5,000,000, and other obligations assumed in India for savings banks, departmental and judicial deposits, etc., which brought the total liabilities up to £223,843,244 in 1901. The total interest for that year, amounting to £7,436,973, was distributed as follows: Railways, £4,376,699; irrigation, £921,328; ordinary debt, £1,776,406; and other obligations, £362,540.

CURRENCY. In British India accounts are kept in rupees, annas, and pies—16 annas making one rupee, and 12 pies making one anna. Beginning with the early seventies the rupee was subject to great fluctuation in value, with a general downward tendency. The burden of taxation was greatly increased in consequence of the great fall in the value of silver, the Indian revenues being raised in silver, while the amount spent

in Great Britain on account of India was paid in gold. This sum is disbursed in the payment of fixed charges, such as salaries and pensions of civil and military officers. The difference between the exchange value and the market value of the rupee became so great that the number of

rupees raised by the Government had to be increased by one-half. The financial embarrassment thus caused led the Government in 1892, when the exchange value of the rupee sank to 1s. 1d., to consider a plan for the closing of the Indian mints to the coining of silver. In June, 1893, a law to this effect was passed, and the rate of 1s. 4d. for the rupee was established as the gold price of silver, provision being made that when the rupee rose to this value the mints should be reopened to the coinage of silver. The value of the rupee gradually rose, and so far as the Government was concerned, the financial conditions greatly improved. But complaint was made that the native growers and the European planters in India were suffering severely from the change. It was argued that these classes

were obliged to pay labor on the old scale, in spite of the appreciation of the currency. Hence, while industrial expenses remained nominally the same, the employers received lower profits. Heavy losses fell also upon the natives, who as times grew hard were obliged to turn their hoards of silver into money. Finally, in the spring of 1898, a currency committee was appointed to investigate the monetary situation in India. This committee reported, in July, 1899, in favor of maintaining the gold standard, and making it more effective; and to this end a law was passed in September of the same year. Since 1899 the value of the silver rupee has been stable at the rate fixed—1s. 4d. (32.4 cents). The coinage of rupees, which for some years after 1893 almost ceased, became large in 1900-1901, and the profit on the coinage was set aside as a special gold reserve fund to be used in maintaining the rate of exchange between Great Britain and India. There is a comparatively small amount of paper money in circulation in India. It is legal tender within certain limited districts. The amount outstanding in March, 1898, was 298,659,000 rupees, about two-thirds of which was in the districts of Calcutta and Bombay.

According to the Indian money system, 100,000 rupees equal 1 lakh, and 100 lakhs equal 1 crore. Hence a sum that would be read in terms of rupees only, according to the English method, would, according to the Indian method, be differently punctuated and read in terms of both the larger and the smaller denominations. To illustrate: The sum 37884517000 rupees would in English read 37,884,517,000 rupees, but in the Indian notation it would be written 3,788,45,17,000 and read "Three thousand seven hundred eighty-eight crores, forty-five lakhs, seventeen thousand rupees." In Indian money estimates, sums are often given in tens of rupees, the abbreviation being Rx.

CIVIL SERVICE. The administrative offices are largely filled through civil service appointments. Candidates taking the examination required to secure a position must be under twenty-four years of age. The successful candidate is then on probation for a year in England, during which period certain requirements are to be fulfilled, as, for instance, the learning of the Indian law. A pension is obtainable after twenty-five years of service. Advancement is secured partly by promotion and partly by seniority. After a probationary period of four years a selection may be made between the revenue and the judicial departments, the civilian remaining in the department selected throughout the remainder of his career in the service. There are about 1000 positions to be filled under the covenanted civil service of India. Inasmuch as the examinations are held in London, there are not many natives of India who are able to take them, and nearly all the highly paid positions still go to Englishmen. However, the minor administration, both administrative and judicial, is mostly filled by natives. It is estimated that 90 per cent. of the civil employees of India are natives.

DEFENSE. The supremacy of the British sea power practically guarantees India from invasion by way of the sea, and the Himalaya Mountains perform a like service for a great part of the northern frontier. The main interest in the defense of India centres about the northwest frontier, which is the historic gateway for in-

vasions into India. In the last two decades of the nineteenth century the British adopted a more active frontier policy. They have established outposts and fortifications commanding the mountain passes that communicate with the west and north and more securely defend the Trans-Indus region. The British have a post of observation at Chitral and possess an 'influence' at Gilgit which enables them to keep informed as to the Hindu-Kush passes. Farther south the Swat Valley is in the hands of the British. The important Khyber Pass (q.v.) is open, and the large garrison stationed at Peshawar serves to protect it. Continuing south, the Kuram and the Tochi valleys are controlled by the British, as are also the Gunal Pass and the Zhob Valley. Quetta has been made a strong defensive point, as has also Sakkar—the city on the Indus where the railroad crosses to the westward. A number of posts along the earlier frontier line farther east are still maintained; others have been abandoned. The scheme of defense has led to the construction of railroads for military purposes, one of which extends to New Chaman, the farthest outpost on the Afghan frontier. These lines now make it possible quickly and easily to transport the soldiers to the different frontier strongholds.

The threatening approach of the Russians to the Indian frontier has established an excuse for the British to maintain a large army. The experience of the Sepoy rebellion has led them to increase the proportion which the British troops hold to the total military force, the intention being that the latter shall constitute one-third of the total number, and that the artillery shall be almost wholly British. The native soldiers are drawn largely from a few tribes, such as the Sikhs, Gurkhas, Rajputs, and Jats, who are the warrior races of the country, and are much more efficient as soldiers than are the masses of the population. Class distinctions are recognized, and the different units in the army organization are composed of homogeneous elements. Through the improvement of sanitary conditions, and the exercise of greater caution in locating British soldiers, fatalities are of much less frequent occurrence than formerly. The native States still maintain military forces, but the British have succeeded in their effort to have their number reduced and brought more or less under their own control. For a statement concerning the organization and statistics of the army, see **ARMIES**.

WEIGHTS AND MEASURES. The unit of weight commonly used is the maund, but it varies greatly in amount, being equivalent to 82½ pounds avoirdupois in Bengal, only about 28 pounds in Bombay, and 25 pounds in Madras. The tola, a small unit, is equivalent to 180 grains. In Bengal there is a unit of measure called the guz, equivalent to 36 inches. An act was passed in 1871 to establish a uniform decimal system of weights and measures, but it has never gone into operation.

POPULATION. India is one of the most densely populated countries, containing between one-fifth and one-sixth of the estimated population of the world. In 1901 the number of inhabitants per square mile was 188, as against 283 (estimated) for China, and 25.6 (1900) for the United States. The population is most unevenly distributed, nearly two-fifths being found in the valley of the

Ganges. As shown in the table, the density is greatest in the Province of Bengal. In the Patna division of Bengal, an area of 23,686 square miles, the density is 653 per square mile. The density of the population corresponds in a general way to the capacity of the different regions to support life, yet there are noteworthy exceptions, as in Assam and Lower Burma, each of which could easily support a much more numerous population than it now does. In most districts the population presses closely upon the limits of the means of subsistence, and cannot increase greatly so long as agriculture continues to be almost the sole dependence. There has been generally an increase and in many places a very marked increase of population since the British took possession. Prior to that time numerous wars, together with famine, plague, and pestilence, tended to check augmentation. The instability of the Government discouraged industrial enterprise, and much land possible to cultivate was left waste. Under British protection such land has been largely reclaimed, and the productive capacity of the country greatly increased. So long as an area of cultivation was being extended the local population augmented. When the limits of culture were reached the population became overcrowded and finally reached a stationary point. In most instances the growth of the population depends almost wholly upon the natural increase in the district, immigration from remote localities playing a very minor part. The people dislike to leave their native locality, and particularly dislike to embark upon sea voyages. The most considerable movement has been that from Bengal into Assam. Another movement of some importance has been from Madras into Burma and Ceylon.

The first attempt of the British to secure a complete census was made in 1872, when the total population was estimated to be 240,931,000. The returns for certain regions were only estimated, and were generally rendered uncertain through the lack of confidence on the part of the natives in the purpose of the Government. In subsequent enumerations there have been greater confidence on the part of the people and a corresponding increase in the accuracy of the returns. The total population for 1891 was 287,314,671, and for 1901, 294,360,356. It should be remembered that certain additions of territory have augmented slightly this increase. The gain during the decade 1881-91 was 10.96 per cent. as against an increase of 1.49 per cent. for the same area in the following decade, or an increase for the latter decade of 2.4 per cent., including the population of the new territory added. In the former decade 94.6 per cent. of the population showed an increase, whereas in the latter period only 63.3 per cent. showed an increase. The gain in the provinces of the last decade was 3.87 per cent.; the population of the native States decreased 6.30 per cent. The contrast shown above between one period and the other, and between one region and another, is largely attributable to the variable agricultural conditions. The earlier period suffered little from famines, the latter excessively. The decrease was greatest in Central and Western India, where the famine was most severe.

The following is a table of the area and population of India and its dependencies:

	Area in square miles	1901	1891
<i>Provinces (Total)...</i>	1,106,861	231,898,807	221,239,515

* See article INDIA, NATIVE STATES OF.

To this should be added some territories in India not included in the census, with an area of about 73,000 square miles and a population estimated at about 700,000. Aden, on the Arabian coast, with an Arabian protectorate embracing 15,500 square miles, and Socotra, a dependency of Aden, are officially included within the Empire of India. With these additions the total area of India and its dependencies is about 1,860,000 square miles.

A striking characteristic of the population is that it is so largely rural. Estimates show that about nine-tenths of the total belong to this class. This is true of even the most densely populated regions. The largest city in the densely populated division above referred to (Patna) has but 135,000 inhabitants. It must be understood, however, that the rural population is everywhere gathered together in villages which may contain only a few families or may number thousands. The country had not many large cities until the period of commercial development brought about by the British. Commerce has occasioned an immense growth in Calcutta and Bombay, but except these cities Madras alone exceeds half a million. (See table below.) Another peculiarity is the large proportion of males compared with European countries. The great privacy to which the females are subjected, particularly among the Mohammedans, and the aversion to intrusion on their domestic privacy, may serve partly to account for this discrepancy. Statistics for famine districts show

that in these regions there is a greater decrease in the male population than the female. It is generally accepted that women withstand the deprivations of the famine more successfully than men.

EDUCATION. Education on the part of England in India has been carried on in the face of many serious obstacles, and under complex conditions peculiar to the country. Social, religious, and racial distinctions, solidified in the system of caste, were so thoroughly interwoven with the whole of the life that they circumscribed the scope and modified the methods of English instruction. British education has never had to deal in India with the implanting of Western culture on an Oriental people having no culture of their own, but the superimposing of one system of culture upon another more philosophically profound in its sphere, and upon a people who cherished an educational lore that antedated by far the one offered them in its stead. A system of education such as it was and restricted to the sanctioned castes—chiefly the Brahmin—had never been wanting in India. When the English began to introduce the new system, a bitter dispute arose as to how much recognition should be given this ancient and native learning; for instance, whether the English classics should supplant the Sanskrit and Arabic, and whether the English or the vernacular should be used as a medium of instruction. These questions were finally decided in favor of European as against Oriental knowledge, and in favor of the vernacular as a medium, though English became prominent in advanced instruction, and generous provisions were made to bring it within reach of all who desired it.

This system, which was finally adopted, and which in the main continues to-day, was outlined by Lord Halifax in 1854. An investigating commission, reporting in 1883, approved the system, but favored emphasizing certain features, such as the encouragement of native schools and of primary and female education, to the end that the masses might share more liberally in the benefits of learning. Religious instruction has never been permitted in the State schools—a policy different from that pursued by the English Government in the schools of England, and which has generally been opposed by the clerical and missionary interests. At the same time the State advances financial aid to missionary

schools without discrimination as to sect, and endeavors to avoid competition with them by not establishing schools where the missionary schools already provide adequate facilities. Both missionary and State schools are under the supervision of State inspectors, and must conform to certain regulations. Grants in aid consist of salary grants, results' grants, building grants, etc. The State educational system is complete in scope, including primary, secondary, and collegiate instruction, and is systematically organized and administered. Normal schools are maintained in every province. There are five universities—Calcutta, Madras, Bombay, the Punjab, and Allahabad. They consist of examining bodies only, but have a large number of affiliated colleges. The number of persons receiving instruction has greatly increased during the past half-century. The field of education is, however, limited. The attendance is largely from the middle classes, especially in the State schools, and while the missionaries reach a larger proportion from the lower castes, the entire number is small in comparison with the number of persons to whom opportunities for education never come.

Two criticisms in particular have been urged against the present system. The first is, the relative over-emphasis of higher education. This emphasis has been in accordance with the 'filtering down theory,' under which it was thought that the masses could be reached best through the agency of a highly educated native class. This theory in practice, however, leaves the masses untouched. The other criticism is that too much attention is given to classical and not enough to industrial instruction, and that, accordingly, the pupils are not fitted to take an active part in the industrial transformation which the country needs.

The figures taken from the last quinquennial review, reporting in 1897, show that there were 1,236,000 pupils in the State schools, 2,019,000 in aided schools, 532,000 in unaided schools, and 568,000 in private schools. Of these only 402,000 were females, or 2.3 per cent. of all the females of school age in India, the male attendance being 22.3 per cent. of all males of school age. The percentage of boys in attendance varied from 38.8 per cent. in the Province of Burma to 9.3 per cent. in the United Provinces of Agra and Oudh. The grand total of all pupils in public and private institutions increased during the decade 1890 to 1900 from 3,692,000 to 4,462,000. Native Christian pupils represented 5.16 per cent., Hindu 72.86 per cent., and Mohammedan 14.62 per cent. of the total attendance. In public institutions there were 97 per cent. of the pupils studying the vernacular language; the percentage of those studying the classical languages and the English language was small. Over a third of the proceeds used for education was derived from fees, the remainder being divided between provincial, local, and municipal funds and other sources. The total expenditure on public instruction increased gradually from 3,31,58,447 rupees in 1894-95 to 3,77,29,012 in 1899-1900.

RELIGION.

From the earliest times India has been a land of numerous religions, and the creeds professed there to-day are almost as great in number as they are varied in spirit and character. The

majority of the people acknowledge Hinduism or Brahmanism (q.v.) as their faith. In the census of 1901 their number is given as over 200,000,000. Next in proportion, claiming about a third of this number, is Mohammedanism, which was introduced into India in the eleventh century, and spread with great rapidity. Its adherents claim no less than 60,000,000 souls throughout India, their numbers being largest in the north. Together these religions make up the faith of 90 per cent. of the entire population. The number of Buddhists is given at over 9,000,000; they are nearly all inhabitants of Burma. Statistics show that the number of nature-worshippers, who are roughly classed under the head of animistic, is no less than 8,500,000; while the Sikh religion is professed by over 2,000,000 individuals. Besides these there is a large representation of Jains, over 1,000,000, and a scattering number of Parsis, nearly 100,000. The spread of Christianity among the natives has been considerable, for the number is given at about 3,000,000 souls. There are nearly 200,000 Jews. Separate articles will be found devoted to the most important branches of Indian religions. (See BRAHMANISM; BUDDHISM; JAINISM; MOHAMMEDANISM; PARSIS; SKHS.) The results of the religious survey of India in the census of 1901 present the following statistics. The first table is itemized by provinces for British India, with totals for native States and agencies. The second is the summary of the Christian population:

second, Brahmanism proper, or the faith inculcated by the priests in the religious books called Brahmanas, and in the philosophical Upanishads (q.v.); third, the period of the two great religious reforms, Buddhism and Jainism (q.v.), both of which were a reaction against decadent Brahmanism; fourth, the newer Hinduism or Brahmanic counter-reform, a wider and more catholic faith which sprang out of the schismatic reform movement; and, finally, the later Hindu sectarian outgrowths and the tendencies of the popular faiths. The *Rig-Veda* and *Atharva-Veda* represent the literature of the earliest period; the *Yajur-Veda* is nearer to the second religious phase, or the Brahmanism of the priests; the sacred books of the Buddhistic and Jainistic reformations are written respectively in Pali (q.v.) and Prakrit (q.v.); again, the great Sanskrit epic poems of the *Mahābhārata* and the *Rāmāyana* represent both the purer Brahmanic stage and the later sectarian tendencies; for the latter our chief source of information is that class of mythological works known under the name of *Purānās* (q.v.) and *Tantras* (q.v.); the material for the developments after B.C. 1500 must be gathered from various sources. With reference to the time of these eras we can only say in a general way that the Vedic period runs from a very early period down to about B.C. 1000 or a couple of centuries afterwards, and merges into the Brahmanic age, which closes perhaps about B.C. 500. The age of Buddhism was about B.C. 500 to A.D. 500, and the

ADMINISTRATIONS, PROVINCES	Population and Religion

For convenience of treatment the religious development of India may be divided into the following periods: First, the Vedic era, or earliest religious beliefs of the Aryan Hindus; period of epic Hinduism, according to Hopkins, covers about the same centuries. From A.D. 500 to A.D. 1500 is the era of Brahmanic counter-reforms and of sectarianism, while since that

time unifying tendencies have been more operative than ever before. It is necessary at the outset, however, to guard the reader against attempting to connect dates with the earlier of these periods. It has not been uncommon for writers on this subject to assign thousands of years before the Christian Era as the starting-points of various phases of Hindu antiquity; others, more cautious, marked the beginnings of certain divisions of Vedic works with 1200, 1000, 800, and 600 years B.C. The truth is, that since Hindu literature itself is almost without known dates, owing either to the peculiar organization of the Hindu mind, or to the convulsions of Indian history, the present condition of Sanskrit philology does not afford the scholar the requisite resources for embarking with any chance of success in such chronological speculations. The question of Hindu chronology will be more particularly considered in the article VEDA. In the meantime, the utmost stretch of assumption which in the present condition of Sanskrit philology it is permitted to make is, that the latest writings of the Vedic class are not more recent than the second century before Christ. A like uncertainty hangs over the period at which the two great epic poems of India were composed, although there is reason to surmise that the lower limits of that period did not reach beyond the beginning of the Christian Era. The Puranic period, on the other hand, scholars are generally agreed to regard as corresponding with part of our mediæval history, or roughly from A.D. 500 to 1500, although the material in these writings is often much older in its content.

VEDIC RELIGION. If the Rig-Veda—the oldest of the Vedas, and one of the oldest literary documents in existence—coincided with the beginning of Hindu civilization, the popular creed of the Hindus, as depicted in some of its hymns, would reveal not only the original creed of this nation, but throw a strong light on the original religion of humanity itself. Unhappily, however, the imagination, indulging in such an hypothesis, would have little foundation to work on. There are, of course, numerous traces in the Rig-Veda of survivals of earlier animistic beliefs, of spiritism, fetishism, and ancestor-worship; but the Hindus, as depicted in these hymns, are far removed from the starting-point of human society; they may, in fact, fairly claim to be ranked among those already civilized communities experienced in arts, defending their homes and property in organized warfare, acquainted even with many vices which are found only in an advanced condition of artificial life. Yet in examining the ideas expressed in the greatest number of the Rig-Vedic hymns, it cannot be denied that they are neither ideas engendered by an imagination artificially influenced, nor such as have made a compromise with philosophy. The Hindu of these hymns is essentially engrossed by the might of the elements. The powers which turn his awe into pious subjection and veneration are—*Agni* (q.v.), the fire of the sun and lightning; *Indra* (q.v.), the god of the storm and the thunder; the *Maruts*, or winds (see MARUT); *Sūrya*, the sun (see SŪRYA); *Ushas*, the dawn, whose hymns are among the most beautiful (see USHAS); and various kindred manifestations of the luminous bodies, and nature in general. He invokes them, not as representatives of a superior being, before whom the human soul professes its humility, nor as

superior beings themselves, which may reveal to his searching mind the mysteries of creation or eternity, but because he wants their assistance against enemies—because he wishes to obtain from them rain, food, cattle, health, and other boons. He complains to them of his troubles, and reminds them of the wonderful deeds they performed of yore, to coax them, as it were, into acquiescence and friendly help; in fact, he seeks them more for his material than for his spiritual welfare. What we should call the ethical side is less pronounced. Sin and evil, indeed, are often adverted to, and the gods are praised because they destroy sinners and evil-doers; but one would err in associating with these words our notions of sin or wrong. A sinner, in these hymns, is rather a man who does not address praises to those elementary deities, or who does not gratify them with the oblations they receive at the hands of the believer. He is the foe, the robber, the demon—in short, the borderer infesting the territory of the 'pious' man. The latter, in his turn, may injure, and kill, but, in adoring *Agni*, *Indra*, and their kin, he is satisfied that he can commit no evil act. Yet some of the hymns, especially those addressed to the supersensuous, transcendental god *Varuna* (q.v.), the guardian of order and right, seem to imply the strongest sense of moral obligation and of sin as we understand the word. On the whole, it may also be said that the internal condition of the Hindu community, the features of which may be gathered from the hymns, seems to bespeak union and brotherhood among its members; and the absence, in general, of hymns which appeal to the gods for the suppression of internal dissensions or public vices, bears testimony apparently to the good moral condition of the people whose wants are recorded in these songs.

It may be imagined that the worship of elementary beings like those we have mentioned was originally a simple and harmless one. It is true that the sacrifice of sheep and goats, bulls, and even horses, was known, but it was not general. By far the greatest number of the Rig-Veda hymns know of but one sort of offering made to these gods; it consists of the juice of the soma (q.v.) or moon-plant, which, pressed out and fermented, was an exhilarating and inebriating beverage, and for this reason, probably, was deemed to invigorate the gods, and to increase their beneficial potency. It was presented to them in ladles, or sprinkled on the sacred *Kusa* grass. Clarified butter, too, poured on the fire, is mentioned in several hymns as an oblation agreeable to the gods, and it may have belonged to the primitive stage of the Vedic worship. There were no temples of the divinities, and in early times no images. The altar, if used, was very simple. The gods easily gathered from the atmospheric region roundabout.

There is a class of hymns, however, to be found in the Rig-Veda which already depart materially from the simplicity of the conceptions we are referring to. In these the instinctive utterance of feeling makes room for the language of speculation; the allegories of poetry yield to the mysticism of the reflecting mind; and the mysteries of nature becoming more keenly felt, the circle of beings which overawe the popular mind becomes enlarged. Thus, the objects by which *Indra*, *Agni*, and the other deities are propitiated become gods themselves; soma, espe-

cially, the moon-plant, with its juice, is invoked as the bestower of all worldly boons. The animal sacrifice, the properties of which seem to be more mysterious than the offerings of soma, or of clarified butter—is added to the original rites. Mystical allusions and symbolic expressions begin likewise to crop out in the later portions of the Veda, revealing the fact that the Hindu mind was no longer satisfied with the adoration of the elementary or natural powers, and giving evidence that the religion was beginning to deal with the problem of the mysteries of creation. In the tenth and last book of the Rig-Veda, speculations are found with regard to the origin of the universe, the whence and the whither, the who and the what. As soon as the problem implied by hymns like these was raised in the minds of the Hindus, Hinduism must have ceased to be the worship of only elementary powers. Henceforward, therefore, we see it either struggling to reconcile the latter with the idea of one supreme being, or to emancipate the inquiry into the principle of creation from the elementary religion recorded in the oldest portion of Vedic poetry.

BRAHMANISM PROPER. The development from the older into the newer, from the elemental and natural into the artificial, ritualistic and philosophic, or from the early Rig-Veda stage of religion into Brahmanism, may be traced through the *Yajur-Veda*, or book of knowledge of the sacrifice and the ritual. The priestly power of the Brahmans is supreme in this sacred book, and in the *Yajur-Veda* may be seen the beginnings of Brahmanism, as shown in its fuller development in the branch *Brāhmaṇas* (see VEDA) and in the philosophical writings termed *Upanishad*. (See UPANISHAD.) In the *Brāhmaṇas*—a word of the neuter gender, and not to be confounded with the similar word in the masculine gender, denoting the first Hindu caste—the mystical allegories which now and then appear in what we have called the second class of Vedic hymns, are not only developed to a considerable extent, but gradually brought into a systematic form. Epithets given by the Rig-Veda poets to the elementary gods are made the bases of legends, assuming the shape of historical narratives. The simple and primitive worship mentioned in the hymns becomes highly complex and artificial. A ponderous ritual, founded on those legends, and supported by a far more advanced condition of society, is brought into a regular system, which requires a special class of priests to keep it in a proper working order. Some of the Vedic hymns seem to belong already to the beginning of this period of the Brahmana worship, for in the second book of the Rig-Veda several such priests are enumerated in reference to the adoration of Agni, the god of fire; but the full contingent of sixteen priests, such as is required for the celebration of a great sacrifice, does not make its appearance before the composition of the Brahmaṇas and later Vedas. Yet, however wild many of these legends are, however distant they become from the earlier veneration of the elementary powers of nature, and however much this ritual betrays the gradual development of the institution of castes—unknown to the hymns of the Rig-Veda—there are still two features in them, which mark a progress of the religious mind of ancient India. While the poets of the Rig-Veda are chiefly con-

cerned in glorifying the visible manifestations of the elementary gods, in the Brahmaṇas their ethical qualities are put forward for imitation and praise. Truth and untruth, right and wrong—in the moral sense which these words imply—are not seldom emphasized in the description of the battles fought between gods and demons; and several rites themselves are described as symbolical representations of these and similar qualities of the good and evil beings, worshiped or abhorred. A second feature is the tendency, in these Brahmaṇas to determine the rank of the gods, and, as a consequence, to give prominence to one special god among the rest; whereas in the old Vedic poetry, though we may discover a predilection of the poets to bestow more praise, for instance, on Indra and Agni than on other gods, yet we find no intention, on their part, to raise any of them to a supreme rank. Thus, in some Brahmaṇas, Indra, the god of the firmament, is endowed with the dignity of a ruler of the gods; in others, the sun receives the attributes of superiority. This is no real solution of the momentous problem hinted at in the Vedic hymns, but it is a semblance of it. There the poet asks 'whence this varied world arose'—here the priest answers that 'one god is more elevated than the rest;' and he is satisfied with regulating the detail of the soma and animal sacrifice, according to the rank which he assigns to his deities.

A real answer to this great question is attempted, however, by the theologians who explained the 'mysterious doctrine,' held in the utmost reverence by all Hindus, and laid down in the writings known under the name of *Upanishad* (q.v.). It must suffice here to state that the object of these important works is to explain, not only the process of creation, but the nature of a supreme being, and its relation to the human soul. In the Upanishads, Agni, Indra, Vayu, and the other deities of the Vedic hymns become symbols to assist the mind in its attempt to understand the true nature of the one absolute being, and the manner in which this being manifests itself in its worldly form. The human soul itself is of the same nature as this supreme or great soul; its ultimate destination is reunion with the supreme soul, and the means of attaining that end is not the performance of sacrificial rites, but the comprehension of its own self and of the great soul. The doctrine which at a later period became the foundation of the creed of the educated—the doctrine that the supreme soul, or (the neuter) Brahman, is the only reality, and that the world has a claim to be noticed only in so far as it emanated from this being, is already clearly laid down in these Upanishads, though the language in which it is expressed still adapts itself to the legendary and allegorical style which characterizes the Brahmana portion of the Vedas. The Upanishads became thus the basis of the enlightened faith of India. They are not a system of philosophy, but they contain all the germs whence the three great systems of Hindu philosophy arose; and like the latter, while revealing the struggle of the Hindu mind to comprehend the one supreme being, they advance sufficiently far to express their belief in such a being, but at the same time acknowledge the inability of the human mind to understand its essence.

From the Brahmanic religion with its theology,

its sacrifice, its stifling ritual, and widespread priestcraft there was bound later to come a revolt. Premonitory symptoms of this are plainly to be seen in the Upanishads, which prepared the way for emancipation. The reform wave swept over India in the two great reactionary movements of Buddhism and Jainism. The character and extent of these reformatory movements are spoken of under special articles, and need not be discussed here. The eastern part of India was the source from which they sprang, but Jainism gradually spread westward especially, and Buddhism expanded itself over other parts of India to Ceylon and far beyond the borders of Hindustan.

HINDUISM. In spite of the reform movements, the old Brahmanism was not destined to disappear. But it was forced to undergo changes which were largely due to the influence of the protesting faiths of Buddhism and Jainism. During the very time while they were flourishing it quietly but firmly held its own, was consciously or unconsciously being remodeled and adjusted to altered conditions and environments, and was gradually but surely changing into the newer Hinduism, with all that restoration meant. It is this changing Brahmanism and earlier Hinduism in its sectarian developments that is presented to us in the great Hindu epics.

The Epic period of Hinduism is marked by a similar development of the same two creeds, the general features of which we have traced in the Vedic writings. The popular creed strives to find a centre round which to group its imaginary gods, whereas the philosophical creed finds its expression in the ground-works of the *Sāṅkhya*, *Nyāya*, and *Vedānta* systems of philosophy. In the former, we find two gods in particular who are rising to the highest rank, Vishnu and Siva; for Brahma (the masculine form of Brahman), though he was looked upon, now and then, as superior to both, gradually disappears, and becomes merged into the philosophical Brahma (the neuter form of the same word), which is a further evolution of the great soul of the Upanishads. In the *Rāmāyaṇa*, the superiority of Vishnu is admitted without dispute; in the great epos, the *Mahābhārata*, however, which, unlike the former epos, is the product of successive ages, there is an apparent rivalry between the claims of Vishnu and Siva to occupy the highest rank in the pantheon. It is one of the difficult problems of Sanskrit philology to unravel the chronological position of the various portions of this work, to lay bare its ground-work, and to show the gradual additions it received, which must be done before it will be possible to determine the successive formation of the legends which are the basis of classical Hindu mythology. A great deal has been done, however, and this much seems to be clear even already, that there was a predilection during this epic period for the supremacy of Vishnu, one of whose incarnations was the much-beloved Krishna (q.v.), and that the policy of incorporating rather than combating antagonistic creeds led more to a quiet admission than to a warm support of Siva's claims to the highest rank.

The philosophical creed of this period adds little to the fundamental notions contained in the Upanishads; but it frees itself from the legendary dross which still imparts to those works a deep tinge of mysticism. On the other hand, it

conceives and develops the notion that the union of the individual soul with the supreme spirit may be aided by penances, such as peculiar modes of breathing, particular postures, protracted fasting, and the like; in short, by those practices which are systematized by the Yoga doctrine. The most remarkable epic work which inculcates this doctrine is the celebrated poem *Bhagavadgītā*, which has been wrongly considered by European writers as a pure Sāṅkhya work, whereas Sankara, the great Hindu theologian who commented on it, and other native commentators after him, have proved that it is founded on the Yoga belief. The doctrine of the reunion of the individual soul with the supreme soul was necessarily founded on the assumption that the former must become free from all guilt affecting its purity before it can be merged into the source whence it proceeded; and since one human life is apparently too short for enabling the soul to attain its accomplishment, the Hindu mind concluded that the soul, after the death of its temporary owner, had to be born again, in order to complete the work it had left undone in its previous existence, and that it must submit to the same fate until its task is fulfilled. This is the doctrine of metempsychosis, which is a logical consequence of a system which holds the human soul to be of the same nature as that of an absolute God. The beginning of this doctrine may be discovered in some of the oldest Upanishads, but its development belongs to the epic time, where it pervades the legends, and affects the social life of the nation. See TRANSMIGRATION.

PURANIC HINDUISM. The Puranic period, with its various cults, comprises the development of the newer Hinduism from about the sixth century of our era to the sixteenth century. The *Purānas* (q.v.) and the *Tantras* (q.v.) represent this phase of the religion, which succeeded epic Hinduism and supplanted Buddhism. The old Brahmanic vigor was not dead, but was ready to revive. In the eighth century Kumarila strengthened it on the ritualistic side and the great Vedantist Sankara, in the ninth century, added to its power on the philosophic side. But the Puranic period of Hinduism was a period of decline, so far as the popular creed is concerned. Its pantheon is nominally the same as that of the epic period. Brahma, Vishnu, and Siva remain still at the head of its imaginary gods; but whereas the epic time is generally characterized by a friendly harmony between the higher occupants of the divine spheres, the Puranic period shows discord and destruction of the original ideas whence the epic gods arose. Brahma withdraws, in general, from the popular adoration, and leaves Vishnu and Siva to contest in the minds of their worshipers for the highest rank. The elementary principle which originally inhered in these deities is thus completely lost sight of by the followers of the Puranas. The legends of the epic poems relating to these gods become amplified and distorted, according to the sectarian tendencies of the masses; and the divine element which still distinguishes these gods in the *Rāmāyaṇa* and *Mahābhārata* is now more and more mixed up with worldly concerns and intersected with historical events, distorted in their turn to suit individual interests. Of the ideas implied by the Vedic rites, scarcely a trace is visible in the

Purānas and *Tantras*, which are the text-books of this creed. In short, the unbridled imagination which pervades these works is neither pleasing from a poetical nor elevating from a philosophical point of view. Some Puranas, it is true—for instance, the *Bhāgavata*—make in some sense an exception to this aberration of original Hinduism; but they are a compromise between the popular and the Vedantic creed, which henceforward remains the creed of the educated and intelligent. They do not affect the worship of the masses as practiced by the various sects; and this worship itself, whether harmless, as with the worshippers of Vishnu, or offensive, as with the adorers of Siva and his wife Durga, is but an empty ceremonial, which, here and there, may remind one of the symbolical worship of the Vedic Hindu, but, as a whole, has no connection whatever with the Vedic Scriptures, on which it pretends to rest. It is this creed which, with further deteriorations, caused by the lapse of centuries, is still the main religion of the masses in India.

The philosophical creed of this period, and the creed which is still preserved by the educated classes, is that derived from the tenets of the Vedanta philosophy. It is based on the belief in one supreme being, which imagination and speculation endeavor to invest with all the perfections conceivable by the human mind, but the true nature of which is, nevertheless, declared to be beyond the reach of thought, and which, on this ground, is defined as not possessing any of the qualities by which the human mind is able to comprehend intellectual or material entity. See VEDANTA.

HINDU SECTS AND MODERN POPULAR FAITH. Under this designation may be comprised the sects which arose during the last period of Hinduism and the beliefs which are common to the Hindus to-day. These believers suppose that their religion is countenanced by the Vedas; but its source in reality is to be found in the *Purānas* and *Tantras*. They have in common a general sort of recognition of the Hindu trinity or triad—Brahma the creator, Vishnu the preserver, and Siva the destroyer—but in practice they are either Vishnuites or Sivites; for Brahma is little more than an abstraction, and plays a very subordinate part to-day contrasted with his rivals. Sivaism may loosely be said to be more popular in the northeast and south of India; Vishnuism rather in the northwest, but also in the south. The wives or female energies of these two gods also receive adoration. (See VAISHNAVAS; SAIVAS; SAKTAS.) Common to them all are certain acts of worship; the offering of votive gifts, adoration in the temples, and the performance of special ceremonies, such as the fulfillment of vows by going on religious pilgrimages for the purpose of acquiring merit. The caste system also has a strongly religious bearing, although it tends to break down through association with Occidentals. (See CASTE.) Beside the great sects there are likewise some of limited extent and total insignificance, such as the worshippers of Agni, the god of fire; of Surya, the sun god; of Ganeśa, the god of wisdom and remover of obstacles. Some of these latter sects were looked upon as partly unorthodox, partly heterodox, as early as the ninth and fourteenth centuries of our era. Regarding the sect of the Sikhs, which arose in the fifteenth century, ref-

erence may be made to the special article on that topic. Reform movements in India have been familiar since the early days of Buddhism and Jainism, down through Sikhism to the modern times. In the nineteenth century a special religious agitation was set on foot by Rammohun Roy (1774-1833) (q.v.), which resulted in the establishment of the Brahmo-Somaj (q.v.), a sort of national church of the Hindus. The movement has extended widely throughout India, and, like the Arya-Somaj, it is eclectic in its tendencies, seeking to combine the teachings of the Veda with the tenets of the Bible and the sacred books of other faiths. There are also in India some 17,000 believers in the Jewish religion, and allusion has been made above to the presence of some 90,000 Parsis, who made their home in India more than a thousand years ago. These topics are treated under separate headings, and need only be referred to here.

CHRISTIANITY IN INDIA. With reference to the spread of Christianity in Hindustan, as mentioned above, it may be stated that India was one of the earliest fields of Christian missions. Tradition assigns it as the scene of the Apostle Thomas's labors and martyrdom. Whether this was the case or not, we find a Syrian church planted in Malabar in Southern India, which undoubtedly had a very early origin. The Jesuit missionaries, from the middle of the sixteenth century onward, had a large success in India. (See XAVIER, FRANCIS.) The earliest Protestant missionaries in India came from Holland and Denmark. With the latter mission the eminent Schwartz was connected. England's first missionary effort was made by the Society for the Propagation of the Gospel, and the Christian Knowledge Society, which commenced in the beginning of the eighteenth century, by aiding the Danish mission already established in Southern India. Subsequently, the East India Company adopted the policy of excluding missionaries altogether from their territories; but since the beginning of last century, when these restrictions were withdrawn, great activity has been manifested, in which all denominations are represented. In the proclamation to the princes, chiefs, and people of India, read in the principal cities, on November 1, 1858, it was declared "that none shall be in any wise favored, none molested or disquieted, by reason of their religious faith and observances, but that all shall alike enjoy the equal and impartial protection of the law." The fullest toleration in matters of faith is the rule throughout British India. Fanaticism only, as when it sought to enforce the burning of widows or suttee (q.v.), or to offer human beings in sacrifice, is curbed by the ruling power. There is no exclusively endowed State Church, but Government continues to pay the State grants made to Hindu temples and to Mohammedan mosques. Clergymen of the Church of England, the Church of Scotland, and the Roman Catholic Church, are retained on the Government establishment as civil or military chaplains. There are Church of England bishops at Calcutta, Madras, and Bombay. The number of Christians in India, in 1891, was given in the census as 2,284,380, of whom the majority (1,315,263) were Roman Catholics. The members of the Church of England numbered about 295,000; the Dissenters nearly 297,000; and the Armenian and Greek sects over 201,000.

For a study of the entire religious development of the Hindus, consult Hopkins, *Religions of India* (Boston, 1895); Barth, *Religions of India* (3d ed., London, 1890); Monier-Williams, *Hinduism*, in the series of *Non-Christian Religious Systems* (London, 1900); Hardy, *Indische Religionsgeschichte* (Leipzig, 1898); Wilkins, *Modern Hinduism* (2d ed., London, 1887).

ARCHÆOLOGICAL REMAINS. The antiquities and the archæological remains in India are largely of an architectural character. (See INDIAN ART.) From the prehistoric age there are no monuments surviving beyond possibly some cairns and cromlechs; and the same is true of the Vedic period of Aryan India, because the structures were mostly of wood or of destructible material. Indian archæology begins practically with the age of Buddhism and Jainism. Connected with these faiths there are characteristic shrines, temples, and monuments in various parts of India, dating from B.C. 250 onward. Most famous from the standpoint of archæological research is the great cave at Karli, and also the caves at Ajanta, Ellora, and Lena, constructed with their assembly halls or churches (*chaityas*) and their monastic cells (*vihāras*). Of like interest are the huge mounds or tumuli (*stūpas*, *tōpes*), like that at Sanchi, near Bhilsa, erected to contain in a shrine (*dāgoba*) some relic of Buddha. The rails about these structures are well known because of their artistic value and because of the light they throw on scenes connected with Buddhist life. (See GAUTAMA BUD-DHA; JATAKA.) Of particular antiquarian interest, likewise, are the various columns or shafts (*stambhas*, *lāts*), set up in various parts of India by King Aśoka (q.v.). The inscriptions on these, like his rock-cut edicts, are of special importance. Under a slightly different category, but of similar antiquarian interest, are the famous Gandhara sculptures, representing incidents in Buddha's life. The influence of Græco-Bactrian art is plainly evident in these. Of a much later date, but quite Hindu in character, are the cave temples of Elephanta (q.v.), near Bombay, with their sculptured figures of Brahma, Vishnu, and especially Siva. These may not, however, antedate the ninth century of our era. The remaining groups of antiquarian remains, chiefly architectural, are grouped under the head of Dravidian architecture, the Bengali and Chālukyan style of temple structure, and the artistic building of the era of Mohammedan rule. For details regarding these consult Fergusson, *History of Indian and Eastern Architecture* (London, 1876), and Le Bon, *Les monuments de l'Inde* (Paris, 1893). In 1897 arrangements were made in connection with the International Congress of Orientalists to establish an Association for Archæological Research and Exploration in India, and special archæological work under the supervision of the French Government has since been carried on in Cambodia, besides the researches conducted by various scholars individually in India itself.

LANGUAGE. With its hundreds of millions of inhabitants, there is as great a diversity of languages in India as there is variety in the peoples themselves. By far the larger majority, over 210,000,000, speak languages or dialects belonging to the Indo-Germanic group of tongues, and related, though perhaps not by direct descent, to the ancient Vedic dialect. This Indo-Aryan

division is therefore first in importance, and three periods or stages may be recognized in its historical development. The earliest of these is sometimes called the Old Indic speech, and includes the Vedic dialect, Pali, in the broad sense now given to this term, and the literary or classic Sanskrit. The second period embraces the Middle Indian Prakrits. (See PRĀKRIT.) The third, termed New Indian, includes the modern Indian vernaculars, which are in the main descended from popular Prakrit dialects, and are spoken largely in the north, east, and central provinces of India. Under this designation are comprised Punjabi, Kaśmiri, and Sindhi, the speech of over 20,000,000 people, on the north and west; next, the Hindi, spoken by 80,000,000, and called Urdu or Hindustani when admixed with Persian and Arabic; again Gujarati and Marathi, the chief languages of the Bombay Presidency, and claiming nearly 30,000,000 speakers; furthermore, Bengali, the vernacular of more than 40,000,000 individuals in the east, together with Uriya and Behari, likewise in Eastern India; also Nepali, the language of Nepal, and Assami, still farther to the east. Separate articles regarding the characteristics of these various Indo-Aryan vernaculars will be found under the individual names. Among the non-Aryan languages the most important family is the Dravidian (q.v.), the tongue of some 50,000,000 people, inhabiting the peninsular portion of India. The Kolarian or Munda branch numbers about 3,000,000 speakers, while the Tibeto-Burman family has more than twice as many. The Khasi group (Assam) and the Mon-Annam and Shan families aggregate together over half a million speakers. In addition to this the division of Iranian languages (q.v.) is represented on the borders of Afghanistan and Baluchistan, and in the speech of the Gypsies; the linguistic statistics of India include, moreover, the languages, like English, German, French, etc., which are used by Europeans resident in India, and similarly such other languages as may be used by various Asiatics living at the time in Hindustan. (See INDIAN PEOPLES.) HISTORY.

The early history of India is wrapped in legend. Only by references in native or in foreign writings and by inscriptions can the story of the ancient period be reconstructed. The Indian mind is essentially an unhistoric one. We have, indeed, many sovereigns mentioned, and even whole dynasties given in the *Purānas* (q.v.), in the epics, and in other Sanskrit writings; but of history, in the real sense of the word, there is practically none. The accounts which are given are so interwoven with myth and fancy that they have almost no value to the historian. From other sources, however, much of India's past may be outlined. Indian history falls rough-

ly into three periods: The Hindu period (c.2000 B.C. to 1001 A.D.), the Mohammedan period (A.D. 1001-1757), and the period of the establishment of European dominion (1757—).

HINDU PERIOD. The Aryans (q.v.) entered the Punjab perhaps as early as B.C. 2000. They came from the Iranian country, apparently by two routes, through the mountain passes in Southern Afghanistan and by way of Chitral, and gradually forcing their way east and south, expelled or subdued the aborigines, such as the Dravidians, and occupied the entire territory north of the Vindhya Mountains. There are but few historic allusions in the earliest part of this period, although the Rig-Veda (q.v.) mentions a battle of ten kings against Sudas, King of the Tritsu clan, evidently a tribal war, and contains a number of references to Aryan victories over the aboriginal tribes. The epics of the *Mahābhārata* and the *Rāmāyana* contain legends of wars which must have been of much importance. The former epic narrates almost as its main theme the strife between the Kurus and Panchalas, both on the Upper Ganges, while the latter tells of the war waged by the Kosalas of Oudh against the demoniac armies of Lankia, supposed to be Ceylon. By the close of the period described in the former epic there were ten great Hindu kingdoms: Magadha (South Behar), Anga (West Bengal), Vanga (East Bengal), Kalinga (Orissa), Avanti (Malwa), Saurashtra (Gujarat), and the kingdoms of the Andhras (Deccan), the Cholas (Coromandel), the Cheras (Malabar), and the Pandyas (extreme south). Of these Magadha became the chief before the dawn of authentic history in India. The earliest historic Indian date thus far known is B.C. 557, the reputed birth-year of Buddha. Bimbsara (q.v.) of the Saisunagar dynasty began to rule soon after this (died 485 B.C.), and this line reigned until the early part of the fourth century. In B.C. 315 during the reign of the Maurya king Chandragupta, called by the Greeks Sandracottus (q.v.), who brought all Northern India under the sway of Magadha, India for the first time in the historic period came into relations with the Occident. The invasion of Alexander the Great was to be the forerunner of a long series of inroads, which were to end two thousand years later in the final surrender of India to the West. The stay of Alexander in India was short, but Sandracottus entered into an alliance with the Greek ruler of Persia and Bactria, Seleucus Nicator, whose daughter he married, and to whose ambassador, Megasthenes (q.v.), we are indebted for our earliest non-Indian information on Hindustan. The great Sandracottus was succeeded by his son Bindusara in B.C. 291, and his grandson, Aśoka, whose reign lasted approximately from B.C. 259 to 222, is famous as the royal promulgator of Buddhism. A series of weak kings followed, and the foreign influence on India steadily gained strength. A half-century after Aśoka's time the Græco-Bactrian dynasty extended its power over the Upper Ganges and the Punjab, only to be driven out by the Indo-Scythians about B.C. 100. The greatest monarch of this line was Kanishka, a Kushana king, who founded the Saka (or Saliwahana) era (q.v.) in A.D. 78. The northwestern (Kabul) Indo-Scythian princes gave way in the second century A.D. to the western (Gujarat) Kshatrapas, who in

turn were overthrown by the Guptas toward the end of the third century. The name of Chandragupta I. (about 319) is one of the most important in this dynasty. He made his house supreme over practically all Northern India, and his son, Samudragupta, was equally powerful. The power of the Guptas was finally broken in the early part of the sixth century, having previously been weakened by invasions of the Huns. During the Gupta period the Hindus flourished in arts and in religion, and the so-called Renaissance of Sanskrit literature came in the reign of Vikramaditya (about 455-480). It was about this time that Buddhism attained its acme in India. To this fact we are indebted for some of our best information regarding the condition of the land. Chinese travelers, notably Fa-Hien (400), Hiouen-Tsang (643), and I-Tsing (671), came to India seeking for a knowledge of Buddha's teachings in their purity, and the records which they left form the only non-Indian information on Hindustan which we possess from the time of the Greeks until the coming of the Arabs. In the first half of the sixth century Harshavardhana, the hero of the one historical romance in Sanskrit (see NOVEL), extended his sway over all Northern India, even conquering Nepal. From this time the Hindu power began gradually to decline. Of the succeeding dynasties the most important were the Chalukja and Chola, but the day of native monarchy over India was past. Petty kings came and went, warred with each other, and by their lack of harmony helped to prepare the way for the second great epoch of India, the Mohammedan period. The subject of early Hindu eras and dates is very involved, and only the chief epochs can be given here. Hindu chronology begins with the Kaliyuga (q.v.), B.C. 3102; Chandragupta established the Maurya dynasty B.C. 315; Aśoka was crowned B.C. 259; the Samvat (q.v.) era (attributed wrongly to Vikramaditya, who lived much later) begins B.C. 57. This is the chief era of India. The Saka (q.v.) or Salvahana era begins A.D. 78; the Gupta or Vallabhi era A.D. 319; the Harshavardhana era A.D. 606; the modern Burmese era, A.D. 639. According to a new theory of Bhandarkar (not yet accepted by scholars generally), the Saka and following dates have to be increased by 200.

MOHAMMEDAN PERIOD (1001-1757). *House of Ghazni* (1001-1186).—The Sultan Mahmud of Ghazni (q.v.), founder of the House of the Ghaznivides (q.v.), was the first conqueror who permanently established the Mohammedan power in India, and the Hindu princes fell one by one before a succession of Mohammedan dynasties. The House of Ghazni succumbed to the *House of Ghor*, which was supplanted by the *Slave Kings of Delhi* (1206-88). One of these sovereigns, Altamsh, who ascended the throne in 1211, added the greater part of Hindustan proper to his dominions. He died in 1236. *The Khilji Dynasty* (1290-1320).—Under Ala ud-Din (1295-1316), of the House of Khilji, the Afghan power in India reached its highest point. He crushed the Hindus in Gujarat, defeated the Moguls in several battles on their invading the Punjab, and, most important of all, invaded the Deccan. Like so many Oriental conquests, however, his success was but temporary. *House of Tughlak* (1320-1414).—Ala ud-Din's descendants having been slain, Tughlak, Governor of the Punjab, seized the throne in 1320. The Tughlak dynasty

was short-lived; and in 1398, during the reign of the last of the Tughlak kings, the Tatar Timur, or Tamerlane (q.v.), sacked Delhi, and proclaimed himself Emperor of India. Two short-lived and unimportant dynasties followed the Tughlaks, the *House of Sayyid* (1414-50), and the *House of Lodi* (1450-1526). To the kings of this dynasty succeeded the *Great Moguls of the House of Timur* (1526-1707). Baber (q.v.), a descendant of Timur, who had for twenty-two years been sovereign of Kabul, invaded India for the fifth time toward the end of the year 1525, and after defeating Sultan Ibrahim Ludi on the plain of Panipat, April, 1526, he entered Delhi in triumph, and established himself as Emperor of the Mohammedan dominions in India. He died in 1530, and was succeeded by his son, Humayun. Akbar (q.v.), son of Humayun, one of the greatest of Mohammedan monarchs, became Emperor in 1556, and reigned for nearly fifty years. His son, Jehangir, ascended the throne in 1605, and his grandson, Shah Jehan (q.v.), at the beginning of 1628. Shah Jehan is celebrated as the builder of the Taj Mahal at Agra (q.v.), one of the most splendid monuments of Oriental architecture. In 1658 Shah Jehan was imprisoned by his son, the famous Aurungzebe (q.v.), who usurped the Imperial power. This remarkable man raised the Mogul Empire to the highest pitch of greatness and splendor. The death of Aurungzebe took place in 1707, and the decay of the Empire, which had begun a few years before, proceeded rapidly. In 1739 the Persian Nadir Shah invaded India, sacked Delhi, and carried away the famous peacock throne, as well as a vast amount of treasure. Viceroy of the Great Mogul formed their provinces into independent States; while Hindu and Mohammedan adventurers carved out kingdoms with the sword. Of these the most important were the nizams of the Deccan, the rajahs of Mysore, the peshwas of the Mahrattas, and the Rajput and Sikh princes. The Mahrattas reached the height of their power about the middle of the eighteenth century, but in 1761 they sustained a crushing defeat at the hands of the Afghan ruler, Ahmed Shah (q.v.), in the battle of Panipat. The dismemberment of the Mogul Empire opened a wide field for admission and enterprise to the nations of Europe. The Venetians, the Genoese, the Portuguese (the first to reach India by way of the Cape of Good Hope in 1498), and the Dutch had by turns traded with India; and in 1602 the English appeared on the scene. See EAST INDIA COMPANY.

In 1653 Madras was erected into a presidency, and in 1668 the island of Bombay, which was the dowry of Charles II.'s Queen, the Infanta Catharine of Portugal, was transferred by the Crown to the East India Company. The year 1686 witnessed the foundation of Calcutta. The French East India Company was chartered in 1664. See GAMA (VASCODA), ALBUQUERQUE, GOA, PONDICHERY, CHANDERNAGAR.

BRITISH RULE (1757). Great jealousy existed between the English and the French. The war for ascendancy began in 1745, and did not end with the Peace of Aix-la-Chapelle in 1748. (See DUPLEIX.) The struggle in the Carnatic continued with ardor under the pretext of supporting the claims of rival native princes to sovereignty. Clive (q.v.), one of the most famous persons in Anglo-Indian history, turned the contest

in favor of the English. His memorable defense of Arcot in 1751 broke the spell of French invincibility. Five years afterwards, however, Siraj-ud-Daula, Nawab or Governor of Bengal, attacked and captured Calcutta. The English prisoners, 146 in number, were confined in the small military prison known as the Black Hole, and only 23 survived till morning. Clive quickly took command of an expedition fitted out at Madras, recovered Calcutta (1757), and, assisted by Admiral Watson, prosecuted the war vigorously, till, after a hollow peace and a renewal of hostilities, he thoroughly defeated Siraj-ud-Daula in the battle of Plassy, June 23, 1757. This victory gave the English the provinces of Bengal and Behar, and from this year is dated by the English themselves the foundation of their Empire in India. From Mr Jafar, whom the East India Company appointed to succeed the defeated Nawab, they exacted vast sums of money. The government of an empire by a commercial corporation was a strange political experiment. Naturally the members had no thought of administering affairs for the benefit of their subjects, or even of far-reaching improvements in their own interest, but were guided throughout by the narrowest and most sordid selfishness. After the victory of the English at Baxar in 1764, over the united forces of Shuja-ud-Daula, Nawab of Oudh, and the Mogul Emperor (Shah Alam), the latter asked protection of the English. He confirmed the Company in its possessions and granted it the collectorate (*diwani*) of Bengal, Behar, and Orissa, on condition of receiving the sum of £300,000 as tribute to himself from Bengal, and £600,000 as an annual allowance to his Nawab. These enormous grants were soon cut down by Clive, and were eventually repudiated by the Company, which also failed to fulfill other engagements which it had entered into with Shah Alam. On the other hand, the cost to the Company of maintaining its authority and standing army prevented it from undertaking public works and from developing the resources of the country. Clive purged the Indian Government of oppression, extortion, and corruption: from the work he did during his last visit (1765-67) began a purer administration of the British Empire in the East. The Regulating Act, passed in 1773, substituted a new council of four at Calcutta in place of the far larger council which had hitherto managed affairs for the Company. The new body was to assist and check the Governor-General, instituted in the same year. It was also given a limited control of the actions of the Madras and Bombay presidencies, and was thus made the political head of the British possessions. To Warren Hastings (q.v.), the first Governor-General (1774-85), the new council was exceedingly hostile. Hastings, on his part, used unscrupulous means of replenishing the Company's exchequer, but by his talent and energy he averted dangers which threatened the British supremacy in India. The powerful Mussulman sovereigns, Hyder (Haidar) Ali, ruler of Mysore, and the Nizam of the Deccan, assisted by French officers, combined with the Mahrattas against the English. Sir Eyre Coote broke up the confederacy, and defeated Hyder Ali in 1781. Next year the Supreme Court of Justice, which had always harassed the Governor-General, was deprived of its independent powers,

and the policy of Hastings was successful, both in the council and in the field. In 1784 Pitt instituted the Board of Control under a Cabinet Minister. By this act the English Government began to deprive the Company of its monopoly of political power in India. Lord Cornwallis (q.v.), who succeeded Hastings in 1786, was both Governor-General and commander-in-chief. To check the corruption of the English revenue officials, he made the *zemindars* (native collectors of revenue) proprietors of their districts on condition of paying a fixed annual sum to the Company. He also improved the judicial administration by forbidding a revenue official to act as a judge. These were his chief reforms. With the Nizam, the Mahrattas, and the Rajah of Coorg as allies, Cornwallis in 1790 made war on Tippu, Sultan of Mysore, who had invaded Travancore, then under British protection. Terms were dictated to Tippu at his capital, Seringapatam, and he was compelled to cede half of his domains to the Company. Cornwallis was succeeded by Sir John Shore (1793-98), whose rule was in no respect memorable. Shore was followed by the Marquis of Wellesley (1798-1805). The British Empire in the East, like that of Napoleon I. in Europe, could be maintained only by constant fighting. Tippu broke his faith by intriguing against the English, both with the French and with native princes. His bad faith cost him his crown and life; in May, 1799, Seringapatam was stormed and Tippu killed. The Hindu dynasty displaced by Hyder Ali was restored, and the administration was carried on successfully for the young Rajah by Sir Arthur Wellesley, afterwards Duke of Wellington. In the famous battle of Assaye in 1803, he defeated the Mahrattas under Sindhia, and the victories of Lord Lake in Northern India extended considerably the dominions of the Company. As Lord Wellesley's policy was too aggressive to suit the views of the East India Company, he was superseded by Lord Cornwallis, who returned to India only to die. Lord Minto, who governed from 1807 to 1813, organized the districts conquered by Wellesley. This administration was peaceful—a reaction of the profit-seeking Company against the ambitious policy of Minto's predecessor.

The Marquis of Hastings (1813-23) conquered the Gurkhas of Nepal, forced the Mahratta ruler of Indore to cede a great part of his territories, crushed the robber gangs called Pindaris, and made the British power supreme in India. The next administrations were those of Earl Amherst (1823-28) and Lord William Bentinck (1828-35). The first was signalized by the first Burmese War, the second by the suppression of suttee and the thugs. It was Bentinck, in fact, who introduced the idea of governing India for the good of the governed. The Earl of Auckland (1836-42) followed Bentinck. He is known chiefly by his unjustifiable and disastrous attempt to make British influence paramount in Afghanistan (q.v.). An unexpected insurrection in Kabul compelled the retreat of the British army, which was overwhelmed in the Kurd-Kabul Pass (1842). Auckland was succeeded by the Earl of Ellenborough (1842-44). The 'army of retribution' proceeded to Kabul soon after Lord Ellenborough took the reins of government. Kabul was sacked and several public buildings razed to the ground, after which the

country was evacuated and Dost Mohammed allowed to reoccupy his throne. The conquest of Sindh by Charles Napier, followed by its annexation, also belongs to this administration. Lord Ellenborough having been recalled by the East India directors, from alarm at his martial tendencies, Sir Henry Hardinge (1844-48) was sent to take his place. The attention of the new Governor-General, however, was soon diverted from works of peace to battle with the bravest people of India. Ever since the death of Runjit Singh, the ally of the English in 1839, the Punjab had been in a state of disorganization. The Sikhs, uneasy at the conquests made by the British in Sindh and Gwalior, resolved to invade British territory. The first Sikh war (1845-46) commenced on the part of the Punjab by the passage of the Sutlej, and was followed by the bloody battles of Mudki, Ferozshah, Aliwal, and Sobraon, in which, after hard fighting, the Sikhs were defeated with great slaughter. The result of the war was that a British Resident and British troops were stationed at Lahore, although the boy prince, Dhulip Singh, was acknowledged as Maharajah under a protectorate. The Cis-Sutlej States, the Jalandhar Doab, and the region between the Ravi and the Sutlej were annexed.

The administration of the Marquis of Dalhousie (1848-56), who succeeded Hardinge, is memorable for the commencement of superb public works, the introduction of cheap uniform postage, railways, telegraphs, improvements in government, and social progress generally; a second Sikh war, ending in the victory of Gujrat, February 21, 1849; a second Burmese war, finished in 1852; and the annexation of four kingdoms—the Punjab, Pegu, Nagpur, and Oudh, besides lesser territories, such as Satara. The organization of the Punjab into a model province, soon to become notable for prosperity as well as for its faithfulness to England, was a splendid achievement, of which Dalhousie had reason to be proud. When Lord Canning (1856-62) assumed office, everything promised peace and prosperity. With the early days of 1857, however, came the first mutterings of the storm that was to sweep over a large portion of British India. At the commencement of the year cakes of flour were circulated mysteriously through the region of the Upper Ganges; by this means the natives were concerting rebellion. Treasonable placards appeared at Delhi, and other suspicious occurrences gave warning of native disaffection or conspiracy. The chief causes of discontent seem to have been the annexation policy and the rapid introduction of modern European improvements, which, by threatening to destroy the whole native civilization of India, roused the fears and superstitions of Hindus and Mohammedans alike. At the same time the English civil and military officials failed to respect the religious feelings of their subjects. For instance, the Enfield rifle with its cartridge, greased with tallow and lard, was at this time put into the hands of the Sepoys without explanation or precaution; and General Anson, the commander-in-chief, snubbed caste, and was against all concession to the 'bestial prejudices' of the natives. It must be remembered that the Hindu considered the cow sacred, and he would lose caste by tasting anything prepared from its meat, while the Mohammedan was not permitted by his religion to eat pork. Suddenly the dis-

affection broke out into open revolt before the English were aware of the impending danger. On May 10, 1857, the Sepoy Mutiny began at Meerut, a town in the neighborhood of Delhi, with a frenzied uprising of the native troops, who had been exasperated by the imprisonment of a number of their men who had refused to handle English cartridges. The mutineers liberated their comrades and proceeded to massacre the Europeans. The British troops failed to act promptly, and the Meerut Sepoys rushed to Delhi to raise the standard of the fallen Mogul. His person, invested with the traditions of native sovereignty, naturally became the centre of rebellion. Delhi at once fell into the hands of the mutineers. Nana Sahib of Bithur, whose claims as the adopted son of the Peshwa of the Mahrattas had not been recognized by the British Government, fanned the insurrection. At the end of June General Wheeler was forced to surrender to him at Cawnpore; and, in spite of the promise of safe conduct to Allahabad, all the men were immediately massacred. The women and children were butchered on July 15th, by order of Nana Sahib, when he heard of Havelock's march from Allahabad. Nana Sahib was unable to withstand Havelock, who entered Cawnpore. The Europeans in the residency at Lucknow were besieged on June 30th. Four days afterwards, the commandant, Sir Henry Lawrence, died of his wounds, and his place was taken by Inglis, who bravely held out till he was relieved, on September 25th, by the heroic Havelock. The final relief was achieved by Sir Colin Campbell, and on November 17th the city was again in complete possession of the British. In the meanwhile, in September, Delhi was retaken by General Archdale Wilson. By June, 1858, no city or fortress of any importance remained in the hands of the mutineers. Oudh was entirely reduced by the beginning of the year 1859. The able rebel leader, Tantia Topi, a Mahratta Brahman, was taken, tried by court-martial, and hanged. During the mutiny valuable assistance and protection were received from many native chiefs. On the other hand, it was the fate of the last representative of the East India Company to sentence the last Great Mogul and heir of the House of Timur 'to be transported across the seas as a felon.' He died in Pegu in 1862. The transfer of the Government of India to the British Crown (1858) was the immediate consequence of the mutiny. Under the system then inaugurated, the Government of India is vested in a Principal Secretary of State, responsible to the Crown, and assisted by a council sitting in London. Subject to this authority is the Governor-General, henceforth termed the Viceroy, aided by an Executive Council, corresponding to the old Council of Calcutta, and by a new Legislative Council, composed in part of non-official members, native as well as European. The first Viceroy was Lord Canning. The two following Viceroy were the Earl of Elgin (1862-63) and Sir John Lawrence (1863-69). Toward the close of Lord Elgin's administration, a Mohammedan rising in Northwest India was apprehended, and it was considered most desirable that the new Viceroy should have practical experience of Indian affairs. Sir John, afterwards Lord Lawrence, was accordingly appointed Viceroy. He conducted the Government with prudence and zeal; but unfortunate events occurred during his term

of office. A war in Bhutan terminated unsatisfactorily for England in 1865; and a dreadful famine in Orissa, resulting from a drought, caused the death of 1,500,000 people. He was succeeded by the Earl of Mayo (1869-72). This administration was inaugurated by a great demonstration at Ambala, March 27, 1869, when the Ameer of Afghanistan was received in state and given a supply of arms, and the first installment of a money subsidy of £120,000 a year. In returning from Rangoon to Calcutta, the Earl of Mayo was assassinated by a convict, February, 1872. Lord Northbrook (1872-76) was the next Viceroy. The chief events of his administration were 'the Bengal famine,' which, however, was foreseen and provided for, and the visit of the Prince of Wales to India (1875). Northbrook was followed by Lord Lytton (1876-80). The most important events in the tenure of office of Lord Lytton were the proclamation of the Queen as Empress of India (1877), another famine, and the Afghan War (1878-80). The Marquis of Ripon (1880-84), the Earl of Dufferin (1884-88), and Lord Lansdowne (1888-93) were the next three Viceroy, under whose administrations much was done for the improvement of the natives. In 1885 King Thebau of Burma was dethroned, and on January 1, 1886, the country was formally annexed by the English. The Earl of Elgin became Viceroy in 1893. During his term of office the demarcation of the boundary between Afghanistan and India, as determined by the Durand Treaty of 1893, was practically completed. In 1895 the region called Bashgal, in the basin of the Chitral River, was taken from the British sphere of influence, and annexed to Afghanistan. In 1895-96 the Government was called upon to deal with a mutiny of the fanatical Moplahs in Southwest India. They held out stubbornly, but were at last put down. In 1897 there was a far more serious outbreak of the Afridis on the Afghan frontier, and several sharp engagements between them and the British occurred during the summer. In addition to these difficulties, the administration had to contend with famine and plague. Notwithstanding all discouragements, however, Elgin made substantial progress in internal improvements. In 1899 Lord Curzon of Kedleston became Viceroy. In that year the gold standard was established. The famine, continuing through the year, affected 30,000,000 people. Some disaffection appeared among the Mahrattas and at Poona violent demonstrations were made against the Government. But the country, as a whole, was loyal; and on the outbreak of the South African War, several native chiefs offered their services to the British Government.

(Calcutta, 1876-1902); *Report on the Meteorology of India* (Calcutta, 1875-1900); *Rainfall Data of India* (10 vols., Calcutta, 1891-1900); Deakin, *Irrigated India* (London, 1893); Buckley, *Irrigation Works in India and Egypt* (New York, 1893).

FLORA. Hooker, *Flora of British India*, vols. i.-vii. (London, 1872-97); Drury, *The Useful Plants of India* (2d ed., London, 1873); Drury, *Handbook of the Indian Flora* (3 vols., Madras, 1864-69); Tschirch, *Indische Heil- und Nutzpflanzen und deren Cultur* (Berlin, 1892); Haberlandt, *Eine botanische Tropenreise* (Leipzig, 1893); Brandis, *Forest Flora of India* (London, 1896).

FAUNA. Blanford, *The Fauna of British India* (London, 1889-98); Jerdon, *The Birds of India* (3 vols., Calcutta, 1862-64); Beavan, *Handbook of Fresh Water Fishes of India* (London, 1877); Day, *Fishes of British India* (London, 1884); Hume and Marshall, *The Game Birds of India* (Calcutta, 1879-80); Ball, *Jungle Life in India* (London, 1880); Moore, *Lepidoptera Indica*, vols. i.-v. (London, 1890-1901); Kipling, *Beast and Man in India* (London, 1891).

GEOLOGY. Medicott, Blanford, Ball, and Mallett, *A Manual of the Geology of India* (5 vols., London, 1879-87); Indian Geological Survey, *Manual of the Geology of India* (Calcutta, 1893); Oldham, *Manual of the Geology of India* (2d ed., Calcutta, 1893); *Memoirs of the Geological Survey of India* (33 vols., Calcutta, 1859-1901); *Records of the Geological Survey of India* (Calcutta, 1868-97); Oldham, *A Bibliography of Indian Geology* (Calcutta, 1888).

INDUSTRIAL AND ECONOMIC DEVELOPMENT. Kaye, *Administration of the East India Company* (London, 1853); Royle, *The Productive Resources of India* (ib., 1882); Birdwood, *The Industrial Arts of India* (ib., 1880); James, *Indian Industries* (ib., 1880); Connell, *The Economic Revolution in India* (ib., 1883); Stevens, *Dawn of British Trade to East Indies* (ib., 1887); Watt, *Dictionary of the Economic Products of India* (6 vols., ib., 1890-93); Chesney, *Indian Polity* (ib., 1894); Danvers, *Letters Received by East India Company* (ib., 1896); *Official Reports on Various Subjects Connected with India* (London); *Annual Statement of Trade and Navigation* (Calcutta); Markham (ed.), *Statement Exhibiting the Moral and Material Progress of India* (London, 1873 et seq.); Ranade, *Essays on Indian Economics* (Bombay, 1899); Dadabhai Naoraji, *The Poverty of India* (London,

1901); Romesh Dutt, *Famines in India* (ib., 1900).

RELIGION. G. Smith, *The Conversion of India* (London, 1893); Crooke, *Introduction of the Popular Religion and Folk-Lore of Northern India* (Allahabad, 1894); Barth, *Religions of India* (trans., Boston, 1882); Rhys Davids, *Buddhism* (New York, 1896); Kern, *Manual of Indian Buddhism* (Strassburg, 1896); Warren, *Buddhism in Translations* (Cambridge, Mass., 1896); Battacharya, *Hindu Castes and Sects* (Calcutta, 1896); Oldenberg, *Buddha, sein Leben, seine Lehre*, etc. (3d ed., Berlin, 1897); Hopkins, *The Religions of India* (Boston, 1898); Max Müller, *Six Systems of Indian Philosophy* (London, 1899); Grünwedel, *Mythologie des Buddhismus in Tibet und der Mongolei* (Leipzig, 1900); Aiken, *The Dharma of Gautama the Buddha, and the Gospel of Jesus Christ* (Boston, 1900); and the authorities referred to under BUDDHISM; VEDANTA, etc.

GOVERNMENT; ADMINISTRATION. Orlich, *Indien und seine Regierung* (London, 1839-61); Fawcett, *Finance of India* (London, 1880—); Cunningham, *British India and Its Rulers* (London, 1881); Strachey, *India* (London, 1888); Stokes, *The Indian Codes* (London, 1888); Black, *Report of the Indian Surveys, 1875-90* (London, 1891); Baden-Powell, *Land System of British India* (3 vols., Oxford, 1892); Chesney, *Indian Policy* (3d ed., London, 1894); Probyn, *Indian Coinage and Currency* (London, 1897); Ilbert, *Government of India* (Oxford, 1898); Dutt, *Open Letter on Famines and Land Assessments in India* (London, 1900); Hunter, *Statistical Account of Bengal* (London, 1877); *Statistical Abstract Relating to British India* (London, annual); *Annual Statistical Abstract for Several Colonial and Other Possessions of the United Kingdom* (London, annual); *Statistical Atlas of India* (Calcutta, 1895).

POLITICS. Duferin, *Speeches Delivered in India* (London, 1890); Hanna, *Indian Problems*, i.-iii. (London, 1895); Crawford, *Our Troubles in Poona and the Deccan* (London, 1897); Ayle, *Indian Frontier Policy* (London, 1897); Aubin, *Les Anglais aux Indes et en Egypte* (Paris, 1899); Durand, *The Making of a Frontier* (London, 1899); Lady Betty Balfour, *History of Lord Lytton's Indian Administration, 1876-80* (London, 1899); Foucher, *Sur la frontière indo-afghane* (Paris, 1901); Lilly, *India and Its Problems* (London, 1902); and for the Eastern Question, Curzon, *Russia in Central Asia* (London, 1889); id., *Problems of the Far East* (London, 1894); Popowitch, *The Rival Powers in Central Asia*, translated (Westminster, 1893); Krauss, *Russia in Asia, 1538-1899* (London, 1899); Levedey, *Russes et Anglais en Asie centrale. Vers L'Inde*, translated (Paris, 1900); Colquhoun, *Russia Against India* (New York, 1900).

ETHNOLOGY. Elliott, *Memoirs on the History, Folk-Lore, and Distribution of the Races of the Northwestern Provinces of India* (London, 1869); Dalton, *Descriptive Ethnology of Bengal* (Calcutta, 1872); Lewin, *Wild Races of Southeastern India* (London, 1870); Hunter, *Annals of Rural Bengal* (London, 1872); Rowney, *Wild Tribes of India* (London, 1882); Ujfalvy, *Aus dem westlichen Himalaya* (Leipzig, 1884); Spiegel, *Die arische Periode und ihre Zustände* (Leipzig, 1887); Le Bon, *La civilisation de l'Inde* (Paris, 1887); Monier-Williams, *Modern India and the*

Indians (London, 1889); Taylor, *The Origin of the Aryans* (London, 1889); Crooke, *Ethnographical Handbook of the Northwestern Provinces and Oudh* (Allahabad, 1890); Risley, *Tribes and Castes of Bengal* (Calcutta, 1891-92); Oppert, *On the Original Inhabitants of Bharatavarsa or India* (London, 1894); Hewitt, *The Ruling Races of Prehistoric Times in India, Southwestern Asia, and Southern Europe* (London, 1894-95); Crooke, *Tribes and Castes of the Northwestern Provinces and Oudh* (Calcutta, 1896).

HISTORY. Mill, *History of British India*, edited by Wilson (London, 1858), the standard history; Elliott, *History of India as Told by Its Own Historians* (8 vols., London, 1869-77), especially for Mohammedan rule; Elphinstone, *History of India* (London, 1866), an authority for the Mogul Empire; Wheeler, *History of India from the Earliest Ages* (4 vols., London, 1874-76); Trotter, *History of India Under Queen Victoria* (London, 1887); Hunter, *The Indian Empire, Its History, People, and Products* (London, 1893); id., *History of British India*, vols. i.-ii. (London, 1899-1900); Keene, *History of India* (London, 1893). The best authority for the period before the Mohammedan invasion is Lassen, *Indische Altertumskunde* (Bonn, 1844-61), much enlarged in the second edition, of which only two volumes appeared (ib., 1867-74). Consult, also: Mitra, *The Indo Aryans* (Calcutta, 1881); Dutt, *A History of Civilization in Ancient India* (3 vols., Calcutta, 1889-90); Weber, *Die Griechen in Indien* (Berlin, 1890); McCrindle, *Invasion of Alexander the Great* (London, 1896). For the Mohammedan period may be suggested: Keene, *The Turks in India* (London, 1879); id., *The Fall of the Mogul Empire of Hindustan* (London, 1887); Bayley, *Local Mohammedan Dynasties of India* (London, 1886); Lane-Poole, *History of the Moghul Emperors of Hindustan, Illustrated by Their Coins* (London, 1892); id., *Medieval India Under Mohammedan Rule* (New York, 1902); for the Mahrattas, Grant-Duff, *History of the Mahrattas* (London, 1826). For other intrusive elements, Malletson, *The French in India* (London, 1868); Danvers, *The Portuguese in India* (London, 1894); Mendez, *A India portugueza* (Lisbon, 1896); Seth, *History of the Armenians in India* (Calcutta, 1895); and for British rule, Mahon, *Rise of our Indian Empire* (London, 1858); Orlich, *Indien und seine Regierung* (Leipzig, 1859-61); Torrens, *Empire in India: How We Came by It* (London, 1872); Hunter (ed.), *Rulers of India* (London, 1890 et seq.); Lyall, *Rise of the British Dominion in India* (London, 1893); Bose, *History of Hindu Civilization During British Rule* (Calcutta, 1894-96); Frazer, *British India* (London, 1896); Lyall, *Rise and Expansion of British Dominion in India* (London, 1896); Crawford, *Our Troubles in Poona and the Deccan* (London, 1897); Roberts, *Forty-one Years in India from Subaltern to Commander-in-chief* (London, 1897); Inness, *The Sepoy Revolt* (London, 1897); Gough and Inness, *The Sikhs and the Sikh War* (London, 1897); Malletson, *History of the Indian Mutiny* (6 vols., London, 1899); Aubin, *Les Anglais aux Indes et en Egypte* (Paris, 1899); Morison, *Imperial Rule in India* (London, 1899); Warburton, *Eighteen Years in the Khyber, 1879-98* (London, 1900).

INDIA, FRENCH. Possessions of France in India, comprising the five towns of Pondicherry,

Chandernagar, Karikal, Mahé, and Yanam (see these respective titles), with a total area of about 196 square miles. Population, in 1901, 275,094. For history, see under EAST INDIA COMPANY, FRENCH; CLIVE; DUPLÉIX; and LA BOURDONNAIS.

INDIA, FURTHER, OR FARTHER. See INDO-CHINA.

INDIA, NATIVE STATES OF. The native States of India consist of over 600 States, which do not come under the administrative system of British India, but have varying degrees of independence, and are mostly governed by native princes. Many of the States are quite small, but some are very large. The total area is 679,393 square miles, with a population of 62,461,549. It is noteworthy that, excepting Travancore, these States are located in the interior of the country. The population is very heterogeneous. In many of the States the ruler belongs to a minority or alien race and religion.

The early policy of the East India Company was to make alliances with the different States, recognizing the native princes as its equals. The plan did not prove satisfactory, as it was impossible to preserve harmony while the native princes were not subject to more positive restraint. The policy was then introduced of recognizing them as subordinates, and limiting their military forces, the British themselves guaranteeing protection, and taking charge of the external relations of these States. In the middle of the nineteenth century the policy of annexation was followed for a short time—Oudh, for example, being annexed in 1856. But since the Sepoy Mutiny (1857) the policy has been to allow the States to enjoy a share of independence under native rulers. The extent to which the British authority is exercised over the native States varies greatly between different States and at different times in the same State. They are not permitted to make wars or to receive foreign consuls. The commercial treaties made by the British embrace also the native States, their interests being recognized as identical with those of the provinces. The guaranty of protection implies the right to establish such military forces within the native territories as the purposes of defense demand, and to have control of railroads and telegraph lines which are not 'local,' i.e. do not begin and end within the States. Each State is thus protected from external attack and internal revolt, and a large local army is not necessary.

Since the peace of the Empire is in danger of being broken by disputes over the succession to the rulership in any State, or the rule of certain candidates may be deemed prejudicial to the Imperial welfare, the British may intercede to determine who the successor shall be, and no one to whom they object can be advanced to the chieftaincy. If flagrant and intolerable instances of misrule arise, the right of interference is presumed to follow as a further consequence from the rôle the Imperial Government plays as guarantor of the protection of the States' general welfare. Under special circumstances, as, for instance, the murder of a British commissioner, the British have resorted to some extraordinary methods of interference. But ordinarily in the important States the rulers are given a free hand in determining the State policy and execut-

ing it. In the numerous small States the Imperial jurisdiction is usually much more extensive, and many of them are administered by a British officer in the name of the chieftain. The British at times have exercised absolute rule even in some of the larger States. Their rule in Mysore had extended over half a century when (1881) it was restored to native rule. Some of the States pay a tribute to the British, but it is always small, and usually by way of compensation for special services. The policy of allowing native States to exist alongside of British provinces has its advantages and disadvantages. Eminent Indian officials hold that as far as British interests are concerned it would be better to annex a number of the leading States. The fact that this is not done is assumed to be an evidence of the unselfish motives of the Imperial policy. The proximity of the native States causes such inconveniences as rise out of the different prevailing systems of currency, limitations in the development of the Imperial irrigation system, and violations of the regulations concerning the growing of the poppy. It also tends to render certain laws inoperative—as, for instance, those against infanticide.

In order to facilitate the relations with the native States, to watch over the course of affairs within their territories, and be in a position to exert a needful influence, the British appoint political agents to the various States. With rare exceptions, the agent resides within the territory to which he is accredited. The agents to the principal States are under the immediate jurisdiction of the Imperial Government. The general condition of affairs in the native States compares unfavorably with that prevailing in regions under British administration. The British claim that the burden of taxation upon the masses falls heavier in the States than in the provinces. At the same time the public is benefited much less, for the expenditure is largely for the unnecessary wants of the ruler and his coterie of adherents, while roads, irrigation, schools, and other public needs are sadly neglected. Freedom of the press is not tolerated. It is claimed that communities which have been transferred from native to provincial administration have invariably protested against being transferred back under a native administration. Laws are made or revoked as it suits the whim of the ruler. Mysore, the most progressive of the States, has a so-called 'representative assembly,' but its members have no vote in making the laws or appropriations. Rural boards have also been established in this State, but they have no money at their disposal. Consult the authorities referred to under INDIA, paragraphs *History and Government*; and for a more detailed statement concerning the different States, see the articles under their respective titles.

BIBLIOGRAPHY. Roussellet, *India and Its Native Princes* (London, 1896); Ghose, *The Modern History of the Indian Chiefs, Rajas, and Zamindars* (London, 1883); Tupper, *Our Indian Protectorate* (London, 1893); Griffith, *India's Princes* (London, 1894); Chakrabarti, *The Native States of India* (Calcutta, 1895); Mehta, *The Hind Rajasthan* (Calcutta, 1896).

INDIA, PORTUGUESE. Possessions of Portugal in India, comprising Goa, Daman, and Diu. (See these respective titles.) Area, 1558 square miles. Population, in 1881, 420,868; in 1894, 494,836.

For history, see under INDIA; EAST INDIA COMPANY; DIAZ; GAMA; ALMEIDA; and CASTRO.

INDIA INK. A black pigment, formed by mixing lampblack and gum into a paste and then pressing it into molds where it dries into sticks of various shapes. It was originally made in China and Japan, and the best grades are still produced in those countries, the common lampblack of Occidental countries being too coarse for many purposes. It is said that the Chinese collect the lampblack used in its manufacture from the oil of sesame. In China India ink is applied with a brush, both for writing and painting. In Europe and America it is chiefly used for black-and-white drawings, it being possible to regulate the depth of the shade by the amount of water used in mixing the ink. India ink is the only true black ink produced, all other grades having a tinge of some other hue.

INDIA MUSEUM. A collection in London, illustrating the antiquities, history, and resources of India. In 1880 it was placed under the management of the South Kensington Museum, and has been much enlarged.

INDIANA. 'The Hoosier State.' One of the North Central States of the American Union; bounded on the north by Lake Michigan and the State of Michigan, on the east by Ohio, on the south by the Ohio River, separating it from Kentucky, and on the west by Illinois. It lies between latitudes 37° 47' and 41° 50' N. and longitudes 84° 49' and 88° 2' W. The extreme length is 277 miles; greatest breadth, 145 miles; area, 36,350 square miles, of which 440 square miles are water.

TOPOGRAPHY. Indiana resembles Illinois in its physical features. Lying within the prairie region, it has a gently undulating surface which slopes by imperceptible stages toward the southwest. The northeastern part has an elevation of 1000 to 1200 feet, the northwestern 500 to 700 feet; along the Ohio River the elevations are about 500 feet in the southeast and 300 feet in the southwest. There are sandy hills near Lake Michigan, and a series of low elevations of glacial origin occurs in the southern part, extending from the Ohio, in Clark County, northward to Parker County on the Wabash. A portion of northern Indiana is drained into the Mississippi through the Kankakee and Illinois, into Lake Michigan through the Calumet and Saint Joseph, and into Lake Erie through the Maumee, but most of the streams have a southerly or southwesterly course into the Ohio and Wabash. The last-named rises in western Ohio, and crossing northern Indiana it is joined by the Salamonia, Mississineva, Wild Cat, Eel, and Tippecanoe. Near the western border the Wabash receives the Vermilion from Illinois, while its most important tributary, White River, joins it 50 miles above the confluence with the Ohio. The southern border is drained directly into the Ohio through the White Water, Blue, Little Pigeon, and other short streams. There are several small lakes in northern Indiana, the largest being English Lake on the headwaters of the Kankakee.

CLIMATE AND SOIL. The mean annual temperature for the State is about 52° F., ranging from 48° in the northern to 56° in the southern counties. Cold northerly winds lower the winter temperatures to an extreme of -25°. At Indianapolis the thermometer shows an average

temperature of 28° for January, and 76° for July. The mean rainfall for the year over the whole State is about forty-three inches. With the exception of sandy areas around Lake Michigan, the soil is generally fertile, and some of it remarkably so. In the northern and central parts the soil is composed of drift materials, more or less assorted by water action into beds of sand and clay. Without the drift region in the southern tier of counties, the soil has been derived by weathering of sandstones and limestones, and is generally less fertile than that of the prairies. The richest soils are found in the river valleys, particularly in those of the Wabash and the White Water.

FLORA AND FAUNA. See these topics under UNITED STATES.

GEOLOGY. The geological relations are greatly obscured by the heavy covering of glacial materials. North of the Wabash the prevailing strata are of Devonian age and mostly limestones. The eastern part of the State between the Ohio and the Wabash is underlain by Silurian and the western by Carboniferous rocks.

MINERAL RESOURCES. The coal-fields of Indiana cover an area of 6500 square miles in the western and southwestern counties. They are of Carboniferous age and yield bituminous coal suitable for heating. The chief producing counties are Clay and Vigo, each with an annual output of more than 1,000,000 tons, and Sullivan, Vermilion, Greene, and Parke counties. The total output in 1901 was 6,918,225 short tons, valued at \$7,017,143. Petroleum, one of the most valuable products of the State, is found in the Lima district of Adams, Wells, Jay, Blackford, and Grant counties. From 1889 to 1901 inclusive, the output was 38,355,000 barrels; in the last year it amounted to 5,757,086 barrels, valued at \$4,822,826. Natural gas is obtained in many of the central counties, including Hancock, Henry, Hamilton, Tipton, Madison, Grant, and Delaware, the area of the field being about 3000 square miles. In 1901 there were 4600 wells in operation, and the output was valued at \$6,954,566. A large quantity of gas is transported to Chicago. Indiana has a valuable quarry industry, producing sandstones and limestones suited for building and ornamental purposes. The Bedford oolitic limestone, which comes from southern Indiana, is one of the best-known building-stones in the country. Brick-clays are widely distributed, and marls adapted to the manufacture of hydraulic cement are found along the Ohio River.

AGRICULTURE. According to the census of 1900, 94.1 per cent. of the land area of the State was included in farms. The farm area increased in every decade but one—1880 to 1890—of the last half of the nineteenth century, making a total gain in the half-century of 69 per cent. In the same period the improved land increased more than twofold, amounting, in 1900, to 77.2 per cent. of the total farm area. The most extensive non-arable lands are in the hilly region of the south-central section, and in the swamp lands of the northern part. Formerly the land that was too wet for successful cultivation constituted in the aggregate a very considerable portion of the total area, but by an extensive system of drainage the greater part of it has been reclaimed, and now constitutes the most productive land in the State. The average size of farms

had decreased from 136.3 acres in 1850 to 97.4 acres in 1900, every decade of that period having witnessed a decrease. The rented farms amount to 28.6 per cent. of the total number, over four-fifths of which are rented according to the share system.

Agriculture has the advantage of a very superior system of railroad transportation, and of numerous city markets within the State. Besides, proximity to such great centres in adjoining States as Chicago, Cincinnati, and Louisville opens up a wider field. Indiana is not divided into crop belts, nor does any one crop have a monopoly. The three-crop rotation system is commonly in vogue, and for a long time the State was one of the leaders in the production of corn, wheat, and hay (timothy and clover). Recently, with the great development of some of the Western States, that place has been lost, though a high rank is still held. The census for 1900 showed a larger acreage for corn, wheat, and hay than was reported at any previous census. Potatoes and oats are grown everywhere, but in somewhat larger quantities in the northern part of the State. Barley, buckwheat, and rye are raised, but not in large quantities. All kinds of fruits and vegetables common to the temperate zone are raised. Much attention is being given to the production of tomatoes for canning, and no other State west of the Alleghany Mountains equals Indiana in this respect. Of the total number of orchard trees, apple-trees (8,624,593) constitute 61.1 per cent. Large quantities of peaches are grown in some of the southeastern counties. The number of peach, pear, and plum trees each more than trebled during the decade ending with 1900.

STOCK-RAISING. Stock-raising is important, attention being evenly divided between horses, cattle, and swine. Every decade since 1870 has witnessed an increase in the number of all varieties of farm animals except sheep, which suffered a corresponding decrease. (The decrease shown in the table in the number of dairy cows is due to a change in the method of enumeration, and is, therefore, only apparent.) Sheep-raising is largely confined to the northeastern part of the State. In 1899, \$8,027,370 was realized from the sale of dairy products, about half of which was from sales of butter and the remainder principally from sales of milk. The receipts from poultry products are also very large. The following tables, taken from the census returns of 1890 and 1900, show the relative importance of the different crops and varieties of farm animals and the changes which have occurred during the decade:

CROP (acres)	1900	1890
	Corn	4,499,249
Wheat	2,893,293	2,570,017
Oats	1,017,385	1,102,479
Rye	43,562	62,890
Hay	2,442,414	2,330,504
Potatoes	84,245	113,509

LIVE STOCK	1900	1890
	Dairy cows.....	574,276
Other neat cattle.....	1,110,202	932,621
Horses.....	751,715	720,035
Mules and asses.....	67,725	59,644
Sheep.....	1,010,648	1,081,133
Swine.....	3,763,389	3,320,817

MANUFACTURES. Indiana is somewhat less fortunate than some of its sister States in respect to natural facilities of transportation and the possession of cities favorably situated to draw trade. It has no manufacturing centres of the first rank. Nevertheless, the highly developed state of railroad transportation gives Indiana an easy access to the markets of the country; and this, together with the superior resources of the State, is resulting in a rapid development of manufacturing. In 1900 there were 155,900 wage-earners engaged in manufactures, an increase of 41 per cent. for the decade ending with that year, as against an increase of 59.1 per cent. for the preceding decade. The percentage of the population engaged in manufacturing grew from 3.5 in 1880 to 5.0 in 1890 and 6.2 in 1900. Among the factors which are accountable for this recent growth, the most important is the development of the natural-gas resources of the State. From about 1886 the production of gas increased steadily until 1899, when it exceeded in amount that of any other State. The nature of this fuel confines its use to the region of production and to the immediately surrounding territories, where it may be secured by piping. Consequently, its benefits have been greatest to such towns as Elwood, Anderson, Muncie, and other places located in the natural-gas belt. The industries which have been attracted to this district are those which require an abundance of cheap fuel, such as iron and steel and glass manufactures. These two industries now take rank among the most important of the State, the increase of each during the decade 1890 to 1900 being respectively 307 and 392 per cent. The Indiana glass-factories now send shipments to Norway and New Zealand.

The manufacture of tin and terne plate has developed as a branch of the iron and steel industry. Another group of industries, and one that includes the three most important manufactures of the State, owes its development to the abundant local agricultural resources. Wheat and corn respectively give rise to the flour-milling and the distilling industries; and the feeding of stock, especially hogs, is largely responsible for the development of an important slaughtering industry. From the table appended it will be seen that there has been a slight decrease in the value of the flouring and grist mill products; but this is due to the decline of prices rather than in the amount of the output of the mills. The value of the production of liquors and of slaughtering and meat-packing products, on the contrary, increased respectively 134.9 and 57.1 per cent. Three-fourths of the liquors produced are distilled. The distilling interests are centred largely in Terre Haute. The slaughtering and meat-packing industry is the most extensive at Hammond (not far from Chicago) and at Indianapolis. During the decade 1890 to 1900 there was a decided decrease in wholesale slaughtering, not including meat-packing. This decrease has been much more than counterbalanced by the growth in that branch of the industry which includes meat-packing.

Another important group of manufactures has developed as a result of the extensive local timber resources. The forests contain valuable hardwood timbers, which are extensively used in the manufacture of carriages and wagons, furniture, and agricultural implements. South Bend is

noted for the manufacture of carriages and wagons. To the supplies of hard-wood also is partially due the prominence attained in car-construction. The wood-pulp industry is likewise dependent upon the forests for its raw materials. Although the resources of the forests are rapidly diminishing, the industries which depend upon forest products continue to thrive, the necessary supplies being obtained from the adjoining States to the north and the south. Among other industries the manufacture of foundry and machine-shop products is the most important. The gain during the decade amounted to 80.5 per cent. The printing and publishing output and the manufacture of pottery, terra-cotta and fire-clay products also showed decided gains during the decade. The census figures on the next page show the relative importance of the leading industries for the years indicated.

TRANSPORTATION. Indiana's natural means of transportation consists of the Ohio River, forming the entire southern boundary of the State; its tributary, the Wabash, navigable at high water as far as Lafayette; and Lake Michigan on the north, with the single port of Michigan City. The National Road, running east and west through the central part of the State, played an important part during the pioneer period, as did also two canals—one, the Wabash and Erie, entering the State at the northeast corner and running diagonally across it to Evansville in the southwest corner; the other, the White Water Canal, extending from Lawrenceburg in the southeast corner of the State, north to Hagerstown. But these have been superseded by railroads, and for a number of years have been abandoned. Railroads have come to be the principal means of communication, the State being most advantageously placed in this respect. All lines from the east centring in Chicago pass through the State, as do most of the lines connecting the great commercial centres of the East with those of the West, besides some important northern and southern lines. Of a total mileage of 6459, less than 1000 miles of road have terminals within the State. There are 1.93 miles of railroad per 100 square miles of territory, and 24.91 miles for every 10,000 inhabitants. Recently there has been a remarkable development of cross-country electric car lines, and apparently these will become common in districts where local passenger traffic is great, or where railroad accommodations are wanting. Indiana has, in addition to one port of entry, two ports of delivery, Evansville and Indianapolis.

BANKS. In 1902 there were 145 national banks in the State. Their capital stock was \$16,774,000; cash, etc., \$8,998,000; loans, \$62,453,000; and deposits, \$76,079,000. There were 110 State banks with a capital of \$4,914,000; cash, \$1,618,000; loans, \$17,991,000; and deposits, \$23,316,000. There were 68 private banks with a capital of \$1,639,000; cash, \$659,000; loans (not including loans on real estate and other collateral security), \$5,472,000; and deposits, \$9,692,000. In the savings banks of the State there were \$6,561,000 deposits, the average deposit being \$267.93.

GOVERNMENT. Indiana has its second Constitution, the present one having been ratified by a vote of the people in 1851. An amendment may be proposed by either House, and after being approved by a majority of the members elected to each House of two consecutively chosen assemblies

INDUSTRIES	Year	Number of establishments	Wage-earners, average number	Value of products, including custom work and repairing
Total for selected industries for State.....	1900	5,441	98,470	\$247,207,994

it becomes a part of the Constitution. Voters must be twenty-one years of age, and have resided in the State six months, the township sixty days, and the ward or precinct thirty days. General elections are held on the first Tuesday after the first Monday in November; the time of holding township elections is determined by law.

LEGISLATIVE. The Senate cannot exceed fifty, nor the House of Representatives one hundred members. The former are elected for four, and the latter for two years, from districts composed of contiguous counties, and no county can be divided for Senatorial apportionment. The regular sessions of the Legislature meet biennially on the Thursday after the first Monday of January in odd years, but the time of meeting may be changed by law. If an organization of either House is not effected in five days, compensation to the members of such House stops until its organization has been accomplished. Ordinary sessions are limited in length to sixty-one days, and special sessions to forty days. Revenue bills must originate in the Lower House.

EXECUTIVE. The Governor and Lieutenant-Governor are elected for four years, the former being eligible but for four in any period of eight years. A majority of the members in the

two Houses may override the Governor's veto. Bills sent to the Governor become law if not returned within three days. The Governor exercises the usual pardoning power, subject to legal regulations. A secretary, auditor, and treasurer are elected for two years.

JUDICIAL. The Superior Court judges (from three to five) are elected for six years from districts by the State at large. A clerk of the Superior Court is elected for four years. The State is divided into judicial circuits, in each of which a judge is elected to serve six years, but the law makes it possible for a judge elected on one circuit to hold court in another. A prosecuting attorney is elected in each judicial circuit for two years. Justices of peace are elected in townships for four years. Other courts or tribunals of conciliation may be established by law.

LOCAL GOVERNMENT. At the general elections each county elects a clerk of the Circuit Court, auditor, and recorder to serve four years each, and a treasurer, sheriff, coroner, and surveyor to serve two years each. A new system of local government aiming at a more complete separation of the executive and legislative functions became operative in 1899. Legislative boards are

elected for each of the townships and for the county as a whole. They control expenditure and the levying of taxes. The local executive officers cannot create debts without the permission of these legislative bodies.

FINANCE. In January, 1901, the total State debt amounted to \$4,504,615. Of this \$1,085,000 cannot be paid off until 1915, and \$144,000 cannot be paid off until 1937, and bonds held by Purdue University representing an additional \$340,000 run perpetually. In October, 1901, there was a balance in the treasury of \$611,649. For finance of education and charitable and penal institutions, see paragraphs under those headings.

POPULATION. In one or two respects Indiana differs much from other Northern States in point of population. It has been less affected by immigration, the native-born population being proportionally greater than that of any other Northern State. Furthermore, the population is peculiar in that a large per cent. came from the South—Kentucky, North Carolina, and Virginia—while generally being unaffected by the westward wave from New England and New York. Again, the proportion of urban population—30.6 per cent. in cities of only 4000 inhabitants (1900)—is less than that of any other of the Northwest Territory States. Of the 146,000 foreign born, the Germans constitute about one-half. The following shows the growth of population: In 1800, 2517; 1820, 147,178; 1840, 685,866; 1860, 1,350,428; 1880, 1,978,301; 1890, 2,192,404; 1900, 2,516,462—males, 1,285,404; females, 1,231,058; colored, 57,960. Indianapolis (the capital) in 1900 had 169,164; Evansville, 59,007; Fort Wayne, 45,115; Terre Haute, 36,673; South Bend, 35,999.

The State has thirteen Representatives in the National House of Representatives.

RELIGION. The Methodists from the pioneer days to the present have been the leading denomination, having more members in Indiana in proportion to the total State membership of all churches than in any other Northern State. In recent years the Christian Church has had a phenomenal growth. The Catholics are proportionally weaker than in any other Northern commonwealth. Altogether 55 different denominations are represented. Besides those mentioned, the most important are the Lutherans, Baptists, Presbyterians, United Brethren, and Friends.

EDUCATION. In recent years the educational status of Indiana has improved very rapidly. The percentage of illiteracy for the age period of ten years and over decreased from 7.5 per cent. in 1880 to 4.6 per cent. in 1900. The percentage of illiteracy of the colored population was 22.6. In 1899 there was 73 per cent. of all persons between the ages of six and twenty-one enrolled in the State schools, as against 71 per cent. in 1879, and the per cent. of attendance on the basis of enrollment increased during the same period from 61 per cent. to 76 per cent. This increase is partially the result of the recent compulsory education laws, which compel children between the ages of six and fourteen to attend the full term of the local school. The average length of the school term increased from 132 days in 1879 to 152 in 1900. A State law now requires a minimum term of six months, but there is still a decided contrast between the average length of the rural and the city schools. A care-

fully graded system is now universal throughout the State, and through the agency of a competent corps of county superintendents an efficient supervision of schools is effected. A serious problem has arisen in consequence of the very general decrease in the attendance at the rural schools. In 1899 there were 1848 schools having less than 15 pupils each. The solution of the problem is being found in the abandonment of the small schools and the transportation of the pupils to one centrally located school.

The greatest progress has been made in the high-school system of the State. Township high schools are now common. In 1899 there were 717 high schools, with courses of from two to four years in length, and 150 other schools in which some high-school work was done. High schools giving four-year courses and maintaining a certain standard of proficiency are granted commissions upon the approval of the State Board of Education. In the above year there were 156 commissioned high schools.

A considerable number of the teachers of the State have received collegiate and normal-school training. A more satisfactory system of examinations for teachers' certificates has been introduced, extending the jurisdiction of the State in the granting of certificates. At present life licenses are granted by the State Board of Education, as are also licenses for eight years and for sixty months. State licenses are issued by the State superintendent of public instruction for periods ranging from sixty to twelve months in length, while the county superintendent issues certificates for terms of thirty-six to six months. The State maintains a normal school at Terre Haute, which in 1900 had an enrollment of 1672. Among the private normal schools are the Northern Indiana Normal School, at Valparaiso; the Tristate Normal, at Angola; Rochester Normal University, at Rochester; and the Eastern Indiana Normal University, at Muncie. In 1900 the total number of male teachers was 7208; female, 8409.

The total expenditure for schools in 1900 was \$8,188,089, of which \$4,800,965 went to teachers and superintendents. A comparative study of the last few decades of the nineteenth century shows that the rate of the State tax for common schools is decreasing, necessitating heavier local burdens, the sum raised by local taxes having increased fourfold during that period (\$2,542,552 in 1899). It is also found that the per capita cost of education has greatly increased in the rural districts and decreased in the cities. Indiana has fortunately provided a large permanent school fund, amounting in 1900 to \$10,359,959. Of this \$2,467,655, called the Congressional Township Fund, was secured from the sale in each township of the sixteenth section of land. The remainder (\$7,892,303), called the Common School Fund, is composed of the county seminary fund, saline fund, bank-tax fund, surplus-revenue fund, and the sinking fund.

Higher education is provided by the State University at Bloomington, and technical instruction by Purdue University at Lafayette. There are numerous higher denominational institutions, including Depauw University (Methodist), at Greencastle; Notre Dame University (Roman Catholic), near South Bend; Indianapolis University (including Butler College, Christian); Earlham College, at Richmond (Friends); Wa-

bash College, Crawfordsville; Hanover College (Presbyterian); and Franklin College (Baptist). Vincennes University, at Vincennes, and Rose Polytechnic Institute, at Terre Haute, are non-sectarian.

CHARITABLE AND PENAL INSTITUTIONS. Indiana has only recently begun a serious study of correctional and charitable problems. Formerly the township trustees distributed alms without let or hindrance, the burden of which was borne by the county. At present the township bears the expense of caring for its own poor, outdoor relief is discouraged, and uniform and detailed reports are made to county and State officers. Judges of the Circuit Court are now authorized to appoint boards of county charity, whose members are unsalaried. The State has pursued a policy of placing children in families rather than retaining them in institutions, and all children not defectives have been removed from the poor asylums. In 1900 the number of children in orphans' homes was 1682. The former prison at Jeffersonville has been transformed into a reformatory for first-offense cases, and is conducted very much on the 'Elmira' plan. The State has a parole law. There is a State board of charities appointed by the Governor, which has the power to investigate and supervise the charitable and correctional institutions of the State. These institutions are as follows: Hospitals for the insane at Richmond, Logansport, Evansville, and Indianapolis; a State Soldiers' Home, at Lafayette; School for the Deaf, Dumb, and Blind, at Indianapolis; School for Feeble-Minded Youths, at Fort Wayne; Soldiers' Orphans' Home, at Knightstown; Girls' Reform School, at Indianapolis; Boys' Reform School, at Plainfield; Woman's Prison, at Indianapolis; State prison, at Michigan City; and the State Reformatory, at Jeffersonville. Of these, all but the State prison are under the control of non-partisan boards. The expenditure incurred by these institutions in 1900 was \$1,648,455, of which \$1,290,790 was for maintenance. The earnings of the institutions for the same year amounted to \$132,489. The expenditure for outdoor relief for the year ending in October, 1900, was \$209,956, or only one-third as great as it was in 1895. The number of inmates (3096 in 1900) in the county poor asylums decreased relative to the total population during the same period. In 1900 the expenditure for gross maintenance of county poor asylums amounted to \$345,496.

HISTORY. French trappers and fur-traders appeared within the present limits of Indiana as early probably as 1679. It is certain that La Salle, on his way to the Illinois Indians, crossed the northwestern part of the State by way of the Kankakee in 1680. The Miamis and Ouabachi (or Wabash) Indians then occupied the region, and welcomed the French, who built Fort Ouatanon, on the Wabash, in 1720, and Fort Vincennes in 1727. The first permanent settlement was founded in 1734-35, by a number of families who made their home in the neighborhood of Fort Vincennes. The population increased slowly; but, owing to the richness of the soil, the inhabitants (French entirely, together with negro and Indian slaves) enjoyed ease and great plenty. The territory came into the possession of England in 1763, but the English occupation was too brief to effect any change in the people or the laws. In 1778-79 George Rogers Clark (q.v.),

with a handful of men, wrested the country from Great Britain. Hostilities with the Indians, continuing from 1781 to 1795, when a peace was conquered by General Wayne, brought great distress upon the settlers at Vincennes. In May, 1800, the Indiana Territory was organized, comprising all that portion of the Northwest Territory lying west and north of Ohio. Michigan and Illinois were subsequently set off, reducing Indiana to its present extent. Vincennes was the capital till 1813, when the seat of government was removed to Corydon. In 1811 Gen. William H. Harrison (q.v.), at the head of a force of regulars and militia, crushed the Indian tribes under the brother of Tecumseh at the battle of Tippecanoe (q.v.). When the war with England broke out the Indians renewed hostilities, but they were speedily subdued, and never more troubled the settlers. As in the case of Illinois, a large proportion of the immigrants into Indiana came from the South, and before 1816 repeated attempts were made to legalize slavery in the Territory, in spite of the ordinance of 1787. In 1816, the year of the State's admission into the Union, the question was definitely settled against slavery by the first constitutional convention, though a law prohibiting negroes and mulattoes from immigrating into the State remained in force till after the Civil War. The growth of the State in wealth and population was accelerated greatly by the construction of the National Road and the Wabash and Erie canals. Wild speculation in lands and railroads led to a general bankruptcy in 1837; but after 1846, when a compromise with the public creditors was effected, the economic and financial condition of the State improved steadily. Its prosperity since the Civil War has been due in great measure to the discovery of extensive coal, iron, and gas fields, and valuable deposits of building-stone, in different parts of the State. Conditions have been monotonously peaceful, except for spasmodic eruptions of mob violence (see **WHITE-CAPS**) in 1869 and 1888, and the disorders around Hammond attending the great railway strike of 1894, when strikers and Federal troops came into conflict. As a result of the strike, a board of labor commissioners was created in 1897, to act as a permanent tribunal of arbitration. In the same year an anti-trust law and a factory-inspection law were passed, and primary education was made compulsory. For more than twenty years after 1878 the State balanced almost perfectly between the two great political parties, vacillating, in State elections especially, from side to side by minute majorities in a total vote of several hundred thousand. The opportunity for political manipulation was correspondingly great, and in national elections every device known to practical politics was brought into play to gain the electoral vote of the State. Law-making was carried on frequently in a partisan spirit, and it was a favorite manœuvre with the minority in the Legislature, Republican or Democrat, whenever it was hopelessly outnumbered on an important question, to resign in a body, so as to prevent a quorum and thus block legislation. In national elections the State was Democratic up to 1860, excepting in the years 1836 and 1840, when it cast its vote for William H. Harrison, the Whig candidate. It was Republican from 1860 to 1872, Democratic in 1876, 1884, and 1892, and Republican again in 1880, 1888, 1896, and

1900. The Governors, since its organization as a Territory, have been as follows:

TERRITORIAL

William H. Harrison	1800-1811
John Gibson	1811-1813
Thomas Posey	1813-1816

INDIANA. (1) A romance by George Sand (1832), and the name of the heroine, a young Creole, ignorant of the world and married to a husband much older than herself. Her love is gained by Raymon, a man of leisure, who, when she yields to his ascendancy, refuses to compromise himself and repulses her offer. After Raymon's marriage and the death of her husband, she becomes the wife of an English lover. The novel was written after the author had separated from her husband, and voices her indignation at the results of ill-assorted marriages. *Indiana*, which was George Sand's first novel, had a great success from the social question involved and the intense individuality which the author put into her work. (2) A character in Steele's comedy, *The Conscious Lovers*.

INDIAN AFFAIRS. The position of the Indian tribes within the limits of the United States is anomalous. Strictly speaking, they are not a part of the body politic, but are regarded as 'domestic dependent nations,' and are officially spoken of as the 'wards' of the nation. So long as they maintain their tribal relations, their right to regulate their domestic affairs has been generally conceded. Recently this right has been restricted by acts of Congress enlarging the jurisdiction of the Federal courts in respect to crimes committed by Indians. The tribes inhabiting the Indian Territory, namely, the Cherokees, Chickasaws, Choctaws, Creeks, and Seminoles, are officially known as the 'five civilized tribes.' They have adopted the habits of civilized life and live under well-ordered governments. Each nation has its own popularly elected executive, legislature, and judiciary. They may enact such laws for the regulation of their internal affairs as do not conflict with the Constitution and laws of the United States, while the decisions of their courts receive the same recognition as to faith and credit as those of the Territories. The title to

land occupied by them is not in the individual members of the tribe, but in the nation as a whole, and it can be alienated only with the consent of the Government. White men may become members of an Indian nation by adoption, and are then subject to the jurisdiction of the tribal courts, although they still retain their citizenship. The Supreme Court has held that an Indian born within the jurisdiction of a tribe can become a citizen of the United States only by naturalization. By an act of Congress, however, passed in 1887, it was provided that Indians residing on lands allotted to them in severalty should be considered as citizens of the United States without the formality of naturalization. The immediate effect of the act of 1887 was to confer citizenship upon 10,122 Indians to whom allotments had already been made under special laws and treaties. Every year from 1000 to 2000 Indians signify their desire of becoming citizens by taking allotments. The right of Indians to sue and be sued in both Federal and State courts is well recognized, and they are frequently given the right of suffrage by the States in which they reside. At the present time there are estimated to be over 20,000 Indian voters in the United States. The Constitution confers upon Congress the power to regulate commerce with the Indian tribes, and until the year 1871 the common method of dealing with them was by treaty through the agency of special commissioners. In that year, however, an act of Congress abolished this practice, and placed under the immediate control of Congress all commercial or diplomatic intercourse with the Indians.

From an early period it has been the practice of the Government to conclude treaties with the Indians for the extinction of their possessory right to the lands occupied by them and for their removal to certain territories specially set apart for their occupation. These lands are known as Indian reservations, the largest and most important of which at the present time is the Indian Territory (q.v.), created in 1834. Whenever the United States sets apart an Indian reservation, whether within the territorial limits of a State or not, it has full authority to protect the Indians in their persons and property and to provide for the punishment of all offenses committed within the reservation. An Indian reservation lying within the limits of a State is, however, subject to its jurisdiction also except so far as concerns the government and protection of the Indians themselves, unless otherwise provided by treaty with the Indians. While all territory officially known as 'Indian country' is subject to the jurisdiction of the United States, and while it belongs to Congress to enact laws for the regulation of intercourse of Indians with one another and with citizens of the United States, it is the policy of the Government to leave to the Indians the regulation of their own domestic concerns as far as practicable. By acts of 1885 and 1890 Congress curtailed the jurisdiction of the Indian tribal courts. By the act of 1885 the authority to administer their own criminal laws among themselves, so far as certain enumerated crimes committed by Indians are concerned, was withdrawn and vested in Territorial courts. By the act of 1890 the Federal courts were given jurisdiction of all civil cases in the Indian Territory except those over which the tribal courts have exclusive jurisdiction, and over all cases of con-

tract between Indians and citizens of the United States, and all controversies between members of different tribes, as well as certain other cases specially enumerated. By the same act certain laws of Arkansas were extended over the Indian Territory. State courts have no jurisdiction over offenses committed by tribal Indians upon a reservation within the State.

It is the policy of the United States to exercise a general supervision over the affairs of the Indians and to protect them from the encroachments of unscrupulous whites, as well as from the evil consequences of their own ignorance and improvidence. Many statutes have been passed by Congress to prohibit hunting on their lands, to prevent cutting timber from their lands, or pasturing stock on them, to prevent the sale of intoxicating liquors to them, etc. Citizens of the United States of good moral character are permitted to trade with Indian tribes, upon giving bonds. The power of appointing and licensing Indian traders, as well as prescribing rules concerning the kind, quantity, and prices of goods to be sold, belongs to the United States Commissioner of Indian Affairs. This officer is further empowered to remove from Indian reservations all persons found there contrary to law or whose presence is deemed detrimental to the peace and good order of the Indians.

Until 1832 the supervision of Indian affairs was intrusted to a bureau in the War Department. In that year Congress authorized the President to appoint a commissioner charged with general superintendence of Indian affairs. He has the direction of eight inspectors and a large number of superintendents, agents, teachers, mechanics, etc. Since 1849 the business of Indian affairs has constituted a bureau in the Department of the Interior. The most numerous officials in the Indian service are the agents, appointed by the President for a term of four years, who are required to give bonds. Their duties are to superintend the intercourse among Indians within their respective agencies and to execute the orders of the commissioner. An important feature of the Indian service is the educational work. The President is empowered to employ capable persons to instruct the Indians in agriculture and to teach their children reading, writing, and arithmetic. By an act of 1882 he was authorized to appoint an inspector of Indian schools. The schools under Government control are the non-reservation training-schools and the reservation boarding and day schools. Besides these there are contract schools under the supervision of religious associations which receive Government aid. By an act of Congress passed in 1890, provision was made for field matrons who organize sewing-schools, weekly clubs, and Sabbath-schools among the Indians. In 1893 more than 21,000 Indian children were receiving the benefits of education, about two-thirds being enrolled in Government schools. The number of Indians occupying reservations is 134,476. The annual appropriation by Congress for the Indian service usually exceeds \$10,000,000. The policy now being pursued by the Government will result in the incorporation of all Indians in the body politic as citizens, and with it the Indian reservations will disappear, the individuality of the Indian will be recognized, and the paternal care and control now exercised by the United States will cease.

INDIANAPOLIS. The capital of Indiana and its largest city, and the county-seat of Marion County; on White River, in the centre of the State, 183 miles southeast of Chicago and 111 miles northwest of Cincinnati (Map: Indiana, C 3). It lies 700 feet above sea-level, in a broad, rolling plain. The surrounding region is rich in agricultural and mineral resources, and in forest trees of exceptional beauty. Large natural-gas and oil fields are tributary to it, and near by are coal-lands 7000 square miles in extent. Besides there are found in the vicinity of the capital building-stone, marl, iron, and other minerals. Wholly an inland city, Indianapolis relies on railways for its commerce. Within 50 miles of the centre of population of the United States for the past two decades, its location has made it a great railway centre. Here terminate seven divisions of the Big Four system, six divisions of the Pennsylvania Railroad, two divisions of the Cincinnati, Indianapolis and Western Railway, the Lake Erie and Western, and the Monon, besides ten interurban electric systems. The railways bring their passenger trains into a handsome union depot, and the interurban lines have contracted to erect a large union terminal station to cost over \$1,000,000. Freight passing Indianapolis is carried over a belt railway, 15½ miles long. It encircles the city. The street-railway system represents an outlay of about \$9,000,000, with 125 miles of tracks, and a park (Fairview) containing 200 acres.

The city is noted for the beauty of its streets, ranging from 40 to 120 feet in width, and shaded mainly by hard maples and elms, and crossing at right angles. In the heart of the city is a circular plaza, once known as 'the Governor's Circle,' and now called Monument Place, from which radiate four avenues to the four corners of the city. The park system comprises 1250 acres, and includes Riverside, extending for five miles along both sides of White River; the Indiana Central Canal and Fall Creek; Garfield, Brookside, Military, Saint Clair, and University parks, and Woodruff Place. The most notable structure in Indianapolis is the Soldiers' and Sailors' Monument, designed by Bruno Schmitz, of Berlin. It was erected by the State to commemorate the part Indiana bore in the wars of the Union. The monument is a shaft of stone and bronze 285 feet in height, surmounted by a figure of Indiana Triumphant. About the base are allegorical groups in stone representing war and peace, and beneath these are two great fountains. Near the monument are four subsidiary bronze statues of Gen. George Rogers Clark, Gen. William Henry Harrison, Gov. James Whitcomb, and Oliver Perry Morton. There is also a statue of Schuyler Colfax in University Park, and in the Capitol grounds one of Thomas A. Hendricks. A large fund has been raised for a memorial to Benjamin Harrison. The buildings most worthy of note are the Capitol, 492 by 185 feet, built of Indiana limestone at a cost of \$2,000,000; the court-house, city hall, Federal arsenal, new post-office (to cost \$2,500,000), Christ Church, Manual Training High School and some of the common-school buildings, Columbia Club, Commercial Club, the Claypool Hotel, the Propylæum, a wom-

an's building devoted to literary and social purposes, and, perhaps the finest of all, the public library, with 100,000 volumes. Three of the city's bridges possess more than ordinary beauty; they span Fall Creek at Illinois and Meridian streets and at Central Avenue, and are of stone.

Indianapolis is the seat of the University of Indianapolis, with an academic department known as Butler College, and departments of law, medicine, and dentistry. Here are also a Roman Catholic theological seminary, a negro Baptist college, a college under the control of the United Brethren Church, the Heron Art Museum and Art School, the State institutions for the education of the deaf and dumb and for the blind, a number of medical, dental, and law schools, etc. Public philanthropic institutions are numerous—a State reformatory for women, a State hospital for the insane, and many smaller hospitals, homes, and refuges for the sick and unfortunate. The public-school system includes, besides common schools, an academic high school and a manual-training high school, and a normal training-school. Its inventory of assets amounts to \$2,398,766; its indebtedness (July 1, 1902), \$868,000; its annual budget (1901), \$934,337. Although far inland, Indianapolis is a port of entry and a point for the receipt and distribution of foreign as well as domestic commerce. Its chief articles of trade are grain and its products, live stock, meats, and the output of its extensive manufactories—milling machinery, engines, drugs, vehicles, furniture, bags, woollens, starch, and terra-cotta.

The government of the city is vested in a mayor, a council of twenty-one members (fifteen elected by wards and six at large), and a police judge, all chosen biennially. Appointments to the subordinate administrative departments are made by the Mayor. A school board of five, elected by popular vote and serving four years, governs an independent school corporation through an educational executive, the superintendent and a business executive (termed business director) each serving four years. The municipal budget (1901), including school expense, balances at about \$2,700,000, the main items being: For fire department, \$194,000; for police, \$160,000; for parks, \$100,947; for light, \$113,273; for public health, \$54,154; for water, \$90,000. The tax valuation of all property, at perhaps three-fourths actual value, is \$129,000,000, and the total debt of the city, exclusive of school debts, is about \$2,300,000. Population, in 1850, 8091; 1860, 18,611; 1870, 48,244; 1880, 75,056; 1890, 105,436; 1900, 169,164. The population in 1900 included 17,100 foreign born and 15,900 negroes.

Settled in 1819, Indianapolis received its name in 1821, and became the capital on January 1, 1825, the seat of government being removed from Corydon. The opening of the first railroad in the State from Madison, on the Ohio River, occurred on October 1, 1847, and gave the little town its first impetus. The growth since 1889, when the introduction of natural gas revolutionized manufacture in Indiana, has been remarkable. Here Henry Ward Beecher served as pastor of the Second Presbyterian Church (1839 to 1847); Benjamin Harrison made Indianapolis his home from 1856 until his death, in 1901. Consult: *Indiana Gazetteer* (Indianapolis, 1849); Nowland, *Early Reminiscences of Indianapolis*

(Indianapolis, 1870); Sulgrove, *History of Indianapolis and Marion County* (Philadelphia, 1884).

INDIAN ARMY. See ARMIES, section on *British Empire*, and EAST INDIAN ARMY.

INDIAN ART. India cannot compete with the peoples of Western Asia in the antiquity of its existing monuments, largely because the earliest constructions were of wood, as is shown by the report of Megasthenes, Greek Ambassador of King Seleucus (c.300 B.C.) to the Court of Pataliputra, who admired the vast halls of the wooden palace of the Indian King, with their gilded columns. Stone and brick came into use c.250 B.C., under Asoka, and here Indian architectural history begins. It falls into three main periods: (1) BUDDHIST (B.C. 300 to c.700 A.D.), in which architecture begins to decline in the fifth century; (2) NEO-BRAHMANIC, ruling alone, in harmony with Buddhism in certain regions, from A.D. 700 to 1000, and then dividing the field with the (3) MOHAMMEDAN style, which began with the Afghan invasion in the early eleventh century. Since the English conquest Indian architecture has lost all vitality. There is no unity in India under these periods or styles. Local differences are enormous. The two main geographical divisions are North India, which was the earlier to develop, and South India. At the same time Indian art as a whole has a very characteristic style. It far excels in architecture at least the art of China and Japan, and it governs the art of neighboring regions like Tibet, Cambodia, Burma, and Siam, and islands like Java and Ceylon, which owe their civilization to India.

ARCHITECTURE.

In seeking to explain the origin of Indian architecture, some traces of Greek influence have been found in the north, filtering through the Greek Kingdom of Bactriana, and visible in early monuments of Kabul and Kashmir in the Ghandara monasteries of Jamalgiri and Takht-i-bahi, and in India proper at the Amravati Stupa; but both Egypt, and especially Assyria, exercised far more fundamental influence, through the intermediary of Persia, which was flourishing when Indian art commenced. But whatever suggestions were received, they serve but to bring out the originality of Indian art, which stands at the antipodes of Greece in its exaggeration of forms, its multiplication of details, its love of complicated and confused lines. At the beginning comparative simplicity reigned, and it was not until long after the Christian Era that the richness of design was reached which remained characteristic. This was partly due to the use of brick, instead of stone or marble, in nearly all open-air structures before the tenth century A.D., which diminished the opportunity for elaborate surface ornamentation. The principal classes of monuments are the *chaityas*, or temples, the *viharas*, or monasteries, and the *stupas*, or mound sanctuaries. The temples are at first excavated in the rock; not until the fifth century were any built above ground (except that of Buddha Gaya), to judge from remaining examples.

BUDDHIST PERIOD. Of the earliest monuments, those of the Buddhist period, aside from the memorial columns or *lats* (e.g. those of Asoka),

the important works were some thirty rock-cut temples and about a thousand monasteries, also cut out of the mountain-side. The temples are large, single, oblong halls, divided into nave and aisles by two rows of heavy columns, approached by a vestibule with an arched façade, richly carved, and having at the apsidal end a colossal statue of Buddha. There is a series of these covering a period of nearly a thousand years. The earliest—at Bhaja—are the smallest and simplest. At Karli (second century B.C.) the nave has a stilted tunnel vault, and the heavy columns are octagonal, with bases and capitals surmounted by elephants, making the interior somewhat resemble a dark, tunnel-vaulted French Romanesque church. Even more impressive are the largest cave temples at Ajanta and Ellora (q.v.), where temples and monasteries are multiplied side by side in the face of the rock. The massive piers, the wonderfully varied sculptures, and the frescoes at Ajanta are of special interest. The monasteries are more modest: they are often grouped about these temples, and consist of a large central hall, out of which open the individual cells of the recluses, all cut out of the rock. One of those at Ajanta is 65 feet square, and is supported by twenty pillars. The cells are on two sides, the entrance porch at one end and the sanctuary at the other, the whole being richly carved and painted. The third class, the *stupas*, or *topes*, are great brick memorial mounds of circular form. They were at first of domical outline, surmounted by a little chapel or shrine, and surrounded by a marble rail or balustrade entered by four gates. The Bharhut stupa (c.150 B.C.) has been demolished, but that of Sanchi is in splendid preservation. The Amravati stupa is remarkable for its elaborate and beautiful figured sculptures. Finally, the only temple built above ground during the Buddhist period, Buddha Gaya (c.100 B.C.), is in the form of a pyramid with square base, at the corners of which rise four small pyramids. It is 52 meters high, in nine stories, and with three inner superposed sanctuaries. Like all the other early monuments, it is built of brick. Originally it was surrounded by a marble rail like the *stupas*. The pyramidal form is exceptional in the north at this period, though later it became common in the south. Evidently there is little of constructive value in this period, as Buddha Gaya is the only example of the builders' art, the rest being cut out of the mass or mere mounds.

NEO-BRAHMANIC PERIOD. The next period, the Neo-Brahmanic, almost entirely abandons the impressive rock-cut temples and monasteries, and develops decorative details. Indian art, which has hitherto been confined to the North, spreads not only southward, but far beyond the borders of India, and had previously been carried to China. The principal branch of this art is mistakenly called Jaina by some authorities. Its most interesting examples are perhaps in the Province of Orissa. The southern school asserts its independence. In the North the Brahman temples consist of one or more rectangular halls approached by porches and surmounted by curvilinear pyramids, while the temples of the South are immense rectangular inclosures entered through pyramidal doorways of several stories. Even now no true vaults are used in construction, but spaces are covered by false vaults of over-

hanging courses, and there are no vast interiors as there were in the earlier rock-cut temples. The central halls of the monasteries become open cloisters with their cells. A curious class of buildings at Ellora shows the transition to this period from the Buddhist, for they are in the open instead of cut in the mountain; but are entirely hewn out of the rock instead of being constructed. The Neo-Brahmanic monuments can be classified under five heads: (1) In the Northeast, Orissa; (2) in Bundelkhand and Rajputana; (3) in Gujarat; (4) in the Central Provinces; (5) in the South.

The style in Orissa, as it flourished for 700 or 800 years, differs from that of the South in having no storied towers or columnar halls or *gopurams*. The numerous temples at Bhuvanewar are its highest expression. The tower of the larger temple (c.600 A.D.) is 180 feet high, and near it is the 'Black Pagoda,' whose superb decoration marks a new era. But in general these temples are small. They are built of stone, which has entirely replaced brickwork in this region. Much later (c.1200 A.D.) is the temple of Jagamath at Puri, which shows the absolute decadence of this style.

Quite distinct is the contemporary school of Rajputana, whose ruined city, Khajuraho, with its several miles of ancient buildings, including some forty temples, is unsurpassed in India. The plan of these temples is more elaborate, being made cruciform by the projection of wings and porches, and the elevation being elaborated by the grouping of many subordinate pyramids and spires around the central pyramid. Each temple stands on a stone platform, and ordinarily measures about 40 meters in height and 35 meters in width. Like the preceding, the remarkable temples at Gwalior date from the tenth to the eleventh century. Decorative and figured sculpture now spreads luxuriantly over every inch of surface. The interiors are small and dark, the supports heavy and broken, and the decoration of the pyramidal exterior has become the most effective part of the style. The style of contemporary towers is shown by the rich examples at Chittur. Perhaps the extreme of delicacy of design and minute care in execution appears in the two temples of Mount Abu (eleventh to twelfth century), built entirely of white marble, and each standing on a raised platform. The carved inside surface of a dome in the earlier of these temples (c.1030) is a more astonishing piece of work than the most elaborate English late-Gothic fan-vaulting. The use of false domes is an interesting feature of a whole group of these temples, including those at Nagda recently discovered.

Passing to the centre of India, we find few but important works. The temples of Ellora (q.v.), famous the world over, exemplify the fusion of Buddhism and Brahmanism. There are about thirty excavated in the rock over a distance of two kilometers, during a period of about three centuries (A.D. 500-800); others, again, as mentioned above, are cut in the rock above ground. The earliest and greatest temple is that of Viswakarma (see ELLORA), $26 \times 13 \times 10$ meters, divided into three aisles by 38 pillars. The temple of Indra is remarkably rich decoratively, but less so than the Kailasa, which is largely in the open (eighth century), cut out of a single mass of rock, and one of the most fantastic and

brilliant creations of Indian art. Another group of subterranean temples is on the island of Elephanta (q.v.), dating approximately from the eighth century, and easily visited from Bombay. The absorption of Buddhism by Brahmanism, seen during its earlier stages at Ellora, is almost complete at Elephanta, as shown by the sculptures and ritual. Some of the colossal statues are very impressive.

In the South Buddhism never had a strong hold, and its monuments begin after Jaina and Brahmin supremacy. Here also are, however, some subterranean rock-cut temples, the earliest monuments in the region. There are two groups, at Mahabalipur and at Badami. At the former is a most interesting series of small monolithic temples in the open, similar to the Kailasa at Ellora, and apparently the prototypes of the later pagodas of the South. Both groups are thought to belong to the sixth century A.D., and are among the earliest known Brahmin temples. The finest temple at Badami, though small—as are all these monuments—is beautifully executed in every detail, and unusually symmetrical. The sculpture is very profuse, particularly if we consider their early date; but it is less riotous than in the North. All these buildings are better lighted than the earlier rock-cut temples, which received light only through a big arched opening over the entrance, while here the entire façade is open.

There seems now to be a gap of about four centuries in the art of the South, until we reach the earliest pagodas. Pagoda architecture is characteristic of this region. Its most striking example is at Chidambaram. The plan is a large rectangle about 500×400 meters, having a *gopuram* at each cardinal point. These *gopurams* are rectangular truncated pyramids in several stories; the largest is about 50 meters high and has seven stories. There is a large sacred pond 100×60 meters, and the main temple has a thousand columns and measures $103 \times 60 \times 13$ meters. In contrast with the buildings of the North is not only the enormous scale of such monuments, and their elaborate accessories, but also a radical difference in the proportions. The piers are far more slender and higher, with simpler outlines, and the interior effects are better. Even earlier is the pagoda at Tanjore (eleventh century), with a great *gopuram* tower in fifteen stories directly over the sanctuary; the *mantapam* or temple of the sacred bull, an open colonaded shrine in three aisles, is a beautiful example of delicate lofty proportions and wide interiors. Another group of extremely sacred pagodas—inaccessible to Europeans—is at Tripetty; still another at Conjeveram.

But the greatest group in the entire South is at Vijayanagar (q.v.), which has remained a deserted city since 1565. Its monuments are comparatively late, dating mostly from the fifteenth and sixteenth centuries, and they belong to the culminating period of art in this region. The great pagoda of Liva and the temple of Vitoba illustrate the grandiose and monumental character of the buildings, although their taste is less pure than that of previous centuries. Still later is the great pagoda at Madura, an immense and imposing composition (seventeenth century). One of the best portions is the present Bazar or 'Puthu Mantapam,' 100×30 meters, with a roof supported by an imposing avenue of 128

piers, mostly in the form of realistic monsters and divinities, in a style much used in the South, but never with such richness and life-like detail as here.

In the matter of size and imposing composition nothing equals the great pagoda of Srirangam, one of the most gigantic edifices in the world. In the construction of the great pagodas it was the custom to make any additions by throwing out another concentric quadrangle, with its series of *gopuram* pyramids, the original sanctuary remaining in the centre; and, peculiarly enough, every time another quadrangle was erected its *gopurams* were higher than the preceding, so that the central *gopurams* ended by seeming insignificant. At Srirangam successive rulers had added to the original pagoda until there were seven concentric rectangles, the outer one measuring 880×760 meters. Aside from its size, there is little merit in the structure, as it is bare or poor in detail and design. As a whole these Southern pagodas are the most impressive buildings in India.

There is a region in the South, Mysore, which remains an architectural mystery. Hardly touched by explorers, it promises a rich and original harvest, if we can judge from the temples of the deserted cities of Baillur and Hullabid, wonderful and delicate creations, showing a sense of proportion and restraint unusual in India.

BUDDHIST STYLE IN NEIGHBORING LANDS. Passing now to outlying parts of India and neighboring provinces, we find in the sequestered province of Nepal, between India and Tibet, an archaic style that explains some of the origins of Indian art and illustrates the connection with China. A first type of monument is that of the large circular domical stupas of earth and brick, surrounded not by a balustrade, but a simple plinth, and dedicated to Buddha. These are the earliest (Sambunath, Buddnath). A second and far commoner type is that of the pagoda-like temples in brick and wood formed of several stories of superposed roofs, each one in retreat and raised at the corners, in perfect analogy to Chinese monuments (Bhatgaon, Patan). A third type is that of stone temples of quite a different style and of admirable design. Chronologically all these buildings are late—not more than two to five centuries old—but they represent earlier types in a region that remained in a prehistoric undeveloped condition. So the class of pagoda-like temples of brick and stone is of extreme interest. It is the same in Burma, where many monasteries were built of wood or brick, and forms of Babylonian origin are perpetuated.

Of even greater architectural interest is Cambodia, whose ruined cities have only recently been discovered, with buildings dating between 950 and 1350. Here brick construction and stonework are very successfully combined. The ancient capital, Angkor, has a superb series of temples, particularly that of Nakhon Wat. Its inclosure measures about one mile each way, and the buildings are well composed. As in Southern India, there is a large pond surrounded by courts, corridors, and temples. Grouped pyramids are used, in stories of decreasing size. Monumental staircases most effectively connect the buildings. The sculpture is exceedingly rich, but is symmetrically arranged, and the lines are not broken up, but compose simply in a manner quite un-Indian.

The Renaissance character of some of the ornamentation is startling. In quality of detail the Angkor buildings are unsurpassed in India.

In Java, also, there is an interesting offshoot of Buddhist art. Its chef-d'œuvre is the famous Boro-Buddor (q.v.), built in the seventh century, a perfect epitome of Buddhist art before its fall. It is a stupa or dagoba in seven stories, approached by five processional paths, along which are seventy-two small domes surmounting separate dagobas which surround the central one. Nothing like this remains in Northern India among Buddhist monuments, so that for comparison one must go to Gandara, in the Northwest, to Jamalgiiri and Takht-i-Bahi, which are its prototypes.

Still another little-explored region is the island of Ceylon, which also contains a mass of Buddhist monuments. The ancient capital, Anuradhapura, is unique among Buddhist cities in having a series of monuments illustrating this cult throughout nearly a millennium, it having lasted here for centuries after Brahmanism had displaced it on the mainland. There remain seven separate stupas, with processional paths, as in Java. Two of these stupas have three rows of high columns surrounding the central mound, monoliths about 26 feet high, reminding of the columns of a Persian palace. There is but little sculpture used in the decoration, and in some of it the lines of hieratic animals give additional points of resemblance to Western Asia.

MOHAMMEDAN STYLE. The superb Mohammedan architecture of India is treated under **MOHAMMEDAN ART.** It belongs to two stages—the Afghan and the Mongol. In some cases, as at Ahmedabad, the fusion with pure Indian art is so thorough as to leave only part of the credit to imported ideas from Persia and Bagdad. But at Delhi and Bijapur the style is fundamentally foreign.

DECORATIVE ARTS.

GENERAL CHARACTER. The religious character of Indian art is quite as prominent in other branches as it is in architecture. A knowledge of the intricacies of the Hindu pantheon is a necessary prerequisite to the study of the sculpture and painting, the pottery and even the lacquers, bronzes, and goldsmith work. There is little æsthetic value to the representations of the human figure in India; they interest in the mass, as decoration; and for their subject, as illustrative material for the study of Indian thought. The endless repetition of the same theme in the same monument is characteristic of its symbolic use, as it is, indeed, of the Oriental spirit. This impersonal character has favored the extraordinary tenacity of tradition and continuity of style still to be observed in the various provinces. This has been made possible by the hereditary nature and continuous life and organization of the different crafts, not only in the guilds of the cities, but especially in the groups of artisans which, organized as guilds, have for some 3000 years formed an integral part of the village communities of India, supplying its inhabitants by perpetual contract. The sumptuary arts fostered by the aristocracy naturally flourished in the cities and not in these village communities. Although originality vanished centuries ago, no fundamental damage had been inflicted on Indian arts until under British rule the incongruous architecture of Europe, the degrading methods

of machine manufactures came into fashion in place of the native methods of hand work. This tenacity makes it possible to study some of the methods of antique art in modern India, because the continuous overland trade during antiquity and the Middle Ages kept India in constant relations with Persia, Babylonia, and Assyria, Egypt, and the late Hellenic States after Alexander's time, and later with the Mohammedan powers. The stepped temples of Babylonia, the filigree gold jewelry of Etruria and Greece, the enameled tiles of Persia, the products of the looms of Mesopotamia, and, later, the arts of the Mohammedans of Egypt, Syria, and Persia, were all echoed in India, with greater or less purity. Yet there was always enough of a transformation to give an aspect of Hindu unity to whatever was borrowed. Indian art has always been full of a character of its own. Its greatest successes have been in its decorative work, both on a small scale and in masses, and in the imposing compositions of its architecture. Its failures are due to a poor sense of form both in line and composition.

SCULPTURE. The three centuries before and after the Christian Era saw the development, under Buddhist influence, of the most artistic schools of sculpture that India ever saw. In certain parts of the North and Northwest, especially, there are strong traces of Greek and Persian influences, as in several monuments of the region of Peshawar. The famous Asoka edict-pillars and the encircling marble rails of the Buddhist *topes* of Bharhut, Buddha Gaya, and Sanchi (Bhilsa), all belong to the earliest stage (c.250-200 B.C.). Somewhat later are the rich series of the Amravati type and the sculptures of the earliest cave temples of Ellora, Kanheri, and Ajanta. The Buddhist style was continued in Ceylon after it had decayed on the mainland, as is shown at Anuradhapura. Most of these sculptures can be studied in the South Kensington Museum (London) or the Indian Museum (Calcutta), and in the British Museum and the Madras Museum. The subordination of sculpture to architecture is evident even at this early period: the human figure, though used in colossal size in statues and high reliefs, especially in representations of Buddha, is usually in rather minute proportions, and in confused and intricate compositions. Line upon line of reliefs are superposed, in which architectural detail and decorative design play an important part. The rock-cut figures of the caves are hardly as delicate as the earlier sculptures of the rails or the later work on the open-air temples. The almost classic style of Muttra, of which echoes even survive at Amravati, is gradually replaced by one given to grotesque and exaggerated forms: the female figure especially is treated with undue emphasis. No ideal types were created. The prevalent realism expressed itself more successfully in animal forms, which were plentifully interwoven with human and decorative motifs.

After the decay of Buddhist art, sculpture did not revive till the Jaina period of the eleventh century, whose temples at Gwalior, Mount Abu, and Khajuraho show the existence of a style of exquisite delicacy and profuse richness. Every part of the surface of the temples at Mount Abu, both within and without, is carved, and the later style of Hindu sculptures finds here its prototype. Horizontal lines are emphasized: decora-

tive design is given more importance than purely figured compositions. Then and even earlier the art of sculpture received great development in outlying regions, in Kashmir, Tibet, and the French sphere of influence. There probably never existed a style of art in which sculptured ornament was so profuse as the art of India and its neighbors. A second decadence came with the Mohammedan conquest; decorative design still flourished, but the Moslem dislike for the portrayal of the figure had its effect. Hindu traditions, however, were stronger than the Mohammedan belief: the recent sculpture of Delhi, Bombay, and Madras is directly derived from the eleventh century style through intermediary stages. Martand and Avantipore in Kashmir, Madura, Ellora, Puri, and Khajuraho contain the foremost works of the old Hindu school. Cole's *Catalogue to the Objects of Indian Art in the South Kensington Museum* (London, 1874) gives a good classification of the sculptures, which are also described in Fergusson's works, and in special monographs and volumes of the Government surveys and reports. The three divisions of the Brahman style—Dravidian, Chalukyan, and Indo-Aryan—all afforded great scope for sculpture by the elaborate plans and colossal proportions of their sacred buildings. The most extensive and magnificent sculptured effects in the Dravidian style are found at the temple of Rameswaram, in the Chalukyan style (with great prevalence of animal and bird friezes) at that of Hullabid, in the Indo-Aryan (Hindu) at Bhuvaneshwar.

The lack of aesthetic qualities in composition and form, which prevented monumental sculpture from reaching a high level of achievement, were not noticeable in the smaller branches of sculpture, such as carving in wood, marble, soapstone, and ivory, metal-work, clay figurines, as well as inlaying and enameling. The naturalism and exquisite detail here appear to advantage. Work in black wood, ebony and sandalwood is still carried on in many villages, for small objects, and in teakwood for the details of house decoration. Carved ivory is as popular as in China and Japan, both for statuettes and for reliefs of religious and genre scenes, hunts, animals, and birds.

PAINTING. There is not the same continuity in the use of painting as in the other larger arts. The developed Buddhist art of the period after Christ appears to have used wall-painting on a monumental scale, as in the caves of Ajanta and Bagh in Malwa, but then, as well as later, the impulse came from abroad, usually from Persia. At later times painting was spasmodically employed and became popular in the decoration of sculpture. The identification of the numerous gods by means of their symbols or emblems, and the emblematic use of different colors in their dress, made color an essential element in statuary and relief work. The Mohammedans introduced the illumination of manuscripts from Persia, and later still miniature painting became popular, especially at Delhi. The *Shah Jahan Nameh* and others in the Royal Library at Windsor, and the *Life of Timur*, belonging to Earl Amherst, are beautiful examples of illuminations.

JEWELRY. Of all the smaller arts in India, jewelry is the most universally interesting and beautiful. In it we see survivals of early and late Etruscan, Greek, and Asiatic forms, un-

doubtedly descended from imported originals. The techniques of filigree and granular work, only recently rediscovered in Europe after antique models, never were lost in India. There are at least three very primitive types of jewelry: (1) The heavy gold wire twisted into collars, girdles, bracelets, anklets, and necklaces, used originally throughout India; (2) the chopped gold style made of flat or cubic pieces, strung together, and either solid or hollow, all of general use, but now most popular in Gujarat; (3) the flat beaten silver type of many primitive tribes, similar to early Celtic work. There evidently is great similarity between the Indian races and the Etruscans in the profusion of jewelry that was always worn, as is evident from the earliest literature, such as the *Rig-Veda*; and the sculptures show that its forms have remained unaltered for over two thousand years. The present schools are those of Ahmedabad, with its archaic style; of Mysore, Vizianagram, and other towns, in thinnest pieces of beaten gold; of Kashmir and the Punjab, for the use of gems and enamels in richest but always tasteful variety; of Sindh and Beluchistan, similar but more solid and severe; of Oudh, formerly centred in Lucknow, similar to that of Delhi and Lahore; of Cuttack in Orissa, famous for silver filigree work; and a multitude of minor centres, like Dacca and Dinajpur in Bengal, the work of the last-mentioned place being extremely primitive. The Parsis of Bombay long held on to antique Persian forms, and the South used mythological subjects. The school of Trichinopoly, with very rich chains, necklaces, and bracelets, has long been a favorite one with Europeans. In fine, India has sounded every extreme and form of jewelry, from the most simple and primitive to the richest. See **JEWELRY**.

POTTERY. Even more than jewelry the pottery of India, especially in its unglazed varieties, preserves the ancient forms shown in the early sculptures and paintings. The potters of the villages have never changed these forms since very early times. Unglazed pottery has been made everywhere in India, and still survives quite generally, especially in the Punjab. Decorative pottery for commercial purposes, painted, gilt, glazed, or even pierced, is made in special varieties in different provinces: for instance, the gilt pottery at Amroha, the black and silvery ware at Azimghar, whose meretricious art is in great contrast to the simply beautiful glazed ware of Sindh, of Madura, and of the Punjab. The special pre-eminence of the best Indian pottery has always been the strict subordination of color and ornament to form and the conventionalizing and repetition of natural forms in the decoration. The glazed ware of these three schools only is worthy of standing beside the beautiful primitive unglazed pottery. Their knob and flower patterns, and other favorite floral designs, imitate classic and even Assyrian, Persian, and Egyptian originals; the shapes of the vases are also those of antique examples found in Oriental, Etruscan, and Greek tombs. The turquoise blue, golden brown, dark green, or purple colors are the most beautiful. The exquisite color tones and combinations can be studied even better in the glazed tiles which came into fashion with the Mohammedan conquest after the eleventh century. These encaustic tiles, when used to cover large wall spaces, or even entire buildings such as mosques,

produce an unparalleled effect of splendor. Here especially is Persian influence predominant. The potter was also the image-maker, producing innumerable painted clay figurines, mainly of the gods, to be worshiped in families and shrines.

METAL-WORK. Among the branches of artistic metal-work that of the arms and equipment of the great chieftains is prominent. The Buddhist, Hindu, and Jaina sculptures show how antique are many of the forms still in recent use, but of actual works that are preserved the finest do not date back of the great Mahratta warriors. There are two main schools, the Hindu and the Persian. The Punjab and Rajputana were among the main centres of the art. A comparison of the three great schools of the mediæval Orient shows that the most delicate and simple was the Arab, with its fine filigree work; richer and more highly colored was the Persian with its damaskeening, enameling, and carving; but richest of all was the Indian, which indeed sinned, perhaps, by excess of decoration, breaking the outlines and color scheme by high relief, hammered and cut goldwork, and a multitude of gems. The collection of King Edward has the finest examples of damaskeened suits, of crusading blades carved in relief, and of early matchlocks. The use of carved ivory often gives added brilliancy. Diamonds, rubies, and emeralds are the principal stones used, and the designs are largely floral. The collection of the India Museum ranks next to that of King Edward. Of the chieftains' swords valued as heirlooms and State possessions the finest are those of Swaji, Sultan Chand, and Polygar Katabomma Naik.

Damaskeening in gold and silver wire is a process probably imported during the Middle Ages into India from Persia and Syria. It is practiced in Kashmir, the Punjab, and the Nizam's dominions, though originally of wider use. The ornamentation is in floral patterns, either naturalistic (Bider) or conventional (Purniah). The boxes, bowls, vases, and caskets with this decoration often equal the best Mohammedan work of Egypt and Persia, and are among the most harmonious of Indian industrial works for form and well-composed ornament. The relief work in metal is less chaste and admirable, whether in brass, copper-gilt, bronze, or the precious metals, where the high relief technique and human and animal figures are often used. The gold and gilt work, however, is usually exquisite. The oldest examples are Buddhist pieces found in the Punjab and Afghanistan with Greco-Roman characteristics. The later work in chased parcel-gilt and gold sometimes pierced, especially that of Kashmir, is beautiful in shape, the gold being often given a ruddy hue or olive-brown. Lucknow, Dacca, Cutch, and Gujarat have been famous goldsmith centres.

Images or idols of gold and silver, brass and copper, or of an elaborate alloy, have always been profusely used in private houses for worship. Some are of gold, as those of Krishna and Saraswat; others of silver, as those of Shitala; others of copper, such as those of Surya and the serpent Naga. The larger figures are always cast and finished by hand.

ENAMEL. The art of enameling in *champlevé* is still practiced in greatest perfection at Jaipur in Rajputana, unique for the beauty of its ruby reds, coral reds, emerald greens, and turquoise and sapphire blues. Somewhat less perfect are

the products of the schools of Lucknow, Benares, and Lahore. Indian enamels are combined remarkably with precious stones. Transparent enamels are used with success, and sometimes a thin plate of gold cut in elaborate scenes of figures and ornamentation and etched with a graver is superposed over an enamel ground melted on a gold back.

WOVEN FABRICS. The brocades, embroideries, woven tissues, laces, tapestries, and the like, so long one of the greatest prizes of India, have suffered more than any other branch of art industry. The most sumptuous brocades come from Ahmedabad, Benares, and Murshidabad. The gold-embroidered velvets for state canopies, housings, and caparisons are especially rich. But their designs are not as purely Oriental as are those of the appliqué-work on cloth and the early rugs and carpets with their Persian compositions of birds and animals. The jail industry and the so-called schools of industry have done even more than the rush orders from Europe to degrade the quality—both material and artistic—of India carpets.

BIBLIOGRAPHY. An excellent general view of Indian art is given by Le Bon, *Les civilisations de l'Inde* (Paris, 1887). For architecture, consult: *Les monuments de l'Inde* (Paris, 1893), by the same author; Fergusson, *History of Indian and Eastern Architecture* (London, 1899); Fergusson and Burgess, *Cave Temples of India* (ib., 1880); *Archæological Survey of India*, published by the Government (ib., 1874-1901). Sculpture is well analyzed by Captain Cole, *Catalogue to the Objects of Indian Art in South Kensington Museum* (London, 1874); Birdwood, *The Industrial Arts of India* (London, 1880), is the best authority on the minor arts. For the jewelry, see Eaden-Powell, *Manufactures and Arts of the Punjab* (Lahore, 1872).

INDIANA UNIVERSITY. A coeducational institution of learning, situated at Bloomington, Ind. It was founded in 1820 as Indiana Seminary, and was rechartered as a university in 1838. The university is an integral part of the State public school system, and admits pupils from commissioned high schools without examination. It maintains a professional school of law, and confers the degrees of bachelor of arts, bachelor of laws, master of arts, and doctor of philosophy. No honorary degrees are conferred. The university has a biological station on Winona Lake. The summer school, formerly privately conducted, is now a part of the university. The elective system was introduced in 1885. In 1902 the faculty numbered 70, and the attendance was 1334, including 104 in the law school. At the same time the university had grounds and buildings valued at \$400,000, an endowment fund of \$600,000, and an annual income of \$165,000. The library contains 43,000 volumes.

INDIAN BADGER, BUFFALO, etc. See **BADGER**; **BUFFALO**; etc.

INDIAN BIBLE. An Algonquin version of the Bible made by John Eliot (1661-63). This translation was the earliest version of the Bible to appear in America.

INDIAN CORN. See **MAIZE**.

INDIAN CRESS. See **TROPÆOLUM**.

INDIAN EMPEROR, THE, OR, THE CONQUEST OF MEXICO BY THE SPANIARDS. A tragedy

by Dryden, successfully produced in 1665. It forms a sequel to the *Indian Queen*.

INDIAN FIG. See PRICKLY PEAR.

INDIAN FIRE. A bright white signal fire, consisting of a mixture of potassium nitrate 24 parts, sulphur 7 parts, and arsenic disulphide 2 parts.

INDIAN HEAD. The highest point of the Palisades of the Hudson, opposite Hastings, so called from its resemblance to the features of a human being.

INDIAN HEMP. A very strong bast fibre obtained from the perennial herb *Apocynum cannabinum*, and used by the American Indians for weaving and for cards and nets. It is also sometimes called Canada hemp.

INDIAN LANGUAGES. The languages of India are both numerous and important. Cust in his book on the *Modern Languages of the East Indies* (London, 1878) enumerates nearly two hundred and fifty Indian languages, and some three hundred dialects. Of these languages divisions are: First, the group of Aryan tongues spoken throughout the entire northern half and central portion of India; second, the unrelated Dravidian group (q.v.) in the south; third, the Kolarian languages scattered here and there in Central Hindustan; fourth, the Tibeto-Burmese family of non-Aryan tongues, distributed over the vast area which the name implies; fifth, the Khari, an isolated language near Bhutani. To these may be added likewise two Indo-Chinese spoken families, namely, the Thai, under which comes the Siamese, and the Mon-Annam family, which takes in the Cambodian and Annamite. It may furthermore be stated, for completeness, that the languages of the great Malayan family spoken in Sumatra, Java, Borneo, and the Celebes, and even in the Philippines, have certain Indian affinities or show the influence of the various tongues of India.

The Aryan group of languages in India has preëminence alike for the number and the character of the people that speak those dialects, and for the genius of the languages themselves, as well as for the long historical development of this branch, and for the literature attached to it. In point of time the Aryan division of Indian tongues covers a period of culture extending from at least a thousand years before the Christian Era down to the present time. Broadly viewed, these periods may be recognized in the history of this division of dialects: (1) *Old Indian*, comprising the earliest Vedic dialect and the historic form of the speech known as Sanskrit (q.v.); (2) *Middle Indian*, which embraces Prakrit (q.v.) and Pali (q.v.), both of which are descended rather from the Vedic dialect, or its kin, than from the classical Sanskrit; (3) *New Indian*, including the modern vernaculars of the more cultivated peoples of Hindustan. The general characteristics of the Vedic idiom, together with certain peculiarities of the epic speech, and the classical development of the language, will be found discussed in the article on SANSKRIT (q.v.). Under the Middle Indian or Prakrit group are comprised the Maharashtri dialect, or Prakrit par excellence, with its Jaina varieties, likewise the Magadhi or Ardha-Magadhi, the Sauraseni, which is found in the dramas, the *Apbhranśa* and the *Pāśāci*. The New India group,

geographically arranged, takes in the vernaculars of Assam, Nepal, and Kashmir (the latter called Kasmiri), also Uriya, Bengali, Behari, Hindi, the dialects of the Punjab and of Sindh, likewise Gujarati, Marathi, the Singhalese of Ceylon, Maldivé, and Gypsy.

BIBLIOGRAPHY. The standard work on the Aryan languages of India is Grierson, *Linguistic Survey of India* (Calcutta, 1898). Consult also: Beames, *Comparative Grammar of the Modern Languages of India* (3 vols., London, 1872-79); Cust, *Modern Languages of the East Indies* (London, 1878); and for the phonology, Gray, *Indo-Iranian Phonology, with special reference to the Middle and New Indo-Iranian Languages* (New York, 1902).

INDIAN MADDER. See CHAY ROOT.

INDIAN-MEAL MOTH. One of the most familiar moths (*Plodia interpunctella*) that infest the cereals, Indian meal, dried yeast-cakes, and dried fruits, nuts, etc. The moth has wings which are reddish brown on the outer two-thirds and dirty whitish gray on the inner third. It has a wing expanse of rather more than half an inch. The larva is white, brownish-headed, and worm-like. It spins silken tubes through the substance on which it is feeding, and its excrement and portions of the food adhere to this web.

INDIAN MILLET. See SORGHUM, paragraph *Non-Saccharine*.

INDIAN MUSIC. The music of the aborigines of North America, although never reduced by them to a written science, is nevertheless marked by distinct racial characteristics. Of the greatest importance to the Indian musician was the emotion to be expressed; to this everything was subordinated. As a result the Indian songs can be divided into certain stereotyped classes (such as burial, love, war-songs), in each of which the similarity of the different melodies is most marked. This monotonous character of their tunes is an outgrowth of the very elements which among civilized peoples have been skillfully blended to produce original and unusual effects; for preëminent in Indian music are complicated rhythms (many of them as intricate as those of Schumann and Chopin) and a frequent use of syncopation. When it is remembered that they had no strict forms to restrain them, it will be seen how these two strong elements came in time to dominate and confine their whole musical system. The strictly technical side of Indian music is of less interest. Their scale, like the Chinese, Hindu, etc., consisted of five tones, and was, for the most part, major; their melodies generally ran from the top of the scale to the bottom; their conception of time was very exact; but they had no part-singing; no way of determining pitch, and consequently no universal key. Of most interest to the cultured musician are the wonderful transitions which we find everywhere throughout the native songs. The smoothness and rapidity of their changes from key to key are unsurpassed even in European music. The Indians had a sense of harmony, but, owing to the crudity of their musical science, it was never developed. Only by the use of wooden drums, toned to different pitches, did they get a sort of crude bass. Besides the drums their instruments consisted merely of a flute (with a scale of seven notes), a whistle (with a scale of five

notes), and a rattle, made of dry gourds, loaded with sand or pebbles.

INDIAN MUTINY, or SEPOY REBELLION. See under INDIA.

INDIAN MYTHOLOGY. The mythology of India as found in the ancient hymns of the *Veda* deserves especial consideration, because it represents an earlier state of thought with regard to mythological subjects than is found in any other literary monument of the Indo-Germanic peoples. The development of Hindu mythology down to the present is furthermore of interest because of the chance it gives for a long historical perspective. Attractive parallels may likewise be drawn between the oldest mythological figures of India and those in the pantheon of Greece and Rome, like Father Heaven and Mother Earth (Skt. *Dyāus Piter*, *Prthivī Mātār*, Gk. *Ζεὺς πατήρ*, Lat. *Jupiter*), but they are often erroneous, dangerous, or misleading. Despite, for example, the recognized possibility of kinship by reason of common Aryan or Indo-Germanic unity, such etymological equations as those between Lat. *Uranus*, Gk. *Οὐρανός*, 'Heaven,' and Sanskrit *Varuṇa*, in Indian mythology, or again between *Kérvavos* and *Gandharva*, or the fire-myth of *Prometheus* in connection with Skt. *pramanthana*, the rubbing stick used in kindling fire, break down or become uncertain under the searching light of keen linguistic criticism. Nevertheless, such comparisons are always interesting, and they are often instructive as showing how myths may develop independently or on grounds remotely associated or even disconnected. The mythology of India frequently helps to throw much light on such subjects. Myths abound in the *Rig-Veda*; they are the outgrowth of personifications of the powers of nature and meteorological phenomena. (See AGNI; INDRA; MARUT; MITRA; SOMA; SŪRYA; USHAS; VĀYU; YAMA.) In later Hindu mythology the gods of the old régime gradually become replaced by the great Hindu trinity or triad, Brahma, Vishnu, and Siva, with all the beliefs and notions associated with each of these names (q.v.). The later pantheon is occupied likewise by a band of minor deities, godlings or demigods, like Ganéśa, Kartikeya, Kubera, and the goddesses Durga, Lakshmi, and Sarasvati. (See the articles under these names.) India of all ages has known also many myths, legends, or fables connected with the stars and planets, with sacred rivers, streams, and trees, birds, and animals. Consult: Wilkins, *Hindu Mythology* (London, 1900); Dawson, *Dictionary of Hindu Mythology and Religion* (London, 1879); Macdonell, "Vedic Mythology," in Bühler, *Grundriss der indo-arischen Philologie und Altertumskunde* (Strassburg, 1897).

INDIAN OCEAN. One of the five grand divisions of the hydrosphere, bounded on the west by Africa and the 20th meridian east of Greenwich (running through Cape Agulhas, the southern extremity of Africa), on the north by Asia, on the east by the East Indian Archipelago, Australia, and the 147th meridian (running through the southern extremity of Tasmania) (Map: World, Eastern Hemisphere, K 28). The southern boundary is in an indefinite way assumed to be approximately the Antarctic Circle, although many geographers prefer to call what is south of latitude 40° S. the Southern Ocean.

In its broader sense it covers about 27,500,000 square miles. Gradually narrowing from south to north, the Indian Ocean forks at Cape Comorin into the Bay of Bengal on the east, and the Arabian Sea on the west, the latter again branching off into two arms, the Persian Gulf and the Red Sea, which reach respectively the mouth of the Euphrates-Tigris and the neighborhood of the Mediterranean. These limitations exclude the waters of the Indian Archipelago, as belonging rather to the Pacific Ocean. From Africa it receives the waters of the Limpopo and the Zambezi, and from Asia those of the Irrawaddy, Brahmaputra, Ganges, Indus, and the Shat-el-Arab. It contains numerous islands, chiefly confined to the northern and western regions. Of these Madagascar and Ceylon are the only ones of considerable magnitude, the others being mostly small groups of volcanic or coral formation, the volcanic islands being usually surrounded by coral reefs.

The greatest depth of the Indian Ocean is found in the northeastern part, where, close to the southeast of Java, soundings have been made of 20,340 feet, and a considerable basin of nearly this average depth lies to the northwest of the Australian continent. An elevated ridge running along the 40th parallel has an average depth of 12,000 feet. Krümmel estimates the average depth of the ocean to be 10,970 feet. The surface temperature of this ocean is higher than that of the others, the mean temperature of the northern portion being considerably over 80°, while the bottom temperature, falling below 40° at the equator, indicates an undercurrent of cold water from the Antarctic region. The currents of the Indian Ocean depend to a great extent on the winds. North of the equator they reverse their direction with the annual change of the northeast trade wind to the southwest monsoon, while under the equatorial calm belt the equatorial countercurrent flows eastward. South of the equator, under the southeast trade winds a current flows west, bending south along the coast of Africa through the Mozambique Channel, and meeting the Atlantic westward current at the Cape, where it is turned back to the east toward the south coast of Australia. The winds over the Indian Ocean are, as a rule, gentle, with frequent protracted calms, though hurricanes occur occasionally. This ocean was the first to find a place in the history of commerce. As a commercial channel it virtually maintained its superiority during two thousand years, being habitually traversed in a direct line between Arabia and Hindustan, while coasting voyages alone were known in the Atlantic. This comparatively bold navigation of the Indian Ocean was suggested and facilitated by the periodically alternating monsoons of the northern part.

INDIAN OIL TREE. See BUTTER-TREE.

INDIANOLA. A city and the county-seat of Warren County, Iowa, 18 miles south of Des Moines, on the Chicago, Rock Island and Pacific, and the Chicago, Burlington and Quincy railroads (Map: Iowa, D 3). It controls a large trade in grain, butter, eggs, live stock, fruit, and vegetables. The city has a public library and Simpson College (Methodist Episcopal), opened in 1867. The electric-light plant is owned by the municipality. Population, in 1890, 2254; in 1900, 3261.

INDIAN PEOPLES. For the anthropologist India is of remarkable interest. On its soil may still be met all grades of culture, from the savagery of hill and swamp to the urban civilization born of river and plain, and all forms of human social aggregates, from the primitive family group or clan to the foreign-ruled provinces with their magnificent and luxurious capitals. Here all forms of agriculture are to be found, from the burned-over forest plot to the terraced hillside of the north; in the west and south the utilization of the desert by canals and tanks; all varieties of human dwellings, from the primitive abode in tree and cave to magnificent palaces and temples; all forms of human government, from the primitive democracy and tribal anarchy to organized despotism of the civilized sort; all kinds of marriage, from polygamy to the strictest monogamy, and all varieties of both these systems, and of polyandry as well; as well as all forms of religion from the crudest animism and Shamanism to the agnosticism of certain developments of Buddhism. All these things have been invented, exploited, modified, improved, or degraded by members of the black, the brown, the yellow, and the white races of man for many thousands of years; so that nowhere else in the world have so many millions of human beings done so many things at so many times in so many ways as in India. Remains of the industry of Paleolithic man have been found almost everywhere throughout the peninsula, which makes India seem almost as old as the race of man itself. By far the most important peoples of India belong to the Aryan stock. They are responsible for a number of social and religious ideas and institutions, many of which are simply the expression of the mentality of the more northern and western Aryan in the process of, and after adaptation to, an Oriental and largely tropical environment. They never overcame the land by mere force of numbers, and their influence upon the pre-Hindu population was less racial than social and religious. Many primitive tribes who took over the culture of their conquerors have become assimilated to the Aryan type while preserving intact their aboriginal speech. The complicated caste system (see CASTE) is largely, if not entirely, the result of the contact of the Aryan invaders with the aboriginal population (Dravidian, Kolarian, etc.) of the peninsula, and of the efforts of the conquering race to preserve its purity as much as possible against miscegenation. It was very early dominated by religious ideas, but recent investigations have shown that the lines of caste are not nearly so coincident with racial distinctions as had been assumed to be the case. After the Aryans of India, the Dravidians (the civilized Tamils, Telugus, Kanarese, and Malayalams), the more or less civilized Kodagu, or Koorgs, and the tribes of the Nilgiris, Central India, Orissa, part of Bengal, etc., such as the Irulas, Kurumbas, Badagas, Todas, Kotas, Kader, Khonds, Gonds, Oraons, and Maler, are the most important peoples. The various tribes of this stock illustrate all grades of human culture, from the jungle-dwelling Kurumbas to the high developments of the civilized Tamils, who in literature, architecture, and other arts have shown great ability, and some of them notable capacity for assimilating both Hindu and Christian culture. The Dravidian area lies chiefly in Southern India, but the Tamils have

extended their influence over the north of Ceylon, forming a very important part of the population of that island.

Next to the Dravidians are to be considered the Kolarian peoples (Munda-Kols, Larka-Kols, Bhumi, Santals, Kharia, Juang, Saoras, etc.) of the Orissa-Bengal country and farther inland. The Santals represent the highest development of Kolarian culture, and the Juangs perhaps the lowest; while the others, except some of the Kols, are more or less primitive. Like the Dravidians, the Kolarians, who are looked upon by some as a people even older, have given to and taken from the ancient and modern Hindus, and have also undoubtedly affected the physical type of both Dravidians and Aryans. In the Kolarians, as in the Dravidians, certain scholars detect traces of negroid intermixture, as well as much Aryan and some Mongolian blood. The Veddas of Ceylon, by some ethnologists classified as a separate variety of mankind, certainly are one of the most primitive peoples now existing. They have been thought to represent the oldest non-negroid population of India, now disappearing. Some have sought to class the Todas of Southern Hindustan as a peculiar people. The islands off the Indian coast present some interesting tribes. The Selungs of the Mergui Archipelago are classed by Deniker as 'Indosienians'; but this is rather doubtful, and a like uncertainty exists regarding the inhabitants of the Nicobar Islands, the natives of the interior of Great Nicobar being savages of a rather primitive type. The Minkopis or Andaman Islanders are characteristic Negritos, whose extension must at one time have been much greater. In Assam, Burma, and the Malaccan possessions and protectorates of Great Britain, a great variety of peoples are to be found, chiefly of Indo-Chinese, Proto-Malay, and so-called 'Indonesian' origin, besides the Sakai and Semang of Malacca, who are more or less Negritos. Among the most notable of these peoples, outside of the Burmese, Karens, etc., are the Nagas of Manipur, the Chins of Burma and Arakan, the Lushai tribes of Assam, the Shans of Northern Burma, and some other tribes.

The anthropological history of India includes the following successions and impacts of races: Pre-Dravidian and pre-Kolarian (with mixtures of Negrito and Proto-Malay); Aryan (invasion by the northwest as early as B.C. 2000 at least); Greek invasion, in the time of Alexander the Great (locally important in the Indus region, and more important as partly opening India to the Western world); Bactrian invasions of the northwest (following the Greek, and of local importance); Mohammedan invasions (A.D. 1000-1400), resulting in the establishment of many dynasties in the northwest and west, including the famous Mogul Empire of Delhi, and its successors of the eighteenth century, which were broken up by the revolt of the Mahrattas and Sikhs, who restored Aryan supremacy. Besides these must be counted the Pathan influence in the northwest at various times, the Mongol (Tibeto-Sinitic) influence from a comparatively early period in the Himalayan region, and Indo-Chinese and related influences in the northeast. Malayan elements also were present in the south and east, with the later Arabo-Persian, Dutch, Portuguese, French, and British commercial, missionary, and political achievements. The Parsis (Persians),

who are settled chiefly in Bombay, are of great importance in spite of their limited numbers; the Jews have had some influence on the east coast; and the Chinese in Ceylon. Since coolie labor has been in demand natives of India have found their way to Madagascar, the West Indies, Guiana, and Africa.

INDIAN PHYSIC. A genus of North American herbs. See GILLENIA.

INDIAN PIPE. See ROOT PARASITES.

INDIAN POKE. See HELLEBORE.

INDIAN QUEEN, THE. A tragedy by Sir Robert Howard, in collaboration with Dryden, produced with great splendor in 1664. Its success was probably due to its scenic effects rather than to the heroic verse in which it was written.

INDIAN RED. An impure ferric oxide of a dark-red color, with a tinge of purple. It is used as a pigment. Much of the Indian red of commerce is prepared artificially by the calcination of a mixture of coppers and lime.

INDIAN RESERVATIONS. See RESERVATIONS, INDIAN.

INDIAN RIVER. A tidal inlet along the east coast of Florida, in Brevard and Volusia counties, running inside a sandy bar or beach a half to one mile in width (Map: Florida, H 4). It connects with the similar Halifax River at Titusville, and extends 100 miles south-southeast, opening into the ocean at Indian Inlet. Its width varies from a few hundred feet to three miles, and it is navigable for vessels drawing five feet.

INDIANS, AMERICAN. The name applied first by Columbus and his immediate successors to the natives of the newly discovered islands and mainland of America, under the mistaken impression that these regions were a part of the outlying coast of Asia. The name most frequently used by scientific writers, especially in Europe, is simply *American*; while the term *Amerind* has recently been suggested as a substitute. Recent authorities class the Eskimo with the yellow rather than with the red races; the reader will find them treated under **ESKIMO**.

Granting the existence of a group of characteristic races which may be termed American, the problem of their origin remains unsolved. It is almost certain that no common origin for all of them can be assumed, but that various sources of population and centres of dispersion must be considered. Failing accurate knowledge of the geological conditions existing in earlier epochs, the most probable sources of immigration were Asia by way of the northwest coast of North America, Europe by way of Greenland, and the general region of Polynesia by way of South America. There are correspondences in physical types and cultures which tend to support particularly the idea of Asiatic and Polynesian relations. However, the theory of the Americas as an independent centre of origin has much in its favor, and must be taken into account. For example, the Eskimo, who form a strikingly homogeneous group wherever found, would appear from the evidence to have occupied, in former times, the territory in the neighborhood of Hudson Bay, and to have spread from that focus north and east and west, following the Arctic coast-line, and it is unquestioned that the Asiatic group of Eskimo is of American origin.

In short, the problem is complex and deals with a very remote period, which prevents satisfactory treatment. The most popular explanation is, of course, that of Asiatic origin, based upon the striking similarities in type and culture which are evident to even superficial observation. It must be remembered, however, that any relation is mutual, and it is quite as easy to argue for an Asiatic origin from America as for an American from Asia.

A striking characteristic of the race is the marked uniformity of physical type throughout the two continents of North and South America. In general the color is brown, frequently with reddish tint, light in some tribes and dark in others. The hair is glossy black, either straight or slightly wavy, and baldness is almost unknown. The beard is usually scanty, and is seldom allowed to grow, although a light mustache is somewhat common. The cheek-bones are prominent; the nose usually good, and in some tribes strongly aquiline; the eyes dark and apparently small, from being held less open than in the white man. In cubical brain capacity and structural development the Indian holds a middle place between the white man and the negro. In mental capacity, physical strength and endurance, as well as in vital force to resist or overcome disease, he is far below the white man.

INDIANS OF THE UNITED STATES AND BRITISH AMERICA.

DRESS. As became tribes largely made up of hunters, the dress was generally of skins, so fashioned as to combine the greatest protective warmth with the least incumbrance of weight. From the Arctic Circle to the Rio Grande or farther, except in California and the adjacent region, the native dress was usually of buckskin, consisting, for the men, of a shirt, G-string, or breech-cloth, leggings, and moccasins, and for the women, of a short-sleeved tunic, waist-cloth or apron, belt for knife and sewing-awl, with leggings and moccasins, generally made in one piece. The warrior's shirt was frequently fringed with scalp-locks. In cold weather and on ceremonial occasions a decorated robe was worn, while in warm weather or when engaged in active exertion the men were usually stripped to the G-string. The young children went entirely naked in warm weather. Among the plains tribes the investiture of a boy with the G-string occurred when he was about ten years old, and was an occasion of good-natured rejoicing in the family, as indicating that he was now considered old enough to accompany his older relatives on hunting or war expeditions. The Gulf tribes and those of the Southwest wore turbans of bright-colored woven stuff; but elsewhere, except in the extreme North, the head was usually bare. Some tribes west of the Rockies went practically naked. On the northwest coast the woman's dress was often of bark fibre. The Eastern moccasin was made in one piece; the plains moccasin had a separate sole of rawhide.

East of the Mississippi the men usually shaved the whole head, excepting for a crest along the top and a long scalp-lock plaited and decorated with various trinkets. This scalp-lock, the prize and trophy of the victor in battle, was universal east of the Rocky Mountains, and over a great part of the country westward, but seems to have been unknown in California. On the plains the men generally wore their hair its full length, in

two long braids hanging down over the shoulders in front, with the scalp-lock behind. The Osage and Pawnee shaved the head, excepting the scalp-lock, while the Wichita and Apache let the hair flow loosely down the back. The Pueblo, Piute, and most of the California tribes usually wore it cut off in front above the eyes and at the shoulder-level behind. The Navaho bunched it into club shape. Women usually wore it flowing loosely. Those of the Sioux and Cheyenne wore it neatly braided at the sides. The Pueblo women cut it off at the shoulders and rolled it at the sides, while among the Hopi the unmarried women were distinguished by an extraordinary butterfly arrangement of the hair on each side of the head.

Head-flattening was practiced by the Choctaw and some of the Carolina tribes, and throughout most of the Columbia region. Labrets of bone were used by many tribes of the northwest coast. Nose pendants were common with a few tribes (hence the *Nez Percé*), while ear pendants with both sexes were almost universal. Tattooing was widespread, reaching its highest development among the Haida and others of the northwest coast, and the Wichita of the southern plains. Excepting with the tattooed tribes, painting was an essential part of full dress, colors and designs varying according to the occasion or the particular 'medicine' of the individual.

Necklaces of shells, turquoise, mussel pearls, or, among the Navaho, of silver beads, were worn, with breastplates and gorgets of shell or bone and bracelets of copper wire. Feathers and small objects supposed to have a mysterious protecting influence were worn in the hair, and the dress itself was profusely decorated with shell beads, elk-teeth, porcupine-quills, antelope-hoofs, and similar trinkets.

DWELLINGS AND HOUSE-BUILDING. North of the Pueblo region the general house plan may be described as circular. Among the Haida and others of the Alaskan coast, and extending down to the Columbia, the prevailing type was of boards, painted with symbolic designs and with the famous heraldic totem-poles, carved from cedar-trunks, standing at the entrance. Along the Columbia were found great communal houses. California had several distinct types, of which the dug-out and the dome-shaped clay-built house, entered from the top, were perhaps most common. The Piute, Apache, Papago, and others of Nevada and Arizona had the *wikiup*, an elliptical structure covered with reed mats or grass. The Navaho *hogán* was a circular house of logs, covered with earth, and entered through a short passageway. The square-built stone or adobe dwelling of the Pueblo marked the northern limit of the Mexican culture area. These *pueblos*, as they were called by the Spaniards, were aggregations of continuous rooms occupied by different families, so that the whole village sometimes consisted of but a single house, sometimes several stories in height. The roofs were flat, a projection of the lower wall within the room served for seats and beds, and the fireplace was in one corner, instead of in the centre, as was almost universal elsewhere. For better security against the wild tribes, the outer walls of the lower story were often without doors or windows, entrance being gained through trap-doors in the roof by means of ladders, which were pulled up at night. For the same reason, many of the

pueblos, especially in ancient times, were placed upon high mesas, or on shelves on the sides of almost inaccessible cliffs, whence the name 'cliff-dwellers.' The prevailing type on the plains was the conical skin *tipi* (a word of Sioux origin), no other being so easily portable and so well adapted to withstand the violent winds of the treeless prairies. The Pawnee, Arikara, Mandan, and one or two other tribes living close along the Missouri River built earth-covered log houses, somewhat like those of the Navaho, but much larger. The Wichita in the south built stationary houses of grass thatch laid over poles. About the upper lakes was found the bark-covered *tipi*, while east and southeast was the *wigwam*, a rectangular structure of stout poles, overlaid with bark or mats of woven rushes, and in general form closely resembling a rounded wagon top. Among the Iroquois it became the communal 'long house.' In the Gulf States were found houses, either rectangular or circular, of upright logs plastered over with clay.

The Pueblo villages had underground *kivas*, or public rooms, where the men of the various secret orders made their preparations for the great ceremonials. It corresponded somewhat to the medicine lodge of the plains tribes, built of green cottonwood branches for the celebration of their annual sun-dance, while among the Gulf tribes its place was supplied by the circular log 'town house.' Some of the Eastern and Southern tribes had also dead-houses, temples, and public granaries. In general, an Indian village was a scattering settlement, but with many of the Eastern tribes the more important towns were compactly built and strongly stockaded.

FOOD, AGRICULTURE, HUNTING, FISHING. Excepting on the plains and in the frozen north, agriculture was the chief dependence of most of the tribes. Those on the coast, including the Haida, were naturally fishermen. Those of the upper lakes and about the head of the Mississippi planted little, but gathered large quantities of wild rice and cranberries, besides sugar which they boiled from the sap of the maple. The equestrian plain tribes, excepting the corn-planting Pawnee and Arikara, were hunters pure and simple. Those of the Columbia were salmon-fishers, root-diggers, and berry-gatherers. Those of California and the Sierras were chiefly acorn and seed eaters. The Navaho, since the Spanish mission period, have lived principally by the flesh of their sheep and goats, while the predatory Apaches were expert in preparing the edible roots and petals of various desert plants. The Pueblos may be considered as purely agricultural, raising large quantities of corn, beans, squashes, and other vegetables, as well as chile and native tobacco. The tobacco was also cultivated by the Arikara and others of the upper Missouri, and by most of the Eastern tribes. Wild plums, pecans, mesquite beans, the tubers of the *pomme blanche*, and the seed-berries of the wild rose, were gathered and eaten by the buffalo-hunting tribes of the plains. Agriculture furnished more than half the food-supply of the Iroquois, the Atlantic coast and Gulf tribes, corn standing first in importance. In the arid Southwest irrigation was essential to success, and the Indians were skillful in utilizing the scanty water-supply in this manner.

was hunted for its flesh, skin, horns, teeth, or sinew. On the plains the great game animal was the buffalo, after which came the elk, deer, and antelope. Very few Indians of this region ate the meat of birds or fish, although not averse to eating the horse or dog, while the Navaho and Apache refused to eat or even touch the bear, for some occult religious reason, and had an almost equal horror of fish. The Eastern Indians used fish, flesh, and fowl indiscriminately, only being careful not to put two kinds into the same pot. Salt procured from natural deposits or by boiling the water of saline springs was in general use on the plains and in the Southwest, as well as among some tribes of the Ohio Valley. In the Gulf States lye was used as a substitute.

DOMESTICATED ANIMALS. The horse and dog appear to have been the only animals regularly domesticated, although various birds were sometimes kept in confinement for the sake of the feathers, or possibly in some cases for their flesh. The Indian pony is commonly supposed to have descended from animals brought over by the Spanish conquerors; but some of the Western tribes stoutly assert that the horse was theirs long before the white man ever came. However that may be, it is now so much a part of the religious ceremonial, and daily life of the plains tribes that it is difficult to imagine a time when they were without it. Dogs frequently took the place of horses as light-burden carriers, and were likewise esteemed a choice article of food. The Caddo are said by other Indians to have trained their dogs to follow the trail of raiding enemies, possibly a trick learned from association with the French. The animal's main usefulness was as a vigilant sentry. From animals originally introduced by the Spanish Franciscans over two centuries ago, the Navaho now have more than 400,000 sheep and goats, from the wool and flesh of which they derive almost their whole subsistence.

INDUSTRIES AND ARTS. Aside from his food-procuring occupations, the Indian had quite a number of industries and arts, both economic and esthetic. Having only accidental knowledge of any metal but native copper, his tools were made of stone, bone, shell, or wood.

From stone he fashioned his knife, hammer, axe, spear-head, and arrow-point, as well as his pipe and gaming disk. Flint was the material commonly used for cutting tools in the East and obsidian in the West. Pipes were of great variety and sometimes of great beauty, being one of the most important adjuncts of ceremonial functions. The Navaho and Pueblos were expert in drilling turquoise for necklaces and ear-pendants. The black slate carving of the Haida and other northwest coast tribes is probably not excelled by any primitive people. Pots, bowls, mortars, and pestles were also fashioned from stone. Arrow-heads, knives, skin-dressers, sewing-awls, and fishing-hooks were frequently made from bone. Shells were also shaped into cutting tools, but were in more constant demand for gorgets and for the celebrated wampum beads, which were in universal use in the East for dress ornamentation and for weaving into record belts. The Eskimo and Aleut were expert carvers in walrus ivory, depicting whole hunting scenes upon a single tusk, with great beauty of execution. Mortars, bowls, clubs, masks, and sacred images for ceremonial occasions were made of wood.

The Pueblos carved wooden figurines to represent their traditional mythologic characters, and distributed them to the children as dolls at their symbolic dances. Besides the immense carved totem-poles, the northwest coast tribes hewed great canoes from cedar-trunks, always painted and carved in characteristic style. The wooden dug-out canoe of the Atlantic tribes was a similar affair.

The Indian woman was a capable skin-dresser. Sinew was used for thread, and certain women were professionals in the work of cutting and fitting. Among the Pueblos and Navaho weaving had reached a high state of development, the material used having been originally a native cotton, and later wool. The art of feather-weaving was found with the Gulf tribes, while everywhere east of the Mississippi beautiful mats were woven from grass and rushes and stained in bright colors from native dyes. (See **BLANKET**.) Basketry was found almost everywhere except upon the plains, where rawhide boxes formed a substitute. The materials used were wood or cane splits, rushes, maguey fibre, and grass. The art reached its highest development in California, the Pomo baskets being unrivaled in any part of the world for closeness of weaving, intricacy of design, and beauty of shape and decoration. (See **BASKET**.) Akin to weaving and basketry was the art of decoration with beads and porcupine-quills, the most beautiful specimens being the cradles and colored sashes, on some of which months of labor were expended. Pottery was made by all the sedentary and semi-sedentary tribes of the Eastern timber region and the Southwest, the coil process being everywhere used. In the East the vessel was usually decorated with stamped patterns. Among the Pueblos and adjacent tribes figures in various colors were painted upon the smooth exterior and afterwards fixed in the firing process. Almost without exception the potter, basket-maker, weaver, and skin-dresser was a woman. The only metal really in use north of Mexico at the time of the discovery appears to have been copper, which was obtained native in small quantities in the Southern Alleghanias and in greater quantities from mines along the shores of Lake Superior. It was not smelted, but hammered into a great variety of useful and ornamental objects which passed from tribe to tribe in regular trade. Mica was quarried in western North Carolina for use in mirrors and gorgets, and beads and other small objects hammered out from gold nuggets or meteoric iron have been found in some of the Southern mounds. In the Southwest the Navaho have learned the smelting and forging arts from the Mexicans, and have now many expert silver-workers and blacksmiths, making beads, buttons, wrist-guards, rings, and belts from silver coins which they melt and shape in forges and molds of their own construction.

WAR. As in the tribal stage warfare is the chronic condition, so to the Indian war was the chief glory, scorn of death the highest virtue, and cowardice the greatest crime. Among extreme Northern tribes the principal weapons were the knife, club, and lance. To these were added farther south the bow and arrow, and the hatchet or tomahawk. The bow and arrow were practically universal, but the lance and shield as a rule were used only by the equestrian tribes of the open plains and the desert Southwest, the timber people finding them a hindrance to active move-

ment. Aside from the shield, defensive armor was not commonly used, excepting among tribes of the Alaskan coast, who had protective cuirasses of ivory plates, wooden slats, or of a very tough hide. The bow was selected wood, frequently reinforced with sinew along its entire length, and strung with a sinew cord. The Gulf tribes had also blowguns of cane for hunting. The club was of stone or wood, in the latter case being sometimes supplemented with a piercing blade of flint or iron. The shield of the plains warrior was of the toughest buffalo-hide, cut and decorated according to the spirit dream of the maker, and given to the recipient under the most solemn vows of lifelong tabus and sacred obligations.

In some tribes the direction of all that pertained to war belonged by hereditary right to certain clans or towns. Thus among the Creeks the privilege belonged to the people of the so-called 'red towns,' while on the other hand the 'white towns' had sole direction of peace negotiations. The prairie warriors had military orders with different degrees, the member being advanced from one to another by gradual steps. Thus the Kiowa had six orders, beginning with the 'Rabbits' or boys in training, and ending with a select body of ten tried and veteran warriors.

Service in any particular expedition was entirely a matter of individual choice, and the authority of the leader rested solely upon the voluntary obedience of his followers. On the plains the invitation was usually given by sending around a war-pipe, which every volunteer was expected to smoke. The going and the home-coming were attended with numerous ceremonies, and a successful campaign was celebrated with the scalp-dance, in which the women carried the captured scalps and sang the praises of the victors.

Indiscriminate massacre was the ordinary rule; but prisoners were frequently taken, either for torture, slavery, or adoption into the tribe. In the East the decision of the prisoner's fate was usually left to the women. If adopted, he was taken into a family and became thenceforth a full member of the tribe. If condemned to death, he met his fate with all the courage of his Indian training. On the plains captives were seldom tortured, but were more often taken into the tribe, being rarely, however, so completely admitted to membership as in the East. Along the Pacific Coast from Alaska to California regular slavery existed. The practice of scalping the slain enemy was probably universal north of Mexico, excepting among certain tribes of California, the scalp being kept as a trophy or offered in sacrifice to some tribal medicine. It was not, however, the only or even the chief evidence of the warrior's courage. His standing depended upon the number of his *coups* or brave deeds against the enemy, of which careful record was kept in the tribe. A man was entitled to 'count coup' (French, *a stroke*) not only for killing or scalping an enemy, but also for being the first to touch an enemy in the charge, for rescuing a disabled comrade, or for stealing a horse from a hostile camp. Thus three warriors might count coup upon a single slain enemy—viz. the one who killed him, the one who first touched the body with his coup-stick or weapon, and the one who secured the scalp. In many tribes it was customary to feast upon the flesh of one of the slain enemy after a notable victory.

AMUSEMENTS. The leisure of the Indian was taken up with athletic contests, games, dances, feasts, and story-telling. The ball-play was the chief athletic game everywhere east of the plains, as well as among some tribes of the Pacific Coast, the ball being handled with netted sticks somewhat resembling tennis rackets. From this game are derived the lacrosse and racquet of Canada and Louisiana. Next in importance in the East was the game known to the old traders as *chunkee*, played with a circular stone disk or wheel, and a pole curved at one end in the fashion of a shepherd's crook. The wheel was rolled by one of the contestants, while the other tried to slide the stick after it in such a way that the wheel would lie within the crook when both came to a stop. The plains tribes had a very similar game in which a netted wheel took the place of the stone disk. Foot-racing was common among the agricultural tribes, and horse-racing on the plains. The Wichitas had grand ceremonial races in which every person old enough to run participated. Dice games were universal.

A favorite pastime of the plains women was the awl game, played with marked sticks which were thrown down upon a stone set in the middle of a blanket, tally being kept by advancing an awl along certain marks around the margin of the blanket. Shiny and football were also played by the women. Hunt-the-button games were played within the tepee during the long winter nights, the players accompanying the movements of the hands with songs intended to distract the attention of the other side. Games of divination were also found among many tribes.

Dances, frequently preceded by purification rites and usually followed by feasting, were either social or ceremonial, and of great variety. Many were pantomimic, the performers wearing masks or other costumes intended to symbolize various animals or mythic characters, whose cries and actions they imitated.

Musical instruments were the drum, flageolet or flute, eagle-bone whistle, rattles of various kinds, and even a notched stick rubbed in saw fashion with one end resting upon a gourd for a sounding-board. The rattle was most commonly used in doctor's incantations and in the peyote ceremony, the whistle in the sun dance, and the flute to accompany the songs of the young men while riding about at night. There were songs for every occasion, lullaby, work, love, gaming, medicine, war, and ceremonials.

RELIGION AND MYTHOLOGY. To the Indian every animal, plant, and object of nature was animated by a spirit, beneficent or otherwise, according as it was propitiated or offended. Certain of these were regarded as especially powerful or active, as the sun, fire, and water among the elemental gods, the buffalo, eagle, and rattlesnake among the animals, and the cedar, cottonwood, corn, tobacco, and peyote among plants. The number four was peculiarly sacred, as having reference to the cardinal points. Colors had symbolic meanings, and sometimes also sex and local abiding-places. Thus with the Cherokee the red gods of victory lived in the Sunland or east, while the blue spirits of disaster dwelt in the north. Spirits were propitiated and implored with prayer, sacrifice, vigil, and fasting, and the purificatory sweat bath usually preceded every important ceremony. There was no overruling 'Great Spirit,' excepting as certain gods were

of more frequent importance than others. Among the plains Indians the spirit buffalo was all-important, while with the agricultural tribes the rain-gods took precedence. The sun and its earthly representative, fire, were everywhere venerated. Certain tribes had tribal 'medicine' or palladiums, with which the nation's prosperity was supposed to be bound up and around which centred their most elaborate ceremonial. Thus the Kiowa had their Taime image of stone, the Cheyenne their sacred arrows, the Omaha their great shell. Each man had also his own secret personal medicine.

The priest was also a doctor, medicine and religion being so inseparably connected in Indian idea that there was usually but one word to designate both. The priests were frequently organized into cult societies, and there were also brotherhoods bound together by certain secret rites. Great stress was laid upon dreams and sacrifice. Among the Pawnee, in former times, a captive girl was annually sacrificed to the goddess of fertility. The cannibalistic practices of the Eastern tribes after a victory, and the cannibal feasts of the Northwest coast, in which a slave was the usual victim, were also more or less sacrificial in motive. With these exceptions human sacrifice was rare, such bloody rites as those of the Aztecs being unknown in the North. There were special ceremonies for girls at puberty, and for young men on first taking rank with the warriors. Among the great religious ceremonials may be noted the green-corn dance of thanksgiving for the new crops, among the Eastern tribes; the sun dance and the more recent ghost dance of the plains tribes; the salmon dance of the Columbia region, and the celebrated snake dance of the Hopi of Arizona. To these may be added the peyote cult of the Southern plains. Tribal religions were sometimes subject to revival or revolution as new prophets arose from time to time. Thus the religion of the ghost dance, which has practically superseded the old beliefs and ceremonial forms of the plains tribes, had its origin in Nevada about fifteen years ago.

Each tribe had its genesis tradition and its culture hero—usually a great trickster and frequently an anthropomorphic animal—together with giants, dwarfs, fairies, witches, and various monsters, as well as animal tribes and chiefs, concerning all of whom there was a great deal of myth and folk-lore. Certain stories must be told only in winter, and others only at night, in order not to offend the chief personages concerned.

SOCIAL ORGANIZATION. Government was based upon the gentile or clan system everywhere excepting among certain tribes of the plains and the Pacific region, notably the Kiowa and Klamath. Under this system the tribe was organized into certain clans or gentes, the members of each clan being considered as so closely related to each other that intermarriage within the clan was forbidden. Children usually belonged to the mother's clan and descent was in the female line. Chiefship and certain civil and religious functions inhered in particular clans. Captives or other aliens must be adopted into a family and clan in order to become members of the tribe. These clans were commonly known by the name of some class of animals, e.g. bear, beaver, wolf, etc.; more rarely by plant or other designations. In other words, the clan was distinguished by a

totem, as it is now universally called, and the totemic practices were inseparably tied up with their religious rituals and social organization. See TOTEMISM.

Among the plains tribes generally the clan system was either absent or quiescent, the unit being the band, each band having its own appointed place in the camping circle at the great tribal gatherings, as for instance the annual sun dance.

In exceptional cases tribes combined into confederacies, sometimes accidental and temporary, at other times built up in steady pursuance of a definite policy, as among the Iroquois and Creeks.

Land was the common property of the clan, tribe, or confederacy, excepting in certain tribes of California and the northwest coast, where it is asserted that individual ownership existed. Game, timber, and other natural products were also free, and hospitality was so much a cardinal virtue that it might almost be said that everything which was not hedged in by some sacred tabu was common property within the tribe and might be had for the asking, or without it if there seemed need. While this system almost eliminated the individual pauper, it killed ambition and hindered advancement by making it impossible for any man to rise far above the general level. Accumulation was impossible, and even what property he might possess was usually destroyed at his death. The niggard was rated with the coward, and in some tribes a man rose to the highest rank of distinction by giving away all that he owned. Along the Lower Columbia and the northwest coast this public surrender of the savings of a lifetime was a recognized tribal custom known as the *potlatch*.

Slavery was a regular institution on the Pacific Coast from Alaska to California, the slaves being prisoners of war, their children and descendants, who thus constituted a permanent slave caste within the tribe, condemned to hard labor, harsh treatment, sale, or death at the will of their masters. Slavery of a milder type seems to have existed among the South Atlantic tribes. In more modern times the Southern Indians followed the example of the colonists, and became the owners of negro slaves.

Numerous societies existed for various purposes, military, religious, and social. The plains tribes had a custom by which two young men mutually agreed to become partners or 'friends' through life, the compact being sometimes ratified by a public exchange of names.

Woman, while subject to her husband in ordinary affairs and debarred from certain societies and ceremonies, had yet well-defined rights of her own. She was complete mistress in household affairs, and among the Eastern tribes had either a voice or a representation in councils. With the Iroquois all important questions must be passed upon by a council of the women, who alone had power to declare war. The right of adoption, which meant the decision of a captive's fate, rested also with the women. In general her position was highest in the agricultural tribes. In the division of labor most of the heavy work fell to her share, while the dangerous and arduous undertakings belonged to the man. Polygamy was recognized in most of the tribes excepting the Pueblos.

BURIAL. The method of disposing of the dead

varied with the tribe and environment, inhumation being most common. Some tribes, as the Choctaw and Nanticoke, dug up the corpse after the flesh had had time to decay, and carefully cleaned the bones, to be kept thenceforth in a box in the cabin or deposited in a tribal ossuary. Some of the South Atlantic tribes preserved the mummified bodies in dead-houses. The Hurons exposed the bodies on scaffolds until the annual 'Feast of the Dead,' when all the bones were interred in a common sepulchre. Many of the smaller Eastern mounds were evidently built for sepulchral purposes. The Northern plains tribes usually deposited the bodies in trees or upon scaffolds. The Kiowa buried in the rocks. The Aleut of Alaska doubled the body into a compact bundle and laid it away in a sitting posture in a cave. Southward along the coast canoe burial was common. The Piute, Mohave, and others of the lower Colorado region practiced cremation.

Everywhere it was customary to bury or otherwise destroy the property of the deceased at the time of the funeral, and in many Eastern tribes food was placed beside the grave and a fire kept burning for four successive nights, the period supposed to be occupied by the soul in its journey to the land of shades. Laceration of the body and cutting off of the hair on such occasions was very common, especially on the plains, with wailing of the relatives for several weeks thereafter.

LANGUAGE. The first attempt at classifying the North American languages was made by Albert Gallatin in 1836, the relationships being established chiefly by a comparison of word roots. The beginning of regular systematic research dates from the establishment of the Bureau of Ethnology, under Major J. W. Powell, in 1879. The number of linguistic stocks north of Mexico, as at present recognized by the bureau, is 57, as given below, but it is probable that more extended study will reduce this number by disclosing affinities as yet undiscovered:

Algonquian	Keresan	Shoshonean
Athapascan	Kiowan	Siouan
Attacapan	Kitunahan	Skittagetan
Beothukan	Koluschan	Takilman
Caddoan	Kulanapan	Tafioan
Chimakuan	Kusan	Timuquanan
Chimarikian	Lutuamian	Tonikan
Chimmesyan	Mariposan	Tonkawan
Chinookan	Moguelumnan	Uchean
Chitimachan	Muskhogeian	Waiilatpuan
Chumashan	Natchesian	Wakashan
Coahuiltecan	Palaihnian	Washoan
Copehan	Piman	Weitspekan
Costañoan	Pujunan	Wishoskan
Eskimauan	Quroratean	Yakonan
Esselenian	Salinan	Yanan
Iroquoian	Salishan	Yukian
Kalappoian	Sasteian	Yuman
Karankawan	Shahaptian	Zufian

The necessity for some common means of intercommunication was supplied by trade jargons, chief of which were the 'Mobilian language,' and the Chinook jargon, and by the sign language on the plains. Some tribes had made fairly successful attempts at recording their history and mythic traditions by means of pictographs. Of these the best known are the Walam Olum of the Delaware, and the Kiowa calendars. Intertribal compacts were commemorated among the Eastern tribes by means of symbolic wampum belts. The Cherokee alone had a literature recorded in an alphabet of their own invention.

POPULATION. The theory of a former large Indian population has been found to be erroneous,

but on the other hand the frequent assertion that the Indian has held his own, or is even increasing, is equally incorrect. It must be remembered that the Indian of the discovery was a full-blood, while the officially recognized Indian of to-day may be full-blood, mixed-blood, white man, or negro.

The population varied according to the district, being naturally greatest along the coast, and in rich agricultural regions where the means of subsistence were most abundant. The best summarizing of trustworthy early-writers would seem to make the original Indian population east of the Mississippi about 200,000. Beyond this we have no reliable data for any large area, although it may be noted that so careful an observer as Powers estimates the Indian population of California just before the gold discovery to have been greater than that of all the rest of the United States together. Some examples may serve to show the terrible decrease in almost every section since the advent of the white man, taking only tribes still in existence, and making no account of tribes and whole linguistic stocks which have utterly disappeared.

In 1701 Lawson crossed the Carolinas from Charleston to Albemarle Sound, meeting in his journey sixteen different tribes. Of these only two have any representatives to-day, viz. the Tuscarora and Catawba. The Tuscarora at that time were estimated at 1200 warriors. They number to-day, all told, perhaps 700, of whom probably not one-fourth could make a valid claim to pure blood. The Catawba, who about the first settlement of Carolina had 1500 warriors, were reduced by 1743 to 400 warriors, in 1775 to about 100 warriors, and now number altogether about 100 souls, of whom hardly a dozen are of pure blood. Furthermore, the Catawba themselves in 1743 represented all that were left of more than twenty broken tribes.

The tribes of the ancient Iroquois league, with the larger tribes of the Gulf States, the latter now constituting the five civilized tribes of the Indian Territory, seem to form exceptions to the general history of aboriginal extermination, their numbers now being apparently as great as at any previous era. The figures are deceptive, however, for the reason that an overwhelming majority of those now so enrolled are mixed-bloods—sometimes with but an infinitesimal proportion of Indian blood—adopted whites, negroes, or Indians of other tribes. Thus in 1890 the so-called 'Cherokee Nation' of 27,000 souls included 2000 adopted whites, 3000 adopted negroes, and about 1500 Indians of other tribes, while those of full Cherokee blood were estimated at not more than one-fifth of the remainder. Since then the rolls have been swelled by the compulsory admission of some 7000 claimants repeatedly repudiated by the tribal Government.

On the plains the decrease has been appalling. The confederated Mandan, Minitari, and Arikara in 1804 numbered nearly 8000 souls in eight villages. In 1900 they were 110 in one village. The Osage and Kaw at the previous date were estimated on good authority at 6300 and 1380 respectively. In 1900 they numbered 1781 and 217, including all mixed-bloods. The Pawnee numbered over 12,000 in 1834, 8400 in 1847, 3416 in 1861, 1440 in 1879, and 650 in 1900. The Tonkawa were estimated at 1000 in 1805, 700 in 1849, counted 314 in 1861, 108 in 1882, and now num-

ber but 51. The confederated Kiowa, Comanche, and Apache have decreased over 10 per cent. since 1890. The Navaho and Hopi, who as yet have remained almost undisturbed, seem to hold their own, but in California the native population has been almost wiped out. All that remain of some twenty tribes of the Oregon coast are now gathered upon Siletz reservation to the number of 482 in 1900, with the record for the year of 22 births and 31 deaths. On the North Pacific coast the Aleuts have dwindled within a century from an estimated 25,000 to a present 2000. The celebrated Haida, with 39 villages and 7000 souls in 1840, are now reduced to two villages with a population of but 600.

The chief destruction has been from changed conditions, new diseases and dissipation introduced by the white man. The present Indian population north of Mexico, according to the best official estimates, is approximately as follows: United States proper, 260,000; British America, 100,000; Alaska, 20,000; or a total considerably under 400,000 souls.

INDIANS OF MEXICO, CENTRAL AMERICA, AND WEST INDIES.

The tribes of Mexico and Central America exhibited every stage of culture from the brutish Cochimi and savage Seri to the civilized Maya, Tarasco, or Aztec, with their highly developed agriculture, architecture, and literature. From the Rio Grande to Panama some thirty linguistic stocks were represented, besides the Arakanian and Cariban tribes of the West Indies. From traditional and other evidence nearly all of the more important tribes of Mexico and Guatemala, including those of Piman, Nahuatlán, and Mayan stock, appear to have migrated from the north. The Otomi and Chinantec, however, appear to have antedated this movement and may properly be considered indigenous. There are shadowy traditions of earlier cultivated races, the Ulmec and Toltec, from whom the ruder Aztec acquired their first civilization, but it is difficult to decide whether these names belong to the domain of history or of myth. The roving tribes of the northern frontier seem to have been akin to the Apache, but have now so completely disappeared that even their affinity is not certainly established. The Comanche and Kiowa, as well as the Apache, made constant inroads from the north, penetrating as far down as Zacatecas. The destruction of the peaceable Carrizo tribes of the lower Rio Grande is chiefly due to these raids.

The tribes of the California peninsula, apparently of the Yuman stock, were among the lowest of the human race, possessing every beastly instinct without even the savage virtue of bravery. The Seri of Tiburon Island in the adjacent gulf were but slightly higher in the scale, but earned respect by their determined defense of their territory against all intruders. Their southern neighbors, the Yaqui, were as much noted for their fighting qualities as for their superior industry and reliability. The Tarumari and other Piman tribes of the Sierra Madre, as far south as Jalisco, differ but little in general habit of life from the northern Pueblos. Physically they are dark and rather undersized. The Otomi of the central plateau were but little inferior in culture to the Aztec, by whom they had been subjected. The Chichimec of the same region, so long the sub-

ject of ethnologic conjecture, are now known to have been a definite people of distinct stock.

The Nahuatlán tribes which constituted the nucleus of the ancient Aztec Empire dwelt chiefly in the present states of Mexico and Puebla, the Aztec proper having their capital on the site of the present city of Mexico. Detached offshoots of the same stock were found as far south as Costa Rica. The empire included many tribes or nations of diverse stocks, but not all the cognate Nahuatlán tribes, even in the central territory, were under the rule of the Aztec, their bitterest enemies in fact being their neighbors and kinsmen, the Tlascalteec.

By reason of their military importance, the Aztec have been somewhat overrated. Their general culture, while high in itself, was not superior to that of the Tarasco or Zapotec, and was inferior to that of the Maya. In their social organization they had passed the matriarchal stage and reckoned descent and inheritance in the male line. The national prosperity rested upon agriculture. Land belonged to the clan and marriage was regulated by gentile laws. In architecture they had reached a high stage of advancement, the pyramid of hewn stone being one of the most characteristic features. They knew the secret of bronze, and were skillful workers in gold and copper, but stone implements continued in common use, particularly obsidian for cutting purposes. Their dress was of native cotton, woven and dyed in brilliant colors. They had an extensive pantheon with orders of priests and priestesses, and a ritual ceremonial, impressive but cruel and bloodthirsty in character, thousands of human victims being annually sacrificed to the god of war, and their flesh afterwards eaten by the multitude. Children of the higher classes were educated in public schools, where boys studied military science, writing, history, and religion, and girls were taught cooking, household work, weaving, and morals. There was a large native literature preserved in books written upon parchment or maguey paper, 24,000 bundles of this fibre being exacted as an annual tribute from the conquered tribes. The characters were ikonomatic, or partly ideographic, partly phonetic, upon the principle of the rebus. Their calendar recognized 365 days in the year.

In Southern Mexico were the Tarasco, Totonaco, Zapotec and Mixtec, all populous and civilized nations equal in culture to the Aztec, if not superior. They built houses of cut stone, brick, and mortar, planted fields and orchards, worked gold and copper—the Tarasco wearing complete body armor of wood plated with copper or gold—made beautiful inlaid pottery, and wove cotton garments and robes of bright-colored feathers. They had elaborate ritual religions, accompanied sometimes by human sacrifice, with calendar systems and hieroglyphic literatures like those of the Aztec tribes. The Totonaco, who practiced circumcision and head-flattening, claimed to have built the pyramid ruins of Teotihuacan, a few miles northwest from the city of Mexico. The wonderful ruins of Mitla are claimed by the Zapotec.

Passing by the ruder Zoque, Mixe, and Chinantec, and the more advanced Chiapanec, in Oaxaca and Chiapas, we enter the territory of the highly civilized Mayan tribes, who held the whole peninsula of Yucatan, with large portions

of Tabasco and Chiapas and most of Guatemala, and had an outlying colony in the Huastec of Vera Cruz. Their principal nations, besides the Maya proper in Yucatan, were the Quiche and Cakchiquel of Guatemala. There is evidence that the ancient builders of Palenque and Copan, already in ruins at the time of the conquest, were of the same stock. The Maya proper had at one time formed a powerful confederacy, which, however, had broken up into a number of independent States before the arrival of the Spaniards, by whom they were conquered in detail, the last free remnant being driven from their citadel of Chan Santa Cruz by Mexican troops only as late as 1900, after a stubbornly contested war of several years. When first known, the great cities Mayapan, Uxmal, and Chichén-itzá, now in ruins, were flourishing centres of dense populations, which had attained the highest point of native American civilization. In government they retained a modified clan system, with an hereditary chief ruler, assisted by a council from his own clan. They were preëminent in architecture, building palaces, pyramids, and cities of cut and polished limestone, set in mortar and covered with figures and hieroglyphic inscriptions. Strange as it must seem, all this was done without metal tools, gold and copper being used only for ornamental purposes. Agriculture was the principal industry, the common lands being portioned out by the village chiefs. Honey and wax were obtained from domesticated bees, and an active commerce was carried on by sea along the southern Gulf coast as far as the island of Cuba, copper disks and cacao-beans being used as currency. Their intricate calendar, with its cycles of 20, 52, and 260 years, has been the subject of much scholarly interest, as also their remarkable hieroglyphic records, written upon parchment or maguey paper, or carved or painted upon the walls of their ruined cities, and for which as yet there is no interpreter. The cognate Cakchiquel and Quiche were similar to the Maya in culture, differing only in dialect and extent of territory and influence. The great *Popol Vuh*, a native compendium of the ancient mythology and history of the Quiche, translated by Brasseur de Bourbourg, has been characterized as "one of the most valuable monuments of ancient American literature."

Honduras, Salvador, Nicaragua, and Upper Costa Rica were occupied by tribes of different stocks, some of them of considerable advancement, others, particularly along the east coast, mere savages. The Xineca, on the Guatemala-Salvador frontier, are believed to have been a remnant of the pre-Mayan tribes. The Carib, on the Honduras coast, were exiles from the Antilles. The Mosquito, Ulva, and Rama, farther south along or near the coast, were all wild tribes of different degrees of savagery. The Ulva also have the custom of head-flattening. The Guatuso of northern Costa Rica were an agricultural but brave and savage people, now near extermination, owing to the cruelties of the rubber-gatherers. South of their territory were found tribes of higher culture grade, the northern outposts of the civilized Chibchan tribes of Colombia.

The whole of the West Indies, with the exception of two or three sporadic settlements from Florida in the Bahamas, was held by tribes of the two great South American stocks, Arawakan and Cariban, the former being indigenous, while

the latter were recent invaders, who, at the time of the discovery, had as yet colonized only the southern islands. The Arawakan tribes were peaceful and agricultural, skillful weavers, wood-carvers, and stone-polishers, but unable to withstand the inroads of the more savage Carib.

Below is given a list, from north to south, of the linguistic stocks of Mexico, Central America, and the islands, so far as present limited study enables us to classify them, the Mexican portion being according to the latest researches of Dr. Nicolas Leon. The first five are extensions from the United States; the Cariban, Chibchan, and Arawakan are mainly in South America:

Yuman (Lower California, etc.).
 Piman.
 Athapascan (Chihuahua, etc.).
 Tañon (Chihuahua).
 Coahuiltecan (Tamaulipas, etc.).
 Maratnian (Tamaulipas).
 Serian (Sonora).
 Chichimecan.
 Otomlan.
 Matlaltzincan (Mexico and Michoacan).
 Nahuatlan.
 Tarascan (Michoacan).
 Totonacan (Vera Cruz).
 Zapotecan (Guerrero, Oaxaca).
 Chinantecan (Oaxaca).
 Huavean (Oaxaca).
 Zoquean (Oaxaca, Chiapas).
 Chiapanecan (Chiapas, Nicaragua, Costa Rica).
 Mayan.
 Xincan (Guatemala).
 Cariban (Honduras and islands).
 Lencan
 Xicacuan } (Honduras).
 Payan

INDIANS OF SOUTH AMERICA.

Our acquaintance with the ethnology of South America is still very imperfect, for the reason that vast areas are yet unexplored, while in some regions brought under Spanish or Portuguese dominion so much confusion has been wrought by the migration, disintegration, or complete extermination of tribes that the writings of early missionaries or travelers help little to clear up the difficulties. Here, as wherever else the uncivilized man confronts the European, we find the same steady march toward extinction, brought about originally by wholesale massacres and cruelties at the hands of the white conqueror, and later by the new diseases which followed in his wake.

As in North America, we find also on the southern continent the phenomenon of vast areas occupied by tribes of some half-dozen linguistic stocks, differing little in habit and all upon nearly the same culture plane, with other areas of mountainous or otherwise difficult country held by a multitude of small stocks with habits almost as widely variant as their languages. In general we may group the tribes by three great regions, viz. the Andean, the Amazonian, and the Pampean, the first being the mountainous territory extending along the Pacific coast from the isthmus to about 35° south, in Central Chile; the second, the whole interior stretching eastward from the summit of the Cordillera to the Atlantic, with the exception of the Chaco; and the third, comprising the Chaco forest and the grassy plains of the Pampas, between the Andes and the Paraná River, together with Southern Chile, and stretching southward to Cape Horn.

In the Andean region we find the highest culture, represented by the Chibcha, Yunca, Aymara, and above all the Quichua, whose empire extended nearly two thousand miles along the

coast and made its influence felt even among the wild tribes of the Upper Amazon and the Chaco border. In nearly all these nations we find a firmly established system of government, with social distinctions clearly defined; careful and successful agriculture, including irrigation and the use of manures; superior pottery, with curious designs found nowhere else; weaving of cotton and the hair of domesticated animals; beautiful metal-work in gold, silver, and bronze; and an architecture with such enduring monuments as the stupendous ruins of Gran Chimú, Paucartambo, and Tiahuanaco. So far as can be learned the various governments were based upon the clan system, even in Peru, where the Inca himself was but the executive officer of a council of the gentes. Of the various religious systems the best known is that of the Quichua, whose great god was the Sun, after whom came their culture hero, the white and bearded Viracocha. The dead were buried in the ground, deposited in stone sepulchres, or mummified and preserved thus in temples and caves. Anything in the nature of a hieroglyphic system appears to have been unknown, the nearest approach having been the *quipu* records of the Quichua. The descendants of these cultured Andean nations still number many millions, in fact constituting the bulk of the population over large areas, and although in theory accorded equal civil rights, they are yet, like aboriginal races elsewhere, in a state of practical vassalage to the dominant race of the conqueror.

The tribes of the Amazonian region, the Orinoco, and the Paraná, were all in various degrees of savagery, although nearly all sedentary and more or less agricultural in habit. Cannibalism prevailed extensively, the word itself being derived from the name of the fierce Carib tribe. The custom still exists on some of the southern headstreams of the Amazon. Living mainly under the tropics, many tribes were entirely naked, and tattooing and body-painting, although occasionally found, were rare. Labrets were worn by a number of tribes. Scalping was unknown, but several tribes, notably the Mundurucú, preserved the heads of their slain enemies. The blowgun and poisoned arrow were general throughout the Upper Amazon and Orinoco regions, curari poison constituting a chief article of intertribal trade. Government was of the loosest and confederations were almost unknown. The prevailing religious form was a crude animism, apparently several degrees lower than that of the North American savages. Throughout this vast area the tribes which have not disappeared are still nearly in their primitive condition, excepting where devoted missionaries have gathered them into villages, chiefly in Peru, Bolivia, and Paraguay. The Jesuit missions among the Guarani are recognized as the most successful ever established in America. At one time they contained over 300,000 Christianized Indians, the basis of the modern civilized States of Paraguay and Uruguay.

The tribes of the northern and central Pampean region, including the Chaco and Pampas sections of Argentina, are warlike equestrian nomads and hunters, living in tents of skin, subsisting almost entirely upon meat, and in other respects also very similar to our own plains tribes, but superior in the possession of herds of cattle and sheep, as well as horses, and in a

certain skill in iron-working. The Araucanians of Southern Chile, an extension of one of the most important Pampean stocks, have successfully maintained their independence both against the Inca emperors and the conquering Spaniard. The Patagonians resemble their northern neighbors of Argentina, but represent a somewhat lower grade of culture. Like them, they are brave fighters and of fine physique. The natives of bleak Tierra del Fuego are in perhaps the lowest stage of culture found in South America, occupying the merest temporary shelters, going almost naked even in coldest weather, and having no apparent tribal forms or ceremonials. On the other hand, they are skillful hunters and daring fishermen.

Below is given a tentative list of the existing South American linguistic stocks, numbering approximately sixty so far as present very deficient knowledge permits a classification, Brinton being the chief authority:

Alikulfan (Tierra del Fuego).
 Andaquian (Colombia).
 Arauan (Brazil).
 Araucan or Aucanian (Argentina, Chile).
 Arawakan (Brazil, Venezuela, etc., and islands).
 Atacameñan (Chile).
 Aymaran (Peru, Bolivia).
 Barbacoan (Colombia).
 Betoyan (Colombia, Venezuela).
 Caniehanan (Bolivia).
 Carajan (Brazil).
 Cariban (Brazil, Venezuela, Guiana, islands).
 Cairian (Brazil).
 Catamareñan (Argentina).
 Cayubaban (Bolivia).
 Changuinan (Colombia).
 Charruan (Uruguay, etc.).
 Chibchan (Colombia, Costa Rica).
 Chiquitan (Bolivia).
 Chochoan (Colombia).
 Chonekan or Tzonecan (Patagonia).
 Churuyan (Colombia).
 Cocuacan (Colombia).
 Cunan (Colombia).
 Guahiban or Guayban (Colombia).
 Guaraunan (Venezuela).
 Guaveuran (Argentina, etc.).
 Itonaman (Bolivia).
 Jaruran or Yururan (Venezuela).
 Jivaroan (Ecuador, etc.).
 Laman (Peru).
 Lulean (Argentina).
 Mainan (Ecuador, etc.).
 Matacoan (Argentina, Paraguay).
 Mocoan (Colombia).
 Mosetenan (Bolivia).
 Moviman or Mobman (Bolivia).
 Onán (Tierra del Fuego).
 Otomacan (Venezuela).
 Paniquitan (Colombia).
 Panoan (Peru).
 Payaguan (Argentina).
 Peban (Peru, Ecuador, etc.).
 Piaroan (Salivan?)—(Colombia, Venezuela).
 Puinavian (Colombia).
 Puquinan (Peru).
 Quichuan or Kechuan (Peru, Ecuador, etc.).
 Salivan (Piaroan?)—(Venezuela).
 Samucuan (Bolivia).
 Tacanan (Bolivia).
 Tapuyan (Brazil, Colombia).
 Ticuan (Brazil).
 Timotean (Venezuela).
 Tupian (Brazil, Bolivia, etc.).
 Yahganan (Tierra del Fuego).
 Yuncan (Peru).
 Yuscasan (Bolivia).
 Zaparoan (Ecuador).

INDIAN SARSAPARILLA, NUNNARI-ROOT. The roots of *Hemidesmus Indicus*, an East Indian shrub of the natural order Asclepiadaceae, used as a substitute for sarsaparilla.

INDIAN SUBREGION. A zoögeographical district of the Oriental Region, comprising India from the valley of the Indus eastward to the delta of the Brahmaputra, and southward nearly

to its terminus, where it mingles with the Ceylonese Subregion, which includes Ceylon and the extremity of the Indian Peninsula. It is rich in animal life, which, as a whole, is Oriental in its affinities. The Mediterranean (Palearctic) Subregion seems to extend eastward to the arid valley of the Indus, and India thus possesses several Ethiopian forms, which have led some zoölogists to regard its fauna as Ethiopian rather than Oriental, but the weight of opinion has turned against this view. The eastern shore of the Bay of Bengal is the home of so mixed an animal population that it has sometimes been called an 'Indo-Malayan' subregion, but this is not generally recognized. Northeastern India, along the midslopes of the southern Himalaya ranges, is very different, faunistically, from the peninsular plains or the low hot coastal regions, owing to its elevation, and forms a long westward-reaching tongue of the Indo-Chinese and Manchurian subregions (q.v.). See maps under DISTRIBUTION OF ANIMALS; and the paragraph on *Fauna*, under INDIA.

INDIAN SUMMER. A short season of pleasant weather in the Central and Atlantic Coast States, usually occurring in October or November, more rarely in December, and characterized by an almost cloudless sky, calm or light airs, a hazy atmosphere, and mild temperature in the daytime, but rather cool at night. It may last one or two weeks, and may recur two or three times during a season, but rarely more than twice. During Indian summer weather the barometer stands above the average, and the cloudless sky indicates that there is in general a descending tendency of the air at some distance above the earth. Balloons ascending to great heights show that there is very little horizontal movement in the air, but what there is is toward the east. At this season the leaves of most plants dry up and drop away, adding their débris to the dust in the atmosphere. Owing to the prevailing dryness, forest fires and prairie fires occur at this time, and the smoke adds to the intensity of the Indian summer haze, but is not necessarily the sole cause of it. Frequently such smoke spreads slowly eastward, gathers moisture to itself, and is followed by clouds and gentle rain. Precisely similar weather occurs in Germany, where it is known as the 'Old Woman's Summer' and 'Saint Luke's Summer,' and in England, where it is known as 'Saint Martin's Summer,' or 'All Hallow Summer'; these terms being applied to it according to the various dates on which it happens to occur in October or November. There are also many indications of its existence in China and Siam. The haze attending the African Harmattan in December and January appears very similar to that of Indian summer, but the diatom dust that characterizes the former has not yet been found in the latter.

As to the origin of this expression, Mr. Albert Mathews has shown that it does not occur anywhere either in printed books or manuscripts until the year 1794; but at that time it was in use throughout the Atlantic States. The popular belief that Indian summer weather was predicted by the native Indians in conversation with the first European settlers finds no documentary corroboration, and the idea that the term Indian summer was employed by the early settlers seems to be a myth. In general, neither this term nor anything corresponding to it is to be found in

any Indian language. The term Indian summer in its present usage was introduced into England from America. In 1778 Horace Walpole used the same expression, but he evidently had in mind the intense heats of the midsummer weather in India and the West Indies. For full information on the whole subject, see the *Monthly Weather Review*, vol. xxx., pp. 19-29 and 69-79 (Washington, 1902).

INDIAN TERRITORY. A Territory of the United States, situated nearly in the middle of the country. It is bounded on the north by Kansas and Oklahoma, on the east by Missouri and Arkansas, on the south by Texas, and on the west by Oklahoma. Its area is, approximately, 31,000 square miles (census of 1900).

Because the Indian Territory had been reserved for Indian tribes, it long remained practically unexplored, while the areas around it were surveyed and well mapped. A curious illustration of the fact that little was known about this large region was afforded by the survey of the lands of the Territory authorized by the National Congress in 1894. It had been assumed that the Territory was mainly an open, flat country, and that the survey might therefore proceed very rapidly. It was found, however, that about one-fourth of the Territory is mountainous, and that nearly two-thirds is woodland. As late as 1895 it appeared that while good maps of the drainage of the Chickasaw reservation had been prepared, its relief was not yet mapped; and that little was known either of the drainage or relief of the remainder of the Territory.

Various parts of the Territory differ much in their topography. South of the Canadian River, in the reservations of the Choctaw and Chickasaw nations, the country is considerably broken, being traversed by the winding serpentine ridges forming the southern part of the Ozark Hills. These hills enter the Territory from Arkansas, and the summits near the Arkansas boundary reach an altitude of 2500 feet above the sea. Farther south they diminish in height till, in the middle of the Choctaw reservation, they are not more than 1000 feet above the general level of the country. The rocks of these ridges are, for the most part, quartzite, while the valleys between them are floored with limestone. This difference in the rock formations explains the topography. The quartzite ridges are the survival of the hardest rocks.

The northeastern part of the country, north of the Arkansas and Canadian rivers, is a plateau deeply scored by streams. West of this very broken region the Territory is broadly undulating. The eastern portion of the Territory, particularly in the hilly and mountainous regions, is heavily timbered. The southern part, including the Chickasaw reservation and the western portion of the Choctaw country, is a territory of timber and prairie, the timber predominating to the extent of nearly three-fourths of the area. The largest extent of prairie is in the Cherokee and Creek reservations of the north, where there is little timber except along the streams between the timber belt on the west and the hilly country on the east. Some Azoic rocks are found in the north, and the igneous rocks of the hilly and mountainous areas are above mentioned, but the predominant geological formation is Carboniferous; in this formation are the bituminous coal measures that will probably always be the chief

mineral resource of the Territory. Coal is mined most largely in the southeast and is yielding nearly 2,000,000 tons a year, most of the product being marketed in the Southern States. Gold and silver are also found in the mountain regions, and asphalt has been discovered, but is not yet of much importance.

As the drainage of the Territory shows, the general slope of the land is gently from northwest to southeast. The streams are numerous, but none of them is important for navigation. The Red River flows along the boundary of Indian Territory and Texas. The Canadian River, rising in New Mexico, flows east nearly across the Territory till it joins the Arkansas. The Washita River, emptying into the Red River, drains most of the southwestern part of the country. The Arkansas, passing through the Territory, and the Red River carry off all the drainage.

The whole Territory belongs to the humid area of the eastern half of the United States, with sufficient, though not superabundant, rainfall for agriculture. Lying, however, between the 33d and 37th parallels of latitude, the region has a warm climate, the main annual temperature being about 60° F. For FLORA and FAUNA, see those sections under UNITED STATES.

AGRICULTURE. The Territory has the advantages of excellent natural conditions for the development of agriculture. The soil is fertile, and the rainfall is greater and more certain than it is in Oklahoma Territory to the west. In 1900, 36.6 per cent. of the land was included in farms. Most of the farms are owned by Indians, but there are also a number of negroes who own land, and also a certain number of whites who have secured land, principally by being adopted as citizens by act of the legislatures of the several Indian nations. However, the Indians do not, as a rule, cultivate their own farms, but rent them instead to the whites, the latter constituting seven-ninths of the total number of farmers. The average size of farms varies from 42.5 acres in the small Seminole Nation, to 329.2 acres in the Creek Nation.

The climatic conditions are such that a great variety of products, including those of both the temperate and semi-tropical regions, can be grown. The cultivation of the soil has thus far, however, been largely subordinated to stock-raising, and corn has consequently been the leading crop, comprising, in 1900, 1,181,439 acres. The areas devoted to wheat and oats for the same year were, respectively, 247,247 and 160,457 acres, while the hay and forage crops exceeded 400,000 acres. Cotton produces abundantly and is rapidly becoming of great importance, the acreage devoted to its cultivation in 1900 being 442,065. Fruits and vegetables are also very successfully grown. The prairie lands of the Territory afford excellent and extensive pasturage for stock. The number of cattle in 1900 exceeded 1,500,000. In the same year the horses numbered 198,600; mules, 51,500; sheep, 12,600; and swine, 650,000.

MANUFACTURES. Because of peculiar local conditions, especially the nature of the population, manufacturing has been slow to develop in Indian Territory. However, a good beginning has been made in the decade 1890 to 1900. During this period the number of establishments—including hand trades and houses with a prod-

uct of more than \$500—grew from 20 to 789, the capital increasing from \$204,329 to \$2,624,265. The census of 1900 reported 348 establishments additional, having each a product of less than \$500. The most important industries are cotton-ginning, flour and grist milling, the manufacture of cottonseed oil and cake, and the manufacture of lumber and planing-mill products. The greatest activity centres in the Chickasaw nation.

TRANSPORTATION. The railroad facilities are adequate enough for a higher industrial development than that which now prevails in the Territory. In 1900 there were reported 1500 miles. The principal lines are Missouri, Kansas and Texas; the Saint Louis and San Francisco; the Choctaw, Oklahoma and Gulf; the Santa Fé and the Rock Island.

FINANCE. The different nations assess tribal taxes upon non-citizens and those employing non-citizens. These taxes are collected with difficulty, as effort is made to avoid payment. The Indian Agent collected and disbursed \$825,020 in 1900, of which amount \$139,589 represented royalties upon mineral products.

BANKS. In 1902 there were 69 national banks, with loans amounting to \$7,277,000; cash, etc., \$548,000; capital, \$2,779,000; and deposits, \$5,896,000. The 20 private banks had in loans, \$602,676; cash, \$56,354; capital, \$203,975; and deposits, \$495,810.

RELIGION. Missionary work among the Indians of the Territory has always been very active. The Methodists and the Baptists are in the majority; Presbyterians, Roman Catholics, Disciples of Christ, Friends, and other denominations are represented.

EDUCATION. Religious denominations, the National Government, and the tribal governments all maintain schools within the Territory. Nevertheless, the educational situation is not what it ought to be. The Territory has been rapidly filling up with a population of whites, who, having no voice in the government, have been unable to secure public school advantages for their children. It was estimated (in 1900) that there were 50,000 white children of school age—three times that number of Indian children of that age—who were thus deprived. A recent act of Congress enabling towns to incorporate, elect officers, and provide education for white children, will be a particular relief. For a time the Indians were allowed to manage their own educational affairs. This was so unwisely if not corruptly done that Congress provided in the Curtis Act (1898) that the National Government assume charge, and accordingly a superintendent of education has been placed in authority over the Five Nations (the Seminoles excepted).

POPULATION. The population of the Territory grew from 180,182 in 1890 to 392,060 in 1900, an increase of 117 per cent. This great increase was due to the inflow of whites from the States. The Indians in 1900 numbered 52,510; negroes, 36,870; and whites, 302,680.

INDIANS. The Indians of the Territory consist of the 'Five Civilized Nations,' and those of seven reservations. Ninety-seven per cent. of the population, including whites, is found in the four principal nations. The census of 1900 distributes the population as follows: Cherokee Nation, 101,754; Chickasaw Nation, 139,260; Choctaw Nation, 99,681; Creek Nation, 40,674; Seminole Nation,

3786; Modoc reservation, 140; Ottawa reservation, 2205; Peoria reservation, 227; Quapaw reservation, 154; Seneca reservation, 255; Shawnee reservation, 79; Wyandotte reservation, 288; not located by reservations, 861. The majority of the negroes enumerated in the census are ex-slaves of the Indians, or descendants of ex-slaves, and share with the Indians in the allotment of lands. A non-citizen marrying into a tribe is made a citizen, and also receives an allotment of land.

GOVERNMENT. The 'Five Civilized Tribes' (the Cherokees, Creeks, Chickasaws, Choctaws, and Seminoles), who occupy almost the whole of the Territory, came thither under an agreement with the United States guaranteeing their tribal authority. They organized for themselves forms of government much like those of the States, having a Governor, Senate, and Legislature, elected by popular vote; a national court, school system, and treasury. Under this independent, self-governing system the Five Nations have lived until recent years. The workings of the system were quite tolerable in the early period, but it is quite inadequate on account of the rapid changes in conditions now taking place. The white population of the Territory, who outnumber the Indians six to one, found themselves without a voice in the government, unable to secure such privileges as look toward their proper protection and development. Accordingly, various enactments have been passed by Congress within the past few years, all having for their ultimate purpose the extension of complete Federal jurisdiction over the Territory, the extinction of Indian governments, and the opening of the country to unrestricted white settlement—in other words, their assimilation, political and legal, with the rest of the United States. However, the original guarantee of an autonomous form of government to the tribes and other complicating conditions exist to delay the process of transformation. The resisting Indian is sometimes conciliated, sometimes disregarded. In 1893 a commission to the 'Five Civilized Nations,' the Dawes Commission, was appointed to enter into negotiations with the Indians in the Territory for the allotment of their lands in severalty, or to procure a cession of their lands to the United States. The Commission had in 1901 finally secured from each of the five tribes tentative agreements, looking toward allotment and citizenship; but years are likely to elapse before the work of the Commission is ended, as the task of dividing 20,000,000 acres of land equitably among many thousands of legitimate claimants is enormous. An act of 1897 gave the United States courts jurisdiction within the Territory. The Curtis Act of 1898 had for its general purpose the transfers of the control of property rights from tribal authority to that of the United States. Accordingly it provided, among other things, for the enrollment of citizens, preparatory to the allotment of lands, for the regulation of town sites, and the incorporation of towns; and it gave the President a veto power over acts of the tribal governments. Differences of conditions have prevented a uniform application and enforcement of this policy. Some features are universally carried out, while others are temporarily suspended for certain tribes. An agreement with the Seminoles permits the continuance of the Seminole government

in a limited way, and an agreement with the Choctaws and Chickasaws extended their governments, with certain modifications, until March 4, 1906. Consult: Hinton, "The Indian Territory, Its Status, Development, and Future," in *Review of Reviews*, vol. xxiii. (New York, 1901).

INDIAN TOBACCO. See LOBELIA.

INDIAN TURNIP. See ARUM.

INDIAN YELLOW, or **PURREE.** A coloring matter highly esteemed by artists. It is exported from the East Indies and China in spherical masses, which are of a dark brown color externally, but of a bright orange yellow in the interior. It is obtained in Bengal as a sediment from the urine of cows fed on decayed and yellow mango leaves. Its odor is peculiar, and resembles that of castoreum. It consists chiefly of the magnesium salt of an acid termed *purreic* or *euxanthic acid* ($C_{15}H_{16}O_{10}$). Alkaline solutions dissolve this acid, and form a yellow liquid. A solution of euxanthate of potash, when mixed with the solutions of the salts of the earths, gives brilliant yellow, sparingly soluble precipitates, and with acetate of lead it forms an insoluble yellow. Purree is often found adulterated with chrome yellow.

INDIA-RUBBER. See RUBBER.

INDICATOR (Lat., pointer). In steam engineering, an instrument to measure and to record by means of a diagram the pressure of the steam in the cylinder of an engine. The indicator was invented by James Watt, of steam engineering fame, and the modern indicator is merely a structural modification of Watt's original design. Concisely described, the modern steam-engine indicator consists first of a small cylinder having communication with the interior of the engine cylinder by means of a short pipe provided with a stopcock. In this small cylinder works a piston having a piston-rod extending out of the top of the cylinder. This piston is normally pressed down to the bottom of the cylinder

FIG. 1. STEAM-ENGINE INDICATOR.

by a spiral spring, but when steam is admitted below the piston by opening the stopcock previously mentioned, the pressure forces the piston upward against the spring, compressing it a greater or less amount, according to the steam pressure. The top of the piston-rod is attached to a lever which carries a pencil at one end.

This pencil bears against a slip of paper attached to a drum, which rotates back and forth on its axis for a distance and with motion which corresponds exactly to the stroke and movement of the engine piston. In operation the indicator piston rises and falls with the rise and fall of the steam pressure in the cylinder, and the pencil point is thus given a vertical movement whose magnitude corresponds to the intensity of the steam pressure. At the same time the rotation of the drum gives the paper a horizontal movement under the pencil point, corresponding in magnitude and speed to the engine-piston movement, so that the result of the two opera-

FIG. 2. INDICATOR DIAGRAM.

tions is the inscription of a loop-shaped diagram on the paper. These diagrams enable the steam engineer familiar with their use to calculate the power of the engine, to examine and adjust the actions of the engine valves, and to make certain inferences concerning the transformation of heat into work, and the influence of the metal of the cylinder on that operation. A concise treatise on the subject of indicators and indicator diagrams is Peabody, *The Steam Engine Indicator* (New York, 1900).

INDICTION, in-dik'shūn (Lat. *indictio*, imposition of a tax, period of fifteen years, from *indicare*, to declare, from *in*, in + *dicere*, to say, Skt. *dis*, to show). A period or cycle of fifteen years, the origin of which is involved in obscurity. It began to be used in reckoning time, chiefly by ecclesiastical historians, during the life of Athanasius; it was afterwards adopted by the Popes, through whose influence it came to be so generally employed during the Middle Ages, that the dates of charters and public deeds of this period are expressed in indictions as well as in years of the Christian Era. The time from which reckoning by indictions commenced is, according to some, September 15, 312; according to the Greeks of the Eastern Empire, September 1, 312; but when this method was adopted by the Popes, it was ordered to be reckoned as commencing January 1, 313. The latter, which is now alone used, is called the Papal indiction. If we reckon backward to the commencement of the Christian Era, it will be seen that 1 A.D. does not correspond to the first, but to the fourth year of an indiction—hence, if to any given year of the Christian Era three be added, and the sum divided by fifteen, the quotient will give the position of that year in an indiction—e.g. 1880 A.D. was the eighth year of an indiction.

INDICTIO PASCHALIS, in-dik'shī-ō pās-kā'līs (Lat., Easter declaration). A custom that arose in the early Christian Church of Alexandria of announcing on Epiphany the days on which Easter would fall. Later this declaration was called the *Indictio festorum mobilium*, the announcement of the movable feasts, because the

time when these should be celebrated depended upon the appointment of the days for Easter. The custom soon became general; the fourth Synod at Orleans (541) issued a formal order for the observance in its first canon.

INDICTMENT, in-dit'mēnt (from OF. *enditer*, *endicter*, *inditer*, *indicter*, to accuse, Latin *indictare*, frequentative of *indicare*, to proclaim, from *in*, in + *dicere*, to say, Skt. *dis*, to show). The formal written accusation of crime against a person, presented on oath by a grand jury (q.v.), and upon which he is tried by a petit jury. In Scotland an indictment is also the accusation on which a prisoner is tried; but it runs in the name of the lord advocate, addressed to the prisoner. In England a prisoner is not entitled, before trial, to a copy of the indictment or a list of the witnesses against him except in case of treason. An indictment differs from an information (q.v.) in that it is the act of a grand jury, while an information is the written accusation of crime by the law officer of the Crown or of the State. It differs from presentment (q.v.) in that the latter is an accusation by the grand jury of its own motion, and without any charge of crime, or any bill of indictment being laid before it.

In the United States persons who are accused of felonies or grave misdemeanors can be brought to trial only upon an indictment which a grand jury has declared to be 'a true bill.' When a criminal court is convened, and the grand jury has been duly constituted and instructed, the State's attorney, or some other duly qualified officer, lays before them drafts of indictment against the alleged offenders, and furnishes them with the names of the witnesses whose testimony is relied upon to support the accusation. These witnesses the grand jury examines *ex parte*, not to determine the guilt or innocence of the accused, but to ascertain whether there is or is not *prima facie* evidence of guilt sufficient to warrant their trial. If twelve or more members of the grand jury pronounce in the affirmative, the presentment, with the words 'a true bill' indorsed upon the back thereof, is sent to the court; and, upon the charges therein contained, carefully set forth in the indictment subsequently prepared, the accused is put upon trial before a petit jury. The indictment is prefaced by a 'caption,' in which are set forth the name, term, and place of meeting of the court, the names of the justices, and the fact that the grand jury was lawfully constituted. Then comes a full and particular description of the alleged crime; the name of the accused must be given if known; and if not, he must be described in such a way as to make his identity sure. The time and place of the commission of the crime must also be stated, though it is not always necessary to conviction that these particulars should be exactly supported as charged. In some cases, however, a failure upon this point is fatal to the indictment. In trials for perjury the exact day when the offense was committed must be named. To prove that the crime was committed on some other day will not avail. In cases of murder the death must be described as occurring within a year and a day of the time when the alleged fatal injury was inflicted. When several persons have been concerned in the commission of a crime, they may be indicted either jointly or separately. It is usual to describe the alleged offense in different

ways, in what are usually called 'counts,' in order to cover any uncertainty that may exist beforehand as to the precise way in which it was committed. It is enough if the prisoner is convicted upon a single count. The indictment must charge explicitly whatever is necessary to constitute the offense. In many of our States the harsh rule of the common law, which denied the right of a person accused of treason or felony to have a copy of the indictment, has been abolished by statute. Consult: Pike, *History of Crime in England* (London, 1876); Stephens, *History of the Criminal Law of England* (London, 1883); Pollock and Maitland, *History of English Law* (2d ed., London, 1899); *United States Constitution, Fifth Amendment*.

INDIFFERENTISM (from *indifferent*, from Lat. *indifferens*, not different, from *in-*, not + *differre*, to differ, from *dis-*, apart + *ferre*, to bear). A term used in philosophy and ethics, to designate the theory that the human will is absolutely indifferent to all motives. The doctrine is also called indeterminism or the doctrine of the liberty of indifference, and is opposed to determinism (q.v.). See FATALISM; ETHICS; WILL.

INDIGESTION (from Lat. *indigestio*, indigestion, from *in-*, not + *digestio*, digestion, from *digerere*, to digest, from *dis-*, apart + *gerere*, to carry), or DYSPEPSIA. A term somewhat vaguely applied to various forms of disease of the stomach or of the small intestines in which the natural process of digesting and assimilating the food is deranged. The common cause of indigestion, where organic disease is absent, is the eating of too much food, too rapidly, or without sufficient mastication.

The symptoms of indigestion are by no means constant in all cases. There is often *anorexia* (or want of appetite), but occasionally the appetite is excessive, and even ravenous. Nausea not infrequently comes on soon after a meal; while in other cases there is no nausea, but after the lapse of a couple of hours the food is vomited, the vomited matters being very acid, and often bitter from admixture of bile. In severe cases the vomiting has been known to occur after every meal for several months. Flatulence, relieving itself in eructations, is one of the standard symptoms of this affection, the gas that gives rise to this symptom being sometimes evolved from undigested matters in the stomach. It is very apt to occur in dyspeptic patients if they have fasted rather longer than usual. *Cardialgia* (popularly known as *heartburn*), *pyrosis* (q.v.), or water-brash, and *gastrodynia* (commonly designated *spasm* or *cramp* of the stomach, and coming on at uncertain intervals in most severe paroxysms) are somewhat less common symptoms of indigestion.

The treatment of indigestion is more dietetic than medicinal. All bad habits suggested above must be corrected. The quantity of food which can be digested by the gastric juice and intestinal fluids being limited (see DIGESTION), care should be taken that this quantity is not exceeded; moreover, the meals should not succeed each other too rapidly. With regard to the nature of food best suited to dyspeptic persons, it may be safely asserted that a mixture of well-cooked animal and vegetable food is in general more easily digested than either kind taken

exclusively. Each patient should be advised by his physician as to his dietary. The unquestionable benefit which dyspeptic patients often derive from a visit to a hydropathic establishment is due perhaps not so much to any specific action of the water as to the well-regulated diet, the withdrawal of the mind from personal cares, and the change of scene. The use of purgatives and remedies for indigestion is much overdone by the laity, and lays the foundations of chronic gastric disorder that cannot be cured.

INDIGIRKA, ɛn'dyɛ-gɛr'ká. A river of Eastern Siberia. It rises in the Stanovoi Mountains, 400 miles east of Yakutsk, and, after flowing in a northeasterly course for about 900 miles across a sparsely populated and frozen desert region, it empties through a large delta into the Arctic Ocean, 460 miles east of the mouth of the Lena (Map: Asia, 0 1).

INDIGO (Sp. *indigo*, *indico*, from Lat. *indicum*, from Gk. *ἰνδικόν*, *indikon*, indigo, from *Ἰνδία*, *India*, India). A coloring matter first employed as a dyestuff in India, whence it was brought by traders to the Mediterranean countries. Europeans were not acquainted with its vegetable origin until the time when its importation assumed considerable dimensions, after the circumnavigation of Africa; and as the method of dyeing with woad did not present the indigo in substance, the virtual identity of the two was not suspected. Of late years, artificial indigo has been produced from coal-tar products, and is seriously threatening the existence of the indigo plantations. For the history of artificial indigo, see COAL-TAR COLORS.

INDIGO.

Most of the natural indigo of commerce is obtained from species of *Indigofera*, of the family Leguminosæ. The genus embraces about 400 species, widely distributed throughout tropical and subtropical regions. The best known and most widely cultivated species, as well as the ones which supply nearly all the indigo found in the markets, are *Indigofera anil*, a native of tropical America, and *Indigofera tinctoria*, the original home of which is not positively known, although it is said to occur wild in the Bombay Presidency. *Indigofera argentea*, a native of Arabia and parts of Africa, is a source of much of this valuable dye. Indigo plants are extensively cultivated in the East and West Indies (especially in Bengal), in Central America, parts of Europe, and Africa, etc. The plants are shrubby,

attaining a height of about six feet, have pinnately compound leaves, and usually pink or purple flowers. The pods of *Indigofera anil* are sickle-shaped, short and compressed, while those of *Indigofera tinctoria* are straight, cylindrical, and many-seeded. When cultivated the indigo plant requires a rich, friable soil, well watered, but not too wet. The seeds are sown in drills about a foot apart, and the plants are cut when beginning to flower. In the tropics this can be done at frequent intervals, and four or five crops a year obtained. After cutting, the crop is handled in various ways, fermented in tanks, as described below, and the indigo extracted. Although the plants are perennial, the greatest yields are obtained from annual plantings. In addition to the species mentioned above, at least half a dozen other species of *Indigofera* are known to produce indigo of good character. It is also produced by species of *Sophora*, *Baptisia*, *Amorpha*, *Tephrosia*, and *Galega*, all belonging to the order Leguminosæ. *Baptisia tinctoria* and *Amorpha fruticosa* are known as 'false indigo' in the United States, where they are widely distributed. Plants of other families produce indigo, as *Isatis tinctoria*, a cruciferous plant which was cultivated in Europe during the Middle Ages and is still planted in Southern France (see WOAD); *Wrightia*, and *Nerium*, which belong to the family Apocynaceæ; *Marsdenia tinctoria* and *Gymnema tingens*, of the natural order Asclepiadaceæ; *Polygonum tinctorium*, of the order Polygonaceæ; *Strobilanthes flaccidifolius*, of the order Acanthaceæ; *Spilanthus tinctoria* (Compositæ), and *Scabiosa succisa* (Dipsacaceæ), as well as many others, representing widely separated orders of plants.

Neither the indigo plant nor *Isatis tinctoria* contains the dyestuff (indigotin) ready formed, but rather a colorless glucoside, indicane, which breaks up, by fermentative processes, into indigotin, and a glucose sugar called indiglucin. It is a curious fact that indicane is a normal constituent of human urine, and becomes very plentiful in certain diseases. Natural indigo is prepared for the market in the following fashion: The plants are cut down just before reaching the flowering stage, and are thrown into vats, where they are steeped in water and allowed to ferment for 12 to 15 hours, practically out of contact with air. This produces the soluble *indigo white*, which is taken up by the water; the liquid is then drawn off into 'beating-vats,' where it is violently agitated by machinery, in order to promote contact with the air, so that the indigo white is oxidized to the insoluble *indigo blue*, which forms a thick scum on the surface and then sinks to the bottom as a bluish mud. After settling, the clear liquid is drawn off, and the indigo blue is collected, squeezed between cloths, and dried in the air. It is sold in irregular lumps, which differ in tint, size, and texture according to the various localities in which they are produced. The amount of available dyestuff ranges from 20 to 90 per cent. of the commercial product, some of the impurities being accidental, although intentional adulteration is common enough. This irregularity of composition in the natural product is one of the causes that have advanced the manufacture of artificial indigo, which is always chemically pure. There are a large number of patented processes for the preparation of synthetic indi-

gotin, chiefly held by the German color-factories, and largely based upon the researches of Adolf Baeyer, who showed, about 1880, what the exact chemical constitution of this substance is, and indicated the general principles for its preparation from aniline derivatives. At present, indigo is manufactured on the largest scale by the Heumann process. Phthalic acid, from naphthalene, is converted into anthranilic (ortho-amido-benzoic) acid by way of the phthalimide, and the anthranilic acid is transformed, by treatment with chloracetic acid and fusion with sodium hydroxide, into indoxyl, which readily oxidizes to indigo. According to the United States Census for 1900, three million pounds, or one-quarter of the world's supply of indigo, are annually produced by synthesis. Pure indigotin, whether extracted from natural indigo or prepared artificially, is crystalline, with a coppery lustre and a very characteristic odor; when crushed, it forms a blue powder, and when fixed upon the fibre it constitutes a remarkably fast and brilliant 'navy-blue' dye. A few chemical compounds, analogous to indigo, and of slightly different shades, have been produced; but they are as yet of very slight importance. Mention may also be made of the so-called *indirubin*, a red coloring matter of insignificant tinctorial value, which is found in natural indigo.

DYEING WITH INDIGO. As indigo blue is insoluble in water, it must first be converted into indigo white, which is soluble in alkaline liquids. This change is produced by the chemical addition of hydrogen, so that the blue, $C_{16}H_{16}N_2O_2$, goes over into the white, $C_{16}H_{18}N_2O_2$. This is effected in *cold* vats, which are employed for the dyeing of cotton and linen, by metallic reducing agents, such as sulphate of iron, zinc dust, and alkaline sulphites; while wool and silk are dyed in *warm* vats, where the reduction is caused by a fermentation of vegetable substances, preferably woad, in a manner analogous to that by which indicane is converted into indigo white. These vats are always alkaline. When the reduction of the indigo is completed, the liquid is colorless, with a light bluish scum on top. The scoured materials are then drawn through the vats and exposed to the air while drying. The atmospheric oxygen immediately reconverts the white into the blue, by removing the extra hydrogen atoms. Indigo blue is also soluble in fuming sulphuric acid, forming 'indigo-sulphonic acid' or Saxon blue, which was formerly known as a dyestuff, but has been replaced in modern practice by its sodium salt, *indigo carmine*. The solution of this carmine produces a blue precipitate upon the fibre with an alum mordant, but the color is neither as deep nor as fast as that of the unaltered indigotin from the reducing-vats. With artificial indigo, the final synthesis can be produced on the fibre itself, as when ortho-nitrophenylpropionic acid and potassium xanthogenate are applied separately and the doubly impregnated cloth is then steamed, whereupon indigo blue is formed within the fibre, and the by-products can be washed out.

PRINTING WITH INDIGO. Indigotin is not suited to printing in pigment form, and figured goods are produced by what may be considered as dyeing processes. To procure a blue-and-white pattern, for instance, the whole fabric may first be dyed blue, and the white produced by printing on bleaching agents which will remove the color,

Or the cloth may first be printed with a 'reserve,' a paste composed of gum, pipe-clay, and copper salts, which will prevent the deposit of indigo upon the spots which they protect, while the material passes through the vat. Artificial indigo can again be produced by printing one chemical upon the fibre and putting the other into the bath through which it is subsequently passed.

INDIGO-BIRD. A North American finch (*Passerina cyanea*) of the Eastern United States. It breeds as far north as Nova Scotia and Minnesota, but migrates southward in the fall to Central America, where it spends the winter. It is about 5½ inches in length, and the adult male is rich dark blue in color, variously tinged and shaded, the lores and angles of the chin velvety black. The female is gray brown. It frequents open places on the edges of woods, and delights to sit on the top of a high tree singing a very sweet and peculiar melody, continued late into summer, after most other birds have stopped singing. It is easily domesticated. The nest is built of grasses, leaves, bark, and long hairs, in a little bush or on weeds near the ground. The eggs are three or four, pale bluish white, without spots. See Colored Plate of EGGS OF SONG-BIRDS.

INDIGO-SNAKE. See GOPHER-SNAKE.

INDIUM (Neo-Lat., from Lat. *indicum*, indigo). A metallic element, discovered by Reich and Richter in 1863. It occurs in minute quantities in various zinc ores, especially in the zinc blendes of Freiberg, in some galenas from Italy, and in the flue dust of zinc-furnaces. In the metallic state, the element may be obtained by reducing its oxide in a current of hydrogen, or by fusing the oxide with sodium. The oxide itself is obtained by dissolving Freiberg zinc in weak sulphuric acid, precipitating the solution with metallic zinc, and separating out, from the precipitate, lead, copper, and iron. With oxygen indium forms two compounds, a monoxide (InO) and a sesquioxide (In_2O_3). A number of its salts have been prepared, but none of them has any economic value. Metallic indium is ductile, silver-white, and lustrous. Its specific gravity is from 7.36 to 7.42 and its melting-point is at 176° C. Its chemical symbol is In, and its atomic weight, referred to oxygen, is 114.

INDIVIDUALISM (from *individual*, from ML. *individualis*, relating to an individual, from Lat. *individuus*, indivisible, from *in-*, not + *dividuus*, divisible, from *dividere*, to divide). The doctrine that society is only an artificial device, whose value is to be gauged by its conduciveness to the good of the several associated members or by some other standard set by these individuals. Individualism must be distinguished from egoism, with which it is often confounded. While individualism perhaps is generally egoistic in character, it is not always so. An individualist may maintain that the end which

justifies all justifiable means is "the greatest good of the greatest number;" what makes him an individualist is his conception of the greatest number as composed of *independent* units, the happiness of each of which is to be reckoned as a *separate item* in the sum total of general happiness. Such being the nature of individualism, it is clear that in all the sciences which deal with man as a social being there may be individualistic tendencies. And as a matter of fact individualism has been a marked characteristic of many prominent theories in political science, in economics, and in ethics.

In political theory the consistent individualist regards the State as a means to subserve individual ends. He may be an egoistic anarchist, desiring to remove all restraints which the State imposes upon his freedom of action. On the other hand, he may be an absolutist, believing that the restraints imposed by a supreme government are necessary to prevent the disastrous consequences which would follow from every man's acting upon his unregulated desires, and thus involving himself in perpetual warfare with all his neighbors. Thus we see that the sovereignty of government, which the individualist must deny in ultimate theory, he may stoutly maintain in practical politics. Hobbes, the prime individualist of modern times, was nevertheless one of the staunchest supporters of unlimited despotism when despotism was making its last stand against parliamentary government in England. Again, an altruistic individualist may, like the egoistic, be either an anarchist or a believer in government. The anarchism of our day is in large measure a reaction against absolutism, a reaction motivated by a sincere desire to secure for mankind at large the blessings of freedom. The trouble with it is that it conceives freedom as license, and regards license as in its nature humane when not irritated by authority. Other altruistic individualists, however, who do not share with the benevolent anarchist the optimist belief that man is by nature a saint and only by government a sinner, justify government as a necessary evil: an evil because individuality is more or less repressed by law, but a necessity because without some measure of such repression some individuals would make life intolerable or even impossible for others. It is thus clear that individualism as a political theory is quite compatible with acquiescence in and support of almost any form of government, or even with revolt from all government. Practical individualism, on the other hand, may prevail to a large extent along with anti-individualistic theories, for it is quite logically consistent for a thinker to maintain that the true end of all government is the welfare of society as an organic whole, and yet that this welfare can best be served by allowing every individual to pursue his own ends.

In economics individualism has generally advocated the practice which is formulated in the well-known precept, *laissez faire, laissez passer*. The State is to keep hands off of the economic machinery. Free competition, resulting in the survival of the economically fittest, is the individualistic ideal. Hence we find among individualists a tendency to oppose all sumptuary and other economic legislation. Compensation for service rendered is held to be a matter which concerns merely the parties immediately involved, and no general laws, it is urged, should control the unre-

stricted privilege of any man to buy labor as cheap and to sell it as dear as the relation between supply and demand allows. No minimum of wage, no maximum of hours, no restriction upon the age or sex of employees, no employer's liability except as specified by contract, no fostering of industries by tariff or subsidy, no political arbitration of economic disputes, no Government ownership or operation of any industrial plant—in short, no State interference in production, distribution, or consumption—this is what absolute and unadulterated individualism is apt to hold before itself as the true type of the industrial life. But pure economic individualism is at the present day more a theory than a practice. Public policy has asserted itself against private license, and the struggle at present is not so much between State interference and free competition as between different views as to the points at which State interference is advisable. Thus, in the United States both of the great political parties are anti-individualistic in their economic principles. The Republican Party stands for State interference in international trade, while in matters of internal policy it is inclined to allow competition a freer hand. The Democratic Party advocates greater freedom in international economic activity, while, at least of recent years, it has sought to interfere with the freedom of capital to combine and with the freedom of natural preference for the economically more valuable medium of exchange found in gold. The paternalism of the tariff is offset by the paternalism of State-ordained bimetalism. Individualism has become more of a war-cry than an accurate designation of economic principle. What is true of American economics is also true of the economic status in other civilized countries. The socialism and the agrarianism of Germany are no more and no less anti-individualistic than the governmental policy they oppose. The question is only as to the character of the limitations to be put upon the freedom of the individual in his economic relations.

In ethical theory individualism is not now so important a factor as it was a century or so ago. Pure individualism is incompatible with morality as ordinarily understood. If each man's ideals are the measure of his morality, morality ceases to have any general meaning. This is frankly recognized by some individualists; but some, on the other hand, still maintain the possibility of carrying their theory out logically without detriment to morality. The typical representatives of the latter view are to be found among those who claim for the individual conscience the right to pass definitively upon all questions of morals. "There is no such thing as an erring conscience," they say. In some thinkers, as, for example, Kant, the individualism of the conscience theory of morals is offset by the universalism of the criterion of reason, which directs the conscience. One must see one's duty only in what can be duty for all. The combination of individualism and anti-individualism in an ethics of conscience is, however, a *tour de force* which can be successfully achieved only by those who unknowingly have a higher standard for morality than either conscience or pure reason. But when this higher standard is lacking individualism gets the upper hand, and we have as the logical result the view that everything is right which a man thinks to be right. The individual with all

his idiosyncrasies becomes the measure of the universe. Most ethical thinkers have come to see that this is the natural consequence of the contention that conscience is the supreme *arbiter morum*, while moral practice has always been controlled by other influences besides the conscience of the individual. Or perhaps it would be more correct to say that these other influences operate upon a man by giving character and direction to his conscience, so that while he is guided by his conscience, that conscience is not merely an individual peculiarity. It reflects with greater or less accuracy the ideals of his community—a community sometimes large, sometimes small, but, whether large or small, of decisive influence in determining the kind of conscience the man is to have. Hence, as conscience is not something ultimate and intuitive, but derivative, there is no reason for supposing that its dictates are incorrect. The individual reflects the opinions, prejudices, superstitions, and sane judgments of a community, and gives to them perhaps an individual coloring, especially in matters bearing on his own conduct. The result we call conscience.

The history of individualism cannot here be given. All that can be done is to refer to other articles in this Encyclopædia treating of persons who have made that history. See SOPHISTS; GROTIUS; HOBBS; LOCKE; SPINOZA; QUESNAY; MIRABEAU; TURGOT; SMITH; ADAM; BENTHAM; BRIGHT, JOHN; MARX; SPENCER, HERBERT; NIETZSCHE. Consult, also: Donisthorpe, *Individualism, a System of Politics* (London, 1889); Le Gall, *La doctrine individualiste et l'anarchie* (Toulouse, 1894); McKechnie, *The State and the Individual* (Glasgow, 1896); Ritchie, *The Principles of State Interference* (London, 1891); Schmidt (Max Stiner), *Der Einzige und sein Eigentum* (Leipzig, 1845); Spencer, *Man versus the State* (London, 1884); Wenzel, *Gemeinschaft und Persönlichkeit* (Berlin, 1899); Lutoslawski, *Ueber die Grundvoraussetzungen und Consequenzen der individualistischen Weltanschauung* (Helsingfors, 1898); Tufts and Thompson, *The Individual and His Relation to Society, as Reflected in British Ethics* (Chicago, 1898).

INDIVIDUALITY (from ML. *individualitas*, from *individualis*, relating to an individual). Separate or distinct existence. There is some difference of opinion as to what constitutes individuality, the discussion being principally confined to the domain of natural history. Some authorities regard the various organisms springing by buds from a single hydroid as individual. Others consider various parts of a tree to be individuals. In one sense all the organisms proceeding from one egg may be considered as constituting one individual, since they are derived from one germ, and the production of the zooids by budding is similar to the development of a stock by grafting; but similar only because, in grafting a part of one individual, and not a germinal part, is inserted into another, and there proceeds to grow, as if the original plant extended itself. But in the budding of hydroids the different zooids produced exactly resemble each other, depart from each other, and develop independently into hydroids like their parent; and some may develop much more rapidly than others. The production of a zooid is more like original germination or ovum development than

the growth and extension of a part of the common tissues of a parent.

Individuality, in the psychological sense, which is different from the preceding biological and physiological meanings of the term, has reference to the personality of experience which is largely constituted by the continuity of the personal memory. Cases have not infrequently been reported where this memory continuum has been broken off and another instituted in its place, as the result of hypnotism or some form of disease. A person thus affected loses all memory of previous bodily existence, together with name, home, family, and friends, and begins a life so entirely new and different that he may be called another and different personality. The greatest number of personalities mutually ignorant of the existence of others connected with the same brain is five, in the case of Louis V., reported by Bôurru and Burot in *Variations de la personnalité* (Paris, 1888). For further information, consult: Binet, *Altérations de la personnalité* (Paris, 1892); Janet, *L'automatisme psychologique* (Paris, 1889); James, *Principles of Psychology* (New York, 1890); Podmore, *Studies in Psychological Research* (London, 1899). See DOUBLE CONSCIOUSNESS.

INDIVIDUAL PSYCHOLOGY, or DIFFERENTIAL PSYCHOLOGY. That branch of psychology which deals with the individual differences between mind and mind, as distinct from general psychology (see PSYCHOLOGY), which deals with mental constants and uniformities. It thus includes what Mill called 'ethology' and Bahnsen 'characterology,' though it is as much wider than this discipline as the concept of mind is wider than that of character. Its first principal problem is (1) to determine the range and nature of mental variations. This falls into two parts—problems. The individual psychologist must (a) ascertain how and to what extent mental processes vary from one individual to another, and (b) trace the relation of the processes to one another in a single mind, thus discovering whether they are mutually independent, or whether there are certain fundamental processes upon which the rest depend. The answers to these two questions form the contents of differential psychology proper. We have, however, further to inquire (2) into the conditions of the variations which we have established; we must investigate the influences of heredity, climate, position in life, adaptation, education, sex, age, etc. And lastly (3) we must examine, classify, and explain the expressions of mental difference in handwriting, physiognomy, characteristic gesture, literary style, etc.

The first of the three main problems is psychologically the most important. The observed differences between mind and mind have led, in the first place, to the elaboration of a doctrine of psychological *types*, which—seeing that the mind experimented on in the laboratory is always an individual mind—promises to be of value, not only for individual, but also for experimental psychology (q.v.). Practically all the more complex mental functions (ideation, attention, memory, judgment, action, assimilation, constructive ability) evince typical differences. Unless we take account of them we cannot adequately interpret our experimental results. Conversely, it is clear that the careful and exact work of the laboratory is peculiarly adapted to bring out the

differences which individual psychology is seeking. More difficult is the second part of the problem: to determine the interrelation of the variable processes within a single mind. Here we have three methods at our disposal. The first is that of abnormal cases; we may take advantage of instances where there is extreme development or enfeeblement (perhaps even loss) of some processes, to study the resulting modification of other processes. We may ask, e.g. how loss of memory affects imagination, attention, power of observation, etc. The second is that of isolated variation; we may, by experimental means, vary a single mental process, and see if this variation involves changes in other processes in the same mind. The third is that of 'tests;' we choose in advance a number of processes for study, and proceed to examine them in a number of individuals, noting whether the individual differences in the selected processes run parallel to one another, and correspond in a regular manner. This correspondence or the lack of it will show the degree of correlation obtaining between the mental functions studied. The method is extremely laborious, but is at present more available than any other, and should, in the long run, lead to valid results. Binet and Henri, e.g. suggest the following tests: (1) Memory: Visual memory of geometrical design, memory of sentences, musical memory, memory of colors and of figures. (2) Nature of mental images. (3) Imagination: Passive (finding forms or faces in ink-blots), constructive (development of an essay theme), of design (composition or completion of a picture), and literary (construction of sentences from given substantives or verbs). (4) Duration and range of attention. (5) Comprehension: Observation (analysis of a machine) and discrimination (definition of synonyms). (6) Suggestibility. (7) Æsthetic and moral sentiments. (8) Muscular force and strength of will (persistence in muscular effort). (9) Motor skill and sureness of eye.

Consult: Stern, *Ueber Psychologie der individuellen Differenzen* (Leipzig, 1900), which contains a bibliography; Kraepelin, *Psychologische Arbeiten* (Leipzig, 1896); Titchener, *Experimental Psychology* (New York, 1901).

INDO-CHINA. A geographical term formerly designating the southeastern peninsula of Asia (Farther India), embracing Burma, Siam, French Indo-China, etc.

INDO-CHINA, FRENCH. See FRENCH INDU-CHINA.

INDO-CHINESE. The name applied as a general term to the great majority of the native population of Farther India, or Indo-China. It originally indicated that these peoples were related by speech and physical characteristics to the Chinese, but in part also somatically and culturally to the peoples of Hindustan. The Indo-Chinese peoples speak what are called 'tonic monosyllabic' languages, forming, with the Tibetan and Chinese groups, the extensive and important Sinitic or Tibeto-Chinese stock or family. The chief Indo-Chinese peoples are the following: Burmese, Siamese, Annamese, Cambodians, Tonkinese, who have all in some respects reached the status of civilization. Related to the Siamese are the other Thai tribes, Shans and Laos, who preserve (some of them, at least) the primitive type of the Thai stock better than the Siamese,

and are likewise less civilized, though in the past they have created or have been the bearers of several half-civilizations. The Cambodians, or Khmers, about whose linguistic and somatic relationship there is still some dispute, authorities crediting them with Aryan affinities, especially as to physical characters, have behind them the more or less indigenous culture represented by numerous inscriptions and by the remarkable temples and monuments of Angkor-Vat, etc. The culture of the Indo-Chinese peoples has been largely influenced by both India and China, while the more primitive Malays have also had a not insignificant share in the physical and social complexes there existing. The Khmers have in earlier times borrowed not a little from Hindu sources, though this borrowing may not have been so great as has hitherto been assumed. The Burmese owe a good deal of their civilization to India, the Siamese almost as much, though more indebted to China than the Burmese; while the social life and culture of the Annamese is largely a reflection of Chinese. The Assamese of the northwest, who speak an Aryan language closely related to Hindi, are probably a mixture of some of the more primitive tribes and Hindus. The exact relationship of some of the savage tribes of the northern parts of Farther India is not yet clear, but those not distinctly Thai are more closely connected with the pre-Sinitic inhabitants of Southern China and the Tibetan area. The Moïs, by which general name a number of more or less primitive tribes scattered over the eastern mountains and tablelands are known, are an aboriginal race with perhaps a Caucasian strain. The Kuis of the Shan States are probably aboriginal like the Moïs; the Kuis of Cambodia have for some time been rapidly assimilating in speech and otherwise to the Cambodians. The Mons, or Talaing, of Burma, formerly had a much greater extension, but have been driven back by the more civilized peoples and the mixed races of modern origin. The Tehiam or Chiam, who are the modern representatives of the people who founded the ancient Empire of Champa, are by some authorities thought to possess Malay linguistic affinities. The Karens of Burma, who have recently shown themselves to be so amenable to missionary influences, are related to the Burmese linguistically and physically, but are of a more primitive type. The numerous Chin tribes of the Northwest are probably closely related to the primitive Burmese, but some of them are of very mixed type. The Lushai tribes are perhaps similarly related in general; they, together with the Nagas of the mountains of Manipur, are now more or less mixed—some of them have been thought to have Malay affinities. The Indo-Chinese peoples as a whole are probably of Mongolian stock, with early and later admixtures of Aryans and non-Aryans from India, etc., Malays and possibly Negrits, besides interminglings with the more modern peoples of the Indo-Chinese area. Like Hindustan, Farther India has had a history of primitive occupation, indigenous culture evolutions, foreign conquests, native combinations and disputes, etc. The more civilized peoples have more or less exploited for agricultural, commercial, and labor purposes the less civilized; the Burmese and Siamese the Shans, the Annamese the Moïs, the Laos the wilder peoples of their country; and to this general exploitation the Chinese, whose coming

into this area as colonists and traders antedates the Christian Era, have added much. Back of the modern civilization of Burma, Siam, Annam, Cambodia, etc., lie older half-civilizations of the more primitive tribes—Khmers, Shans, Laos, etc.—whose remains are of considerable importance and of great antiquity. Back of these again are the monuments of prehistoric man in this part of the world—the kitchen-middens of Cambodia, the stone monuments of the Khasi country, etc., and, earliest of all, the chipped implements discovered by Noetting in 1894 near Yenangyoung, on the Irrawaddy, in Upper Burma, which are claimed to prove the existence of Tertiary man in this region. It is probably from some of the proto-Indo-Chinese or their closely allied predecessors that the Malayan stock has sprung. Some of the Indo-Chinese, however, exhibit closer somatic affinities with certain of the Mongolian natives of Northeastern Asia, such as the Tehuktehi, etc. Consult: Von Hellwald, *Hinterindische Länder und Völker* (Leipzig, 1880); Forbes, *Comparative Grammar of the Languages of Farther India* (London, 1881); Bastian, *Völkerstämme am Brahmaputra* (Berlin, 1883); Ehler, *Im Sattel durch Indo-China* (ib., 1894).

INDO-CHINESE SUBREGION. In zoögraphy, a faunal district of the Oriental Region, comprising all that part of China south of the high mountains which carry the Himalaya range eastward nearly to Puchow, and form the watershed between the south coast and the valley of the Yang-tse; also all of Annam, Siam, Yun-nan, Burma, and Assam, and a long, narrow extension westward along the southern slopes of the Himalaya, between the levels of about 2500 and 9000 feet. The name 'Himalayan' or 'Himalo-Chinese' is therefore sometimes given to this fauna and subregion. It is one of the richest faunas in the world, and is especially distinct in its birds, of which more than 40 genera are peculiar, among which the pheasants are conspicuous. In the higher mountains Palearctic forms mingle with it to some extent, but on the whole the affinities are distinctly Oriental. See map under DISTRIBUTION OF ANIMALS.

INDO-EUROPEANS. A term frequently applied to the so-called Aryan race (see ARYAN; EUROPE), as being inhabitants of India and Europe. The word is, however, linguistic rather than ethnological. Even in linguistic usage the term is abandoned by the leading authorities, except among French and Italian scholars, in favor of Indo-Germanic. See INDO-GERMANIC LANGUAGES.

INDO-GERMANIC LANGUAGES. often called INDO-EUROPEAN, ARYAN, or sometimes INDO-CELTIC. The name given to the great cognate group of tongues spoken by the kindred peoples of Southern and Southwestern Asia and Europe, and extending from India as far as the people of Germanic blood have spread. (See ARYAN.) This great group is quite distinct from the Semitic family of languages, from the forms of speech spoken by the Mongolian tribes, and from the various other recognized groups of tongues which are distributed over the world. The question as to the situation of the primitive home of the Indo-Germanic peoples has been much discussed. The present tendency is to locate the original Indo-Germanic habitat in Central or Northern Europe

rather than in Asia. Various theories have been advanced, especially a generation ago, to account for the present distribution of these languages. The genetic arrangement of the tongues in a genealogical tree by Schleicher and other scholars, or views as to migratory movements or dissemination, like Johannes Schmidt's 'wave theory,' will be found referred to in most books relating to linguistics and comparative philology. The kinship of these languages has been scientifically proved by the family features and general likeness in their structure. In point of age they go back as far as the literary monuments of the Vedas.

The division of the Indo-Germanic peoples as represented by the various branches of speech is generally considered to be eightfold, as follows: (1) Indo-Iranian or Aryan proper, the ancient and modern languages of India and Persia; (2) Armenian, forming a sort of bridge between Asia and Europe; (3) Grecian or Hellenic, with its modern representatives in the tongues of Northern Greece and the Peloponnesus; (4) Albanian, a more modern representative of the ancient Illyrian; (5) Italic, the Latin, with its modern descendants in the Romance tongues; (6) Celtic or Keltic, originally occupying the west of Europe, but now confined chiefly to the British Isles, and of particular interest to the historical student of English and French philology; (7) Germanic, the important group to which the Anglo-Saxon, English, the German, and other Teutonic tongues belong; and lastly (8), the Balto-Slavic group, the chief representative of which is the modern Russian. The various subdivisions of these language divisions, together with their branches or dialects, will be found under the respective titles. Besides these there are some sporadic traces or representatives of other Indo-Germanic idioms which are not included in the list because the fragments are too scanty or too scattered to allow a determination in detail of the real character of the speech. Such are the Phrygian, which has affinities with the Armenian, or again the Messapian, which may be connected with the Albanian, or still further, the Macedonian, Gallic, Burgundian, or the like.

With reference to the general features, the Indo-Germanic languages are an inflectional group of tongues, sprung from a common ancestor no longer in existence. They have certain marked or distinctive features or variations of sound and accentuation that are more or less common to all, and they show a general similarity in structure as to roots, affixes, composite forms, with kindred variations of nouns, adjectives, pronouns, and verbs through eight cases, three numbers, including a dual, and a variety of moods and tenses, together with certain common phenomena in syntax and word-order. For a full bibliography, reference may be made to the standard work on the subject, Brugmann, *Comparative Grammar of the Indo-Germanic Languages* (5 vols., London, 1888-95), translated from the German without the three volumes on syntax by Delbrück. A second and revised edition of the original German work began to appear at Strassburg in 1897. Consult also the authorities referred to under **ARYAN**; **INFLECTION**; **LANGUAGE**; **PHILOLOGY**; **PHONETIC LAWS**; and also the articles on **ALBANIAN LANGUAGE**; **ARMENIAN LANGUAGE AND LITERATURE**; **CELTIC LANGUAGES**; **GREEK LANGUAGE**; **INDO-IRANIAN LANGUAGES**;

ITALIC DIALECTS; **LATIN LANGUAGE**; **ROMANCE LANGUAGE AND LITERATURE**.

INDO-IRANIAN LANGUAGES. A branch or group of the Indo-Germanic family of languages. It comprises the Indo-Germanic languages of ancient and modern India, Ceylon, Persia, Afghanistan, Baluchistan, Kurdistan, and the Ossetic portion of the Caucasus. Although the vowel-system is meagre, the consonants, generally speaking, best represent the pre-Indo-Germanic conditions. In inflection this group is the most primitive and highly developed of all the Indo-Germanic language divisions, while the most ancient literature in Indo-Germanic is preserved in Indo-Iranian. See **AFGHAN**; **AVESTA**; **BALUCHI**; **BENGLI LANGUAGE AND LITERATURE**; **CEYLON**, section **LANGUAGE AND LITERATURE**; **GUJARATI LANGUAGE AND LITERATURE**; **HINDUSTANI LANGUAGE AND LITERATURE**; **INDIAN LANGUAGES**; **INDO-GERMANIC LANGUAGES**; **KASHMIRI**; **KURDISH**; **MALDIVE LANGUAGE**; **MARATHI LANGUAGE AND LITERATURE**; **NAIPALI**; **OLD PERSIAN LANGUAGE**; **OSSETIC LANGUAGE**; **PALI LANGUAGE AND LITERATURE**; **PAHLAVI LANGUAGE AND LITERATURE**; **PANJABI LANGUAGE AND LITERATURE**; **PERSIAN LANGUAGE**; **PRAKRIT LANGUAGE AND LITERATURE**; **SANSKRIT LANGUAGE**; **URIYA LANGUAGE AND LITERATURE**.

INDO-MALAYAN SUBREGION. See **MALAYAN SUBREGION**; **INDIAN SUBREGION**.

INDONESIAN, in'dō-né'zhan (from Gk. Ἰνδός, *Indos*, Indian + νῆσος, *nēsos*, island). A term, coined in analogy with Polynesian, Melanesian, Micronesian, etc., used by certain ethnologists to denote certain peoples of the East Indies and Polynesia who are neither Malays nor Papuans, but Caucasian in type. Such authorities would include under this head the 'Eastern Polynesians,' certain tribes of Sumatra, Java, Borneo, the Philippines, etc. The differences between the so-called 'Indonesians' and the Malayan stock are, however, neither so important nor so significant as these writers claim, and there is good reason for looking upon the former as only a more primitive Malayan type, or proto-Malays. The 'Indonesians' and Malays are probably closely related, the former being really primitive Malays. The term 'Indonesian' was introduced by Logan, who attributed a Caucasian (Indian) origin to the lighter-colored natives of some parts of the East Indies, and extended in meaning by Hamy and others, who enlarged upon this theory. The term 'Indonesia' is used by some authorities to designate the Malay Archipelago, or island-group of the East Indies.

INDOOR BASEBALL. This sport varies but little from the regular game of baseball (q.v.). It originated at Chicago in 1887, and is credited to George W. Hancock and fellow-members of the Farragut Club of that city. It can be played in any hall of size which will permit of sufficient light and room for the diamond and fielding, the minimum playing floor measuring 40 × 50 feet. The rules are designed to equalize the difference of size and surroundings from outdoor baseball, as are also the implements of the game. The ball is of compact substance, 17 inches in circumference, weighs 8¼ ounces, and has a white cover; the bat being 2¾ feet long and 1½ inches in diameter. The bases are half-filled with sand, or other heavy substance sufficient to anchor them in place, and the rules of

the National Indoor Baseball Association of the United States govern the game.

INDORE, in-dōr'. A native Mahratta State of Central India (Map: India, C 4). It is traversed from east to west by the Nerbudda River, and also by the Vindhya Mountains, their loftiest point within its limits being 2500 feet above the sea. Valuable timber is found in the forest; and wheat, rice, tobacco, sugar-cane, cotton, poppy, etc., are cultivated. Opium is one of the chief manufactures. The Bhils, one of the wildest and most savage of the aboriginal tribes of India, inhabit Indore. Besides the capital of the same name (q.v.), the principal towns are Rampura, Mehadpur, Bhanpura, and Mhow. Area, 8400 square miles; population, in 1891, 372,800; in 1901, 333,000. The Mahratta ruler bears the name of Holkar (q.v.), whence the State is sometimes called the Holkar's Dominions.

INDORE. The capital of the native Mahratta State of the same name, India, situated on the left bank of the Kuthi (Map: India, C 4). It is about 2000 feet above the level of the sea. Indore was founded in 1767, and contains the palace of the Holkar, a college, and mint. It has a modern drainage system, and a good water-supply, and maintains a public lighting plant, market, reading-room, and dispensary. It has manufactures of cotton and a considerable grain trade. A suburban district, assigned by treaty, contains a British residency, the seat of an agent and his staff, and the Government opium depot of the Central Provinces. Population, in 1891, 92,300; in 1901, 86,200.

INDORSED. See **HERALDRY**.

INDORSEMENT (from *ML. indorsare*, to indorse, from *Lat. in*, in + *dorsum*, back). In its broadest sense, any writing on the back of an instrument. As a technical term of the law merchant, it denotes the writing of the holder's name upon a bill of exchange, check, promissory note, or other negotiable instrument, on transferring it to another. While this writing is ordinarily on the back of such an instrument (whence its name), it is equally effective if made on its face, or on a paper annexed to the instrument. In order to convert the writing into a contract, it must be delivered with the intention of giving effect thereto; or it must find its way into the hands of a bona-fide holder. The contract obligation of an indorser is to pay the indorsed instrument, provided payment is duly demanded, and payment is refused, and due notice of the dishonor is given to him. If the payee or holder simply signs his name, the indorsement is said to be blank, and the subsequent holder may fill out the indorsement to any one. A special indorsement is one which specifies the person to whom, or to whose order, the instrument is to be payable, e.g. 'Pay C. D. or order. (Signed) A. B.' When personal liability as indorser is to be avoided, the words 'without recourse' are added. Such an indorsement does not prevent the further negotiation of the instrument, or cast any suspicion upon its validity. A similar restriction is made in England in the case of checks by crossing them. (See **CHECK**.) One which limits further negotiation is called a restrictive indorsement, e.g. 'Pay Corn Exchange Bank only.' It is provided by modern legislation that when an indorsement is conditional, a party required to pay the instrument may disre-

gard the condition and make payment to the indorsee or his transferee, whether the condition has been fulfilled or not. This changes the old rule, under which an acceptor or maker paid a bill or note with such an indorsement at his peril, if the condition was not fulfilled. That was thought to be unduly hard upon the party required to pay. See **BILL OF EXCHANGE**; **CHECK**; **NEGOTIABLE INSTRUMENT**.

IN'DRA. The great national god of Vedic India. Although Indra lost his supremacy through the rise of Brahma, Siva, and Vishnu, he is still preserved as a figure in the Hindu pantheon. As represented in the *Veda* (q.v.), he is primarily the god of the lightning and thunder, with the attendant phenomena of the storm, wind, and rain; by vanquishing the demons of drought and darkness he restores the sun to the sky, the light of dawn, and the day. The realm of his activity is the atmosphere; and the many hymns of the *Rig-Veda* that are devoted to his praise—far outnumbering those to any other god—are rich in meteorological imagery and poetic allusions to natural phenomena. Armed with the thunderbolt (*vajra*), his special weapon, and inspired by copious draughts of intoxicating *soma*, his favorite beverage, he goes forth to do battle with the demons, especially Vritra, who, wrapped like a choking serpent about the clouds, has shut up the waters as prisoners. One of the hymns that describes this battle and the god's triumph over the dragon (*Rig-Veda* 1.32) is an epic in miniature. As the god of battles, Indra is looked upon in the historical hymns of the *Veda* as the royal patron of the victorious Aryans in their conflicts with the aboriginal inhabitants of India. His supremacy during the whole Vedic period is unquestioned; the more ethial and transcendental Varuna is no rival to his prowess.

In the later mythology a change takes place; Indra gradually sinks to a secondary rank among the gods. His installation as god of the lesser divinities is described in the *Āitar̥ya-Brah̥mana*; and from that time onward he becomes rather a figurehead in the pantheon, and the type of a mortal king, than the former supreme lord of heaven. The Epic and Puranic periods distinctly show that he has ceased to enjoy the worship accorded him in Vedic times. He remains ruler of the atmosphere, it is true, and one of the eight world-guardians, regent of the eastern quarter of the sky, wielding his thunderbolt and sending down rain, but his real power is gone. Instead of descriptions of him as the great god of battles, praises are lavished on the delights of his paradise, *Svarga*, with its heavenly musicians and enchanting nymphs, the *Gandharvas* and *Apsarasas*, and all the joys of this happy abode of the gods and faithful worshipers. Like the later writings, the epics bring to view the sensual side of Indra's character in his amours with Ahalya, the wife of a sage—a bit of scandal as old as the Brahmanas. In consequence of the curses of the outraged seer, the god was doomed to lose his virile power; the conqueror Indra ceases to be invincible, even a son of the demon Ravana vanquishes him, as told in the *Rāmāyana*, and wins the title *Indra-jit*, victor over Indra, for his prowess. The *Purānas* likewise describe him as worsted by the rising god Krishna, an incarnation of Vishnu, and they name various successors of Indra as

rulers in the different *manvantaras*, or ages of the world.

Among the Hindus at present Indra is little worshipped. In Bengal a single day of the year is consecrated to his service, and, on occasions of drought, he is prayed to in other parts of the country. But Indra the mighty is no more. His golden chariot in the *Veda* is now replaced by an elephant on which he is generally represented as riding, and the thunderbolt is grasped in his hand. The face and body are sometimes portrayed as covered with figures resembling eyes, into which they are said to have been mercifully transformed from the thousand vile marks that came out upon his person in consequence of the curse brought upon him for his incontinency with Ahalya. For a full description of Indra during the Vedic period, consult: Perry, "Indra in the *Rig-Veda*," in the *Journal of the American Oriental Society*, vol. xi. (New Haven, 1880), and Macdonell, *Vedic Mythology* (Strassburg, 1897); for the later Indra, consult also Dowson, *Hindu Mythology* (London, 1879); Hopkins, *Religions of India* (Boston, 1895); Wilson, *Hindu Mythology* (2d ed., London, 1900).

INDRANI, in-dra'nè. A name of the wife of the Hindu god Indra (q.v.) in the *Veda*. She is called Saci or Andri in the later legends.

INDRE, ä'n'dr'. A river of France, rising on the northern border of the Department of Creuse (Map: France, H 5). It flows northwest through the departments of Indre and Indre-et-Loire, past the towns of La Châtre, Châteauroux, and Loches, and joins the Loire 17 miles below Tours, after a course of 136 miles, for the last 40 of which it is navigable for small craft.

INDRE. A central department of France, the western portion of the old Province of Berry, lying immediately south of the Department of Loir-et-Cher. Area, 2666 square miles, of which about four-fifths are in tillage and pasture (Map: France, H 5). Population, in 1896, 289,206; in 1901, 288,788. The chief rivers are the Indre, the Vienne, the Creuse, and its tributary, the Anglin. The surface is for the most part flat, and the land is generally fertile, producing large crops of wheat and barley. The principal resources of the department are its vineyards and its flocks. The principal manufactures are woolen and linen cloths, hosiery, scythes, paper, and porcelain. Iron-mines are worked. Capital, Châteauroux.

INDRE-ET-LOIRE, ä lwär. An inland department of France, part of the ancient Province of Touraine, lying northwest of the Department of Indre (Map: France, G 4). Area, 2377 square miles, of which more than one-half is arable; population, in 1896, 337,064; in 1901, 335,541. The department is watered by the Loire, the chief river, and by its tributaries, the Cher, the Indre, and the Vienne, all of them navigable. In the south the surface is hilly, but in the other districts it is undulating and fertile. Cereals are grown, but wine is the most important product. The chief manufactures are bar iron, woolen cloth, silk, rope, paper, and leather. Capital, Tours.

INDRI. A large, monkey-like lemur (*Indris brevicaudata*), of Madagascar, which is regarded as the most highly organized of the tribe, and differs from other lemurs in several important

particulars, such as having only 30 teeth, the large size of the hind limbs as compared with the fore limbs, the webbing of the toes, and the fact that only one offspring is produced annually. The coat is variable black and white curiously contrasted, and the ears look like hairy tufts. Unlike most lemurs, the indris are wholly diurnal, going about in the forests of the East Coast, to which they are confined, in small parties, and subsisting mainly on fruit. Their voices are loud, and when angry or hurt the animals utter piercing shrieks or mournful cries. These howlings and other characteristics have led to many native superstitions in regard to the indri, which alone constitutes a subfamily of the Lemuridæ. See Plate of LEMURS.

INDUCED ELECTRIC CURRENTS. See ELECTRICITY; INDUCTION.

INDUCTANCE. See INDUCTION.

INDUCTION (Lat. *inductio*, inference, from *inducere*, to lead in, from *in*, in + *ducere*, to lead). A form of the logical process of discovering the general character of individual phenomena. In order to understand any fact or event, we need not only to be able to tell of its sensible qualities or constituents, but also to know what identity (q.v.) it has with other facts or events. Such an identity is a general character, or, as it is called in logic, a universal. When in the case of several objects we discover an identity in color or shape, we perform the act of conception (q.v.). If, using some already discovered identity between some objects as a point of departure, we assume some other identity to exist between the same objects, we are said to generalize or to make an induction. Induction may thus be defined as the universalizing of perceived relations or connections between objects. Among these relations one of the most important is that of antecedence and consequence. (See CAUSALITY.) This universalization is corrected or confirmed by further observation of these connections in other individual cases until at last often a valid judgment asserting unconditional connection is reached. A valid induction is one which, starting from particular observations, thus reaches a valid universal judgment. Scientific inductions do not differ in principle from the naïve inductions we have already described; the difference is one of degree, not of kind.

Looking now at inductions ascertained to be valid, we discover three stages in the process of arriving at certified results. The first stage is called *preliminary observation*. At this point actual coexistences and sequences or other relations are observed and form the data for the induction. The second stage consists in the generalization of some actually ascertained coexistence or sequence, or other relations. This is *induction proper*. The third stage is *verification*, the correcting or confirming of the validity of the generalization by further observation. Frequently the term induction is used to include all these three steps; in this case the second step is called generalization. Let us now take up these three steps in order.

I. Preliminary observation may be quite casual and accidental, or it may be intentional. A person may happen to see some connection between phenomena, or he may be intently looking for connections. In the latter case, the

observer may simply look at things as they offer themselves to his notice, or he may set about to interfere with the spontaneous course of events in order that he may the better observe the connection. The latter sort of observation is called an experiment. When experiment is possible, it is usually of great assistance in collecting data for generalization. Indeed, almost all the great advances in modern science have been due to experimentation rather than to mere observation. In intentional observation, whether it be simple or experimental, it is extremely important for the observer to know what he is to look for. Not every detail in the complex of details under observation is pertinent to the matter in hand; and yet no *a priori* rules can be given to direct an investigator. Much depends on experience and skill not subject to rules. But by analyzing successfully conducted inductions, logicians are able to formulate several important rules of procedure, which thus are *a posteriori*. For our present purposes we can do no better than quote John Stuart Mill's canons of induction. These state the conditions under which generalization may be made. Hence the observer should be on the watch for the occurrence of these conditions.

The canons are as follows: First Canon, for the Method of Agreement: *If two or more instances of the phenomenon under investigation have only one circumstance in common, the circumstance in which alone all the instances agree, is the cause (or effect) of the given phenomenon.* Second Canon, for the Method of Difference: *If an instance in which the phenomenon under investigation occurs, and an instance in which it does not occur, have every circumstance in common save one, that one occurring only in the former, the circumstance in which alone the two instances differ, is the effect, or the cause, or an indispensable part of the cause, of the phenomenon.* Third Canon, for the Joint Method of Agreement and Difference: *If two or more instances in which the phenomenon occurs have only one circumstance in common, while two or more instances in which it does not occur have nothing in common save the absence of that circumstance; the circumstance in which alone the two sets of instances differ, is the effect, or the cause, or an indispensable part of the cause, of the phenomenon.* Fourth Canon, for the Method of Residues: *Subduct from any phenomenon such part as is known by previous inductions to be the effect of certain antecedents, and the residue of the phenomenon is the effect of the remaining antecedents.* Fifth Canon, for the Method of Concomitant Variations: *Whatever phenomenon varies in any manner wherever another phenomenon varies in some particular manner, is either a cause or an effect of that phenomenon, or is connected with it through some fact of causation.* These are statements of the conditions under which scientific men make inductive inferences. Hence in our observations for the purposes of induction we should keep the following questions in mind: Is it the case that any instance in which the phenomenon under investigation occurs, and any instance in which it does not occur, have every circumstance in common save one? Is it the case that two or more instances of the phenomenon under investigation have only one circumstance in common? Is it true that two or more instances in which

the phenomenon under investigation occurs have only one circumstance in common, while two or more instances in which it does not occur have nothing in common save the absence of that circumstance? Is a part of this phenomenon under investigation known to be the effect of certain causes? Does the phenomenon under investigation vary in any manner whatever whenever some particular circumstance varies in some particular manner? In case any of these questions can be answered in the affirmative, an induction may be made. It must not, however, be supposed that an investigator sets about his work with only such general clews as are furnished by these questions. In any particular investigation, a knowledge of exactly what has already been done by previous workers is indispensable. If he has this knowledge, the investigator is in a position to ask much more definite concrete questions than the five we have just mentioned. But, however much more definite his problem may be, it may always be reduced to general expression, and when so reduced it will assume the form of one of the five questions stated above, which give the headings for the treatment of the methodology of observation. Any more specific methodology can be worked out only on the basis of the practiced experience of the expert in any particular line of research.

II. It has already been said that when any one of the five questions given in the last paragraph can be answered in the affirmative, we universalize the actually observed relation between phenomenon and circumstance. But now it will probably be asked what warrant there is for this universalization. The answer is somewhat as follows: To universalize is an instinctive tendency of thought. The child 'jumps at conclusions' in very much the same way as the kitten jumps at a moving string. What the child does, the ordinary adult also does, and unless corrected by experience the probability is that every one would generalize every observed relation. But experience does check the tendency in a measure. The child who generalizes the observed connection between shape and reboundingness, or color and reboundingness, comes by later experience to find that his generalization is invalid. The truth of the universal judgment implied in his expectation is not borne out by later developments. But he is nothing daunted. He proceeds to generalize some other observed connection until at last he gets a *general law which is uncontradicted by experience*, and which he therefore accepts as true. The first generalizations are naïve, instinctive attempts to find uniformity in the world of experience. The attempt in any particular direction may be baffled, but only to be followed by an attempt in another direction. In other words, some attempts fail and others succeed. To succeed is to find that subsequent experience conforms and continues to conform to the expectation aroused by previous experiences. To fail is to find that subsequent experience disappoints this expectation, while in either case the expectation is, from the point of view of logic, an unreflective generalization. In later life consciousness becomes reflective; it looks back upon its own processes and finds that in cases of successful generalization certain conditions are present, while in cases of failure these conditions are absent. The same instinctive generalizing

tendency which led to the generalization of the earliest connections discovered, now leads to the generalization of the connections between successful generalization itself and the conditions under which the success is achieved. These latter generalized connections are logical laws of thought. We now are in a position to see that there are two kinds of laws of thought, logical laws and psychological laws. The psychological laws are those which express the modes of thought-behavior, whether the results of the behavior be intellectually satisfactory or not. The logical laws express the conditions under which the results of thought-behavior are intellectually satisfactory to the thinker. Thus it is a psychological law that an immature thinking consciousness generalizes instinctively, i.e. without any foresight of the results to be gained; it is a logical law that if the generalization is to be valid it must be made only under certain conditions, given in the five canons mentioned above. This logical law is itself validated by the fact that it is a generalization made in conformity with the law of which it is itself the expression. In other words, it is self-consistent, and also consistent with all the known facts. A more stringent test of the validity of any law has never been conceived. If now it is further asked whether we know that the thought which conforms to the laws of thought thus discovered will continue to be successful in the future as it has been in the past, we can answer by saying that we have only one plausible reason to suppose it should not be successful, while every other reason that we know would lead us to believe that it will be successful. That one exception is the fact that in past experience when we thought that we had discovered laws, we often found that we were in error. Hence, it may be reasoned, it is possible that we may be in error now as to the logical laws of thought. But this argument has not the force that at first sight we might be tempted to ascribe to it. If we know that in the past we thought wrongly in many instances in which we thought that we were right, and if we now generalize this knowledge and say that therefore on the same principle we may now be in error, and may always be in error, we are making a naïve, uncriticised induction; and such inductions our past experience has proved to us to be very precarious. We can criticise the naïve induction when we discover that in the past any supposed knowledge turned out to be error only in cases which did not conform to certain conditions. If now our generalization as to the valid laws of thought is made in conformity with these conditions, lack of conformity to which made other inductions invalid, then the invalidity of those other inductions is no reason for attributing invalidity to these laws of thought. Past errors in induction should indeed make us very circumspect. We should use our utmost endeavors to avoid the causes which misled us; but having avoided the causes, we need not be timid as to the validity of an induction which in the past has never been impeached by experience, but, on the contrary, has been verified time and time again. A persistent objector may still argue that the fact of our having made errors in the past is still a good reason for doubting the validity of all inductions, and therefore for doubting the validity of the laws of thought which we have

discovered by induction. A man who argues thus forces us to resort to a valid form of the *argumentum ad hominem*. (See ARGUMENT.) He obliges us to remark that he assumes for the purposes of his argument the validity of the law he is assailing. What is an appeal to the fact of past error in proof of the fallibility of all laws of thought? It is nothing but an *induction* from past experience. The correctness of the conclusion of this induction would carry with it the invalidity of all argument by induction, and therefore the invalidity of this argument which seeks to prove by induction the correctness of the conclusion. Here as elsewhere (see KNOWLEDGE, THEORY OF) we see that one cannot reason against the laws of reason without putting one's self out of court.

III. Verification of an induction consists in testing it in new instances. Any newly made induction is presumably based on a limited experience and it needs to be examined in its bearings upon other parts of experience. The question in the mind of a person verifying an induction is this: Does the universalized relation prove its universal character in all our experience so far as this experience is pertinent to the relation at issue? This question can be answered only by looking at our past experience and by getting further pertinent experience. No verification of a true universal can be exhaustively completed; but, as we saw under II. above, it may be practically conclusive. There may be no reason left for doubting a proposition except the bare possibility that it may not be true in cases as yet beyond our ken, but a bare possibility is always an unreasonable possibility. The relation of induction to deduction is treated under DEDUCTION. The question whether any general proposition can be arrived at without induction has often been affirmatively answered. (See A PRIORI.) But that answer is incorrect. (See KNOWLEDGE, THEORY OF.) For instance, the geometrical axiom that things equal to the same thing are equal to each other is derived from experience by induction. It is first seen in individual instances that individual things, equal to the same individual thing, are equal to each other. This relation is then universalized. So with the arithmetical judgment: 'Two and two are four.' Hegel and J. S. Mill are the great logical protagonists of this view. Mill's statement of the view is more familiar than Hegel's, but it is defective in that it is based on an atomistic view of experience (see ATOMISM), a view which makes against the validity of induction by reducing all induction to mere simple enumeration (*inductio per enumerationem simplicem*), or a bare telling off of isolated findings, and a summation of the results of these findings into a collective statement.

Consult the authorities referred to under LOGIC; especially to be named here are the logics of Hegel, J. S. Mill, Bain, Minto, Jevons, Ueberweg, Lotze, Wundt, Sigwart, Bradley, Bosanquet, Hibben, and Creighton, also Hobhouse's *Theory of Knowledge* (London, 1896).

INDUCTION. If an electrified body is brought near an uncharged one—either conductor or non-conductor—the latter will exhibit electrical forces; it is said to be charged by 'induction.' In general, if a charged body is surrounded by a uniform medium, such as air, and if a body of

any other material than that of the medium is introduced, thus making the surrounding medium heterogeneous, there will be induced charges on the body introduced. The question as to the character of the charges on this body and their distribution depends upon the relative electrical inductivity of the body and the surrounding medium. (See ELECTRICITY.) Similarly, if there is a magnet surrounded by a uniform medium, such as air, and if a body of a different kind of material from the medium is brought near the magnet, it will exhibit magnetic forces and is said to be magnetized by induction. The character and distribution of this induced magnetization depend upon the relative magnetic inductivity of the medium and the foreign body. (See MAGNETISM.) If the body which is introduced is iron or any magnetic body, and if the medium is air, the induced magnetization is such as to produce attraction by the magnet; if bismuth is introduced there will be repulsion. Electro-magnetic induction is the phenomenon observed when the magnetic field of force included by a conducting circuit is altered in any way, viz. electric currents are produced in this circuit. These induced currents are due to the *changing* of the field of magnetic force, and are in such a direction as to tend to neutralize the change; they last only so long as the field is changing. See ELECTRICITY.

TUBES OF ELECTRIC INDUCTION are tubes which can be imagined drawn in the medium surrounding electrified bodies by choosing any small closed curve in this medium and drawing lines of force through each point of it. A hollow tube is thus made which has one open end on a positively charged body and the other on one negatively charged. If this tube is made of such a cross-section that it includes unit electrostatic charges as its two ends, it forms a 'Faraday tube.'

TUBES OF MAGNETIC INDUCTION are tubes formed in the same manner in the field around magnets by drawing lines of magnetic force through the points of any small closed curve. Faraday conceived the idea of these tubes being continuous through magnets and all bodies, not ending on any surface; they form, therefore, closed circuits, like a rubber tube with the two open ends brought together. The tubes are conceived to be of such cross-sections that the number leaving a north pole of unit strength is 4π , where $\pi = 3.1416$. See MAGNETISM.

Owing to an electric current in a closed circuit, there is a magnetic field of force inclosing it; the tubes of magnetic induction form closed curves around the conductor. The *coefficient of self-induction*, or the *inductance*, is the number of these tubes threading through the circuit when there is a unit current in the conductor. Some of these tubes of magnetic induction may also in their paths pass through a neighboring closed conducting circuit, and the number of those tubes which do so when there is a unit current in the first circuit is called the *coefficient of mutual induction* of the two circuits. It may be shown that if there is a unit current in the second circuit, thus producing tubes of magnetic induction of its own, the number of these which thread the first circuit is the same as in the last case. The coefficient of self-induction depends upon the shape of the circuit, the number of turns of the conducting wire, and on the surrounding medium, and the coefficient of mutual induction depends

upon these properties for each circuit and upon their relative positions. It can be shown that inductance plays the same part in the phenomena of electric currents that inertia or mass does in the motion of matter. The practical unit of induction is the henry (q.v.).

INDUCTION BALANCE. An instrument to determine the presence or character of a piece of metal, which may be either concealed, as a bullet in a human body, or in the form of a counterfeit coin or alloy. It was originally devised by Dove in 1841, but was improved and constructed in a serviceable form by Hughes in 1879. It consists of two sets of induction coils in which the primaries are connected together in a circuit that includes a battery and a microphonic or other circuit-breaker, while the secondaries are in connection with a telephone used by the observer. The current traverses the primary coils in opposite directions, and the secondary coils are so arranged that the sound of the microphone or circuit-breaker is not heard, owing to the inductive effect being neutralized completely. If a coin or other metallic substance is introduced into the vicinity of one of the pairs of coils, this equilibrium will be disturbed, as part of the induction acts upon the metal and gives rise to induced currents. This of course produces an audible sound in the telephone. The instrument is also used to measure hearing, and it then is known as an audiometer, the perception of sound being tested by altering the positions of the coils. An arrangement of the induction balance was devised by Prof. Alexander Graham Bell to locate a bullet in the human body, and apparatus based on the foregoing principle was employed and numerous different forms made and tested. It was used in an attempt to discover the bullet by which President Garfield was killed, but the presence of the metallic mattress interfered with the operation of the instrument. Instances, however, of its successful use are on record. Consult: Bell, "Induction Balance," in *American Journal of Science* (New Haven, 1883); Hopkins, *Experimental Science* (New York, 1890).

INDUCTION COIL. A form of electrical apparatus used for transforming an interrupted current of low potential or pressure into one of high potential and alternating in direction. The fundamental fact of electro-magnetic induction was first stated by Michael Faraday in a paper presented to the Royal Society on November 24, 1831, in which he derived the conclusion that any change in a magnetic field will induce an elec-

FIG. 1. DIAGRAM OF INDUCTION COIL.

tric current in a conductor situated in it. This basic principle of electro-magnetic induction underlies the construction and operation of the induction coil. As regards its construction, it consists of four essential parts: A bundle of soft

iron wire, AA (Fig. 1), called the core; the 'primary coil,' BBBB, of insulated copper wire wound on the iron core, which is usually made of comparatively large wire and short in length; a much larger 'secondary coil,' CC, of longer, finer copper wire; and a device, D (Wagner's hammer, 1839), called the rheotome or interrupter, which alternately makes and breaks the connection of an electric current through the primary coil. In dimensions they vary from a few inches in length and a fraction of a pound in weight to those of large dimensions used for wireless telegraphy described below.

The operation of the apparatus is as follows: The small spring S, being in contact with the point P, allows the current from the battery E to flow through the primary coil, converting it and its core into a powerful electro-magnet. The production of this powerful magnetic field in and around the secondary coil induces in it a momentary current of high potential, and opposite in direction to the primary. This secondary current is usually able to pass as a spark between the terminals of the secondary TT. When the core AA becomes magnetic it attracts the piece of soft iron I on the spring S and draws it up, thereby breaking the connection between the spring S and the point P, and interrupting the flow of current in the primary. Thereupon the electro-magnet AB loses its magnetism, and, ceasing to attract the iron I, the spring returns to

ondary coil in the same direction as the primary current, and hence in the opposite direction to the current induced in the secondary upon starting the current in the primary. The above cycle of operations repeats itself periodically, at a rate depending upon the spring S. Many modifications of the interrupter are used, some attached directly to the coil, as above described, some operating independently, but still electro-magnetically, and yet others are driven by an independent motor and are purely mechanical. Fig. 2 illustrates a form due to Foucault. One circuit runs from the binding post k' through the

FIG. 3. EARLY RITCHIE INDUCTION COIL.

A, Core of iron wire; B, B', binding posts of primary circuit; C, D, binding posts of secondary circuit; E, standard carrying interrupter; F, armature; G, tension spring; H, contact screw; J, contact spring; K, binding post; L, contact point.

FIG. 2. FOUCAULT INTERRUPTER.

its original position, restoring the contact between S and P and again starting the current in the primary. The disappearance of the magnetic field on breaking the primary circuit induces a momentary current of high potential in the sec-

magnet D, pulling down the armature *a* supported by the spring *c*, and lifting the wire B out of the mercury cup B', interrupting the current, whereupon *a* springs up and B enters the mercury, again starting the current. This device may be introduced into the primary circuit of an induction coil, or the latter may be connected to the posts F, H, K, so as to use the wire A and cup A' for interrupting the current for the induction coil, while B' operates to keep the apparatus in motion. A commutator consisting of a hard rubber cylinder with metal contact pieces is shown at I, with binding posts at *n* and *m*. Fig. 3 shows another form of interrupter attached to an early form of induction coil. Fig. 4 shows the latest improvements—a Queen coil, with independent mechanical interrupter, capable of giving a 46-inch spark.

In some cases an alternating current is used in the primary without an interrupter; then the induction coil becomes practically a transformer, and the action is essentially the same as in apparatus of this class. See TRANSFORMER.

The quantity of electricity moved at the break is equal to that moved at the make in the primary circuit; but, owing to the fact that the magnetism in the core vanishes much more rapidly at the break than it builds up at the make, the effect at the break is more compressed, and the potential, or electrical pressure, much greater than at the make. The suddenness of the break is of the greatest importance, and most of the improvements in interrupters have been designed to make the break as sharp as possible. The important factors which affect the potential or length of spark produced by an induction coil are the relative number of turns of wire in the primary and in the secondary, the suddenness of the break, and the voltage or potential of the current used in the primary coil.

Pohl in 1835 made a very crude induction apparatus of a different style; but the first to make large coils of the above type were Stöhrer and Ruhmkorff, and from the latter is derived the name 'Ruhmkorff coil,' which is frequently used as a synonym of induction coil. In 1855 Poggenдорff increased the suddenness of the break by so arranging the device that the interruption occurred under an insulating liquid or in vacuo. (The cups B' A' in Fig. 2 have alcohol over the mercury.) In 1857 Ritchie, of Boston, devised a means of winding the secondary coil in sections, like circular disks, which, laid together and connected, formed the cylindrical coil. This obviated to a great extent the danger of a spark jumping across from one turn of the secondary to another through the insulation. Ruhmkorff was so impressed with the superiority of a Ritchie coil exhibited in Paris that he adopted the Ritchie method of winding, and it prevails at present.

FIG. 4. QUEEN COIL.

Poggenдорff proposed, and in 1853 Jean tried with good success, the use of a liquid as the insulation of the secondary, and at present most of the high-potential coils use liquid insulation. The advantage lies in the fact that if a spark should jump over, the hole in the insulation

would immediately close. Fizeau suggested a decided improvement in 1853, introducing a condenser at the break, as shown at F (Fig. 1). This enables the extra current of the primary to run into the condenser for an instant, while the points S and P are first separating, and by the time that F is charged P and S are too far apart for the current to jump across.

In 1869 a coil was built for the London Polytechnic Institute the core of which was 5 feet long, 4 inches in diameter, and weighed 123 pounds. The primary had 6000 turns of wire 0.095 inch in diameter and 3770 yards long, weighing 145 pounds. The wire of the secondary was 0.015 inch in diameter and 150 miles long. This coil gave a spark 29 inches long and could penetrate more than 3 inches of glass. The modern coil shown in Fig. 4 gives a spark 46 inches long.

The induction coil is especially used in the study of the electric discharge in rarefied gases, as in Geissler, Crookes, and X-ray tubes; also in electro-therapeutics, and more recently for X-rays and wireless telegraphy. Although the static machines have supplanted the induction coil in the best X-ray laboratories, it still holds its place in wireless telegraphy. It was by means of such a coil that Heinrich Hertz carried out his brilliant researches which led to the discovery of electric waves, thus confirming the great theoretical hypothesis of Maxwell, and laying the foundation for wireless telegraphy.

All of the large manuals of experimental physics also devote considerable space to this class of apparatus.

INDUCTION MOTOR. See DYNAMO-ELECTRIC MACHINERY.

INDUCTOPHONE (from *induct* + Gk. *φωνή*, *phōnē*, voice). A form of apparatus consisting of coils of wire and a telephone receiver, designed to afford communication between moving trains and stations. The apparatus and system were devised by Willoughby Smith, of London, in 1882, but never have been practically applied. Signals were transmitted inductively from coils of wire placed along the line to other coils in the train and received by means of a telephone.

INDULGENCE (Lat. *indulgentia*, indulgence, from *indulgere*, to indulge). A term of Roman Catholic theology, signifying the remission of temporal penalties due to sin, by one who has the power to distribute the spiritual treasures of the Church. An indulgence is not believed to remit guilt; only sacramental absolution avails for that; but it affects the punishment which would otherwise

be inflicted in the regular exercise of ecclesiastical discipline. According to Bellarmine's statement, one who has been absolved from guilt in the sacrament may be released from penalty by an indulgence. It is an act, not of 'order,' but of 'jurisdiction,' based upon the power of the keys. (See KEYS, POWER OF.) So complete is this power held to be that the efficacy of an indulgence is believed, in a true sense, to satisfy divine justice, as well as to secure the remission of temporal penalties, whereby it is made to extend beyond this present life into the state of purgatory. The ground of this satisfaction is sought in the treasure of merit laid up by Christ and the saints, and always at the disposal of the Church whenever need requires. This *thesaurus meritorum* is fundamental to the fully developed theory of indulgences. The clergy are its duly appointed custodians; its beneficiaries are the adherents of the Church throughout the world who themselves fall short of sainthood; the indulgence is its channel of communication.

The history of indulgences begins with Roman law, where the word *indulgentia* means the remission of a punishment or of a tax. From legal the word easily passed into ecclesiastical usage. A sovereign Church, like a sovereign State, might exercise clemency, instead of exacting the full measure of punishment which the law required. But long-continued, and sometimes bitter, controversies indicate the doubts which many Christians felt as to the propriety of this contention, which finally led to the catastrophe of the sixteenth century, when Luther voiced the protest of a large section of Christendom against the current application of the doctrine. The first important step toward establishing the dispensing power of the Church was taken in consequence of the Decian persecution, beginning A.D. 250, when the problem arose how to deal with the lapsed. These questions were answered by the beginnings of penitential discipline. The further question of the relaxation of discipline was also answered on the side of mildness. The power of 'loosing' was declared to be no less real than the power of 'binding' (cf. Matt. xvi. 19). Ambrose especially taught that the two were correlative, and the Church accepted his view. But the Council of Ancyra (A.D. 314) had already sanctioned the use of clemency, at the discretion of the bishop, and this position had been indorsed by the first Ecumenical Council at Nicæa (325). Appeal was made to the example of Saint Paul, who recommended a degree of mercy toward the offender in Corinth (see II. Cor. ii. 6-8). The main exercise of this power, in the fourth and fifth centuries, was in shortening the canonical periods of penance, evidence of which is found, for instance, in the teaching of Gregory of Nyssa.

By degrees a variety of substitutes for the canonical penalties were introduced. Fasting might be remitted in consideration of repeating a certain number of psalms, or of paying a fine (as by Theodore of Tarsus, Archbishop of Canterbury, in the seventh century). Almsgiving, pilgrimages, and holy wars came to be the most popular means of securing indulgences, especially in the period of the Crusades (q.v.). The Council of Clermont (1095) asserted that the pilgrimage to the Holy Land took the place of all other penance. With the decline of the Crusades in-

dulgences were offered for fighting against heretics, such as the Albigenses and Hussites (q.v.). The first great jubilee indulgence was published by Pope Boniface VIII. in 1300. The fully developed scholastic theory upon which indulgences are based is found in Thomas Aquinas and Alexander of Hales. The importance there attached to the 'treasure of merit' naturally led to a popular belief among the ignorant that pardon for sin and immunity from punishment were matters of ecclesiastical bookkeeping—that they could be bought and sold. It was in view of this popular impression, and the undoubted abuses which grew out of it, that Luther published his theses on indulgences in 1517, the event which marks the beginning of the Protestant Reformation. See LUTHER.

The Council of Trent, at its twenty-fifth session (1563), condemned those who assert that indulgences are useless, or deny that the Church has power to grant them; but in reaffirming its belief the Church decreed the abolition of all evil gains and other abuses which had grown up in connection with the indulgence system. Since that time the Church has attempted to guard against misinterpretations of the doctrine, and to safeguard it from the criticisms to which it had previously been exposed.

From what has been said it will be evident that Roman Catholics do not understand by an indulgence a remission of sin itself, much less a permit to sin, or a pardon for the future. They hold that its benefits can be enjoyed only by a sinner who has repented and resolved to lead a new life, and they deny the charge that the indulgence system has introduced any laxity of principle into the Church.

The power to grant indulgences for the whole Church resides only in the Pope, but primates, archbishops, and bishops have power to grant them within their own jurisdictions. The indulgence may be either plenary or partial, the former remitting the whole of the temporal punishment, the latter something less than the whole. For example, an indulgence of forty days is understood to remit as much as would have required forty days of penance without it. Indulgences may be attached to certain articles (e.g. a crucifix), or to certain places (as a shrine). In these cases the original possessor of the article, or the pilgrim to the shrine, receives the benefit of the indulgence. A custom of granting indulgences for the dead grew up in the Middle Ages. The right and efficacy of such grants has been much debated; but the Church holds them to be salutary, even though their precise scope cannot be defined. As limited by Sixtus IV. (Constitution of 1477), they are 'only by way of suffrage'—i.e. the Church does not assume direct authority over the dead.

Lea, *History of Auricular Confession and Indulgences in the Latin Church*, vol. iii., "Indulgences" (Philadelphia, 1896); "The Roman Catholic Doctrine of Indulgences," by the Bishop of Newport, in the *Nineteenth Century* (January, 1901); Addis and Arnold, *Catholic Dictionary* (2d ed., London, 1884), article "Indulgence."

INDULT (Lat. *indultum*, indulgènce, from *indulgere*, to indulge). A term derived from the

Roman Imperial codes, and used in canon law to designate an exceptional concession or privilege granted by the Pope to one or more persons. The best-known examples apply to the privilege allowed in certain cases to kings and other rulers of nominating to bishoprics and ecclesiastical benefices; thus Francis I. of France received this power when the Pragmatic Sanction was abolished in 1516. Indults were frequently granted in the Middle Ages allowing perpetual non-residence at the same time that the income was drawn; but this practice was abolished by the Council of Trent, except that canons who have a record of forty years' irreproachable service are dispensed by indult from further residence in the seat of their chapter. Temporary indults of this nature are frequently granted for absence on important ecclesiastical business.

INDUNO, ɪn'dʊn-ō, GIROLAMO (1827-91). An Italian painter, born in Milan. He studied at the Milan Academy, and first exhibited in the Paris Salon in 1855. His pictures are mainly of military or of humorous genre subjects. They include: "Garibaldi's Soldiers" (1855); "A Vivandière"; "Dancing Lesson in the Last Century"; "A Souvenir of Rome;" and "The Musicians."

INDUS (Lat., from Gk. *Ἰνδός*, from Skt. *śindhu*, river). The great river that bounds India on the west, separating it from Afghanistan and Baluchistan (Map: India, A 3). It is over 1800 miles long, and the drainage area of its basin is estimated at 372,000 square miles. It rises 50 miles southeast of Gartok, an important trading centre in Tibet, its source being 15,000 feet above the level of the sea, on the north side of Kailas, a Himalayan peak, 19,796 feet high. Its general course, till it forces its way between the Himalaya proper and the Hindu Kush, is toward the northwest. It flows past Leh, the capital of Ladak; receives the waters of its important Trans-Himalayan tributary, the Shyok, from the north; and after a descent of 11,000 feet in a course of 500 miles, through some of the grandest mountain scenery of the world, about 60 miles below Iskardo bends sharply southward, above the confluence of the Gilgit. It flows past Bunji, on the Kashmir-Kohistan border, and 20 miles below takes a western course to Kotgata, where again it turns southward, and at Darband emerges from the Kohistan Mountains into the plains of the Punjab. It becomes navigable at Attock (ancient Taxila), the scene of Alexander the Great's passage, 870 miles from its source. Here it receives the Kabul River (q.v.), its chief affluent on the right. Continuing past Dera Ismail Khan, Dera Ghazi Khan, and other minor towns, near Mithankot, about midway in its further course of 940 miles to the Arabian Sea, it receives the waters of the Chenab, the Ghara, the Jhelum, the Ravi, the Beas, and the Sutlej, through the Panjnad (literally 'five rivers,' which gives its name to the Punjab). Each of these rivers, as well as the Kabul, is practicable for inland craft to the mountains.

Below the confluence of the Panjnad the volume of the Indus, past Sakkar and Hyderabad, becomes gradually less. Through the arid, rainless, alluvial plain of Sindh it divides into numerous channels, many of which do not return to the main stream, while others return much

shrunken in volume. This wasting of the waters is not very apparent to the eye, owing to the gradual slackening of the current and the ascent of the tides. Miani, 8 miles north of Hyderabad and 75 miles from the sea, is the head of the delta which extends for 130 miles along the coast of the Arabian Sea. The chief outlets of the Indus are the Kori, Mal, and Yatho mouths. The annual rise of the river, owing to the melting of the mountain snows, extends from May to August, and is often attended by considerable inundations and changes of the deltaic channels, chiefly owing to the enormous amount of sand and clayey silt brought down by the current. Modern engineering has done much to obviate the inconveniences caused. The value of the Indus as a navigable route of traffic, never considerable, has been lessened since the building of railways through its valley from Karachi to Attock, and navigation is now confined to native craft. In a hot climate, where precipitation is almost nil, the river is more important as a means of irrigation, and the various works toward this end inaugurated by the British Government have led to a remarkable agricultural development throughout Sindh. The river is spanned by several modern bridges, of which the chief is the huge cantilever bridge at Sakkar, and the northernmost an iron suspension bridge above Bunji. Fish of excellent quality abound in its waters, and form the staple article of commerce and food of the surrounding country. The gavia, or long-snouted alligator, is the amphibious reptile of the river. The Indus is the 'King River' of Vedic poetry.

INDUSIUM, in-dū'shī-ūm or -zhī-ūm (Lat., tunic). In ferns, a flap-like outgrowth which covers the sorus or group of spore-cases (sorangia). Indusia are exceedingly varied in structure, and furnish characters for classification. Occasionally the sporangia are developed along the leafy margin which inrolls to cover them, as in the maidenhair fern and the common bracken. In this case the inrolled leaf-margin is spoken of as a 'false indusium.' See FERN.

INDUSTRIAL ACCESSION. A phrase borrowed by the Scotch from the Roman law to denote the increased value given to a thing by labor and skill bestowed upon it. See ACCESSION; FIXTURE.

INDUSTRIAL ARBITRATION AND CONCILIATION. Modern industry, with its sharp distinction between employer and employed, and its rapidly changing methods of production and conditions of employment, has given rise to a new class of disputes, which affect vitally not only the parties immediately concerned, but the general public as well. These disputes lie for the most part beyond the province of courts of justice, and therefore an imperative need has arisen for a new form of tribunal to which they may be referred. To meet this need, boards of arbitration, official or unofficial, have been organized in all of the leading countries of the world.

A preliminary function of these organs of industrial arbitration is what is usually termed *conciliation*. Before a dispute can be arbitrated it is necessary that the facts in the case should be investigated and placed in their true light. When industrial disputes result from mere misunderstandings—and it is safe to affirm that a

majority of them have no deeper origin—the preliminary investigation may suffice to bring the contending parties to an agreement. It is therefore natural that the work of settling disagreements of this kind should be assigned to two bodies, a board of conciliation, which investigates each case and attempts to clear away misunderstandings, and a board of arbitration, which gives awards on the cases in which more essential points are at issue. Where, however, boards of conciliation and arbitration are actually organized separately, their relation is often merely that of a lower and an upper court, the organ of conciliation giving awards, subject to revision in the board or court of arbitration.

Arbitration and conciliation may be voluntary or compulsory. In the former case, the organ of arbitration may be created by the contending parties, or may be officially constituted; but either party is free to refuse its services or to accept its awards. When arbitration is compulsory, disputes must be arbitrated at the request of either party, and decisions of the court of arbitration are sanctioned by legal penalties.

The earliest systematic arbitration of industrial disputes appears in France. Before the French Revolution there was a tribunal at Lyons for the settlement of disagreements arising in the silk trade. This tribunal was connected with the guild, and disappeared with the abolition of corporations (1791). It had worked so successfully that it was restored in 1808, forming the germ of the *conseils des prud'hommes* (boards of experts) which still perform this function in France and Belgium. The example of Lyons was soon followed by several cities in Southern France, and with excellent success. These early boards contained no representative of the working classes, the one at Lyons being composed of five merchants and four overseers. By a law of 1809 workmen were admitted, but they were always in the minority until 1848, when they were given, for a short time, equal representation. At the present day, the *conseils des prud'hommes* are found in all of the important cities of France. They are composed of a board of conciliation, consisting of a representative of the workmen and a representative of the employers, which has jurisdiction in disputes involving less than 200 francs, and a board of arbitration consisting of three employers and three workmen, whose findings are subject to appeal to the Tribunal of Commerce in cases involving more than 200 francs. The court of arbitration has power to summon witnesses and to take testimony under oath. Acceptance of the decision is voluntary. Nevertheless, two-thirds of the cases brought before the court are settled by the board of conciliation; only a small percentage are appealed to the tribunal of commerce. It is, however, only minor matters that are brought before the courts. They have proved unable to prevent strikes and lockouts, which in late years have seriously crippled French industry. In Prussia industrial courts were established in 1849, but did not prove to be of much use, and were later abolished. In 1890 an Imperial law authorized the municipalities to create such courts. The president is appointed by the commune; the assessors must be workmen and employers in equal numbers. They have power to summon witnesses and to take testimony; in cases involving 100 marks or more, appeal to the regular

courts is permitted. Few municipalities have availed themselves of the privilege. Moreover, unofficial arbitration has made little headway in the Empire. In Switzerland far greater progress has been made in this direction. Unofficial arbitration is carried on under the direction of trade unions, and several of the cantons have established *conseils des prud'hommes*, after the French model. Arbitration is compulsory in some of the cantons, notably Luzerne, where refusal to accept an award may be punished by fines and imprisonment; in some cantons it is optional, as in France.

In England voluntary and unofficial arbitration was instituted early in the nineteenth century, and has made greater progress than in any other country. In 1836 disputes in the pottery trade were settled in this way; and within the following decades several important trades adopted the same practice. Committees of employers and employed meet informally to discuss grievances, and usually succeed in reaching an amicable agreement; and where these committees are best organized, as in the coal trade of Durham, the decisions of the committee are rarely rejected by the disputants. In the last decade, upon the initiative of the London Chamber of Commerce and the trade unions, local boards not connected with any particular trade have been created in large numbers, and have been successful in diminishing the number of serious disturbances in industry. But in England, as in France, the more important disagreements have had to be adjusted by protracted and costly strikes and lockouts.

New Zealand enjoys the distinction of being the only country which undertakes systematically to prevent strikes and lockouts by a general law of compulsory arbitration. In 1894 a law was enacted creating boards of conciliation and a court of arbitration, the latter having power to enforce its awards by penalties. The boards of conciliation consist of four to six members, one-half representing the labor associations, the other half representing associations of employers. They are elected every three years by the associations of employers and employed. Each board elects as chairman an impartial outsider, who votes in case of a tie. The arbitration court is composed of three members appointed by the Governor, one from a list nominated by the employers, a second from nominees of the laborers, and the third from the judges of the Supreme Court. Cases are tried before the court only upon the request of one of the disputants, and all means of conciliation are attempted before resort is had to arbitration. Strikes and lockouts are forbidden while the case is pending. Awards of the court may be extended to a whole district. Under the act trade unions are recognized as corporate bodies; and only by belonging to such a body does a workman secure standing in the court. Numerous disputes have been settled by the court, and light fines have hitherto been sufficient to enforce its awards.

The first noteworthy case of unofficial arbitration in the United States was in 1865, when a committee was appointed to arbitrate differences between the Sons of Vulcan and their employers. Since that date arbitration committees have been chosen in many trades, often operating with marked success. Much attention has been

attracted by the signal success of an unofficial board which operates in the coal-mining industry of Illinois. The activity of this board dates from 1898, and since that year innumerable grievances which might have led to strikes have been amicably adjusted. When such disputes arise, representatives of the coal operators and of the United Mine Workers (q.v.) meet, together with the miners and operators immediately interested. The mere discussion of the points at issue frequently results in explaining away alleged grievances.

Official boards of arbitration were established in Massachusetts and New York in 1886. At present twenty-four States in the Union have made statutory or constitutional provision for industrial arbitration or conciliation. Seventeen of these contemplate the administration of arbitration through permanent boards: Massachusetts, New York, Montana, Michigan, California, New Jersey, Ohio, Louisiana, Wisconsin, Minnesota, Connecticut, Illinois, Utah, Indiana, Idaho, Colorado, and Kansas. The Constitution of Wyoming directs the Legislature to establish courts of arbitration to determine all disputes between employer and employed. Provision is made for appeals to the Supreme Court from the decision of compulsory boards of arbitration. Kansas enacted compulsory arbitration in 1898, but in the following year the enactment was declared unconstitutional. In addition to the State courts, temporary tribunals were created by Federal statute in 1888 to settle grievances between railroads engaged in interstate commerce and their employees. These tribunals consisted of one member chosen by each party, and a third chosen by these two. The law was repealed in 1898, but was reenacted in the same year in its essential features.

The organization of the State boards varies in detail, but the feature of equal representation of employers and employed is general. Their principal function is to investigate disputed questions, conciliation rather than arbitration being the end in view. In Massachusetts the arbitration board has power to summon witnesses, to take testimony under oath, and to require books and writings to be produced. The results of the investigation may be made public at any point in the proceedings. In other States the powers of the courts or boards are generally of a similar nature. The Massachusetts board has won a national reputation for efficiency, and while unable to prevent all strikes, has unquestionably done much to diminish their frequency.

An examination of the workings of boards of voluntary arbitration shows that for the settlement of disputes which are due to misunderstandings, or which involve matters of minor importance, their usefulness is unquestioned. Wherever they have been judiciously conducted they have served to lessen friction between employer and employed, and have often averted strikes and lockouts. But there are certain questions of general policy which have defied settlement by voluntary arbitration. Such, for example, are the recognition of labor organizations by the employer, exclusion of non-union labor from employment, a general and material increase or lowering of wages. These questions are still usually determined by the strength and endurance of the contending parties. Investigations by impartial boards of arbitration may direct pub-

lic sentiment, and so may bring pressure to bear upon the party whose ethical position is the weaker. But this pressure has not proved sufficient to prevent prolonged strikes, causing widespread distress to the public, as well as to the parties to the struggle. It is for this reason that a growing sentiment manifests itself in favor of compulsory arbitration. It is pointed out that under a system of industrial concentration a strike may wholly cut off the supply of one of the necessities of life—a condition which is manifestly intolerable. Advocates of compulsory arbitration point to the example of New Zealand, where for seven years disputes have been adjudicated without cessation of industry. Opponents of compulsory arbitration are, however, no less decided in their views than are the advocates of it. It is pointed out that laborers will frequently demand terms to which employers can accede only by producing at a loss; and that courts of arbitration, under the influence of a public sentiment naturally favorable to the laborer, will often give awards which will discourage business enterprise. It is alleged that this is the case in New Zealand, although this is vehemently denied, and there is no evidence that capital is withdrawing from the colony. Moreover, it would obviously be difficult to force the laborers to abide by a decision unfavorable to them, since men cannot be compelled to continue to work against their will. The incorporation of laborers into associations with collective responsibility (see TRADE UNIONS) is advocated as a measure which will obviate this difficulty; but such a measure is strongly opposed by the better organized labor unions, as well as by those who view with suspicion any tendency away from individual freedom and responsibility. In spite of the difficulties which beset compulsory arbitration, however, it would appear to be obvious that social welfare demands that judicial means should be developed for settling peacefully those disputes which can now be settled only through strikes involving untold losses and suffering.

Bliss, editor, New York, 1897); Jeans, *Conciliation and Arbitration in Labor Disputes* (London, 1894); Köpke, *Ueber gewerbliche Schiedsgerichte* (Zürich, 1895); Brumel, *De la conciliation en matière commerciale* (Paris, 1898); Lloyd, *A Country Without Strikes* (New York, 1900); *Congress on Industrial Conciliation and Arbitration* (Chicago, 1894); *Massachusetts State Board of Arbitration, Annual Reports* (Boston, 1886-1901); *Report of Industrial Commission*, vol. xvii. (Washington, 1901).

INDUSTRIAL COMMISSION. A non-partisan commission, created by act of Congress, June 18, 1898, to investigate industrial conditions, and to suggest Federal and State legislation for the better regulation and adjustment of conflicting industrial interests. The commission consisted of 19 members, of whom 5 were Senators, appointed by the president of the Senate, 5 Representatives, appointed by the Speaker of the House, and 9 especially qualified persons, appointed by the President with the consent of the Senate. The specific duties of the commission were, first, to investigate questions of immigration, labor, agriculture, manufacturing, and business, and, second, to suggest, on the basis of the

facts ascertained, proper Congressional legislation and also uniform State legislation, equitable at once to employer and employee, producer and consumer. The life of the commission was limited to two years, but this time was subsequently extended to December 15, 1901, and to February 15, 1902, successively. The work of the commission, owing to the inevitable preoccupation of its Congressional members, in their own and in public affairs, was largely carried on by the Presidential appointees, and by specially engaged experts. Of the latter may be mentioned: on strikes and arbitration, E. Dana Durand; on labor legislation, Frederic J. Stimson; on trusts and industrial combinations, Jeremiah W. Jenks; on transportation, William Z. Ripley; on agriculture, John F. Crowell; on immigration, John R. Commons; on taxation, Max West; on labor organizations, Charles E. Edgerton. The fact that no equally competent body of men, empowered to call for witnesses and documentary papers, had ever before examined American industrial methods and organizations, together with the fact that the period of prosperity succeeding 1897 brought industrial phenomena into accentuated relief and activity, resulted in the commission's bringing together a great body of new correlated and substantiated evidence concerning practically every phase of industrial life. Testimony was taken from nearly 700 witnesses, including heads of trusts, railroads, and mercantile establishments, public officials and leaders of trade unions, and in addition the commission collected much valuable but hitherto scattered information from official, national, and State documents, from judicial decisions, and from the researches of experts. The *Report of the Industrial Commission*, completed February 19, 1902, and issued as a Government publication, consists of 19 volumes, as follows: Trusts and Industrial Combinations (2 vols.); Trust and Corporation Laws; Prison Labor, Transportation (two vols.); Labor Legislation; Distribution of Farm Products; Capital and Labor in Manufactures and General Business (two vols.); Chicago Labor Disputes; Agriculture and Agricultural Labor; Agriculture and Taxation; Capital and Labor in the Mining Industries; Immigration and Education; Foreign Labor Legislation; Labor Organizations; Labor Disputes and Arbitration; Railway Labor; Industrial Combinations in Europe; Final Report—Miscellaneous.

INDUSTRIAL EXHIBITIONS. See EXHIBITIONS, INDUSTRIAL.

INDUSTRIAL FRUITS. In Scotch law, the annual produce of land which the life-renter is entitled to. For the corresponding doctrine of English and American law, see EMBLEMENT.

INDUSTRIAL INSTITUTIONS. See AGRICULTURAL EDUCATION; JUVENILE OFFENDERS.

INDUSTRIALISM. A term first applied by Saint-Simon and his followers to the 'modern régime,' but also to the peculiar systems of social organization which they advocated. In his *Data of Ethics* Spencer uses the term as descriptive of "a theoretically possible form of society purely industrial in its activities." Pure 'industrialism' according to Spencer would be reached when men were scrupulously honest in the fulfillment of agreements, while yielding "to one another no advantages beyond those agreed upon."

The meaning to be attached to the term has

not yet been definitely established. By some it is employed to characterize the modern industrial system in which manufacturing industries predominate; others employ it as a description of modern civilization as opposed to the 'militarism' of preceding times. (See MILITARISM.) The definition which has been most generally accepted agrees in the main with Spencer's conception. This is exemplified by the deprecations of the 'industrialism' of modern life, found in literature and religious writings.

INDUSTRIAL REVOLUTION. In the latter part of the eighteenth century and the early part of the nineteenth the economic life of England underwent a great transformation, which has aptly been called the Industrial Revolution. As late as 1760 the 'open-field' system (q.v.) was the prevailing characteristic of British agriculture. Even in 1794, when the process of inclosing the commons and open fields had been progressing rapidly for a quarter of a century, out of 8500 parishes in England 4500 were still farmed in common. Great stretches of country lay quite unimproved; extensive bogs and heaths were found in all parts of the island. In many counties the miserable crops merely afforded sustenance to the agricultural population. The means of transportation were so defective that in one county surplus produce went to waste, while in an adjoining county scarcity prices prevailed. Industry was carried on by the domestic system, under which the manufacturer or merchant put out his materials to be worked up in the laborers' homes at piece wages. Exchange was still carried on largely by means of weekly markets, annual fairs, and through itinerant traders. British foreign trade was, however, increasing rapidly, and with the increased demand for goods prices of manufactures rose, affording the means of supporting a larger industrial population. The increased need for food rendered systematic agriculture more profitable; and the development of capital diverted much wealth to husbandry. A number of wealthy gentlemen turned their attention to the improvement of stock and the proper treatment of the soil (see AGRICULTURE), and demonstrated that agriculture could furnish returns rivaling those of trade, with the result that methods of agriculture were revolutionized. The Continental wars enhanced the prices of agricultural produce, and gave a great impetus to the adoption of the new methods. Between 1760 and 1843 nearly 7,000,000 acres of land were inclosed and put to intensive tillage.

At the same time, the domestic system in industry was giving way to the factory system, as a result of the great mechanical inventions. In 1770 Hargreaves patented the spinning-jenny; the water-frame was invented by Arkwright in 1769; Crompton's mule was introduced in 1779. In 1769 Watt obtained his first patent for an improvement in the steam-engine, and in 1785 it was successfully applied to the cotton manufacture. The effect of these inventions was enormously to increase output, the cotton manufacture trebling from 1788 to 1802. The iron industry, which had hitherto been relatively insignificant, and was dwindling to still greater insignificance with the destruction of the woods, was revived by the employment of pit-coal in smelting, rendered possible by the application of

the steam-engine to furnish power for the blast. The adoption in the woolen industry of the improvements in cotton manufacture extended the new system greatly. As a result of all these changes, English commerce, foreign and domestic, developed rapidly; shipping increased, good roads were built, and an era of canal-building set in. Industry shifted from the rural towns to the large cities of the north of England, where labor was concentrated in factories, with the effect of improving the organization of labor, and of making practicable numberless subsidiary labor-saving devices. Immense fortunes were made by those who were able to make use of the improved methods; population grew rapidly with the increased chances of employment. From 1791 to 1821 the population of England increased 43 per cent.

The period was, however, marked by a great deal of hardship to the working classes. The open-field farmers, displaced by inclosures, flocked to the cities and helped to reduce wages, at times, to a starvation level. The introduction of machinery deprived the hand workers of their means of livelihood; the crowding together of population in the large cities resulted in untold evils, moral and physical; the new life in the factory was not yet subjected to the regulations afterwards found to be imperatively necessary. The employment in factories of women and children, with all its attendant evils, became common in all the manufacturing towns. The general effect of the revolution, however, was to give England a century's start over her rivals in the competitive race. The foundations for the prosperity of England to-day were laid by the thorough change in industry. Consult: Toynbee, *Industrial Revolution* (6th ed., London, 1902); Held, *Zwei Bücher zur sozialen Geschichte Englands* (Leipzig, 1881). See FACTORIES AND THE FACTORY SYSTEM.

INDUSTRIAL SCHOOLS. This term, now passing out of general use, has been variously and loosely applied to a large class of schools, mainly of a philanthropic, reformatory, or experimental nature, in which industrial work has been taught to boys and girls at a comparatively early age. This kind of school has been represented perhaps more fully than elsewhere in England, where the 'Ragged School' is a prominent type. The primary purpose of such schools is generally other than industrial, and the aim of the industrial instruction varies from the mere desire to keep boys off the streets to the serious effort to teach a trade. These institutions have not, however, filled the purpose of real trade schools, mainly on account of the early age of the pupils, and the short period of instruction. Simple operations like broom and brush making, chair-seating, or basketry, have been prominent in such schools; tailoring, shoemaking, and wood-working less so. Industrial classes, which represent the same characteristics as the above, are often a feature of orphan asylums or homes for juvenile defectives. On the whole, this type of school has not demonstrated any important function in training for industrial work, and its place in the social order, as has been pointed out, is mainly pathological. In the early discussion on the introduction of manual training into the common schools, the term 'Industrial Education' was very often applied to this sub-

ject. See TECHNICAL EDUCATION; MANUAL TRAINING; GEORGE JUNIOR REPUBLIC.

INDY, *ân'dé'*, PAUL MARIE THÉODORE VINCENT, D' (1851—). A French composer and pianist, born in Paris. He copied closely the method and style of Berlioz, and, like Berlioz, his genius inclined strongly toward symphonic art. It was his mother who gave him his first practical instruction, and at fourteen years of age he was reckoned a master of the piano. From 1862 to 1865 he studied under Diémer, after which he studied theory under Lavignac, and attended the lectures of Marmontel. In 1870 he enlisted in the army, and at the conclusion of the Franco-Prussian War took up his studies under César Franck. In 1873 he became a member of the organ class at the Conservatory. Afterwards he was engaged as second kettle-drummer and choir-master of the Société des Concerts du Châtelet, a post which he accepted as much for the study of the orchestra as for a means of livelihood. In 1885 he took over the management of the Société Nationale de Musique, and when César Franck became president of it, he acted as secretary, together with Chausson, and practically managed all its affairs. Besides his appointment of inspector of music in the city schools of Paris, he received the decoration of chevalier of the Legion of Honor, and was given charge of various important choral societies. He was a thorough disciple of Wagner, and by some has been charged with imitating too closely the German master. His *leit-motifs* are usually developed with exquisite felicity, and he is frequently daringly original. His most important works are: the tripartite symphonic poem *Wallenstein*, of which the second part, *I Piccolomini*, was first produced by Pacheloup in 1874; *Symphonie sur un air montagnard français*; and *La forêt enchantée* (1896). His one-act comic opera *Attendez-moi sous l'orme* (1882) was practically a failure, but he retrieved himself in 1895 with the music drama *Fervaal*, of which he wrote both words and music.

INEBRIETY. See INTOXICATION.

INEDUCABILIA (Neo-Lat. nom. pl., not educable, from Lat. *in-*, not + Neo-Lat. *educabilis*, educable, from Lat. *educere*, to educate, from *e*, out + *ducere*, to lead). A division of mammals, proposed by Gill, embracing the rodents, edentates, insectivores, and bats, based upon the character that in all these the cerebrum is small, and does not cover the olfactory lobes or cerebellum, as in other Eutheria. This division does not enter into current classifications. It is, nevertheless, approved as marking a fact of interest.

INEQUALITY (Lat. *inæqualitas*, from *inæqualis*, unequal, from *in-*, not + *æqualis*, equal, from *æquus*, even). The relation between two magnitudes which are not equal. If a 1-1 correspondence can be set up between the individuals of two groups, *a*, *b*, they are said to be equal. But if this correspondence extends to all of the individuals of *a* and to only a part of those of *b*, then *b* > *a*, and vice versa.

INERTIA. *in-ër'shî-à* (Lat., sluggishness, from *iners*, idle, from *in-*, not + *ars*, art). A general property of matter of which we become conscious through our muscle-senses whenever by our muscles we change the motion of matter, e.g. throw or stop a ball, open a door, stop a revol-

ing wheel, etc. It is noticed that the intensity of the sensation depends both on the material body itself and on the *rate* at which its motion is changed. Similarly, if the motion of the body is stopped by some inanimate object, the effect on the latter is proportional to the rate of decrease and varies with the body stopped; e.g. if a moving body meets a spiral spring and compresses it until it is brought to rest. If two moving bodies are brought to rest by a given spring in the same time and produce the same amount of compression, they may be said to have the same inertia. (On this definition is based the system for measuring quantities of matter, q.v.). If it takes longer to bring the first body to rest, it is said to have the greater inertia. It is believed that, if there were nothing external to the moving body affecting it, it would continue to maintain its motion unaltered forever. Galileo was the first to advance this idea; and it is now assumed as one of the principles of mechanics. On the other hand, if there is some external action on the body it takes time to produce a change in its motion, and the change produced in a given time will vary inversely as the inertia; or, to produce a given change in motion, the external action required varies directly as the inertia. It is to Newton that we owe our ideas of inertia as a measurable fundamental property of matter. Up to his time weight was the only property of matter used as a measure of the 'quantity of matter.'

INESCUTCHEON (*in* + *escutcheon*, from OF. *escusson*, *escuçon*, Fr. *écusson*, *escutcheon*, from OF. *escut*, *escu*, Fr. *écu*, shield, from Lat. *scutum*, shield). In heraldry (q.v.), a single shield borne as a charge.

INES DE CASTRO, *ē'nēs de kã'strô*. See CASTRO, INEZ DE.

INESILLA DE CANTARILLA, *ē'nã-sē'lyã dã kãn'tã-rē'lyã*. In Le Sage's *Gil Blas*, a character who retained the power of charming men during the whole of a long life.

INEXPIABLE WAR, THE. A war of extermination waged by Carthage against her unpaid mercenaries in B.C. 241-238. The scenes of this war are pictured in Flaubert's *Salammbô*.

INEZ, *Span. pron. ē'nãth*, DONNA. In Byron's *Don Juan*, the mother of Don Juan.

INFALLIBILITY (from ML. *infallibilis*, infallible, from *in-*, not + *fallibilis*, fallible, from *fallere*, to deceive, Gk. *σφάλλειν*, *sphallein*, to overthrow, AS. *feallan*, OHG. *fallan*, Ger. *fallen*, Eng. *fall*). The immunity from error, in all that regards faith and morals, which is claimed by the Roman Catholic Church, and, at least as regards the past, by the Greek Church, as represented in the decrees of the councils which that Church looks upon as ecumenical. The latter claim, however, which does not go beyond that of inerrancy, or actual exemption from error up to the present time, differs widely from that of infallibility as put forward by the Roman Church, which involves not alone an actual historical immunity from error, but also such a positive and abiding assistance by the Spirit of God as will at all times both protect against the possibility of error, and guide and direct in the faithful teaching of all necessary truth. The infallibility claimed by the Roman Church is thus of two kinds, passive and active—the first (Matt. xvi. 18), in virtue of which the Church never can receive or

embrace any erroneous doctrine, no matter by whom proposed; the second, in virtue of which she is charged with the function (Matt. xxviii. 19; Mark xvi. 15; Ephes. iv. 11-16) of permanently teaching to the world the essential truths of God, of actively resisting every access of error, and of authoritatively deciding every controversy by which the oneness of belief among the faithful may be endangered. Catholics regard this gift as a natural and necessary accompaniment of the authority in the matters of faith with which they believe the Church to be invested, and which, if not guided in its exercise by such infallible assistance, would be but a false light, and an attractive but dangerous delusion. They have always agreed that the body of bishops throughout the Church, acting in common with the Pope, constitute the most perfect organ of the infallibility of the Church; and hence, that when they unite in any way, whether as assembled in a general council or separated in place, their judgment is infallible. Thus, if a doctrinal decree were addressed officially by the Pope to the whole Church, and either expressly confirmed or tacitly accepted by the bishops, this decree was held to be infallible. In like manner, if a doctrinal decree, emanating even from a local council, as that of a national or even a provincial Church, should be universally accepted by the Pope and the bishops, that decree also was held to be infallible. In a word, wherever there is found the united judgment of the Pope and the bishops, all agreed in accepting it as the infallible judgment of the Church. But should the Pope alone judge without the bishops, there arose the well-known dispute of the Gallican and Ultramontane divines; the latter affirming, the former denying, the Papal judgment to be infallible, but all agreeing that it was not binding as an article of Catholic faith so long as it had not received the assent of the body of the bishops. The formal definition of Papal infallibility as *de fide* dates from the Vatican Council of 1870. The minority of bishops who opposed the decree did so, as a rule, not because they disbelieved the doctrine, but because they considered its imposition as a necessary article of faith inexpedient. As formally declared, the definition is that the doctrinal decrees of the Pope teaching *ex cathedra*—that is, when in discharge of the office of pastor and doctor of all Christians, by virtue of his supreme apostolic authority, he defines a doctrine regarding faith and morals to be held by the universal Church—are to be accepted as possessing the same infallibility which attaches to the teaching of the Church. See COUNCIL.

On the matter of subjects to which the gift of infallibility extends Catholics are agreed in one principle, that it embraces all those subjects, and those only, which are necessary for the maintenance of divine truth in the Church. Hence, presupposing divine revelation, either written or oral, it embraces all questions of faith and morality, all subjects of general discipline, so far at least as to preclude the introduction, by authority of the Church, of any discipline which should be injurious to faith or to morality. On the other hand, it does not embrace questions of science, or matters of fact, or abstract opinions unconnected with religion. Thus the popular misconception that the decision in the case of Galileo bears on the question of this

strictly defined infallibility is seen to be baseless. It may be well also to point out that the Pope is not by its terms supposed to have the power to invent and enforce new doctrines, but can only declare and define those which have been held either implicitly or explicitly in the Church from the beginning. See Foster, *Fundamental Ideas of the Roman Catholic Church* (Philadelphia, 1899); Hefele, *Honorius und das sechste allgemeine Concil* (Tübingen, 1870); Salmon, *The Infallibility of the Church* (London, 1888); Rive, *Unfehlbarkeit des Papstes* (Paderborn, 1870); Manning, *Privilegium Petri* (London, 1870); Andrie, *Cathedra Romana* (Mainz, 1872).

INFAMOUS CRIME (OF. *infameus*, from ML. *infamosus*, from Lat. *infamis*, infamous, from *in-*, not + *fama*, fame). An offense which is deemed to reveal such an absence of moral principle as to indicate that the culprit would totally disregard the obligation of an oath. Such crimes are punished according to their character, and the disabilities of infamy are imposed as an incident thereto. At the early common law treason, felony, forgery, and offenses tending to pervert the administration of justice by falsehood and fraud, such as perjury, conspiracy, and cheating, were included in this classification. The Constitution of the United States provides that "no person shall be held to answer for a capital or otherwise infamous crime unless on presentment and indictment of a grand jury." The Federal courts have included all crimes punishable by imprisonment in a State prison or penitentiary in this category, and many of the State courts have adopted their classification. See **INFAMY**. Consult the authorities referred to under **CRIMINAL LAW**.

INFAMY (from Lat. *infamia*, from *infamis*, infamous). The condition of legal disability and discredit imposed upon a person convicted of an infamous crime (q.v.). The term originated in the Roman law, under which system many derelictions of duty, such as a simple breach of certain contracts, as well as certain crimes, were punished with the civil and political disabilities of infamy. In the early English law the doctrine of attainder (q.v.) attached to the more serious crimes, and infamy only involved incompetency as a witness and incapacity to serve on a jury. The disabilities attaching to infamy are largely regulated by statute to-day, and in England and many of the United States all disqualifications on this account have been abolished. See **ATTAINDER**; **INFAMOUS CRIME**.

INFANCY, ARABIC GOSPEL OF THE. See **APOCRYPHA**, NEW TESTAMENT.

INFANT. At common law, any male or female person under the age of twenty-one years. As the common law makes no account of a fraction of a day except when a question of property is involved, an infant is held to become of age on the day before the twenty-first anniversary of his birth. It has always been the policy of the law to safeguard infants from the consequences of their own indiscretion by modification of many of the rules of law applicable to adults. Thus an infant's contracts are voidable (not void like the contracts of married women). That is, they are binding upon an adult contracting with the infant, but they may be avoided by the infant upon the ground of his infancy; but if the infant expressly or by implication ratifies the

contract after he is of age, the contract cannot be afterwards avoided by him. (See **RATIFICATION**.) Thus, if the infant purchases goods and retains them after he is of age, he will be deemed to have ratified his contract to pay the purchase price even though he disclaims such intention. In a similar manner, an infant may avoid and set aside his conveyance of real estate at any time during his infancy, or within a reasonable time afterwards, unless he has ratified his conveyance after attaining his majority. Whenever an infant disaffirms his contracts or conveyance he is entitled upon principles of quasi-contract (q.v.) to recover from the other party to the contract the reasonable value of the consideration or performance which he (the infant) has given under the contract, even though he has (before coming of age) squandered the consideration which he has received under the contract. If, however, the infant have any money or property which he received under the contract, he must return it to the other party to the contract in order to disaffirm the contract. While an infant is not bound by his contract, he is bound to pay for necessities (see **NECESSARY**) purchased by him, his liability being based on the theory of quasi-contract (q.v.). An infant may also pledge his parent's credit for necessities upon theory of implied agency if the parent does not supply them. A parent is not liable as a matter of law to pay for articles supplied to his child by a third person; but a parent may so act as to estop himself from denying the authority of the infant to act as his agent, as by regularly paying for articles purchased by the infant.

In general, infants are liable for their torts. Where, however, the effect of holding the infant for his tort is indirectly to enforce his contract, the courts have denied his liability in tort. The practical application of this rule involves some very nice discrimination for the court. Thus an infant who hires a horse, and so negligently cares for him that the horse is injured, is not liable for tort or upon his contract; but if the infant appropriates the horse to his own use by going to some place other than that specified in the contract for him, the infant is deemed to have abandoned his contract and to be liable in tort. Upon similar grounds it has been held that, while an infant is generally liable for deceit (q.v.), one who fraudulently represents himself to be of full age and thereby procures another to enter into a contract with him is not liable for the tort, but the soundness of the position has been questioned.

An infant who is a property-holder is subject to the laws of taxation, and his land is liable to be taken from him by eminent domain as if he were of age. At common law a legal marriage might be contracted between a boy of fourteen and a girl of twelve. See **AGE**.

An infant if sufficiently intelligent to have criminal intent is responsible for any crimes that he may commit. It is a rule of the common law that this responsibility can never arise before the infant is seven years of age. After that period until he is fourteen the law presumes nothing for or against him. His capacity to understand the nature and consequence of his act must be proved by the prosecution in order to establish his guilt. After he is fourteen he is presumed to have capacity to commit crime, and the burden of

creating a reasonable doubt of his capacity rests upon him. See further under AGE; CONSENT; etc.

The parents are entitled to the custody of the infant child during infancy, and are also entitled to earnings until this right is voluntarily renounced by them, when the infant is said to be emancipated. As between the father and the mother, the father was at common law entitled to the custody of the child. The modern tendency of the courts is to accord the custody in case of dispute to the parent best able and qualified to care for the child, whether it be the father or the mother.

In many States male infants of eighteen years or over may serve as executors and administrators.

Infants are not permitted to sue in their own name and right in either courts of law or equity. The action must be brought by the infant's near friend (*prochain ami*) or guardian *ad litem*, who is a relative, a friend, or other proper person permitted by the court to prosecute the action in the infant's behalf. Courts of equity early constituted themselves the especial protectors of children, giving them relief in various ways, particularly by appointing guardians over their person and property. The care of an infant's property by guardian is now generally regulated by statute (see GUARDIAN), the effect of which is to place the infant's property in the possession of a guardian appointed by the court, who is required to invest and care for the property as a trustee for the infant. See the articles CONTRACT; RAPE; etc., and consult the authorities referred to under such titles and under DOMESTIC RELATIONS.

INFANTE, ên-fân'tâ (Sp., Port., infant). The title given in Spain and Portugal to the princes of the royal family, with the exception of the heir apparent, the corresponding title of Infanta being given to the princesses. Since the fourteenth century the heir apparent to the throne in Spain has been styled Prince of Asturias, and the heir apparent in Portugal, until the separation of Brazil from the mother country, bore the title of Prince of Brazil. The personal domain of an infante or infanta is called the *infantado*.

INFANTE, JOSÉ MIGUEL (1778-1844). A South American statesman, born in Santiago de Chile. He played a prominent part in the Revolution of 1810, which resulted in the independence of Spanish America. He was President of the Government Junta in Chile after 1814, and went on a diplomatic mission to the Argentine State in 1817. His patriotism was unselfish; he came out against arbitrary authority, and refused office when he thought his country in no need of his services. In 1843 he declined the position of Chief Justice of the Supreme Court, offered him as a mark of the nation's gratitude. He contributed greatly toward the emancipation of slaves in Chile and took active part in the establishment of the common-school system.

INFANTICIDE. The killing of an infant or newly born child; often in a broader sense, the killing of an infant, whether entirely born, or in the act of being born, or of the matured fœtus in the womb.

As an institution or customary practice infanticide has existed in most savage or semi-

civilized races, and still survives in many; as an occasional or abnormal act it has existed in all times and among all peoples, ancient or modern.

Some authorities, as McLennan, have claimed that the custom has been practically universal among primitive races; but the researches of other investigators, as Spencer and Westermarck, have shown it to have been much less widespread than this. Infanticide as practiced among early peoples is to be traced ultimately to conditions of hardship attached to the bringing up of children. Thus among the Abipones, where the women often practice infanticide, the boy was generally sacrificed; for when a son grew up it was necessary to buy a wife for him, while a grown-up daughter would always demand her price. But this hardship more usually attaches to the bringing up of female children, and it is therefore the females who are usually killed rather than the males. This is said to be especially true of those tribes who are surrounded by enemies, and who are forced by their manner of living to lead a migratory life. Among them sons were a source of strength, and daughters an element of weakness. The result of the practice of killing female children among these people often left the primitive hordes with very few young women, so that they were forced to prey upon each other for their wives. This by some has been considered to account for the rise and growth of exogamy; while others have (with less reason) attributed infanticide to the custom of exogamy. In Africa, on the other hand, where the warm climate and the abundance of tropical fruits make the conditions of existence easy, there are no well-authenticated cases of the habit of destroying new-born children; and the ancient writers state that the practice was unknown to the Egyptians.

The natives of two-thirds of the South Sea Islands practice infanticide probably more extensively than any other peoples known to history, either because of lack of food for their infants, or because the rearing of the child diminished the charms of the wife, or because of the disagreeableness of the rearing of the infants. The chief reason, however, was probably the fact that the islands are of very limited extent, and were as thickly populated as they could be and support life by the natural products of the soil. In parts of Australia it is said that the *mother* destroyed all but two boys and one girl, while in Samoa and other Pacific Islands and in some parts of Australia the custom is unknown. Generally speaking, therefore, infanticide is most commonly observed among races living where the struggle for subsistence is most severe, or where customs impose the most burdens upon those rearing children. The best-known instances of infanticide are those which existed in various forms through India, but which are now mostly suppressed in the territory under the control of the British Government by a system of compulsory reporting of births and deaths and of police supervision in districts suspected of it. It was practiced among certain of the tribes of lower caste, as well as among the Rajputs, although forbidden by the Koran and the Vedas. Among some tribes it was due to hardship attaching to the procuring of the means of subsistence, and among others its origin, or the persistence of it, was due to artificial hardships attendant

upon child-rearing, as among the Rajputs, with whom it was dishonorable for a girl to remain unmarried, and the necessary expenses of her marriage were a ruinous burden upon the parents. A similar condition obtains among certain of the American Indians of the Northwest, among whom the potlatch exists as a necessary incident to the marriage of a daughter.

When infanticide has become established as a custom among a savage race, its practice, like all practices connected with birth or marriage, frequently assumes a sacrificial or religious import, and it is by some considered to be the explanation of the origin of the practice of sacrificing children to the gods, the custom of exogamy as above noted, and other rites or ceremonies. So, also the method of killing becomes, in many cases, a matter of custom, as by casting into the Ganges in some parts of India (whence the reverence paid to the alligator, who fed upon the children), or poisoning with opium or datura smeared upon the mother's breast, or by sacrifice to some god. Where the practice survives as a sacrifice it is usually the boy child that is killed. Any change which makes child-rearing less of a burden tends to decrease or do away with infanticide; thus, it is observed that with the growth of industrialism, so that the child labor becomes of value, the practice disappears. It may, however, still be permitted or survive as a means of disposing of the weak or defective, as was the case to a late date in ancient Greece, where the killing of weak children was enjoined in the ideal systems of Aristotle and Plato, and by the actual laws of Lycurgus and Solon.

Infanticide, as it exists among peoples whose laws or customs forbid its practice, is due to special abnormal causes, as of extreme destitution, insanity, abnormal antipathy to the child, fear of disgrace, etc. The usual cause among modern civilized nations is the desire on the part of the mother to escape the shame of illicit child-bearing, or to escape the burden of caring for an illegitimate child. The frequency of cases due to this cause are, of course, directly related to the general standard of morality of the people, as well as to local causes, such as prostitution, etc. They occur most frequently in rural districts and in the densely populated cities, and more frequently in Europe than in the United States. (See ILLEGITIMACY.) In some cases, as in France, laws have been passed which aid the mother in supporting her illegitimate child with-

out exposure or undue burden; and these laws are said to have reduced the proportionate number of infanticides, but to have increased the number of cases of illegitimacy.

The laws of all modern civilized nations treat infanticide as a crime, but they vary too greatly to admit of being specifically stated here. Some of them treat it as a special crime of less gravity than murder, restricting infanticide to the killing of an infant which is newly born (within the time limited by the law); and others make no distinction between infanticide and murder, the question as to when the infant was born being immaterial. The latter is the case at the common law of England and the United States, where the unlawful killing of a fully born child (see BIRTH) is murder, as distinguished from the killing of an unborn child, which is abortion (see ABORTION). On account of the difficulty of proving the fact of birth alive in alleged cases of infanticide, various statutes have been passed affecting cases where a mother has abandoned an infant found dead, or has concealed the birth of an infant found dead, some of which laws were unduly harsh and have been repealed.

See, further, under such titles as BIRTH; ABORTION; EXPOSURE; FOUNDLING HOSPITAL; ILLEGITIMACY; MURDER, etc. Consult, for the full discussion of the law as to infanticide and much of the general history, the works referred to under MEDICAL JURISPRUDENCE, such as Taylor, *Principles and Practice of Medical Jurisprudence* (3d ed., Philadelphia, 1883); *Manual of Medical Jurisprudence* (12th Amer. ed., Philadelphia, 1897); Wharton and Stillé, *Medical Jurisprudence* (4th Amer. ed., Philadelphia, 1884). For the other aspects of infanticide, consult the works referred to under MAN; MARRIAGE; CRIMINOLOGY; SOCIOLOGY, etc., such as Lubbock, *Prehistoric Time* (5th ed., London, 1889); *The Origin of Civilization, and the Primitive Condition of Man* (3d ed., London, 1874); Lecky, *A History of European Morals* (3d ed., London, 1877); Westernmark, *The History of Marriage* (New York, 1891); McLennan, *Studies in Ancient History, etc.* (London, 1876); and for the history of the subject in India, consult Browne, *Infanticide: Its Origin, Progress, and Suppression* (London, 1857).

INFANT PHENOMENON, THE. Ninetta Crummles, a character in Dickens's *Nicholas Nickleby*, the daughter of Vincent Crummles, the theatrical manager.
